On March 26, 1681, in the parliament held at Oxford, Russell again seconded the Exclusion Bill. Upon the dissolution he retired into privacy at his country seat of Stratton in Hampshire. In the wild schemes of Shaftesbury after the election of Tory sheriffs for London in 1682 he had no share; upon the violation of the charters, however, in 1683, he began seriously to consider as to the best means of resisting the government, and on one occasion attended a meeting at which treason, or what might be construed as treason, was talked. Monmouth, Essex, Hampden, Sidney and Howard of Esrick were the principal of those who met to consult. On the breaking out of the Rye House Plot, of which neither he, Essex, nor Sidney had the slightest knowledge, he was accused by informers of promising his assistance to raise an insurrection and compass the death of the king. Refusing to attempt to escape, he was brought before the council, when his attendance at the meeting referred to was charged against him. He was sent on June 26, 1683, to the Tower. Monmouth offered to appear to take his trial, if thereby he could help Russell, and Essex refused to abscond for fear of injuring his friend's chance of escape. Before a committee of the council Russell, on June 28, acknowledged his presence at the meeting, but denied all knowledge of the proposed insurrection. He reserved his defence, however, until his trial. He would probably have saved his life but for the perjury of Lord Howard, who expressly declared that Russell had urged the entering into communications with Argyll in Scotland. Howard's perjury is clear from other witnesses, but the evidence was accepted. Russell spoke with spirit and dignity in his own defence, and, in especial, vehemently denied that he had ever been party to a design so wicked and so foolish as that of the murder of the king or of rebellion. The legality of the

trial, in so far as the jurors were not properly qualified and the law of treason was shamefully strained, was denied in the act of 1 William & Mary which annulled the attainder. Hallam maintains that the only overt act of treason proved against Russell was his concurrence in the project of a rising at Taunton, which he denied, and which, Ramsay being the only witness, was not sufficient to warrant a conviction.

Russell was sentenced to die. Many attempts were made to save his life. The old earl of Bedford offered £50,000 or £100,000, and Monmouth, Legge, Lady Ranelagh, and Rochester added their intercessions. Russell himself, in petitions to Charles and James, offered to live abroad if his life were spared, and never again to meddle in the affairs of England. He refused, however, to yield to the influence of Burnet and Tillotson, who endeavoured to make him grant the unlawfulness of resistance, although it is more than probable that compliance in this would have saved his life. He drew up, with Burnet's assistance, a paper containing his apology, and he wrote to the king a letter, to be delivered after his death, in which he asked Charles's pardon for any wrong he had done him. A suggestion of escape from Lord Cavendish he refused. He behaved with his usual quiet cheerfulness during his stay in the Tower, and spent the last morning in devotion with Burnet. He was executed at Lincoln's Inn Fields on July 27, 1683.

A true and moderate summing-up of his character will be found in his *Life*, by Lord John Russell (1820).

RUSSELL, SIR WILLIAM HOWARD (1821-1907), English war correspondent, was born at Lilyvale, near Tallaght, Co. Dublin, on March 28, 1821, being one of the Russells of Limerick, whose settlement in Ireland dates from the time of Richard II. He entered Trinity college in 1838. Three years later he was thrown very much on his own resources, but a relative, R. W. Russell, who had been sent to Ireland by *The Times*, deputed him to report the Irish elections at Longford, and his success definitely turned his attention to journalism. Coming to London in 1842, he went to Cambridge, but left before taking a degree. He was special correspondent for *The Times* in Ireland in 1845, in Denmark in the war of 1849-50, and in the Crimean War. His letters written from the Crimea were published in book form as *The War, 1855-56*. The exposure made by Russell of the mismanagement in the Crimea contributed to the fall of the Aberdeen ministry. Russell also served as correspondent in India in 1858, in America in 1861-3, in the Seven Weeks' War of 1866, in the Franco-German war of 1870; and he was with Wolseley in South Africa in 1879 and in Egypt in 1882. In 1860 he founded the *Army and Navy Gazette*. Russell was knighted in May 1895, and was the recipient of numerous war medals and various foreign orders. He died on Feb. 11, 1907.

His works include: *My Diary in India in 1858-59* (1860); *My Diary, North and South, during the Civil War in America, 1862* (1862); *My Diary during the Last Great War* (the Franco-Prussian war of 1870) (1872); *Hesperiden*, a description of a tour in the United States and Canada (1882); and *The Great War with Russia* (1895).

RUSSELL OF KILLOWEN, CHARLES RUSSELL, BARON (1832-1900), lord chief justice of England, was born at Newry, county Down, on Nov. 10, 1832, the son of Arthur Russell. The family was Roman Catholic. Educated first at Belfast, afterwards in Newry, and finally at St. Vincent's College, Castleknock, Dublin, in 1849, he was articled to a firm of solicitors in Newry. In 1854 he was admitted, and began to practise his profession. In the legal proceedings arising out of Catholic and Orange disturbances young Russell distinguished himself in the cause of his co-religionists. After practising for two years, he determined to seek a wider field for his abilities. He went to London in 1856, and entered Lincoln's Inn. In 1858 he married Ellen, daughter of Dr. Mulholland of Belfast, and in 1859 he was called to the bar, and joined the Northern Circuit. He had to rely upon himself. But the equipment was sufficient. A well-built frame; a strong, striking face, with broad forehead, keen grey eyes, and a full and sensitive mouth; a voice which, though not musical, was rich, and responded well to strong emotions, whether of indignation, or scorn, or pity; an amazing power of concentrating thought; an intellectual grasp, promptly seizing the real points of the most entangled case, and rejecting all that

was secondary, or petty, or irrelevant; a faculty of lucid and forcible expression, which, without literary oratoricalness or grace of style, could on fit occasions rise to impassioned eloquence—all these things Russell had. But beyond and above all these was his immense personality, an embodiment of energetic will which riveted attention, dominated his audience, and bore down opposition. In his early years Russell's practice was mostly at the Passage Court at Liverpool, and he published a book on its procedure in 1862.

In 1872 Russell "took silk," and from that date for some time he divided the best leading work of the circuit with Holker, Herschell and Pope. Holker became solicitor general in 1874, Herschell in 1880, and about that time Pope left the circuit. Russell's success as a Q.C. during this period of his career was prodigious. He excelled in the conduct alike of commercial cases and of those involving, as he used to say, "a human interest," although undoubtedly it was the latter which more attracted him. He was seen to the least advantage in cases which involved technical or scientific detail. If his advocacy suffered a defeat, however, it was never an inglorious defeat. Those who were on the Northern Circuit at the time could not easily forget the case of *Dixon v. Pimmsell*—a libel action brought by a Liverpool shipowner against Pimmsell—in which Holker won a notable victory for the defendant; or *Nuttall v. Wilde*, a breach of promise action, in which Pope led brilliantly for the successful plaintiff, and Russell's speech for the defence was one of the finest in point of passion and pathos that was ever heard upon the Northern Circuit.

In 1880 Russell was returned to parliament as an independent Liberal member for Dundalk. From that time forward until 1894, he sat in the House of Commons: for Dundalk until 1885, and afterwards for South Hackney. During the whole of this epoch, in home affairs, Irish business almost monopolized the political stage; and Russell was Irish to the core. From 1880 to 1886, as a private member, and as the attorney-general in Gladstone's administrations of 1886 and 1892, he worked in and out of parliament for the Liberal policy in regard to the treatment of Ireland as few men except Russell could or would work. His position throughout was clear and consistent. Before 1886 on several occasions he supported the action of the Irish Nationalist party. He opposed coercion, voted for compensation for disturbance, advocated the release of political prisoners and voted for the Maamtrasna inquiry. But he never became a member of the Irish Home Rule or of the Parnellite party; he was elected at Dundalk as an independent Liberal, and such he remained. When, as attorney-general in the Gladstone administration, he warmly advocated the establishment of a subordinate parliament in Ireland, he did so because he sought the amelioration and not the destruction of Ireland's relations with the rest of the kingdom.

Russell rapidly became in London what he was already in Lancashire, a favourite leader in *nisi prius* actions. The list of *causes célèbres* in the period 1880-94 is really a record of Russell's cases, and, for a great part, of Russell's victories. The best known of the exceptions was the libel action *Belt v. Lawes* in 1882, after a trial lasting more than 40 days, resulted in a verdict for the plaintiff, for whom Sir Hardinge Giffard (afterwards Lord Chancellor Halsbury) appeared as leading counsel. The triumph of his client in the Colin Campbell divorce suit in 1886 afforded perhaps the most brilliant instance of Russell's forensic capacity in private litigation. More important, however, as well as more famous, than any of his successes in the ordinary courts of law during this period were his performances as an advocate in two public transactions of mark in British history. The first of these in point of date was the Parnell Commission of 1888-90, in which Sir Charles Russell appeared as leading counsel for Parnell. In April 1889, after 63 sittings of the commission, in the course of which 340 witnesses had been examined, Sir Charles Russell, who had already destroyed the chief personal charge against Parnell by a brilliant cross-examination, in which he proved it to have been based upon a forgery, made his great opening speech for the defence. It lasted several days, and concluded on April 12. This speech, besides its merit as a wonderful piece of advocacy, possesses permanent value as an historical survey

of the Irish question during the last century, from the point of view of an Irish Liberal. The second was the Bering Sea Arbitration, held in Paris in 1893. Russell, then attorney-general, with Sir Richard Webster (afterwards Lord Alverstone, L.C.J.), was the leading counsel for Great Britain. Russell maintained the proposition, which he again handled in his Saratoga address to the American Bar Association in 1896, that "international law is neither more nor less than what civilized nations have agreed shall be binding on one another as international law." The award was, substantially, in favour of Great Britain.

In 1894, on the death of Lord Bowen, Russell accepted the position of a lord of appeal. A month later he was appointed lord chief justice of England in succession to Lord Coleridge. Brief as was his tenure of the office, he proved himself well worthy of it. He was dignified without pompousness, quick without being irritable, and masterful without tyranny. In 1896 Lord Russell (Pollock and Hawkins being on this occasion his colleagues on the bench) presided at the trial at bar of the leaders of the Jameson Raid. Russell's conduct of this trial, in the midst of much popular excitement, was by itself sufficient to establish his reputation as a great judge. One other event at least in his career while lord chief justice deserves a record, namely, his share in the Venezuela Arbitration in 1899. Lord Herschell, a British representative on the Commission, died somewhat suddenly in America before the beginning of the proceedings, and Russell took his place.

Russell contributed to the reform of the law by his advocacy of improvement in the system of legal education, and in promoting measures against corruption and secret commissions, though the bills he introduced did not become law. He died on Aug. 10, 1900. Few English lawyers have ever excited the admiration abroad that Lord Russell did, both on the Continent of Europe and in America.

See R. B. O'Brien, *Life of Lord Russell of Killowen* (1909).

RUSSELL SAGE FOUNDATION, an institution established by Mrs. Russell Sage in memory of her husband. The initial endowment was \$10,000,000, to which \$5,000,000 was added by her will. It was incorporated by an act of the legislature of New York in April 1907, "for the improvement of social and living conditions in the United States of America." The charter further states: "It shall be within the purposes of said corporation to use any means to that end which from time to time shall seem expedient to its members or trustees, including research, publication, education, the establishment and maintenance of charitable or benevolent activities, agencies and institutions, and the aid of any such activities, agencies or institutions already established." The income may only be spent.

The management of the foundation is vested in a board of twelve trustees, which is self-perpetuating. The staff of the foundation study social conditions and methods of social work, interpret the findings, make the information available by publications, conferences and other means of public education, and seek in various ways to stimulate action for social betterment. Departments exist for dealing with charity organization, industrial relations, consumer credit, family welfare, social statistics, etc. The foundation does not relieve individual need and it avoids duplicating the work of existing agencies. In 1922 the foundation organized the Committee on Regional Plan of New York and its environs, providing the funds and office space and some staff assistance in preparing a plan for the future development of the New York region, an undertaking which took about seven years to complete.

RUSSIA is the general name given to those territories of the Eurasian continent which are comprised within the Union of Soviet Socialist Republics (U.S.S.R.), or more shortly, the Soviet Union. The 11 republics within the union in 1939 were the Russian Soviet Federated Socialist Republic and the Ukrainian, Byelorussian, Azerbaijanian, Georgian, Armenian, Turkmen, Uzbek, Tadzhik, Kazakh and Kirghiz Soviet Socialist Republics. The first three of the above, together with the former Transcaucasian Soviet Federated Republic, were original members of the U.S.S.R.; the Uzbek and Turkmen republics were added in 1924,

the Tadzhik republic in 1929; the Kazakh and Kirghiz republics were admitted in 1936, when also the Transcaucasian S.F.S.R. was split into the Azerbaijanian, Georgian and Armenian Soviet Socialist Republics. To the above 11 republics were later added the Karelo-Finnish Soviet Socialist Republic (admitted to the union by the supreme soviet in March 1940) and the Moldavian, Latvian, Lithuanian and Estonian Soviet Socialist Republics (all admitted in Aug. 1940), thus bringing the total number of the republics of the union to 16. (See Table I.)

TABLE I.—Union of Soviet Socialist Republics after World War II

Republic	Capital	Area (sq. mi.)	Population (1946 est.)
U.S.S.R.	Moscow	6,331,000	109,000,000
Ukrainian S.S.R.	Kiev (Kiev)	222,000	40,540,310
Byelorussian S.S.R.	Minsk	80,200	6,000,000
Uzbek S.S.R.	Tashkent	137,300	6,282,430
Kazakh S.S.R.	Alma-Ata	1,043,000	6,442,000
Georgian S.S.R.	Tbilisi (Tiflis)	20,400	3,577,700
Azerbaijanian S.S.R.	Baku	33,100	3,200,730
Lithuanian S.S.R.	Vilnius (Wilno)	25,300	2,032,000
Moldavian S.S.R.	Chisinau (Kishinev)	13,000	2,400,000
Latvian S.S.R.	Riga	24,000	1,765,340
Tadzhik S.S.R.	Stalinabad (Dushanbe)	52,100	1,485,000
Kirghiz S.S.R.	Frunze	76,000	1,459,500
Armenian S.S.R.	Yerevan	20,000	2,817,000
Turkmen S.S.R.	Askhabad	187,000	1,253,000
Estonian S.S.R.	Tallinn (Reval)	17,400	956,000
Karelo-Finnish S.S.R.	Petrozavodsk	68,000	200,000
Total		8,598,700	108,214,730

Source: Areas are taken from the *Boikhsaya Svietskaya Enklavatsiya*. *Soyuz Sovetskikh Sotsialisticheskikh Respublik* (Moscow, 1948). All the areas are post-World War II (that is, including territorial rearrangements in the west and east). Population figures are from *Geographical Review* (April 1949).

By 1952 the Russian S.F.S.R. included 47 regions or *oblasti*; 12 autonomous republics (Bashkir, Buriat Mongol, Chuvash, Dagestan, Kabardinian, Komi, Mari, Mordovian, North Ossetian, Tatar, Udmurt and Yakut); 6 autonomous regions (Adige, Cherkes, Birobidzhan, Khakass, Gorno-Altai and Tuva); 6 territories or *krai* (Altai, Khabarovsk, Krasnodar, Krasnoyarsk, Primorsky and Stavropol); and 10 small national districts or *okrugii* (Aghinsk, Chukot, Evenki, Khamti-Mansi, Komi-Permyak, Koryak, Nenets, Taimyr, Ust-Orda and Yamalo-Nenets).

The four autonomous republics outside the R.S.F.S.R. are Kara-Kalpak, Abkhazian, Adzharia and Nakhichevan, of which the first is part of Uzbekia, the last is part of Azerbaijan and the remaining two are parts of Georgia.

The three autonomous regions outside the R.S.F.S.R. are the Nagorno-Karabakh (part of Azerbaijan), the South Ossetian (part of Georgia) and Gorno-Badakhshan (Tadzhikistan).

The name "Russia" (*Rossiia*) comes from the Slavonic *Rus*, possibly derived from *Rossii* (a Finnish name for the Swedes), which seems to be a corruption of the Swedish *rothsman*, "rowers" or "seafarers."

The total area of the Soviet Union in Sept. 1939 was 8,173,666 sq. mi. This, because certain non-Russian lands had been lost after the revolution of 1917, was smaller than the area of the former Russian empire. Between 1939 and 1945 the Soviet Union annexed the following territories: Estonia, Latvia, Lithuania, the northeastern part of East Prussia (renamed the Kaliningrad region

and part of the R.S.F.S.R.), the formerly Polish western Ukraine and western Byelorussia, the formerly Finnish Karelian isthmus and Pechenga region (Petsamo), the formerly Rumanian Bessarabia and northern Bukovina, the formerly Czechoslovakian Sub-Carpathian Ruthenia, the formerly Japanese Karafuto (southern Sakhalin) and Kurile (Kurilskiy) Islands and the formerly "independent" republic of Tannu Tuva. (See Table II.) The total area of the Soviet Union including these new territories was 8,598,700 sq. mi.

The Soviet Union extends over the eastern part of Europe and the northern and central parts of Asia, stretching north and south from Cape Chelyuskin (77° 43' N. lat.) to Kushka on the Afghan frontier (35° 08' N. lat.). East and west the country extends approximately from a point on the Gulf of Danzig near 19° 38' E. long. to Cape Dezhnev (East cape) on the Chukchi (Chukotski) peninsula near 169° 40' W. long. Occupying one-seventh of the land surface of the world the Soviet Union is exceeded in area only by the British Commonwealth, but while the latter is scattered, the Soviet Union forms a single geographical and political unit.

The northern frontier of the U.S.S.R. extends along the shores of the Arctic ocean, from the Rybachy peninsula on the Murman coast in the west to the Bering strait in the east. The western frontier runs from the shores of the Barents sea down to the shores of the Black sea. On the west the Soviet Union borders on Norway, Finland, Poland, Czechoslovakia, Hungary and Rumania. Since June 1940, when Rumania had to cede Bessarabia to the Soviet Union, the southern frontier runs from the Kiliya mouth of the Danube and proceeds along the shores of the Black sea. Thence it extends eastward along the southern limit of the Armenian highland to Nakhichevan, along the Araks river, south along the Talysh range and across the Caspian sea. The frontier from the eastern shore of the Caspian sea follows approximately along the crest of the Kopet-dagh range and east onto the Pamir highland. Thence it extends along the Tien-shan, the Altai, the Tannu Ola and the Trans-Baikal mountains. From the Manchurian frontier the boundary runs along the Argun river to its confluence with the Shilka and thence along the Amur river to its junction with the Ussuri, where it turns south to follow the Ussuri river to Lake Khanka whence it runs to the shore of the Sea of Japan. On the south the Soviet Union borders on Turkey, Iran, Afghanistan, China (Sinkiang), Mongolia, China again (Manchuria) and Korea. The eastern frontier is entirely a sea border.

More than two-thirds of the Soviet borders are maritime. The northern frontier on the Arctic ocean is maritime in its entire length, but apart from Murmansk, which is washed by the warm Atlantic drift, this frontier is frozen for nearly ten months of the year. The northern sea route, providing a direct connection with the far east, was considerably developed as part of the third five-year plan, and by means of icebreakers the route is kept open during much of the winter, but only with great difficulty. On the eastern coast Vladivostok, the southernmost Soviet port, also requires icebreakers to keep it open during the winter, while the Sea of Okhotsk is frequently closed to shipping by dense fogs and floating ice. The Black sea ports are ice-free but the only outlet from this sea is through the narrow straits of the Bosphorus. Leningrad is the most important port on the Baltic sea and is kept open by icebreakers for much of the winter.

The island possessions of the Soviet Union are numerous, but the majority are in the Arctic ocean and are of little use. The Aleutian archipelago and Alaska were sold to the United States in 1867. The Kurile Islands,

TABLE II.—Areas Annexed by the U.S.S.R., 1939-45

Area	Date and form of incorporation	Area (sq. mi.)	Population (1939 est.)
In Europe.			
Estonia	Decision of the supreme soviet of the U.S.S.R. (Aug. 6, 1940)	78,357	1,134,000
Latvia	Decision of the supreme soviet of the U.S.S.R. (Aug. 3, 1940)	25,173	1,994,000
Lithuania (including both Klaipeda and Vilnius)	Soviet-Finnish treaty of March 22, 1940	17,598	54,000*
From Finland (Karelia and Petsamo-Pechenga)	German-Soviet agreement of Sept. 28, 1939	64,824	20,315,000
From Poland (excluding the Vilnius area)	Polish-Soviet treaty of Aug. 16, 1939	19,459	3,700,000
From Rumania (Bessarabia and northern Bukovina)	Soviet ultimatum of June 28, 1940	4,811	798,000
From Czechoslovakia (Sub-Carpathian Ruthenia)	Paris peace treaty of Feb. 10, 1945	4,247	1,073,000
From Germany (northeast part of East Prussia)	Decision of the Potsdam conference, Aug. 5, 1945	170,000	22,102,000
Total (Europe)			
In Asia.			
From Japan: Karafuto (southern Sakhalin)	Yalta agreement of Feb. 11, 1945	13,025	415,000
Kurile Islands	Japanese surrender of Sept. 2, 1945	3,094	4,000
Tannu Tuva People's Republic	Decision of the supreme soviet of the U.S.S.R. (Oct. 10, 1944)	64,000	70,000
Total (Asia)		81,020	450,000
Grand total		267,855	22,591,000

*About 423,800 Karelians left in 1944 to resettle in Finland.

ceded to Japan in 1875, were recovered by the Soviet Union in Sept. 1945. The Baltic islands, which were given up after the revolution of 1917, were recovered from Finland. The Komandorskiye Islands off Kamchatka, the Shantar Islands near the Pacific coast and, from Aug. 1945, the whole of the island of Sakhalin are Soviet possessions. The chief Soviet islands off the arctic coast are Kolguev Island, Novaya Zemlya and Vaigach Island, the Severnaya Zemlya (formerly Nicholas II Land) north of the Taimyr peninsula, the New Siberian Islands (north of Laptev sound) and Wrangel Island. Franz Josef Land is Soviet territory, but Spitsbergen and Bear Island were recognized in 1920 as being under Norwegian sovereignty. (I. Gv.; X.)

PHYSIOGRAPHY

In very general terms Russia as considered in this article may be described as a wide amphitheatre open to the arctic but bordered to the south, to the west and to the east by high mountain regions. The great inner lowland can be divided into four regions; viz., European Russia, the plain of western Siberia, the Turkistan basin and the central Siberian plateau. The first two of these regions, both plains of low relief, are similar in most of their geographical features but are separated by the Ural mountains; the former drains mainly southward to the Black and Caspian seas, the latter to the Arctic ocean. The Turkistan basin is essentially the drainage area of the Sea of Aral; between it and the Siberian plain to the north is a belt of low hills. The central Siberian region, between the Yenisei and the Lena, is an ancient, eroded plateau, much dissected by river valleys but otherwise gently undulating.

The mountain border, with its vast and lofty chains and deep valleys, is in marked contrast to the lands it encircles. Eastern Siberia has a most irregular surface. It is a complex of great blocks and rifts, of plateaus separated from one another by steep scarps as they rise in tiers toward ridges crowned with snowclad peaks. Side by side are features obviously of great age and others, such as the gorges and rapids of many of its rivers, indicative of recent changes. To the southwest rise the Altai ranges, alpine in their height and character and forming a barrier difficult to surmount between the Siberian lowland and Mongolia. Still farther south and west, across the Dzungarian Gate, are the loftier and abrupt ridges of the Tien-shan and the Trans Alai, between Turkistan and the Tarim basin. From the Pamirs the frontier with Iran is marked by lesser ranges, not much easier to cross in spite of their lower altitude. Between the Caspian and the Black seas lies the great wall of the Caucasus, with a dozen peaks higher than any in the Alps and only a few usable passes. The low Yaila mountains of the Crimea are a reminder that this vast mountain system was once continuous into the Balkans.

The great contrast of relief between the plains and the mountain border reflects a similar contrast in structure. Underlying the plains is a relatively undisturbed floor or platform of Archaean and Palaeozoic rocks. Though usually buried beneath later deposits, this platform is exposed in Karelia, the Ukraine (where it contains the iron ores of Krivoy Rog and the manganese ores of Nikopol), the Timan mountains and the central Siberian plateau. Its surface is no longer horizontal throughout the whole area of course, for it suffered warping and some dislocation as a result of Huronian and Caledonian earth movements. Still more important deformations resulted from the pressures set up by Hercynian folding. The Valdai plateau, the Volga heights, the Urals, the Altai, the Sayan mountains and the ranges east of Lake Baikal were all formed during this period. The more recent Tertiary folding, which produced such striking effects in mountain building further south, affected little more than the highland borders of Russia.

Much more important in the geological history of the country than these violent crustal movements were the alternating advances and retreats of the surrounding seas over the land. In the wide shallow basins so formed were laid down, age after age, the sedimentary rocks which now cover most of the platform. In general these surface rocks are of decreasing age from northwest to southeast, and they are still almost as horizontally disposed as

when they were first laid down.

Tertiary movements in the border country had very marked effects along its whole extent from Kamchatka to the Carpathians. Old ranges, such as the Altai, were further uplifted and new ones, such as the Caucasus, formed. Under the pressures then experienced the whole of eastern and much of central Siberia was shattered by faults and rifts (e.g. the great Baikal rift).

Though the major surface features are thus seen to be of ancient origin, the minor ones are nearly everywhere the results of more recent happenings. Moraine deposits form low hills on the northern lowlands, while many of the flattest areas of the plains are covered by deposits laid down on the floors of postglacial lakes. The separation of the Aralo-Caspian depression from the Arctic has been completed only since Oligocene times. The shrinkage of the inland seas exposed wide expanses covered by Quaternary and recent deposits.

Glaciation.—Russia was profoundly affected by glaciation during the Pleistocene ice age, and the details of its topography over large areas resulted from the events of that period. These are best known and most marked in European Russia. There the ice sheets, issuing mainly from the Scandinavian highlands but also in part from areas near the northern end of the Urals, moved southeastward. Their maximum extension may be regarded as having been marked, roughly, by a line from Nijni-Novgorod (now Gorki) to Smolensk, though two great lobes pushed forward far into the Dnieper and the Don basins.

Over Finland and extending into Karelia the main effects of the glaciation were erosive, removing surface soils and leaving bare rock surfaces with many lakes in irregular, shallow hollows. Long, low, sandy ridges (eskers) cross this region, and near its margin is a great end moraine marking a pause in the final retreat of the ice. Beyond this region to the limit of the ice sheets is the accumulation belt now covered mainly with boulder clays as far as the main end moraine. There was here much interference with river drainage, and many wide valleys were eroded along the edges of the ice sheet. The two great headwaters of the Northern Dvina occupy such a channel. The most important of the moraines, marked by a belt of hilly country northeast and southwest from the Valdai hills, forms the chief watershed of European Russia. The main highways to the west follow the crests of moraines through the marshy country toward Poland. The boulder clays extend southward where the ice lobes penetrated the Dnieper and Don basins.

Beyond the edge of the last ice sheet is the zone of deposition. There much of the surface is covered by loess or *löss*, a fine-grained deposit of material carried by winds from the drying surfaces left after the retreat of the ice sheets. The northwestern belt of the zone has many sandy tracts of outwash left by streams flowing from the surface of the melting ice.

Little is known in detail of the glaciation of Asiatic Russia. Local glaciers were certainly developed (some still exist) in the mountain borders and in the far northeast. In the central Siberian plateau no drift deposits have been found. The northern portions of the lowland were certainly ice-covered, but drift deposits were largely removed or covered by the marine transgression which followed the ice age in the far north. Asiatic loess deposits follow the foothills of the central ranges but are not certainly related to the glaciation. (T. Hæn.)

STRUCTURAL DIVISIONS

For a more detailed description of structure the following division of the land is convenient:

1. Northward-draining areas: (a) northern European Russia; (b) the Urals; (c) the Ob lowland; and (d) the Yenisei-Lena plateau.
2. Southward-draining areas: (a) southern European Russia; (b) the Moscow basin; and (c) the Aralo-Caspian basin.
3. The mountain border: (a) eastern Siberia; (b) the central Asiatic ranges; and (c) the Caucasus.

Northward-Draining Areas.—Northern European Russia.—This division possesses large areas of unfolded Palaeozoic rocks lying on an ancient (Archaean) floor of granites, gneisses and

syenites which emerges on the west in Finland, the Kola peninsula and Scandinavia. Along the line from the White sea to the Gulf of Finland (via lakes Ladoga and Onega) the ancient floor is covered by Palaeozoic rocks, Devonian, Carboniferous and Permian succeeding one another eastward toward the Northern Dvina. The Upper Permian beds have yielded *Glossopertis* and other plants characteristic of "Gondwanaland" and animal remains like those of the corresponding formation in South Africa. Beyond that river the lower levels are mainly alluvials but there are glacial Pleistocene deposits between the river lines. The basin of the Pechora is divided from the land farther west by a minor fold belt bringing up Devonian and some crystalline schist along the line of the Timan hills that may be traceable as a branching of the mid-Urals northwestward to Cape Kanin. The whole region has a very low relief and is consequently unprotected from arctic cold. Apart from the Timan hills this region is below the 600-ft. contour. Its lakes are discussed in the article on Europe (*q.v.*). Its chief rivers are the Pechora (1,000 mi.), the Mezen (500 mi.) and the Northern Dvina (400 mi.). The upper waters of the Pechora and the Northern Dvina interlace with those of the feeders of the Kama, a tributary of the Volga. As a consequence of the low relief the Pechora is navigable for 770 mi., the Mezen for 450 mi. and the Northern Dvina for 330 mi., while the Vychegda, a large tributary of this river, is navigable for 500 mi. The Onega river has rapids.

The Urals.—In the Urals the Palaeozoic strata are folded on the west of a longitudinal axis which exhibits crystalline rocks and is faulted on a large scale. The Devonian rocks in this area are of marine origin. Its greatest heights are chiefly in the regions of folded Palaeozoic rocks and the folds die away into the Russian platform westward in small parallel chains known as *Parma*. Though there is much copper in the Permian rocks on the west the main metalliferous veins of the area are in the faulted zone of crystalline rocks to the east. The greatest height reached in the Urals is 5,545 ft. in the northern Urals (at Tel Pos-iz or Mura-Chakhi). The passes are often low, that on the way from Molotov (Perm) to Sverdlovsk being only 1,245 ft. above sea level. The range is continued to the Arctic coast, Vaigach Island and Novaya Zemlya. (See further *NOVAYA ZEMLYA*; *URAL MOUNTAINS*.) On the south the Urals finger out in a plateau region dissected by feeders of the Ural and a few feeders of the Volga. The Ural river drains the southern Ural mountains, turns west and then south to the Caspian sea, which it reaches after a course of 1,477 mi.

The Ob Lowland.—Eastward the Urals fall rapidly down to the Ob basin, which is one of the largest areas of unbroken lowland on the earth. The floor material is almost entirely alluvial with a little Tertiary here and there. The river rises in the westward prolongations of the Sayan mountains and is 2,260 mi. long, but its very large tributary the Irtysh comes from the Dzungarian Gate and adds enormously to the area of the basin, which is bounded southward by the Turgai and the hills of Semipalatinsk. The Tobol, another large tributary, flows to the Ob from the north of the Turgai. It is generally accepted that under the alluvial floor lies a continuation of the platform of north European Russia let down through the dislocation of the eastern border of the Urals. The lowland extends without an appreciable break to the Yenisei, and only at some places near that river do the older rocks help to form the surface.

The Yenisei Area.—East of the Yenisei the character of the land changes abruptly: a sharp edge rises rapidly to more than 600 ft. and in one place to about 3,300 ft. above sea level, and east of this edge is a great dissected plateau of ancient rocks. Archaean rocks with granites, etc., are exposed near the Yenisei and away to the northeast, but there are larger areas of Cambrian and Silurian rocks and these are covered over a vast stretch of country by Permo-Carboniferous rocks. The plateau extends eastward to the Lena along the valley of which is found evidence of an invasion of the sea in Cretaceous times. The plateau is an ancient block to which E. Suess gave the name of Angara land. Large areas on this plateau rise somewhat above the 1,600-ft. contour, and the diversities of surface are largely the result of river dissection. There is evidence in the Taimyr peninsula of a fold

axis with a general direction from west-southwest to east-northeast but apparently no heights reaching above the 1,500-ft. contour.

The Yenisei is the collecting stream beneath the western edge of this old block, and it rises in the Sayan mountains receiving nearly all its tributaries from the eastern side. Of these the Upper Tunguska or Angara comes from Lake Baikal, the Middle or Stony Tunguska and the Lower Tunguska from the block itself. The river is 2,800 mi. long.

Southward-Draining Areas.—These regions are those which drain to the enclosed seas, the Black sea, Caspian sea, Aral sea and Lake Balkash. Considered structurally they reveal on the west a succession of very slight undulations, anticlines and synclines with axes northwest to southeast from the vicinity of the Carpathians to the borders of the arctic region; on the east the subdued features result mainly from the great virgations of the Tien-shan range.

Southern European Russia.—From the Sea of Azov west-northwestward to beyond Kiev stretches an anticlinal zone in which appear granites and gneisses, some of which are thought to be Archaean. The Dnieper from Kiev to Dnepropetrovsk (Ekaterinoslav) follows the northern border of this zone of hard rock through which the river cuts its way below the latter town. Next follows a syncline in which early Tertiary deposits are widespread, whereas farther south they only cap parts of the old rocks. The syncline is named after the river Donets which follows its axis. Toward the Sea of Azov Palaeozoic rocks are brought to the surface and the land stands somewhat higher. In this region is the Donets coal field, the coal belonging to upper Carboniferous strata as in western Europe. The next zone is the central anticline which is parallel with the two structural zones described and which is thought to die away toward the Caspian. The axis of this anticline is marked to some extent by the Don river where it flows south-eastward below Pavlovsk while, much further northwest, the course of the Southern Dvina is clearly related to it. Along it in the Don region the Cretaceous deposits, capped interfluently by early Tertiary here and there, form the most important outcrops, but on the northwest there is a great area of Devonian (*v. inf.*).

The Moscow Basin.—Northeast of this anticlinal zone is the immense "Moscow basin," floored mainly by Palaeozoic rocks mainly still horizontal, with some Triassic deposits; but there are patches of Jurassic and Cretaceous strata as, for example, around Moscow and in the great bend of the Volga and also farther north from Kostroma to Syktyvkar (Ust-Sysolsk) on a tributary of the Vychegda. There was an intrusion of the sea in Jurassic times which became much more extensive in the Cretaceous period; no upper Cretaceous is known, however, in northern Russia. Around the Moscow basin in the southwest and west the Lower Carboniferous system (with poor coal at Tula, etc.), outcrops in a great curved belt from the region of Tula almost to the White sea. Beyond this belt northwestward is the area of Devonian rocks toward Latvia and Estonia and across to the White sea. They rest unconformably on Silurian rocks which outcrop along the southern shore of the Gulf of Finland and of Lake Ladoga. The Devonian rocks are partly lacustrine (old red sandstone) and partly marine in origin, and the two types are often interstratified: a basal red sandstone is covered by a dolomitic limestone which in turn has a sandstone over it. The Timan hills (*see above*) on the northeast may be said to be an upfold bordering the Moscow basin.

The main axis of the basin is parallel to the course of the Volga above Gorki (Nijni-Novgorod), continued northwestward by the Mologa; i.e., rivers running broadly parallel to the sections of the Dnieper, Donets and Don already noted. Permian rocks outcrop over large areas on the north. The dips of the strata are small, and anticlines and synclines there are really slight undulations which might be followed right across Russia from the Dniester to the Timan hills, always with lines roughly northwest to southeast (or west-northwest to east-southeast) well marked in geology and drainage, though not much indicated in relief save that there is a marked low line of the Dnieper valley above Dnepropetrovsk, the Pripiet marshes or Rokitno swamps and the upper Bug, where it continues the line of the Dnieper and Pripiet into Poland. This

belt of lowlands is of special importance because of the great marshes just named; they form the historic barrier between Russia and peninsular Europe.

The Aralo-Caspian Basin.—Turning now to the east one notes the virgations of the Tien-shan, orographically very subdued in the Aralo-Caspian lowland. One stretches northwestward parallel to and north of the Syr-darya and apparently re-emerges from the lowland in one of the southern branches of the Urals, which are at first a plateau and rise to any considerable height only north of lat. 52° N. Another virgation stretches parallel to the first, this time just north-northeast of the Amu-darya or Oxus river, and is continued into the Mangishlak peninsula that projects into the northeast of the Caspian sea. Farther south still are the hills of the Iranian border reaching the Caspian sea between the Gulf of Kara Bogaz and the town of Krasnovodsk and continued on the west of that sea by the mighty Caucasus. In the Aralo-Caspian lowland the rocks of these virgations are masked by a Quaternary covering with Tertiary deposits south of the lower Oxus and on the Ust Urt plateau between Aral and Caspian. Between the Aralo-Caspian-Balkash area and the Arctic drainage area of the Ob and its feeders is the higher land of Karaganda, related structurally to the Altai and floored by Palaeozoic and igneous rocks. West of this the land continues to be somewhat above the level of the lowlands on either side and is floored by Tertiary deposits, but the higher land narrows down in the Turgai region, which according to general opinion until Oligocene times had a sea communication directly to the Arctic ocean on the north. The two great rivers of the region are the Amu-darya (Oxus), 1,500 mi. long, and the Syr-darya, 1,500 mi. long, both reaching the Aral sea.

Structural geologists have spread familiarity with the idea of a great sea called Tethys reaching in Mesozoic and Eocene times from the present Mediterranean area eastward through the region occupied later by the young folded ranges of Asia Minor, Armenia, the Hindu Kush and Himalaya, etc., to Malaya. Without venturing into details of advances and retreats of the sea, it may be said that the uprise of the fold mountains of Asia Minor, Armenia, the Elburz range and the Hindu Kush left the part of that sea to the north of this more or less isolated as the brackish Pontic lake, losing its former connection via the Turgai low line with the Arctic ocean probably in Oligocene times and becoming much modified by the sinking of the southern parts of the Black and Caspian seas, which are both deep. Apart from these two depressions the land shelves easily from land to sea around the northern parts of the Black and Caspian seas, while the shallow Aral sea is a shrunken part of the Pontic lake, now cut off by lowland from the northeast of the Caspian sea. Balkash is a fresh-water lake on higher land farther east—now at any rate without outlet, whatever may have been the condition of things in the past.

We thus have a series of enclosed seas and lakes of which Balkash, the Aral and the Caspian have no outlet, and the two latter are salt, while the Sea of Azov communicates with the Black sea through a break in the mountain line between the Caucasus and the Yalta mountains of the Crimea, and the Black sea has communicated with the Aegean and the Mediterranean since the sinking of the former. The rivers Dnieper (1,400 mi.) and Don (1,100 mi.) both flow southeastward for a considerable distance and then turn sharply southwestward to the Black sea, probably as a consequence of the recent dominance of flow toward the Aegean following the sinking of the latter. Before that sinking the Danube may for a time have made its way eastward across the lowland to the Caspian area via the curious Manych depression. The Volga (2,300 mi.) is the longest river of Europe, flowing broadly east-southeast parallel to the axis of the Moscow basin and meeting the Kama as it turns south below Kazan. On its course southward it has a sharp eastward loop with Kuybyshev (Samara) at the head opposite the southward bend of the Don. Below Stalingrad the Volga bends southeast, thus continuing the previous line of the Don, and so reaches its delta on the Caspian sea. The great rivers of the Aral basin, the Amu-darya and the Syr-darya, have already been mentioned.

The Mountain Border.—The fold ranges which border the Russian lands on the south were uplifted at various periods, those in the western sections being generally younger than those to the east, though in Kamchatka they are of approximately the same age as the Caucasus. In central Asia they show a characteristic arrangement: range after range runs, more or less east and west, each successive one tending to extend farther west than that to the north of it. As these are discussed in the general article on Asia (*q.v.*) they will be mentioned only briefly here.

Eastern Siberia.—Beyond the Angara block eastward stands an important series of mountain ranges. The Stanovoi mountains and the Kolymski (Kolyma) mountains are more or less parallel to the coasts of the Sea of Okhotsk; but the former are also roughly parallel to the edge of the Angara block on the other side of the Lena and, 100 mi. or so north of Okhotsk, are linked not only with the Kolymski mountains to the east but with the Verkhoyansk mountains which go westward and northward, keeping more or less parallel to the edge of the Angara block with the Lena between them and it. Like the other great rivers mentioned above, this one is formed of a pair, the upper Lena and the Vitim. The length of the Lena is estimated at 2,860 mi. The Verkhoyansk and the Kolymski mountains thus form a great semicircle of mountains apparently determined in the west by the Angara block and in the east by the depression of the Sea of Okhotsk. Within this semicircle other ranges are disposed in more or less parallel curves.

The Tas Kistabit mountains come next to the western Kolymski. The Cherski mountains are a longer range parallel to the whole curve of the Verkhoyansk-Kolymski line and stretching from the east of the Yana river to the west of the Omolon river. Within this again is a smaller range. The Cherski mountains are named after a Russian explorer who died in this region in 1892. The river Indigirka traverses them by a winding gorge often less than a mile wide, and the tributaries of this river also make gorges in the range, in which an altitude of about 3,300 m. (10,727 ft.) is reached. These high mountains are apparently almost without glaciers because of the aridity of the region. A geological traverse going northward between the Kolyma and the Indigirka shows an east-west axis of igneous material alternating with Permian and Triassic rocks.

East of the mouth of the Omolon river a great axis of crystalline rock, flanked on both sides by Permian, runs parallel to the coast as far as Cape Dezhnev (East cape). The Kolymski mountains curving from the south come northeastward as the Anadyr mountains and end in the Chukchi (Chukotski) peninsula. This latter high line is flanked on the southeast by the Penzhina and Anadyr valleys, forming an almost continuous low line from the Sea of Okhotsk across the base of the Kamchatka peninsula to the Gulf of Anadyr north of the Bering sea. (See KAMCHATKA.) Northward from Cape Lopatka along the east coast as far north as the curve of the Aleutian Islands is a belt of volcanoes, part of the "girdle of fire" of the Pacific. The central longitudinal range of the peninsula is continued northeastward, south of the Anadyr valley to Cape Navarin. There thus seem to be three great structural lines abutting upon the neighbourhood of the Bering strait and the northern coast of the Bering sea.

The main curve of the Stanovoi mountains, supposedly fold mountains, continues westward on the south and apparently approaches the Yablonoi mountains, really the eastern edge of the Malkan horst, at an angle. To the west-northwest lies the Vitim plateau. To the southeast is found a type of topography analogous to that of Kamchatka and extreme northeast Asia. There are successive ranges more or less parallel to the coast, imbricating to some extent and separated by lines of lowland fairly parallel with their axes. The Liao, Sungari and lower Amur valleys form a continuous lowland from the Gulf of Pohai (Pechili) to the strait between the mainland and Sakhalin. The Ussuri and lower Amur valleys form a low line from Vladivostok northward with the high range of the Sikhote Alin on its eastern flank. The Sea of Japan and the Gulf of Tatary, narrow waters separating Sakhalin from the mainland, form still another low line with the Sikhote Alin on the west and the high axis of Sakhalin, Hokkaido, etc., on the east. As in the case of Kamchatka, so also here the high axis

is met on the east at a considerable angle by the Kurile Islands, of volcanic type; and south of this junction (that is, in Japan) the high axis is volcanic, just as eastern Kamchatka is volcanic south of its link with the Aleutians. The great river of this eastern region is the Amur, which has a very large tributary, the Sungari, on the south; the Amur's course is governed mainly by the mountain lines of the region; its length is 2,900 mi.

The Central Asiatic Ranges.—These mountains, extending from the Pamirs to the river Aldan, are sometimes grouped together as the Sayanid system. They are mainly the products of folding and faulting in Caledonian times but have in many places been further uplifted by later movements. Thus the Sayan ranges after heavy denudation appear to have been lifted again en masse. This is clearly shown by the relatively flat surfaces of many of the highest areas. The northern ranges of the Tien-shan and the Altai mountains show a similar history. The middle ranges of the Tien-shan are of Hercynian age. The mighty southern ranges, with their vast glaciers and peaks of more than 20,000 ft., and the equally lofty Pamirs are the products of Tertiary movements. The border ranges of Turkistan and Iran consist mainly of folded beds of Cretaceous and Tertiary age.

The Caucasus and Transcaucasia.—These regions are distinct structurally and physically, the Armenian mountain knot being separated from the Caucasus by a relatively low, narrow line occupied by the river Rion on the west and the river Kur on the east, but a long stretch of this low line is well over 1,500 ft. above sea level. This line has to the east the deep basin of the southern Caspian and westward the deep basin of the southern Black sea. (See CAUCASUS.) (R. M. F.; T. HER.)

CLIMATE

The climate of the U.S.S.R. has two outstanding characteristics: its uniformity and its continentality. They are results of its low relief and compact form. Its great plains present over immense distances the same monotony of climate as of level. It is possible, of course, to recognize areas whose climates differ significantly one from another, but the transition from one such province to its neighbours is, practically everywhere, accomplished by almost imperceptible gradations.

Maritime influences are extremely feeble, which is not surprising because 75% of the area is more than 250 mi. from the surrounding seas, several of which, moreover (the Baltic, the Black and the Caspian), are land-enclosed. The frozen Arctic ocean obviously can have little effect; the mountain barrier shuts out monsoonal winds from the south; and offshore winds and high coastal ranges limit Pacific influences to a narrow coastal belt on the east. Hence the Russian lands almost everywhere show to a high degree the features of a continental climate: great extremes of temperature, both diurnal and annual; abrupt change from winter to summer and vice versa; low rainfall with summer maximum and largely convectional in character; violent windstorms. The south coast of the Crimea and Transcaucasia (both sheltered by high ground on the north and with winter rains drawn from the Black sea) and the area between the lower Amur and the Pacific (feebly monsoonal in character) are the only areas to which this general description does not apply.

The climate of the U.S.S.R. is dominated by the polar continental air mass which extends over the whole land for the greater part of the year. In the summer it shrinks to a narrow belt along the arctic coasts of Asiatic Russia. It is characterized by its low temperature and low humidity. Disturbances are infrequent and local. Thus, still, dry days with clear skies, very low temperatures and slight snowfall are characteristic of the nine months or so during which it covers the land—conditions which though harsh are by no means unhealthful but do severely limit human activities.

In winter, pressures are high over the whole of Siberia, especially so near Lake Baikal where in January they exceed 30.5 in. Outblowing winds are therefore normal over Asiatic Russia. A narrow extension of this high-pressure area spreads westward, roughly along lat. 50° N., as far as central Europe. On its northern side southwest and west winds blow, while to the south the winds are generally between north and east. The feeble low pres-

ures experienced during the brief summer give a much more irregular air circulation.

Rainfall is generally less than 20 in except in coastal and mountainous areas and the middle and western areas of European Russia. It is almost entirely derived from Atlantic sources, being brought by cyclonic disturbances, more frequent in summer. The total precipitation decreases eastward along a middle zone from Moscow to Lake Baikal and, much more rapidly, both to the north-east and to the southwest of this zone. The arctic northeast has a rainfall as low as that of the desert Aral basin.

The summer isotherms follow the latitudinal lines with remarkable regularity. In January their direction is rather from north-west to southeast, with the pole of cold in the region of Verkhoyansk (January mean -59° F., minimum recorded near -100°). Temperature ranges thus increase toward the east, from 31° at Batum to more than 100° northeast of Yakutsk. In the Siberian arctic only 60 days, on the average, are frost-free, and even in European Russia it is only in the Ukraine that the surface is snow-covered for fewer than 100 days. Both the Sea of Azov and the northern half of the Caspian are frozen over in January.

Siberian Climates.—All the features of the Russian climate already outlined are represented sharply in Siberia. Its northerly situation, its isolation from Atlantic and Pacific, the increasing altitude of the land toward the south (offsetting in part the decreasing latitude) and its openness toward the arctic all tend to bring down its temperatures. By reason of its winter high pressures, bitterly cold winds blow out from it over the surrounding lands. Its low atmospheric pressure in summer draws in warmer and more humid air from beyond its borders, thus producing its summer maximum rainfall. Snow lies long, but the depth of fall is slight—in the northeast so slight in many parts that the sledge is not usable. On the whole the weather is dry, the sky generally cloudless. Temperature ranges are unequalled in any other land. Verkhoyansk is generally credited with the lowest recorded temperature (about -100° F.), but it has also recorded 100° F. The Siberian summer, though short, is hot rather than warm.

Winter is clearly the dominant season, as much by its unchangeableness during many weeks as by its severity. The general absence of wind alone makes the cold bearable. When the buran (Siberian blizzard) blows, only shelter from its blast will save the life of the traveller. In the absence of heavy snow the soil and subsoil are deeply frozen. Over nearly all Siberia east of the Yenisei "permafrost" obtains: the subsoil is frozen all the year and the surface soil thaws only for a brief period and only to shallow depths in summer. The depth of this thaw has important effects in determining the nature of the vegetation.

Spring arrives in April. The ice on the rivers breaks up rapidly and, as the thaw begins in the south, the flowing waters cause floods over the still frozen northern channels. As the snow melts, village streets become apparently bottomless seas of mud. For several days outdoor movement of man or beast becomes almost impossible. The surface soon dries, however, and a brief period of delightful spring weather is experienced, though often interrupted by the return of severe cold for a short time. Summer follows quickly. The days are warm or hot and the hours of daylight long. Its monotony is broken by sudden storms, sometimes accompanied by hail, or there may be short burning spells with dust storms. In any case one can be sure of the return of clouds of voracious mosquitoes. By August, however, or by early September in the south, night frosts are experienced and in two or three weeks winter has returned.

Over such a vast expanse there are naturally variations in climatic conditions, and these make possible a division into climate provinces or regions.

The polar or tundra province includes a narrow belt along the Arctic shores from the Kola peninsula to the Bering strait. Its southern limit may be taken at the 50° July isotherm, which is also near the limit of tree growth. The chief characteristics are its very long winters (about ten months), short summers (temperatures as high as 80° F. have been recorded), low precipitation and strong winds. Both temperature and precipitation decrease

eastward, the latter falling as low as four inches near the Lena delta. Winter temperatures are higher near the coast than in the interior.

The far eastern province is characterized by a monsoonal reversal of wind direction—land to sea in winter, sea to land in summer. Winter conditions are severe (even Vladivostok, in the extreme south, has 110 days of frost and a January mean temperature of 5° F.). It is sharply distinguished from other Siberian regions by its humidity. Fogs are frequent, snowfall heavy (particularly near the Sea of Okhotsk) and rainy days numerous in summer.

Eastern Siberia is notably dry and cold. Precipitation varies from 14 in. near Lake Baikal to 4 in. in the north. Days with snow are few (nine at Blagoveshchensk, none in some years and in some sections). Immense areas have mean annual temperatures below freezing point. On the other hand, the July isotherm of 68° F. does not reach so far north in any other part of the world.

Central Siberia is also very dry. The number of snowy days is higher, though the total fall is still slight. Temperatures remain very low (Irkutsk January mean -5° F.). Lake Baikal reduces temperature ranges very considerably in its immediate vicinity.

In **western Siberia** the winters are still harsh (Tomsk January mean -3° F.). Heavy snow is often brought by violent storms and piled in great drifts. Tomsk has an average of about 120 snowy days. The snow cover limits the depth to which the soil is frozen, so that it is quickly fit for cultivation after the spring thaw. Its thorough soaking at this time is also favourable to seed germination. During the warm-to-hot summer, rain falls in heavy showers, though the total precipitation is still only moderate (Tomsk 20 in., Omsk 12 in.).

Russian Climate.—The climate of European Russia is controlled by the same major influences as that of Siberia: its northerly latitude and openness toward the arctic, the absence of any barrier on the Asiatic side and the shutting out of marine influences (except to a limited degree) by the Scandinavian highlands, the Carpathians and the Balkans. It is accordingly both continental and uniform, in marked contrast to that of the rest of Europe. Nevertheless, the Baltic depression and the north German plain do permit, if only in attenuated form, the penetration of Atlantic influences.

As has been seen, the Siberian anticyclone in winter throws west across central Russia an arm of high pressure bringing cold Asiatic winds to the east, centre and south of the country. The lower pressures to the northwest permit the entry of humid and relatively mild air from the west. In summer, while the east and south still receive hot, dry continental winds, the north, northwest and centre experience cooler and moister oceanic air. Precipitation therefore decreases from northwest to southeast (Riga 22 in., Moscow 21, Saratov 15, Astrakhan 6). Snowfall, fairly heavy in the lake region, becomes quite light toward the Black sea and the lower Volga, a reminder that winter is the season of least precipitation (Moscow 16%). The summer, though it has often long periods of drought interrupted by brief but heavy rainstorms, is the season of greatest precipitation (Moscow 36%, Kaluga 40%).

Latitude has a marked effect on summer temperatures (Archangel July mean 60° F., Astrakhan 78° F.) but has less effect in winter when distance from the sea becomes a more important factor (Leningrad January mean 15°, Moscow 12°, Orenburg 3° F.). But it is the length of the seasons rather than their mean temperatures that has most influence on Russian life. In the far north at least six and one-half months of frost can be expected, Leningrad, Nijni-Novgorod (Gorki) and Orenburg (Chkalov) from five to six, Moscow and Kuybyshev from four to five, Odessa and Kherson from one to three. Unlike the Siberian winter, however, conditions are liable to violent changes: blizzards, sudden falls in already low temperatures, or brief thaws (*otpepeli*).

Spring, coming in April or May, sets free the frozen rivers and puts an end to all outdoor movement. In a couple of months, except in the far north, summer has arrived, bringing hot days everywhere. Evaporation is then intense, the soils dry quickly and river levels fall considerably. Dry winds from the east bring

dust storms that may cover and often scorch the growing crops. Harvest follows seedtime with but a brief interval for festival between. By early October the first snow showers have fallen in Moscow. From mid-November winter tightens its grip on the whole country once more.

The southern shores of the Crimea and the northeastern coast of the Black sea have a Mediterranean climate. There the winters are generally mild and rainy, the summers dry and rainless. Frosts are experienced only in a few days in January and February. High ground to the north provides shelter in each case.

Transcaucasia has a subtropical climate. The Kolkhiz lowland, open on the west to the Black sea, has a milder winter than even the Crimea and a cooler summer. Precipitation is heavy with a slight winter maximum. Winds from the Caucasus produce foehn effects.

Turkistan.—Across the lower Volga, in Kazakhstan, the climate becomes yet drier and more extreme. Wild blizzards sweep it in winter, though the total snowfall is slight. Autumn and spring are virtually nonexistent, a grilling summer (July mean 77°) following immediately on a bitterly cold winter (January mean 5°).

Further south, in the Aralo-Caspian basin, conditions are still more severe. Precipitation varies between 3 in. and 8 in. a year, except along the mountain margins (Tashkent 14 in.). Most of it falls in spring and the rest near the end of the year. Temperature ranges, both annual and diurnal, are large. Cold waves from the north sweep across the basin in winter, while the cloudless summer skies and dry air give full play to a burning sun. The Aral sea is frozen for five months; three months later eggs can be cooked in the sands near its shores.

SOILS AND THEIR INFLUENCE

The science of pedology or soil study owes much of its modern position to the work of Russian investigators. This might perhaps have been expected in a land so long almost wholly dependent on agriculture. Uniformity of level and of climate over wide areas naturally emphasized the importance of soil variations in the choice of crops and in their productivity. The derivation of the soil from the underlying surface rocks by processes of denudation which varied with climatic conditions and the later addition of products of organic decomposition was of course widely recognized. The main value of Russian work arose from the emphasis that it placed on regarding the soil as a living, or at least an evolving, thing.

Among the first of Russian workers in this field was V. V. Dokuchayev (1846-1903), after whom was named the Institute of Soils responsible for continuing his researches and for the publication of important papers and maps on the subject. K. D. Glinka was an important early follower; it was the publication in 1928 by the department of agriculture of the United States of a translation of his classic *The Great Soil Groups of the World and Their Development* that first made the work of the Russian school known to English-speaking students.

From the standpoint of their origin, the soils of Russia fall into three main groups, each covering a wide area. Those of the north are derived from the drift left on the final recession of the ice sheets, mainly their ground moraine and the outwash from it. To the south lies the belt of loessic soils produced by wind action on the drying surface of the newly uncovered glacial deposits. Over the areas formerly covered by the Aralo-Caspian sea the surface consists of marine deposits left behind as these waters shrank. Since their formation all have been changed by the action of the weather, especially by fluctuations of temperature and by rain and soil water. The growth and decay of the vegetation that covered them and the action of burrowing animals, of cultivators and especially of bacteria all helped in varying degree to determine the nature of the present soil cover and are still controlling its development. The great importance of climate in this respect is suggested by the zoning. The rise of temperature, decrease of rainfall and increase of evaporation from northwest to southeast are evidently largely responsible for the soil changes.

The soil is clearly "alive" in the sense that it is still developing,

though that development may be, and is in many districts, extremely slow. The humus produced from decaying vegetation largely determines soil colour and is of great importance because of its water-holding property. In suitable conditions of temperature and water, bacteria rapidly reduce the organic content of the soil to inorganic forms (the "mineral stage" of Russian authors), which then become available for new plant growth. These salts are normally dissolved in the soil water and so carried to the lower soil layers. In this way is produced the soil profile, which in a well-developed soil consists of three horizons: the upper or A horizon, usually loose in texture and being robbed of its mineral content by the soil water; the B horizon, more compact and containing most of the salts leached from A; and the C horizon, consisting mainly of fragments of the underlying mother rock.

In arid regions the soils contain little humus since lack of moisture limits the growth of vegetation. Excessive evaporation brings soil water to the surface where it leaves behind its dissolved mineral contents. Thus carbonates especially are found at or near the surface, sometimes forming a clearly marked layer. Frost, with the check that it places on plant growth and on bacterial activity, prevents development. The steepness of mountain slopes, producing constant downward movement of rock fragments, also checks development.

Glinka classified soils into about two dozen types, not all represented in the U.S.S.R. Only the major groups are distinguished in the following survey.

Tundra Soils.—This most northerly group of soils is found over nearly one-sixth of the total area of the U.S.S.R., extending beyond the tree line (the word "tundra" implies the absence of trees) to the shores of the Arctic ocean. The outstanding characteristics of these soils are due to the rigorous climate. In the brief summer only the upper layers are thawed, the subsoil remaining permanently frozen and therefore impervious. Neither surface water nor burrowing animals can penetrate the frozen layers. Marsh conditions are widespread over all the lower areas in the warmer period. Vegetation is shallow-rooted and scanty. Its decaying remains lie on the surface and accumulate there to form a black acid layer. This bog soil is, almost entirely, partially decomposed vegetable matter. The subsoil, on the other hand, is almost wholly inorganic. Low temperatures limit bacterial activity and the frozen subsoil prevents earthworms from carrying on their beneficent work of conveying organic material underground and bringing mineral fragments to the surface.

Where the subsoil is sandy there is some leaching from the surface soil, and tundra soils approach the podsol type. On drier mounds uplifted by the action of frost peat may develop, but this is less common than is generally believed. In the tundra of the far northeast of Siberia the very low precipitation is accompanied by an almost total absence of vegetation, and the land surfaces are often of bare rock or pebble-covered, with little soil of any kind.

Under such conditions agriculture is clearly impossible. The few inhabitants are pastoral nomads dependent on their reindeer herds, on summer fishing and on winter hunting in the forest fringe. There is some reindeer breeding to provide animals for winter haulage in the forest zone to the south. Transition from tundra to forest gives rise to a narrow belt where scattered examples of dwarf species of birch and spruce are typical. These, like the forest trees themselves, first become evident in the river valleys, where there is some shelter from winds and the subsoil ice lies at a deeper level.

Forest Soils.—Soils of this group cover more than half the U.S.S.R. All are podsoils or modified podsoils; that is to say, soils of an ash-gray colour (*sol* = "ash") typical of cool, humid climates. They are best developed in the taiga or coniferous forest region. There surface water can reach deeper than in the tundra, since temperatures are high enough to prevent the permanent freezing of the subsoil and, in dry periods, to cause some rise of water in the soil to replace the slight loss from the surface by evaporation. These conditions are evidently favoured by the forest cover, for it prevents heavy leaching by rain while maintaining fairly constant humidity of the soil. The shelter it gives from

winds also reduces losses by evaporation. On the other hand, leaf transpiration keeps the subsoil fairly dry.

Coniferous Forest Type.—The decay of the needle leaves of the conifers proceeds very slowly by reason of their resinous nature and gives rise to a thin and rather peaty surface layer. It produces a very acid type of humus and the soil water passing through it is therefore capable of bringing about almost complete decomposition of the mineral constituents of the underlying layer. Iron and aluminum hydroxides are thus carried downward, leaving behind little but silica or fine clay. The A horizon in a typical podsol is thus frequently sandy, grayish where a proportion of humus remains but sometimes almost white where it has been removed, and strongly acid. Since almost all the plant food it contained has been removed, these soils are agriculturally of little value. This is evidently of great importance, since they cover about two-fifths of European Russia. Horizon B shows two distinct layers. The upper of these is brownish yellow or coffee coloured and contains most of the products of humus decomposition. In texture it is usually clayey, the finer mineral fragments being cemented by gummy substances resulting from this decomposition. Sometimes a hardpan layer is produced at this level. The lower section is usually rusty brown in colour and heavily impregnated with iron hydroxide. When this layer is sufficiently thick and consolidated it is often a factor in the production of the marshes common throughout the taiga belt. Red-brown patches, due either to humus or ferrous hydroxide concentrations, are sometimes seen in the subsoil below the B horizon.

Coniferous trees form the major part of the vegetation except on the northern edge of the forest; there a belt of birch occurs, at first dwarf and lichen-covered but increasing in size and number southward. Where the A horizon is sandy the Scotch pine is prevalent, on the clays some variety of spruce. In Siberia the silver fir and Siberian larch are the commonest trees. Economically the forests are important as sources of softwood timbers and of furs.

Bog and Marsh Type.—This is common north of about the 60th parallel of latitude in Europe, in the wide, ill-drained northern parts of the west Siberian lowland and in the Pripet area of western Russia. It is especially common on surfaces of glacial clay. The water table is high, and hence there is little downward movement of soil water. Decomposition of vegetation is incomplete because of lack of aeration, so that peaty surface layers are common. The remains of dwarf birch and alder and of marsh plants and mosses accumulate slowly, giving an acid surface soil. Dissolved iron is often precipitated in nodular form and, as bog iron ore, has been worked in some regions for several centuries (e.g., in the Vychegda valley).

The marsh areas have been of great strategical importance in Russian history. In the earlier days of invasion from the Asiatic steppe they were often places of refuge. The great Pripet marshes formed an important barrier across the European plain, giving a natural western frontier toward Poland. Peat is worked extensively and is used for power production in some areas.

Mixed Forest Types.—From central Europe across European Russia to the Urals near Molotov (Perm) there extends a wedge of mixed forest where deciduous trees mingle with and ultimately almost replace the northern conifers. Beyond the Urals this forest occurs again in a narrow belt as far as the Ob. As has been seen, this is the area in which Atlantic influences upon the Russian climate are most effective and are particularly evident in the heavier precipitation. The soils of the region vary in character in accordance with differences in local climate and in the mother rock from which they are derived, but in general they show a transition from the podzolized soils of the coniferous forest to the black earth of the steppe.

Heavier precipitation causes a continuance of the leaching of the A horizon, but the surface layers are less acid than farther north. Higher temperatures encourage more complete decomposition with greater activity of earthworms and bacteria. The horizon is darker in colour, gray rather than white, as the humus content of the upper layer rises to from 3% to 6%. This upper layer, seven to nine inches in depth, accounts for the greater agricultural productivity of this zone as compared with the region to the north.

In texture the layer is said to be nodule. In the lower layers of the horizon this structure becomes coarser and the colour grayer. The A horizon may be as thick as 30 in. The change is gradual to the B horizon which may reach to a depth as great as nine feet in the southern areas. The colour of this horizon is generally brown, grayish in the upper layers but reddish in the lower. Very fine clay particles and some calcareous material occur at the lower levels. The origin of these grayish soils is still disputed. Some hold that they represent a degraded form of the black earth, caused by a southward spread of tree growth over the steppe. In support of this view it is noted that where patches of woodland occur in the steppe valleys they are accompanied by gray soils. Another opinion sees in them mainly the result of forest clearing and the improvement by long-continued cultivation of a formerly podzolized soil.

The gray soils occur in a narrow but irregular band across European Russia and in the still narrower zone of the wooded steppe of western Siberia. Though still essentially forested, this country allowed its early inhabitants to maintain themselves by agriculture in the clearings. As settlement increased these could be and were extended by cutting and burning. The longer frost-free period makes possible the growth of deciduous trees except in eastern Siberia, where this type of forest is completely absent. The heavier leaf fall from this type of tree increases the supply of humus to the surface layer of soil. The richer undergrowth, which consists mainly of perennial grasses, contributes to the same result and also encourages the rearing of farm animals.

In the narrow west Siberian area the trees are mainly aspen and birch. West of the Urals the forest is much richer in species. The most important of these are the oak, especially common on the glacial clays, the lime, the maple and the ash. The last-named is most abundant in the more southerly areas. Conifers are still common, more particularly on the sandy outwash soils and alluvial areas along the rivers.

The mixed forest zone has played a great part in the history of Russia for within it the Russian nation was born. Groups fleeing from the Asiatic invaders of the steppes there found shelter. Under the influence of a settled agricultural life they were welded into groups which later coalesced to form the first Russian state. All the suitable land has long been cultivated and the hardier cereals—barley, rye and oats—grown. Flax and hemp provided fibres for early industrial use, and the potato was soon widely grown after its first introduction. Forage crops—hay and lucerne—also do well and support the growing dairying and cattle-breeding industry, especially in parts of Siberia.

Black Earth.—Soils of the black earth type (chernozems) underlie about 12% of the U.S.S.R. and form in European Russia the largest continuous area of the type anywhere. They occur south of the forest soils and north of the arid and mountain areas. Their essential characteristics are the high humus content and the presence of calcium salts, especially the carbonate. They evidently represent a modification of an earlier soil enriched by the decay of animal and plant remains. Because of their wide development in loess areas, it was at one time thought that they were simply loess with an addition of humus; this is not now accepted, as they are found to occur in quite characteristic form on mother rocks of varied kinds. At the same time there seems little reason to doubt that loess and the *limons* found over calcareous rocks are particularly favourable to their development. Sandy subsoils, too, carry thicker coverings of chernozem than do clayey subsoils. The better drainage afforded by loess and sands is probably the reason in each case.

The humus content of the black earth varies from 6% to about 16%. It is lowest in the north and west and increases to the south and east. Thus the percentage varies from 6 to 10 in the Ukraine, where it occurs over the widest area, but increases to 15 or 16 east of the Volga, where it forms but a narrow belt, and in western Siberia, where its distribution is patchy. The black earth is thickest in the Ukraine.

It is clear that the principal factor leading to the development of chernozem is climate. It occurs in regions with a long and severe winter but with summer conditions of high evaporation

leading to a virtual desiccation of the surface soils. Snow accumulates during the winter, and the spring thaw provides the moisture necessary for a quick and abundant growth of grass. This water supply, however, is exhausted by late May or early June. Rain falls during the summer months but only at considerable intervals, and the total amount is small. The intervening periods of drought stop the growth of the steppe grasses, the decay of whose roots is the chief source of humus. It also prevents the growth of trees, and this also may be of some importance in the development of chernozems since tree roots encourage oxidation. The blackness of the surface layer which gives the soil its name is due to the long-accumulated products of the decomposition of grass roots. The droughts of summer and the frosts of winter both slow down the rate of decomposition. Leaching of the A horizon is largely prevented by the low summer precipitation and rapid evaporation, which moreover produce a strong upward movement of the soil water that leads to a concentration of mineral salts just below the humus level. This is another factor inimical to the growth of trees and explains their restriction to valley areas in the steppelands. Layers of gypsum and of calcium carbonate at different levels are often produced by this movement of soil water.

The typical soil profile in a black earth region shows two major horizons. The upper portion of the A horizon is normally neutral or acid. The surface soil is crumbly, granular in structure and black or deep chocolate in colour because of the high humus content. The lower portions of the horizon, which has a total thickness of 18–40 in., is grayish black to yellowish brown and has a nodule structure. It is in this portion of the profile that calcareous concretions occur, the carbonates formed in the humus horizon being carried down by leaching.

The black earth lands practically coincide with what are sometimes called the tillable steppes. These have produced grain for many centuries without any great loss of fertility. The main handicaps to their utilization are climatic, as they require not manure so much as moisture. Recurrent drought has given rise to terrible famines. The dry soils in the summer months are particularly liable to wind erosion and to loss of topsoil in heavy rain showers. Modern cultivation by machines on a large scale, as in the United States, tended to accentuate these difficulties. Increased diversification of crops, the construction of vast tree belts as windscreens and the utilization of Volga waters for irrigation were developed to offset them. In earlier times the Slav cultivators occupied the wooded valleys and left the bare plateaus of the steppes to the nomadic pastoralists. The modern tendency has been the reverse of this, the open plateau lands being more suited to working by machines. For further information on the region see UKRAINE and BLACK EARTH AREA.

Arid Soils.—Beyond the black earth zone to the southeast, climatic conditions rapidly approach desert character. The decrease in total rainfall, its increasing uncertainty and the rapid rise in the evaporation rate produce marked changes in the soils and their development. The cultivation of the steppe becomes more and more risky, though it is perhaps no longer true to speak of the whole region as untillable steppe. The chestnut soils are fertile when, or where, sufficient moisture is available, the brown soils less so and the gray desert soils only occasionally and then with great difficulty. The humus content decreases rapidly and salinity increases as the chernozems are left behind. A fertile belt, however, lies along the foot of the bordering ranges.

Chestnut and Brown Soils.—These extend from the Crimean steppes across the Volga delta and through Kazakhstan and the extreme south of western Siberia. The chestnut soils are the result of extreme temperatures accompanied by a low rainfall and high summer evaporation. The grass cover is much less rich and less continuous than on the chernozem, with the result that the humus content of the surface soils falls to 5%. Increasing aridity produces the brown soils with only 3% humus. Insufficient leaching of the surface soils causes an increase of their soluble salt content, and this adds to the effect of the growing aridity in limiting vegetation. The A horizon in the chestnut soils seldom exceeds 25 in. (with a humus zone 12–18 in. thick) and in the brown soils falls to 12 or 15 in. Both types show a prismatic structure. The rising

soil waters, consequent on heavy evaporation, cause the concentration of soluble salts in the upper layers. Thus, calcareous concretions often form an almost continuous layer quite near the surface. Because of the poverty of vegetation the nature of the mother rock has more influence on the soil character than is usual. On the other hand, the dryness of the surface reduces the rate of decomposition of mineral fragments.

All arid soils show a tendency toward salinity. This is particularly evident in surface depressions or where there is poor drainage or a high water table. Under such conditions the ground water is often brackish. This is most marked in soils resting on argillaceous rocks. Saline soils, lightly impregnated with soluble salts of potassium, magnesium or calcium and constituting the type known as *solonchaks*, are found in these areas. Their salinity is harmful to vegetation. A white crust sometimes appears on the surface if the concentration of soluble salts is excessive. An alkaline soil known as *solonets* is produced by the leaching of *solonchaks*; e.g., if it is irrigated or if its drainage is improved in any way. The removal of most of the soluble salts leads to both chemical and physical change. Thus the flocculated clay particles of the *solonchaks* are dispersed and its loose texture is replaced by a closer texture, so that the *solonets* is sticky and plastic when wet but sets into hard clods when dry. It is thus practically unworkable.

The chestnut soils are very fertile when supplied with enough water, but their irrigation must be carefully controlled. Raising of the water table is always liable to produce alkalinity at the surface and thus bring about the formation of *solonchaks* or *solonets* and the defoliation of their clay particles.

Gray Soils.—These are found chiefly in the inland drainage areas of Asiatic Russia. They underlie the shifting sands of the deserts and cover the loessic deposits of their southern mountain margins. Under desert conditions neither water nor vegetation is sufficient to play much part in soil production and the evolution of the soil has not proceeded far. In the areas where drifting sand forms the surface one can say it has not begun. Along the northern edge of the basins occur *solonets* clays, poor in carbonate and with a very low humus content. These increase in salinity southward.

The gray soils are alkaline and clayey with a humus content seldom more than 1%. Their colour results from the presence of sodium salts and their bleaching effect. Where the gray soils cover the southern loess they are rich in calcium carbonate, the content being sometimes as high as 15% at the surface and increasing to 25% at lower levels. Where they are well watered, as where mountain streams emerge, they may be very fertile. Cotton and Mediterranean fruits are important products where the problems that the gray soils present to the cultivator can be solved.

Mountain Soils.—In general these vary with altitude wherever the slopes are gentle enough to permit their development and stream or ice erosion does not remove them. As temperatures fall and humidity increases with height, the succession of soils closely parallels that seen in travelling from southeast to northwest across the plains. Thus, in the Altai, chestnut soils at the foot pass into black soils and then to podzolized forest soils at higher levels. The gray desert soils of the Turkistan lowlands similarly pass into chestnut and then into black earths on the mountain slopes. In eastern Siberia, where the soil generally is of the coniferous forest podzol type, the mountain ranges are capped with tundra-type soils.

(T. HENK)

HISTORY

The great east European plain which was united, together with Siberia, under the Russian tsars, presents in spite of its general

uniformity two contrasting geographic aspects which profoundly influenced the trend of its historical development: the northern and the southern. A primitive forest extending over the northern part of Russia reminds one of that described by Tacitus in his *Germania*. It was indeed its continuation and connected Russia with the western part of the European plain. It was comparatively late that this part of Europe was set free from its prehistoric ice cover. It is still full of lakes and great rivers which for long remained the only ways of communication for a scanty population scattered in distant glades. The primitive settlers added a few patches of cultivated land to their habitual means of livelihood—river fish, wild beehives and fur-bearing animals in the forests.

Quite different is the southern Russian landscape. It is the steppe, the prehistoric seat of nomad hordes which inhabited it from time immemorial until quite recently. These lived on horseback and in tents, used mare's milk as their food and thrived on the booty taken in regular incursions against northern sedentary tribes. There the most ancient traces of aborigines are found, of the Palaeolithic stage, followed by the Neolithic, with traces of Aegean culture in its primitive form. There also we learn, by the intermediary of ancient Greek colonies on the northern Black sea shore, the names of ancient peoples of southern Russia; we are unable, however, to identify their nationality. The most ancient of them, the Cimmerians, are said to have been replaced by the Scythians (see SCYTHIA) and these by Sarmatians (see SARMATIA). Some patriotic Russian historians (I. V. Zabelin, D. I. Ilovaisky, D. Y. Samokvasov) tried to prove that these populations were Slavs, but latter research pointed to an Iranian origin; for instance, the modern representatives of the Sarmatae-Alani are found to be the Ossetes, who are not Slavs but a Caucasian people.

The original home of all Slavs is not to be sought in the steppe, but in the forest. Lubor Niederle stated that, originating in the marshy land between the Vistula and Dnieper, the southern Slavs (Serbs and Bulgarians) descended to the Danube as early as the 1st century A.D. The first federation of eastern Slav tribes (Russians) appears in the 3rd–4th centuries A.D. as a powerful and numerous people called Antae, living between the Dnieper and Dniester. They were involved in the wars of the Goths and Huns and were defeated by the Avars in the 6th–7th centuries. In the 7th century appears a new conquering nomad nationality in the steppe, the Khazars (*q.v.*) possessing a certain degree of civilization. They brought under their subjection some eastern Slav tribes whose names are given in the ancient Russian annals (Severyane, Radimichi, Vyatichi, Polyané). Khazar domination lasted until the beginning of the 10th century, when other nomads of Turkish descent and wilder habits—Hungarians (middle 9th century) and Petchenegs (end of 9th century)—overran the steppe and broke for long the connection between Slav settlements and the Black sea shore.

Origin of the Rus.—The Slav forest tribes were now obliged to adapt themselves to the new situation. As a reply to the invasion of the steppe by the Turkish hordes there appears a new organization of defense from the north. The defenders are the "Rus"—a Varangian tribe, in ancient annals considered as related to the Swedes, Angles and Northmen. Both Rus and Varangians are also known to Byzantine chroniclers ('Ρῶς, Βαράγγιοι), first as Norse pirates, then as warriors serving in the imperial guard and finally (10th century) as chiefs of the caravans of traders coming yearly to Constantinople by the "Great Waterway," the *Austrvegr* of northern sagas, through the waterfalls of the Dnieper, whose names are given by the emperor Constantine Porphyrogenitus both in "Russian" (Scandinavian) and in "Slavish" ('Ρωσιστὶ καὶ Σλαβιστῶν). Arabian writers represent the original seat of the Rus as an island covered with woods and marshes; this brings us to the source of the waterway mentioned—Lake Ilmen, near the ancient town of Novgorod, and Lake Ladoga, where the river Neva has its origin. Excavations of 10th–12th century tumuli confirm the presence of Norse warriors, buried (or burned) with their horses and arms, in that very tableland where four chief waterways of Russia, the Neva basin, Volga, Dnieper and Dvina, converge and form outlets to the Baltic, the Caspian and the Black seas and thus determine the direction of ancient

trade routes. Numerous finds of Arabian, Byzantine and Anglo-Saxon coins (9th-11th centuries) along all these routes testify to a flourishing trade which corresponds exactly to the period of foundation of new states by Vikings at the one end and the florescence of Arabian and Persian caliphates before the Mongol invasion at the other end of these trade routes.

KIEV

Russian legend says that the Rus were first asked to come to Novgorod by the local population to put an end to their internal feuds. Rurik (Hrōrek) was the first (semilegendary) *knyaz* (koning, prince) of Novgorod, but his companions wished to descend the *Austrugr*, nearer to Byzantium, and Oleg (Helgi) settled in Kiev. The Russian annals date the arrival of Rurik in Novgorod A.D. 862. But the first reliable datum is Oleg's commercial treaty with the Byzantines (911). A subsequent treaty was concluded in A.D. 945 by Oleg's successor, Igor (Ingvar), together with his companions, whose signatures contain only 3 Slav names among 50 Norse. Constantine Porphyrogenitus gave a very picturesque description of this trade which still remained the chief business of the Rus dynasty. During winter the princes and their *gesits*, who distributed among themselves the towns in the basin of the Dnieper, were busy making circuits among neighbouring tribes in order to force them to pay annual tribute. Their booty consisted of furs, money and slaves. As spring came they loaded their small boats "made of one single tree" (*μονόξυλος*) and conveyed their caravans down the Dnieper ready to ward off the attacks of nomad steppe tribes. In the treaties mentioned their rights of trading in the capital were strictly defined. The *könings* extended their power over local tribes and, to defend the land from nomad incursions, they constructed earthen walls on the frontiers of the steppe. The local aristocracy joined the ranks of their *drushina* (*gesiti*, *comitatus*) and the process of assimilation began. The term "Rus" was now used to designate the southern outpost of the whole system of defense; i.e., Kiev with the surrounding country. The son of Igor and his wife Olga (Helga) had already a Slav name, Svyatoslav. However, he still remained part northern Viking as well as part southern nomad. Svyatoslav did not yet feel at home in Kiev. He wanted to come still nearer to Byzantium and chose Pereyaslavets on the Danube in the Bulgarian land, because, he said "there was the centre where all goods gather from all parts: gold, clothes, wine, furs from the Greeks, silver and horses from the Czechs and Hungarians, furs, wax, honey and slaves from the Rus." Svyatoslav also defeated the Khazars and the Volga Bulgars, but he was defeated by the emperor John I Tzimiskes and slain on his way back home by the Petchenegs (972). With him died the Scandinavian tradition of the Kiev dynasty.

From the reign of Svyatoslav's youngest son, Vladimir, the Norman dynasty was definitely settled in Kiev. It still preserved its connections with other parts of Europe, attempted distant military expeditions against its Slav neighbours and ruled the large territory from the northern lakes to the steppe and from the then uncertain Polish frontier to the river Volga and the Caucasus. This was the most brilliant period of southern Russian history, but its brilliance rested on an extremely unsafe base, as the connection between the newly built state and the country inhabitants remained very loose. The only link which unified the subdued tribes was the power of the grand duke of Kiev. The people paid their tribute to the prince's tax collectors, but otherwise they were left to themselves and preserved their ancient tribal organization and habits.

Another element of union of enormous importance was added by the acceptance of Christian faith in 988 by Vladimir the Saint. He took his religion from Byzantium, but the service was in the vernacular as the prayer books and Bible had already been translated into Slavonic by the "Slav apostles" Cyril and Methodius in the 9th century. From 1037 the Russian church was subject to the Constantinopolitan patriarchate; for two centuries nearly all metropolitans and most of the bishops were Greeks. Eventually the Slav and Russian element prevailed. After Vladimir's death (1015) his son Svyatopolk the Damned assassinated his brothers

(Boris and Gleb, canonized as saints) but was defeated by another brother, Yaroslav, elective prince of Novgorod, who reunited all territory under the grand duchy of Kiev and embellished his capital with a cathedral in Byzantine style. He also founded the monastery at Pechersk, which became a famous seat of faith and learning; he collected books and had them translated. Under Yaroslav the earliest document of Russian law was revised under the name of *Russkaya pravda* ("Russian right"). He gave refuge to two sons of Edmund of England who fled from Canute, to Olaf II of Norway and also to Harald III Haardraade, who married his daughter; he gave his other daughter to Andrew I of Hungary; his third daughter married Henry I of France. His sons married Polish, Greek and German wives.

Yaroslav died in 1054. In order to prevent feuds among his numerous descendants he introduced an order of succession to the grand duchy of Kiev which was based on the principle that all territory as a whole belonged to the family, and different parts of it were distributed among them in temporary possession according to seniority and to the profitability of the seat of administration. The most profitable towns on the main trade route were Kiev, Pereyaslav (on the steppe frontier), Novgorod (the first Norman residence), then Smolensk (on the upper Dnieper) and Chernigov (on its affluent, the Desna). All brothers of the first generation were considered as senior to the following generation. As soon as Kiev passed to another brother all the members of the family changed their seats and approached one step nearer to Kiev. If one died before reaching Kiev, his descendants were called *izgoi* and excluded from "mounting the scale." In the accompanying chart are numbered the successive reigns in Kiev during seven generations after Yaroslav.

The order of succession from brother to brother was kept only in the two first generations (1 to 5). Numbers 9 and 12 show preference given to nephews over uncles. And indeed, as early as 1097, at a conference held by the dukes at Lyubech it was decided that the sons should keep their fathers' heritages. The di-

rect succession from father to son prevailed in all dukedoms. Kiev was seen to be losing its former significance. Its great importance was based on trade; but southern trade was destroyed by the appearance in the steppe (1054) of the Polovtsy (Cumans), nomads far more dangerous than the Petchenegs. It will also be seen that of all Yaroslav's sons only one line survived: that of Vsevolod and his brilliant son Vladimir Monomakh. Monomakh's line was then divided into two; the elder one (6, 9, 12) remained in Kiev and in its turn it was subdivided in two—Roman and Daniel preferred to move west from the then unsafe Kiev to Halicz (Galich; see GALICIA), while two Mstislavs, the Brave and the Daring, as their nicknames show, remained to the end the knights errant of the chivalrous south. The cadet branch of

Vladimir Monomakh (10, 13, 14) opened a new period of Russian history. The centre of influence changed then to northern woodland, far from the steppe. It was a far poorer but safer and, in the long run, more profitable settlement. In 1169 Andrew's troops stormed Kiev. This was the end of southern brilliance, though Kiev was not definitely destroyed till 1240 by a last and most terrible invader, the Mongol Batu, Jenghiz Khan's nephew.

The title of grand duke of Kiev thus lost its importance and with it broke down the unity of Russia. Ducal appanages became independent dukedoms; Russian territory was split in a dozen separate units which waged endless wars against each other. The old Kiev centre suffered the most from these internal dissensions and from incursions from the steppe. The frontier population was nearly exterminated and mixed with Turkish ethnic elements. However, the ancient tribes remained untouched to the west and north of the river Dnieper. In their midst, about the 14th century, appeared new branches of Russian people, speaking their separate dialects, the Little Russians and the White Russians (the old Krivichi).

NOVGOROD AND MOSCOW

By and by three distinct centres emerged from the chaos: Halicz, Novgorod and Moscow. Each was characterized by the prevalence of one of three main features of the political life of Russia during the Kiev period. These three features are: (1) the popular assembly (*veche*), which represented the ancient tribal organization and which met in towns thus consisting chiefly of townfolk; (2) the princes; (3) the boyars and the *druzhina* (*comitatus*), a landed aristocracy, partly of ancient tribal descent, partly the military companions of the prince at the conquest. This aristocracy developed especially in Halicz, where the social structure approximated to western feudalism. On the northwestern frontier it was, on the contrary, the democratic element that prevailed. The chief city, Novgorod, became a republic. "Lord Novgorod the Great" was ruled by a popular assembly (*veche*) which elected its mayor (*posadnik*) and its commandant (*kyryatsky*) and concluded treaties with the dukes who were invited only to watch over the defense. Novgorod had a largely developed trade and large dominions extending from its gates and from the mouth of the Neva over the whole Russian north up to the White sea and the Urals. That country was rich in furs, the chief export. The higher class of citizens was here formed of capitalists and rich merchants, who were to form the aristocratic element in Novgorod.

Another element existed in the political structure of central Russia: the backwoods of the Oka and upper Volga. This country was cut off from all European connections. Its population consisted exclusively of agricultural colonists settled on ducal land. Thus, the duke appeared there as a proprietor and as the organizer of social life. Towns were scarce and the population scattered in clearings. The few *veches* in the chief towns had no influence; noble landed proprietors were completely absent. Thus, the power of the duke was there practically unlimited. Ducal psychology was framed accordingly; unlike the valiant knights of the south, they formed a dynasty of great appropriators, stingy and acquisitive, ruling their dukedoms as private estates. They thus accumulated elements of strength which as time went on aided them to become masters of the whole of Russia.

After the conquest of Kiev by Andrew Bogolubsky the title of grand duke passed from Kiev to a northern town, Suzdal, and from there to Vladimir on the Klyazma. But as early as 1147 Moscow is mentioned in the annals. Its situation was exactly at the centre of Russia between the Oka and the upper Volga. It had long been a great centre of continental river trade, far from the southern area of Tatar devastation. The line of dukes of Moscow starts from Alexander-Nevsky's younger son Daniel.

Their genealogy during the domination of the Golden Horde (1240-1480) is shown in the accompanying table.

All these princes had to ingratiate themselves with the khans of the Golden Horde to receive from them the *yarlyk* (investiture) as grand dukes. They regularly journeyed to Sarai, the capital of the khans at the mouth of the Volga, and underwent every kind of humiliation. But they returned as chief collectors of the Tatar

tribute, which gave them power over neighbouring dukedoms. Only the dukedom of Tver competed with them very stubbornly.

The dukes themselves involved the Tatars in their feuds and brought punitive expeditions on Russia. The khan's protection gave the Muscovite dukes the upper hand over their enemies. They soon succeeded in increasing their possessions. Ivan I extended his domains, by purchase and by violence, over the whole province of Moscow. Demetrius (Dmitry) added to it the upper Volga region (excepting Tver and Yaroslavl), Tula and Kasimov; Basil (Vasily) I the remaining part of Oka and Suzdal, Vladimir, Murom and Nijni-Novgorod; Basil II Elets in the south, Volodga and Ustyug in the north. A religious sanction was given to Muscovite unionist tendencies by the metropolitans of the Russian church who in the persons of Peter, Theognost and Alexius settled in Moscow. Accordingly, the grand dukes of Moscow added to their title: "of all Russia." Demetrius won a great name by his brilliant victory over the Tatars of the Golden Horde led by Mamai in a bloody battle on Kulikovo plain (1380). He thus appeared as a leader of all the national forces (excepting the grand duke of Ryazan) against the oppressors, and he received the blessings of the church at the hand of St. Sergius of Radonezh, the prior of the convent of the Holy Trinity. However, two years later Moscow was sacked and burned by another conqueror, Toktamish, who in his turn was defeated by Timur, his former protector. The Mongolian yoke lasted for another hundred years, although in milder forms. While Moscow was steadily growing in importance in comparison with the rival grand dukedoms of Tver and Ryazan, the boyars and other "men of service" came in crowds to serve the grand duke of all Russia. The institutions of Moscow, which up to then resembled very much those of a large private estate, began to evolve into a system of state administration.

Ivan III and Basil III.—Ivan III's acquisitions of Novgorod and Tver (1471 and 1485) enlarged Russian territory up to the limits of settlement of the Great Russian branch of the nation and brought Russia into direct contact with other countries. Livonia, Lithuania and the Tatar khanate of Crimea. The title "of all Russia" became a reality, and systematic foreign relations were started. The all-Russian potentate proffered historical claims against Lithuania, which possessed a part of formerly Russian territories. The successful wars which followed extended the western frontier to Chernigov and Novgorod-Seversk, while leaving further claims for Smolensk, Kiev "and all Russian patrimony" to Ivan's successors. Ivan also built the fortress Ivankograd close to the Gulf of Finland, thus opening the chapter of Russian pretensions on the Baltic. The Crimean Khan Mengli Ghirai accepted his friendship and helped him to put an end to the Golden Horde. As early as 1480 Ivan refused the Tatar tribute and threw off the yoke.

The title of grand duke seemed inadequate after all these successes; more pretentious claims were based on a new theory suggested by southern Slav and Greek divines. According to this theory the Muscovite duke was a successor of the Byzantine emperors and the only representative of the Orthodox Church in the world. Indeed, the Greek Orthodox Church had accepted the "union" with the Catholics as early as 1439, at the council of Florence, while Constantinople, "the second Rome," had been taken

by the Turks in 1453. Obviously, the Greeks had been punished by God for their apostasy, and their succession had to pass to the third Rome, which was Moscow, and to the Russian grand duke, who remained the only faithful and really Christian prince in the world.

The realization of this new scheme began with the marriage of Ivan III with Zoë (in Russia, Sophia), the only niece of the last Byzantine emperor, Constantine Palaeologus (1472). With her arrival new habits appeared at the Muscovite court intended to magnify the new autocrat (a title used by Ivan in foreign relations). The church that gave its sanction to that change claimed a reward: the prince had to help it against all heresies and internal dissensions. The prior of Volokolamsk convent, Joseph, insisted on burning some rationalistic heretics in Novgorod. He also defended the principle that wealth gives power to the church, and he mercilessly crushed monastic and ascetic tendencies of the reformer Nil Sorsky, the "abstainer from property." Thus, the official theory on Russian church and state was formed as early as the end of the 15th century. Under Basil III the unification of Russian territory was consummated by the acquisition of another republic, Pskov (1510); by the final annexation of Ryazan, the last independent grand dukedom; and by a new extension at the expense of Lithuania—the acquisition of the frontier city of Smolensk (1514). The minority of Basil's son Ivan, who was three years old when his father died (1533), and subsequent disputes over the regency between rival factions, lasting 14 years, did not interrupt the growth of the Muscovite state. The reign of Ivan the Terrible marks the beginning of a new period of Russian history.

Ivan IV the Terrible (1533-84).—The reign of Ivan IV the Terrible was an epoch of great and systematic reform. It gave its final shape to the Muscovite tsardom which it preserved until the epoch of Peter the Great. At the age of 17 Ivan demanded to be crowned as tsar (shortened from Latin Caesar), and he connected this official assumption of title with a legend according to which the imperial regalia had been handed over to his predecessor Vladimir Monomakh by a Byzantine *basileus*. The Constantinopolitan patriarch was induced to confirm that legend, but he substituted Vladimir the Saint for Vladimir Monomakh in order to make good a chronological error. Popular songs preserved the memory of Ivan IV as a democratic tsar, who "ferreted out treason (i.e., the boyars) from Russian land." And, indeed, he definitely deprived the "little dukes" who gathered at his court of their remaining sovereign rights and forced them to exchange their hereditary possessions for other landed estates, while their service to Moscow was made obligatory. To pass over to foreign countries was qualified as treason. The same measures were extended to boyars. Both dukes and boyars tried to recompense themselves by assuming political power in the *duma* of the tsar, and the most powerful of them formed a "selected rada" (a sort of privy council) through which they ruled the state. They summoned the first Russian *zemsky sobor* or "assembly of the country" in 1550, at which representatives of the people revised the criminal code of Ivan III. They also took part in a church council of 1551, where this code was signed and certain traditional rites in church and private life were sanctioned as specifically national. At two previous synods of 1547 and 1549 about 40 new Russian saints were canonized.

However, the regime of the selected rada did not last long. Ivan IV resented it as an interference with his own power, and he broke with the counsels of his youth. He grew nervous and suspicious and began systematically to extirpate dual and boyars' families. To show his wrath against his enemies he left Moscow (1564) and settled in Alexandrovskaya Sloboda. He then divided the kingdom into two parts: his private *oprichnina* which he ruled personally, and the remaining "land" (*zemshchina*) which he handed over to a Christianized Tatar, Prince Simeon Bekbulatovich. Far from suspending reconstruction, this curious division helped to reorganize the Russian ruling class—the men of service—on more democratic lines. Ivan IV imitated for this purpose Byzantine patterns. He strictly regulated the connection between possession of landed estates and military obligations. His foreign

policy—his long and successful war with Poland, Lithuania and Sweden in order to break through to the Baltic—also forced him to adopt reforms in the army and the financial system. Russian *souls* (*dvory*) and foreign mercenaries first appeared under Ivan IV. He also introduced new military taxation and ordered a first general description of taxable land (*pishtoviy knight*) in order to make the levies proportionate to the record of lots of taxed land; here too he borrowed his system from Byzantium. At the same time he centralized the receipts of the state in a "great treasury" while separating them from his own income, which was concentrated in the "great palace." Through its four boards (the fourths) the great treasury collected taxes chiefly from the north, while the peasants of the Muscovite centre had to work for men of (military) service. The nobles received the honorary title of "courtiers" (*dvoryane*), to distinguish their upper section—the tsar's guard—from the "sons of boyars," who formed the lower section—the provincial gentry. Both courtiers and sons of boyars were yearly sent to defend the western and the southern frontiers—especially the latter, which was fortified by walls and hedge-rows (*zaseki*)—against the Tatar incursions. The posts of commanders for each campaign were distributed by the central board called *razryadny prikaz*.

Theodore (1584-98).—The son and heir of Ivan IV, Theodore (Fedor, Fyodor), was a weak man whom Ivan called more fit to be a bell ringer in a convent than a tsar. The direction of affairs fell to his brother-in-law Boris Godunov, an able man who continued Ivan's policy. The Church of Russia received its independence and equality with other Orthodox churches by the granting to its head, the metropolitan Job, of the title of patriarch at the hands of Jeremiah, patriarch of Constantinople (1589). Another important measure was intended to strengthen economically the middle landlord class created by Ivan IV as against the boyars. Peasant labourers were forbidden to leave their estates or migrate to other landowners. All such fugitives who fled from their masters after 1592 (the time of the completion of government registers) were ordered back in 1597. This was the origin of legal serfdom.

Boris Godunov and Basil Shuisky.—In 1598 Theodore died; after some hesitation Boris had himself elected tsar by a *zemsky sobor*. He pursued Ivan IV's policy of weakening the boyars, but he met with opposition on their part. The only legal heir of Theodore, Demetrius, had been killed in Uglich, the place of his exile, in 1591. But the boyars with the help of the Poles opposed to Boris a "Pseudo-Demetrius," a young and well-educated man of obscure origin. Boris died (April 1605) soon after the appearance of this pretender (autumn, 1604), who was accompanied by Polish volunteers and aided by the Cossacks. On June 19, 1605, the impostor entered Moscow. On May 17, 1606, he was killed in a popular outbreak caused by the boyars, who took advantage of the popular dislike of Pseudo-Demetrius' free habits of life and the Catholic tendencies of his Polish protectors. The old dynasty was completely extinguished. The throne of the tsar passed to an influential boyar, Basil Shuisky (1606-10). He gave a formal promise to the boyars "not to repeat the policy of Ivan IV" against them; i.e., not to exterminate them by capital punishment or by exile and the confiscation of estates, without resorting to their court. However, the power of the boyars could not be restored; much more influential now was the rising class of small landlords, men of service. Still more dangerous for Basil were the Cossacks and the fugitive serfs in the newly colonized south of Russia. A real social uprising was started in the south by a former serf, Bolotnikov. The ferment was rife over the south and the east. A second false Demetrius appeared and in the spring of 1608 marched on Moscow. He established his camp at Tushino, near Moscow. The boyars wavered between the tsar Basil and the "thief of Tushino"; there were many flittings. Basil turned to Sweden for help, but as soon as he received aid from Charles IX of Sweden Charles's rival, Sigismund III of Poland, also entered Russia as Basil's adversary and as pretender also to the Russian throne. In Sept. 1609 Sigismund appeared before Smolensk. In July 1610 Basil was dethroned by the boyars and the men of service. The throne remained empty through internal dissensions and

a real time of troubles set in which lasted for three more years (1610-13).

The "Time of Troubles."—The boyars preferred a Polish candidate, and together with the men of service they offered the throne to Sigismund's son Wladyslaw (Wladislaus). A delegation was sent to Smolensk, and Moscow voluntarily received Polish troops under Stanislaw Zolkiewski. A treaty was concluded with Wladyslaw which secured the rights of the duma and the privileges of the landed gentry. A Polish dynasty might have settled in Moscow but for Sigismund's desire to keep the throne for himself. Sigismund's pretension woke up the spirit of national opposition. The second Pseudo-Demetrius at once won popularity, especially among the Cossacks and the lower classes. But in Dec. 1610 the impostor was killed by a Tatar of his suite. The middle landlord class then took action on the urging of the patriarch Hermogen. The men of service under Prokopy Petrovich Lyapunov and the Cossacks under Prince Dmitry Timofeyevich Trubetskoy and the ataman Ivan Martynovich Zarutsky blockaded Moscow; inside the town a popular uprising forced the Poles to retreat to the Kremlin. But here again dissensions arose among the besiegers. Lyapunov was killed by the Cossacks, and the men of service returned to their homes. The south of Russia was in complete disorder; crowds of Cossacks and Polish marauders dispersed all over the north. This finally decided the gentry to make a new effort and to gather a new national army which would "exclude the Cossacks and stand firm until a new sovereign is elected by all the land." Prince Dmitry Mikhailovich Pozharsky was made commander in chief of the army and Kuzma Minin, a butcher from Nijni-Novgorod, the treasurer. All northern towns and districts sent their detachments and their representatives to the army as it advanced up the Volga. In April 1612 it stopped at Yaroslavl. As Novgorod had been taken by the Swedes, Pozharsky offered the throne to Charles Philip, brother of Gustavus Adolphus. In August Pozharsky's army moved southward to Moscow. On Nov. 27 the Poles capitulated in the Kremlin, and a national candidate was set free: the young Michael Romanov, whose father, the metropolitan Philaret (Theodore Nikitich Romanov), a nephew of the first wife of Ivan IV, was at that moment a prisoner in Poland. All votes were at the disposal of a national tsar, more acceptable to the gentry as he did not belong to an old princely family and was young enough (he was 17) to secure the boyars against overbearing conduct. Michael was unanimously elected by a regular *zemsky sobor* on Feb. 21, 1613.

THE ROMANOV (ROMANOFF) DYNASTY

Michael and Alexius.—The *zemsky sobor* which elected Michael (1613-45) continued its session for three years, helping the new tsar to restore the disorganized and ravaged country. A second *zemsky sobor* was then summoned, which pursued for three more years the work of pacification. The co-operation of the tsar with the representatives of different social groups was becoming a regular system. But as the third year's session began (1619), Michael's father Philaret, now patriarch, came back from Polish captivity, and until his death in 1633 he ruled Russia as the "second lord" at the side of his weak son. Peace was concluded with the Swedes, who gained the Finnish seashore, at Stolhova in 1617 and with the Poles, who gained Smolensk, at Dudino (1618). But the struggle on the western as well as on the southern frontier was far from being finished. Anticipating new conflicts the government entirely reconstructed the army; it invited foreign commanders and hired whole regiments of mercenary infantry. To cover the increased expenses it had to introduce new heavy taxation. New registers of lots of cultivated land which had survived the devastation of the troubled times were established. However, an attempt to take back Smolensk from the Poles (1632-34) proved unsuccessful and the government did not feel strong enough to wage war with the Turks to retain Azov, which had been taken by a Cossack raid in 1642. The Russian colonization at that time went no farther than the lines of Belgorod and those of Simbirsk and Zakamsk, which were fortified in the period 1636-56. To the south of the Belgorod line there developed at that very time a crosscurrent of Little Russian (Ukrainian) colonization from

the western bank of the Dnieper. The new Cossack settlers (Poltava, Kharkov) felt the more independent from the Poles the farther they went east, and in 1654 their hetman Bogdan Chmelnitski (Khmelintsky) voluntarily surrendered the Ukraine to the protectorate of the Eastern Orthodox tsar. A large autonomy of the Ukraine was acknowledged by Alexius (Aleksey), Michael's son, and successor (1645-76). A war with the Poles ensued in which the Russians finally took Smolensk, occupied Vilnius and Kaunas and forced Lublin to surrender. But before finishing with the Poles Moscow was implicated in a war with Sweden. By the peace of Kardis (1661) Russia gave Livonia to Sweden; by the peace of Andrusovo it resigned Lithuania to Poland but kept for itself Smolensk, the eastern Dnieper bank and Kiev (1667).

European Influences.—The reigns of the tsars Michael and Alexius are closely connected in home as well as foreign policy. Moral and intellectual development was steadily influenced by the increasing intercourse with western Europe. Since the time of troubles foreigners had come in crowds to Moscow. The clergy objected to too-close relations with these foreigners as having their reflection in a change of habits and even of religion. Consequently, about 1652, foreigners were relegated to a suburb called "the German suburb." However, this proved still worse for the old Russian tradition, as the European culture now formed a single and undiluted unit which strongly influenced the court and the upper social classes. Russian boyars—such as A. L. Ordyn-Nashchokin, A. S. Matveyev and Prince Vasily Vasilievich Golitsyn—began to learn foreign languages, to acquire foreign books, to wear foreign clothes and to furnish their apartments with foreign household goods. Translations of foreign books increased in number from 24 in the first half of the 17th century to 94 in the second half. Alexius was especially accessible to the allurements of foreign comfort and pastime, going so far as to enjoy in private "English comedy" in German adaptations.

The Rascol.—The national religious tradition of the 16th century appeared antiquated. The patriarch Nikon found that certain rites of the national church which distinguished it from Greek orthodoxy, far from proving Russian superiority in faith, were based on ignorant distortion of ancient Greek originals of the books of service. He asked some scholars of the theological academy of Kiev (founded by Peter Moghila about 1625) to prepare a revised edition. The majority of the clergy declared this attempt sacrilegious, as the old Russian saints had saved their souls according to the old books and rites. Nikon insisted on his corrections. He invited two patriarchs (of Alexandria and Antioch) to come to Moscow, and at a council of 1667 the schismatics were excommunicated. A long struggle began between the faith of the Old Believers and the Nikonianism, as the official church was now generally called. Masses of the people followed the schism (*raskol*), and as hopes for reconciliation passed they began to believe that the end of the world was approaching.

Peter I the Great (1682-1725).—The reign of Alexius' invalid son Theodore (1676-82) was a sort of prologue to Peter the Great's reform. The leading part fell, under Theodore as well as during the minority of Peter (1682-89), to a well-educated boyar, Prince Vasily Vasilievich Golitsyn. He was the favourite of Theodore's energetic sister Sophia, who broke the tradition of seclusion of Russian women. After Theodore's death Sophia, with the help of the *stralty*, made her brother Ivan a second tsar as Ivan V (reigned 1689) at the side of Peter and assumed the regency. Peter (ten years old) was left to himself and amused himself in the neighbouring village of Preobrazhenskoye with technical and mechanical arts as applied to military games. He surrounded himself with boys of his age who soon became his first regular soldiers. The ill success of Golitsyn's much-vaunted expeditions to Crimea (1687 and 1689) gave Peter the chance to overthrow Sophia, to send her to a convent and to exile Golitsyn. However, as tsar, Peter continued his free life of sport. He now became a habitué of the German suburb, where he made acquaintance with many foreign specialists. A Swiss adventurer, François Lefort, initiated him into the pleasures of debauchery and became his best friend. He also encouraged Peter to extend his playing at soldiers to a real campaign against Azov. During two difficult

campaigns (1695-96) Peter learned chiefly the insufficiency of his knowledge, and Lefort urged him to complete his military and naval education abroad. Peter followed the advice; he joined his embassy in the capacity of a private workman and visited Germany, Holland and England (1697-98). He was forced to return speedily to Russia to stifle the new rebellion of the *streltsy* fostered by Sophia's agents.

He then made peace with the Porte (1699) and on the following day declared war on Sweden and invaded Livonia. This Northern War lasted until 1721, and it proved to be the chief factor in Peter's military, financial and administrative reforms. Independently from these reforms made necessary by the war, Peter directly after his return from western Europe forced his subjects to shave their beards (which was felt as an unbearable religious offense) and to dress as foreigners. The Old Believers (schismatics) especially saw in it a proof that Peter was the expected Antichrist.

Peter's army was crushed by Charles XII at Narva (1700) but while Charles was engaged in defeating Peter's allies, Denmark and Poland, Peter called up the yearly levies, created a new standing infantry, cavalry and artillery, and occupied Livonia, Estonia and the mouth of the Neva, where he founded his new capital, St. Petersburg, on May 1, 1703. The "window to Europe" was thus opened. To cover his new and enormous expenses, he acquired the habit of taking money wherever he found it. He thus completely destroyed the old system of central administration, the *prukazy*; instead, he distributed the financial resources of Russia directly among his generals by dividing Russian territory into eight "governments." Each government (*gubernia*) had to pay for the upkeep of a certain number of regiments. Russia thus received in 1708-12 its first regular division into provinces.

Charles XII made the mistake of advancing from Poland to the south of Russia, instead of proceeding straight against Moscow. The Cossack hetman Mazepa (Ivan Stepanovich Mazepa-Koledinsky) promised to help him, but was unable to raise the Ukraine. He joined Charles with an insignificant force. At Poltava (June 27, 1709) Charles was defeated by Peter and fled to Turkey. The Poltava battle produced a strong impression abroad; Russia was becoming a European state. Russian soldiers restored (Aug. 11) the Polish throne, drove the Swedes from Pomerania and appeared in the middle of Germany. The young Russian fleet won a naval victory over the Swedes at Hango Head. Peter married his niece, Anne, to the duke of Courland (1710) and another niece, Catherine, to the duke of Mecklenburg (1716). He favoured Prussia at the expense of Denmark and Hanover. A Russian army landed near Stockholm (1719 and 1720). In 1721 peace was concluded at Nystad; Russia received Ingermanland, Estonia and Livonia, and parts of Karelia and Finland. After that Peter accepted the title "emperor" (*imperator*), which gave him a claim to equality with the Holy Roman emperor.

Peter was now free to pay more attention to internal reforms. He had to restore the central administration which he had destroyed and to bring it in harmony with his new provincial organization. In the absence of Peter, who only once a year, at Christmas, appeared in his capital (since 1715 in Petersburg), the only central institution which ruled Russia was the senate. From 1711 Peter engaged foreign advisers (Baron Johann Ludwig Luberas and Heinrich Fick) to introduce into Russia the colleges on Swedish pattern (1718-22). Three colleges managed finance: *Kammer-, Staats- and Revision-collegia*. Three others were to increase the productive forces of Russia: *Kommer-, Manufactur- and Berg-collegia*. Three chief colleges stood above the others, on an equal footing with the senate, as they represented the tsar's prerogatives: foreign affairs, army and navy. In the provinces all the colleges were supposed to be represented, but as this proved too expensive the whole government of a *gubernia* was reduced to the single *voyevoda* of former times and to his office.

Peter was not a social reformer, but his reforms brought about great changes in the social composition of Russian society. All strata of men of service now melted definitely into one unified class of *dvoryanstvo* (gentry), which had to pass a uniform form (the 14 ranks of the "Table" of 1722) of obligatory service. Possession of landed estates lost all trace of being a remuneration

for service. At the same time the different groups of land labourers, half-free and unfree, on the gentry's estates became a unified class of serfs, subject to the poll tax, introduced by Peter in 1718-22 and collected by the landlords. Peter also tried unsuccessfully to differentiate the burghesses from other classes by organizing them in merchant guilds and introducing a kind of municipal self-government under the German name of *Rathaus* and burgmaster (1699-1721).

Peter's educational reforms proved premature. There had been already founded, under Sophia, a Slavo-Greek-Latin theological academy in Moscow (1685-87), where the influence of Kiev amalgamated with the more orthodox Greek tendencies. Peter added a navigation school, led by an English mathematician, Farquharson (1701; transferred to Petersburg as the naval academy, 1715). Both academies soon became centres of two sets of lower schools, clerical and lay, in the provinces. But they were few—about 40 of each for the whole of Russia—and they had to secure their pupils almost by force. A few hundred pupils only finished their studies there. Peter also ordered the publication of useful books—mostly translations—and he introduced the Russian lay alphabet that remained in use till the Soviet reform. But Peter's books proved too specialized for Russian readers and the language of the translations was nearly unreadable; a literary language had first to be created.

Peter's reforms did not leave untouched the sphere of religion. As the clergy was mostly opposed to his reforms, he deprived the Russian church of its spiritual head—the patriarch, a second monarch. Aided by an educated bishop, Theofan Prokopovich, Peter abolished the patriarchate and put in its place the holy synod (1721). The beheaded church was thus deprived, in the opinion of adversaries of that reform, like Stepan Yavorsky, of its legislative authority in questions of dogma.

From Peter I to Catherine II (1725-62).—Peter met with opposition in his own family; his son Alexius (Aleksey Petrovich) grew up under the influence of the clergy and obviously disapproved of Peter's reform. He fled abroad from Peter's menaces, was brought back by fraud and imprisoned on suspicion of a conspiracy against his father's life and died by torture (1718). There remained only two daughters, Anne and Elizabeth, from the second marriage of Peter with a Livonian prisoner, Martha Skavronskaya, renamed Catherine. In 1722 Peter reserved for the monarch the right to designate his successor. But at the moment of death on Jan. 28, 1725, he failed to do so. Peter's creatures, like Alexander Danilovich Menshikov (q.v.), who had everything to fear from the survivors of old nobility, resorted to the guards and with their help proclaimed Catherine. The legitimate heir, the son of Alexius, Peter, was thus put aside. The Russian throne became "not hereditary and not elective, but *occupative*." The period from Peter's death to Catherine II's accession (1725-62) was an eclipse. Male members of the Romanov dynasty (that is to say, Peter's grandsons Peter II and Peter III, the sons of his son Alexius and of his daughter Anne of Holstein, respectively) were frail and feeble of mind. The women—both Peter's niece Anne (Ivan V's daughter) and his daughter Elizabeth—were stronger in mind and body. But they shared their power with favourites, and their choices were not always happy. Court life flourished under these women's reigns and it became very luxurious and expensive. A special school was founded by Anne (the corps of nobles) to teach the noble guards foreign languages, dances and good manners. Balls, theatrical plays, musical entertainments—chiefly by foreign artists—became regular pastimes. The country was badly ruled; foreign policy was venal. Russia took part in European wars with little benefit for itself. From reign to reign the noble guards gained in influence, as they practically disposed of the throne. Catherine I (1725-27) was followed by the rightful heir Peter II (1727-30), thanks to a compromise between Menshikov and the representatives of the old nobility. His reign was fraught with struggle between the two. But Anne, the widowed duchess of Courland, possessed a bad title. The aristocrats offered her the throne on the condition of limiting her power by the supreme council (created under Catherine I) in questions of her marriage, succession, war and

peace, taxation, military appointments, etc. Anne signed, but profiting by the guards' dissensions tore up the signed charter and reigned as an autocrat (1730-40), aided by her favourite, Ernst Johann Biren (q.v.). She tried to secure the succession in the lineage of her sister, the deceased Catherine of Mecklenburg, by designating as successor under the regency of Biren the baby Ivan VI, just born to her niece, Anna Leopoldovna, duchess of Brunswick. Anna Leopoldovna herself succeeded Biren as regent, but after a few months the guards showed their hatred of the rule of the "Germans" by overthrowing her regency and enthroning Elizabeth, Peter the Great's daughter, who was expected to return to Peter's national policy (1741-62). Indeed, the first fruits of Peter's reforms ripened during Elizabeth's reign: national poetry, a theatre and the first Russian university (Moscow, 1755), all auguring a deeper culture and knowledge for the next generation.

Elizabeth wished to secure the throne for the lineage of her sister Anne of Holstein, and she invited her nephew Peter, educated in the Lutheran religion and in the ideas of Prussian drill, to come to St. Petersburg to learn Orthodoxy and Russian habits. He came and was married (1745) to princess Sophia of Anhalt-Zerbst, the future Catherine II. He was no mate for her. As fast as he lost Russian sympathy by his open aversion to everything Russian, Catherine ingratiated herself by exactly opposite behaviour. After half a year of the reign of Peter III, Catherine was raised by the guards officers to the throne. The brother of her favourite Count Gregory Orlov, Alexis, assassinated Peter as soon as he was banished to Ropsha by Catherine.

For a representation of the succession to the throne of Peter the Great see the genealogical table in the article ROMANOFF DYNASTY. Consult also the articles on the several emperors, empresses and regents just mentioned: ANNA LEOPOLDOVNA; ANNE; BIREN, ERNST JOHANN; CATHERINE I; ELIZABETH (PETROVNA); IVAN VI; PETER II; and PETER III.

Catherine II (1762-96).—The long reign of Catherine II was a turning point in Russian history. She received the fruit of half a century's evolution since Peter the Great's reforms. A prolific writer herself, in regular correspondence with the foremost men of her age, with Voltaire, Diderot, Jean le Rond d'Alembert, Friedrich, baron von Grimm, etc., not to speak of fellow potentates such as Frederick II, Maria Theresa and Joseph II, she wished to make her reign brilliant and herself an ideal enlightened monarch. She began her reforms by compiling from Montesquieu and Cesare Bonesana, marchese de Beccaria, an instruction (*ukaz*) on the basis of which a new code of laws was to be composed. In order to discuss it she gathered an elective assembly of 564 deputies chosen from all classes except the clergy and the serfs, and from all parts of the empire. However, she met with opposition on the part of the gentry to her schemes to fix within definite limits their power over the serfs. Far from engaging in a struggle with the ruling class she yielded to their desires, their power was increased and a number of crown estates were distributed among the ranks of her favourites, thus turning their peasant population into serfs.

Catherine then began to search for glory in foreign politics. She conceived a bold scheme: (1) to recover from Poland the western provinces with an Orthodox White Russian and Little Russian population and (2) to take possession of the Black sea shore, drive the Turks from Europe and found in their place a series of new states in Moldavia and Walachia, in the Balkans and in Greece. She wished to take Constantinople and to place there her second grandson, Constantine, as the emperor of a new Greek empire. His very name was chosen to symbolize this project. Catherine was favoured in accomplishing at least a part of these designs by discords between two German states, Prussia (under Frederick II and Frederick William II) and Austria (under Joseph II, Leopold II and Francis II). In her first Turkish war (1768-74) she had Prussia on her side and Austria against her; after P. A. Rumyantsev's victories she concluded a peace at Kuchuk Kainarji, the beginning of the Eastern Question (q.v.), as by it Russia received the right to protect Turkish Christians. Moreover, in 1772 she took part in the first partition of Poland, pro-

posed by Frederick II in order to consolidate his territory and to compensate Russia for its war expenditure. In the second Turkish war (1787-91) Catherine had Austria on her side and Prussia against her. She had to content herself, after the victories of Suvorov (Alexander Vasilievich, Count Suvorov Rymniksky) and Prince N. V. Repnin, with the acquisition of Ochakov and the steppe between the Dniester and the Bug. But she consoled herself with new annexations from Poland (the second partition, 1793, and the third partition, 1795; see POLAND), while Prussia and Austria were busy fighting against the French Revolution. Catherine also annexed Courland (1795). Her numerous lovers flattered her imperial ambitions, the bold Gregory Orlov in her early years (1762-74), the ingenious Prince Grigory Potemkin in the midst of her reign (1775-91) and the young Platon Zubov, handsome but insignificant, in her declining years (1791-96).

Between her two Turkish wars (1775-85) Catherine returned to the legislative mania of her early years. Made wise by her experience with the commission of the code of 1767, she turned from Montesquieu to Blackstone and profited by the administrative knowledge of J. Sievers, a skilful adviser of German Baltic origin. She then published in 1775 her statute of provinces, a good piece of organic legislation. Here for the first time in Russian history a local unit of administration, judiciary and self-government was created. The statute introduced a regular system of courts of justice, separate financial and administrative offices and—last but not least—corporations of local gentry meeting every three years to discuss their affairs and to elect their marshals. This system lasted until the reforms of Alexander II. The reform of 1775 was completed by two charters granted in 1785 to nobility and to burghesses. The charter of nobility served to perpetuate the power of the ruling class until the liberation of the serfs in 1861, while the burghesses' charter laid the basis for real municipal self-government.

The protection extended to the gentry inevitably created a growing disaffection on the part of the serfs, who impatiently awaited their turn for emancipation. In 1773 the Yaik (Ural) Cossacks revolted under E. I. Pugachev, who called himself Peter III. He roused the Bashkirs and the serfs allotted to the factories in the Urals, assailed Kazan on the Volga and sacked it. Through the whole empire the peasants only awaited his coming to rise, but he did not feel equal to the task, nor could his bands stand against regular troops. He therefore suddenly returned to Cossack country, where he lost his army; he was extradited by his associates, tried and beheaded in Moscow.

Catherine definitely turned her back on the liberal ideas of her youth after the beginning of the French Revolution. She began to persecute representatives of the advanced opinion which she herself had helped to create. A. N. Radishchev, the author of a spirited book, *A Journey from Petersburg to Moscow*, was sentenced to death as a Jacobin in 1790, but the sentence was commuted to ten years' exile in Siberia. N. I. Novikov, a freemason who accomplished admirable educational and editorial work, was sent to Schlüsselburg prison in 1792.

Paul I (1796-1801).—Catherine's son and successor, Paul, mounted the throne when he was 42, barely sane and with a bitter feeling of having been deprived by his mother of his right to succeed his assassinated father Peter III. He hated Catherine's favourites and her policy, both internal and external. He stabilized the succession of the Russian throne by his imperial family statute (1797; in force until 1917). He sent Suvorov to Italy to fight against the French Revolution, and he ended his reign while preparing with Napoleon an expedition to India against England. In social questions Paul's policy was also inconsistent: he alleviated the serf's obligatory work for his landlord by reducing it to three days in a week, but he gave away the peasants of the crown to noble proprietors as serfs in an even larger number than Catherine (120,000 yearly). This did not make him, however, popular among the nobility, as his exalted idea of the divine right of the tsars caused him to treat them in a purely oriental way. He used to say that a person could be reputed of importance only as long as he was permitted to converse with his majesty. His ill-balanced mind and tyrannical proclivities inspired fear in his asso-

ciates, and in the sixth year of his reign he was assassinated by court conspirators.

Alexander I (1801-25).—Paul's son and successor began his reign, as had Catherine (whom he professed to imitate), with attempts at liberal legislation (1801-05), which gave place to active foreign policy and wars (1806-09). There followed a new attempt at a constitutional reform (1809), hampered by the nationalist opposition, which urged and approved the annexation of Finland (1809) and of Bessarabia (1812). The invasion of Napoleon (1812) brought the national feeling to extreme tension. The following years (1813-18) were devoted to the assertion of Russia's influence in Europe. The last years of the reign (1819-25) were marked by a reactionary policy, which provoked the first revolutionary movement in Russia.

Alexander received a careful education at the hand of his grandmother, who wished him to inherit the throne instead of Paul, his father. The Swiss republican F. C. de la Harpe had a strong influence on him in his early years (1784-95). But this education was interrupted by Alexander's marriage (at 16) and did not go beyond imparting to him some general ideas unstained by exact knowledge. His sentimental feelings were cooled by the court intrigues, by the hidden enmity between his grandmother and father and finally by the harsh system of Paul's reign, which Alexander was expected to approve and obliged to share in. The consequence was that he grew up a past master in dissimulation and self-restraint. His evasiveness in face of other people's strong opinions was often taken for weakness. But he knew how to promote his own views and if impeded in his designs he was capable of violent explosions of wrath.

Initial Liberalism.—In the first year of his reign Alexander surrounded himself with a few friends of his youth—N. N. Novosiltsev, P. A. Stroganov, Prince Adam Czartoryski, Prince V. P. Kochubei—a "private committee" whom he wished to help him in drafting large schemes of reforms. He at once cancelled a series of reactionary measures of Paul and declared his desire to abolish arbitrariness and to inaugurate a reign of law. Public opinion received him with enthusiasm. But the private committee, which met regularly for about a year, found dangerous and untimely both a formal declaration limiting the autocrat's power and the abolition of serfdom. The most important fruit of these good intentions was the introduction of ministries instead of the colleges of Peter the Great, which had been practically abolished by Catherine. A new senate statute was intended to make this institution the highest legal authority (1802). A very cautious ukase of 1803 permitted noble landowners to liberate their serfs, granting them at the same time lots of land. Only 47,000 serfs were thus liberated and became "free agriculturists." Somewhat larger measures limited the power of landowners over the serfs in Livonia and Estonia (1804-05). A new and important impulse was given to public education, which was considered to be a preliminary condition to all substantial reforms. Three new universities were created.

Since 1801 Alexander had feared the consequences of Napoleon's ambition, and he took upon himself, although it had no relation to Russian national interest, to organize a new coalition against France. In 1805 and 1806 he was involved in wars which ended in crushing defeats at Austerlitz and Friedland. He then changed his policy and concluded an accord with Napoleon directed against England, whose commerce with the continent had to be forbidden in all countries which adhered to this continental system. At his personal meeting with Napoleon at Tilsit (1807) Alexander played a part which made Napoleon call him a "northern Talma" (a renowned actor) and a "Byzantine Greek." But he was in part genuinely under Napoleon's influence and was entangled into new wars: with Sweden, which finished with the annexation of Finland (1809), and with Turkey, which lasted for six full years (1806-12) and ended with the annexation of Bessarabia. A year later (1808) Alexander again met Napoleon at Erfurt, but Napoleon's intention to raise the Polish question did not please Alexander, while Napoleon was offended by the refusal of the tsar to give him his sister in marriage. Relations were very strained by the end of 1810.

Conservative opinion was very much incensed against Alexander's alliance with the "Corsican usurper," especially as at that very time another and more serious attempt was made to introduce in Russia a constitutional government. Mikhail Mikhailovich Speransky, a prominent statesman, whose views were favoured by the emperor at that time, prepared a scheme based on the introduction of self-government in four stages, beginning with electoral assemblies (dumas) in the cantons and ending at the top with the дума of the state. Each lower дума elected deputies to the upper one: cantonal dumas to district dumas, district dumas to provincial ones; these latter sent all their members to the state дума, a legislative assembly, deprived of legislative initiative but enjoying the right to make motions concerning the interest of the state, the responsibility of functionaries and the violation of fundamental laws. The senate retained only judicial power, while the newly reformed ministries remained organs of the executive. The council of state, composed of high dignitaries and presided over by the tsar, was to prepare drafts of laws. In fact nothing except the council of state and the reformed ministries was realized (1810). Conservative opinion, as represented by nobility and bureaucracy, was furious with Speransky, and the tsar did not choose to defend him. On a futile pretext Speransky was dismissed from his office of imperial secretary and sent to exile (1812). His successor was an extreme nationalist and conservative, Adm. A. S. Shishkov.

Nationalism and Reaction.—When the war of 1812 began, the nationalist feeling reached its pitch. It was to be a Scythian war—a war of retreat. Time and space were to be the chief allies of Russia, whose military forces were one-half or one-third the size of Napoleon's. And, indeed, the deeper Napoleon penetrated into Russia's endless plain the more equal the chances became. Alexander named another conservative, M. Kutusov, commander in chief in the place of M. Barclay de Tolly (Aug. 29), and a third conservative, Count Feodor Vasilievich Rostopchin, general governor of Moscow, which was the final aim of Napoleon's strategy. After the bloody but undecided battle at Borodino (Sept. 7) Moscow surrendered to Napoleon. For five weeks of his stay in Moscow he waited in vain for a peace proposal. Moscow was burned by the inhabitants. His army was in process of dissolution, and winter was approaching. Then followed the famous retreat, during which the Grand army was nearly annihilated, and the wars of liberation of 1813 and 1814, which brought Alexander and his army to the walls of Paris. At the Congress of Vienna (1815) he figured as a saviour of Europe, and he continued to play a leading part at Aix-la-Chapelle (1818), Troppau and Laibach (1820) and Verona (1822). All these events produced an enormous impression on the sensitive temperament of Alexander. "The fire of Moscow," he said later to the German pastor R. F. Eylert, "lit up my soul, I then got to know God and became another man." Alexander now found in the Bible the proofs of his mission and proposed to his allies to establish a Holy alliance, a monarchs' league based on the precepts of the Scriptures. His intention was liberal, but Metternich made use of the idea for his policy of repressing all liberal movements in Europe.

The Revolutionary Movement.—Quite different were the impressions which the younger generation of officers who took part in the Napoleonic wars brought with them back to Russia. Many of them while abroad read political newspapers and were present at the debates of representative assemblies. They learned to quote the books of J. L. Delolme, Count Destutt de Tracy, Benjamin Constant, Gaetano Filangieri, Baron Bignon, etc. After their return to Russia they were shocked by the contrast of arbitrary rule, the abuses of bureaucracy, the venality and secrecy of the courts, the sufferings of the serfs and the indifference to popular education. Two secret political societies were formed by the most active of these officers in 1816-18: one by Pavel Ivanovich Pestel in the southern army and the second by a group of guard officers in Petersburg headed by N. M. Muraviev and Nikolay Ivanovich Turgenev. The former society—more radical—imitated the organization of the Carbonari; the latter borrowed its principles from the Tugendbund. Later on Pestel drafted a repub-

lican and strongly centralized constitution, while Muraviev composed a monarchical and federal constitution on the basis of those of Spain of 1812 and of the United States. Pestel's tactics were revolutionary, while the Petersburg group intended to help the government openly in questions of education, philanthropy, economics and improvement of justice, thus preparing Russia for a constitutional regime. They expected Alexander to sympathize with them, as in 1815 he gave a constitution to Poland and mentioned at the opening of the *sejm* that he was preparing one for Russia. He also acknowledged the old institutions of Finland. However, Alexander soon ceased to distinguish between "the holy principles of liberal institutions" and "destructive teaching which threatens a calamitous attack on the social order" (his expressions in the speech mentioned). He entirely agreed with Metternich (in 1820) that the liberal principles themselves were destructive. A period of reaction began in Russia. The transition to it was marked by an attempt to impart to Russia Alexander's religious enlightenment. The ministry of public education was united, for that purpose, with a new ministry of spiritual affairs, where all professions including the Russian Orthodox were treated equally (1817). Prince A. N. Golitsyn, the procurator of the holy synod and the president of the Russian branch of the Bible society founded in 1812, was made the chief of the united ministries. The consequence was that in 1819-21 the young universities recently opened were entirely destroyed—especially by the curators of Kazan and Petersburg circuits, M. L. Magnitsky and D. P. Runich. They removed the best professors and prohibited good textbooks on natural law, morals and logic, on the ground that the teaching must be based exclusively on Holy Scripture. For Russian church dignitaries even their mystical pietism was heresy: Golitsyn was forced to leave his office, after he had been anathematized by the archimandrite Photius, a fanatic protected by Alexander's favourite Aleksyey Andreyevich Arakcheyev. During the last part of the reign Arakcheyev, an ignorant and brutal man, enjoyed the power of prime minister.

Under these conditions secret societies changed their character. The measures of Alexander convinced them that monarchs' promises are not to be relied upon. They were also impressed by military pronunciamentos in Spain and Naples (1820). Nikolay Turgenyev recorded in his diary in 1820: "We formerly asked, every time we met the readers of newspapers in the club, whether there was a new constitution. Now we ask whether there is a new revolution." One may judge of the impression produced on the officers of the guard when they learned that they had to stifle the Neapolitan uprising, by orders of the Laibach congress.

The former secret society of welfare, imitating the Tugendbund, was officially closed in 1821, as being too moderate. Two societies appeared instead: the northern and the southern constitutionalists and republicans. The constitutionalists were losing ground; radical elements even among them (like the poet K. F. Ryleyev) began to prevail. Proposals of regicide were heard from P. G. Kakhovsky and A. I. Yakubovich but were rejected or indefinitely postponed. In any case, revolutionary tactics were considered inevitable, but no definite scheme was in preparation. Suggestions were made for forcing the tsar, at some favourable opportunity, to nominate a liberal ministry under Speransky and N. S. Mordvinov, who would convoke a great council (later, Russian revolutionaries called it a constituent assembly) which should decide on the form of the government.

A favourable occasion presented itself quite unexpectedly. Alexander died in Taganrog on Nov. 19 (Dec. 1), 1825. The order of succession happened to be undecided. Constantine, the elder of Alexander's surviving brothers, had renounced the throne in 1823, but Nicholas, the younger, did not wish to acknowledge this and swore allegiance to his brother. Constantine would not accept the throne. Nicholas threatened to leave Russia. The correspondence between Warsaw and Petersburg was thus protracted for about two weeks. The Decembrists, as they were called later, decided finally to raise the guard regiments for Constantine against Nicholas and to force Nicholas—in case he survived that day—to appoint a liberal ministry which would do the rest. The rising was a failure (see NICHOLAS I). The last of Russian palace

revolutions was spoiled by too much idealism, but it served as an ominous prognostication of the coming democratic revolutionary movement.

Nicholas I (1825-55).—Nicholas was quite unlike Alexander. With a rough nature of limited understanding, he was conscious of his inferiority and sincerely disliked the idea of becoming tsar. But once tsar, he was sure that he would be enlightened from above for the accomplishment of his divine mission, and he conceived an exalted idea of his personal dignity and infallibility. But he was no mystic. Cold and reserved, he inspired fear and hatred and he consciously made use of these feelings as the instrument of his power. His aim was to freeze every germ of free thought and independent moral feeling, as disturbing agents of the order of things entrusted by God to his personal care.

Nicholas' reign is divided into three parts by two European sets of revolutions: those of 1830 and those of 1848. During the first five years (1825-30) he did not feel quite sure of himself and he appealed for help to advisers of Alexander's liberal period such as Kochubev, Speransky and E. F. Kankrin (Count Georg Cancrin). He even instructed a special committee of Dec. 6 (18), 1826, to collect for him all useful hints about necessary reforms. While punishing severely the Decembrists (five of them were banded, others sent to Siberia), he wished to make use of all their good ideas. But he reserved for himself the control over public opinion and confided to Count A. K. Benckendorff the organization of a new secret police of gendarmes controlled by the "third section" of his personal chancery. He adopted Alexander's policy of protecting the kings from their peoples, but he made an exception for Christian Turkish subjects (in the first place the Greeks). He thus carried on a war against Turkey (1827-29). By the treaty of Adrianople Greece was liberated; the hospodars of the Danubian principalities were to be appointed for life and free from Turkish interference in internal affairs. The straits and the Black sea were to be open.

Nicholas especially attended to education; he wished to clear it of everything politically dangerous and confine it to the upper class. He abolished the liberal university statutes of Alexander (1804); by the new statutes of 1835 he detached the primary education intended for the lower classes from the gymnasiums and universities, where only children of gentry and of officials were to be admitted.

The expulsion of Charles X from France and the Polish insurrection of 1830-31 determined the legitimist tendency of Nicholas' foreign policy; he wished to become a real "policeman" of Europe, and at Münchengrätz he renewed relations with Metternich. But his excessive interest in the "sick man" in Constantinople finished by rousing Europe against him. In 1833 Nicholas saved the sultan from the Egyptian rebel Mohammed Ali, and by the treaty of Unkar-Skelessi received for that service free passage for Russian ships to the Mediterranean, while to all other powers the Dardanelles were to be closed during wartime. This concession drew the attention of the European powers, and in 1841 all the five great powers agreed that the Dardanelles should be closed to warships of all nations.

Slavophiles and Westernisers.—In sharp contrast with Nicholas' educational policy, a new generation grew up which was bred by Russian universities, especially Moscow university, between 1830 and 1848. They were not politicians or liberals of a Franco-English type. They were idealists and students of the philosophy of F. W. J. von Schelling, J. G. Fichte and G. W. F. Hegel. In Moscow literary salons they did not discuss the form of the government, but dug deep into the very foundations of Russian history and the Russian national mind. Most of them declared that Russia was unlike Europe and its type of civilization potentially far higher than the European one. They thought to discover Russia's peculiarity in its old peasants' commune (*mir*), which, they said, revealed the socialistic soul of Russia as unlike the individualist western soul. They execrated Peter the Great's Europeanization of Russia as a fatal deviation from the genuine course of Russian history, and they wanted Russia to come back to the forsaken principles of the Eastern Church and state—to orthodoxy and autocracy. The majority of public opinion, led by A. I. Her-

zen, V. G. Belinsky, Mikhail Bakunin, T. N. Granovsky and others, revolted against this Slavophil doctrine. They opposed to it their own doctrine of the western origin of Russian civilization. Herzen and Bakunin emigrated from Russia on the approach of the revolutions of 1848. They became the originators of Russian socialism, which however did not frighten Nicholas so much as Russian liberalism—an applied doctrine whose dangers he had experienced at the hands of the Decembrists.

Nicholas was not insensible to the chief social question in Russia—that of serfdom. How could he be when peasants' uprisings were steadily growing in frequency? They numbered about 41 in the first four years of his reign, and there were 378 between 1830 and 1849 and 137 during the last five years. Nicholas formed a series of secret committees which, after many failures, prepared the law of 1842 on voluntary accords, which abolished personal serfdom and fixed the amount of peasant lots and payments. Through P. D. Kiselev's energy, the same changes were obligatorily introduced in Poland (1846) and in some western provinces (1847). A real persecution of intellectuals began after the revolutions of 1848. A secret committee, presided over by D. P. Buturlin, was founded to punish press offenses. S. S. Uvarov himself was found too liberal and resigned. His successor, Prince P. A. Shirinsky-Shikhmatov, wished to "base all teaching on religious truth." The university chairs of history and philosophy were closed, the number of students limited; many writers were arrested, exiled or otherwise punished. The private circle of followers of M. V. Butashevich-Petrashkevsky, a young socialist, was sent to forced labour in Siberia (including Theodore Dostoevsky) for having read and discussed prohibited literature.

The Crimean War.—Nicholas also wished to dictate his will to Europe. "Submit yourselves, ye peoples, for God is with us": thus ended his manifesto published on March 27, 1848. He sent a Russian army to subdue Hungary when it had revolted against the Habsburgs. A few years later he inadvertently provoked a conflict with Turkey, because of a special question on the distribution of holy places in Jerusalem between Catholic and Orthodox priests, which he involved with the question of the general protectorate of Russia over Christian subjects of the sultan. European powers would not admit this protectorate, and Nicholas found against himself not only Napoleon III and England but also "thankless Austria." Turkish forces attacked the advanced Russian troops in the Danubian principalities on Nov. 4, 1853; France and England declared war on Russia on March 28, 1854. The courage displayed in the defense of Sevastopol proved useless, as the whole fabric of Russian bureaucratic and autocratic government appeared incapable of competing with European technique. Corruption and lack of communication, feeble development of industry and financial deficiency deprived the valiant soldiers of the most necessary means of defense. (See CRIMEAN WAR; TURKEY: History.) Nicholas died on March 2, 1855, feeling that all his system was doomed to destruction. A wholesale change of regime was indicated to his son and successor, Alexander II.

Alexander II (1855-81).—Alexander, a man of weak character but good-natured, possessed no steadfast views on politics. During the reign of his father he had sometimes surpassed Nicholas in reactionary intentions. But the Crimean War proved too clearly the danger of Nicholas' martinet system, and public opinion was too impetuous for Alexander to resist. He swam with the current, and this period coincides with the great reforms which made his reign a turning point in Russian history. But Alexander was always conscious of his power as unlimited monarch, and his liberalism ended as soon as his reforms brought with them a revival of political or autonomous tendencies. He then began to waver; the reforms were left unachieved or curtailed. Public opinion grew impatient, extremist tendencies won the ground, and the gap between the government and advanced opinion finally became insuperable. As a consequence, the original impulse for reform was exhausted as early as 1865. There followed a period of faltering which turned into a sheer reaction as the revolutionary movement grew.

Emancipation of the Serfs.—The greatest achievement of the era was the liberation of peasants. It paved the way for all other

reforms and made them necessary. It also determined the line of future development of Russia. The chief motive which decided Alexander is clearly expressed in his words to the Moscow gentry: "The present position cannot last, and it is better to abolish serfdom from above than to wait till it begins to be abolished from below." However, Alexander met with passive opposition from the majority of the gentry; their very existence as a class was menaced. The preparatory discussion lasted from 1857 to March 1859 when the drafting commissions of the main committee were formed, composed of young officials—such as N. A. Milyutin and Y. A. Soloviev and their Slavophil friends Y. F. Samarin and Prince V. A. Cherkasski—enthusiastically devoted to the work of liberation. Y. I. Rostovtsev, an honest but unskilled negotiator enjoying the full confidence of the emperor, was mediator. The program of emancipation was very moderate at the beginning, but was gradually extended under the influence of the radical press and especially Herzen's *Bell*. But Alexander wished that the initiative should belong to the gentry and exerted his personal influence to persuade reluctant landowners to open committees in all the provinces, while promising to admit their delegates to discussion of the draft law in Petersburg. No fewer than 46 provincial committees containing 1,366 representatives of noble proprietors were at work during 18 months preparing their own drafts for emancipation. But they held to the initial program, which was in contradiction with the more developed one. The delegates from the provincial committees were only permitted—each separately—to offer their opinions before the drafting committees. Unfortunately, Rostovtsev died in Feb. 1860. Alexander, who already feared that he had gone too far in his concessions, appointed as his successor Count V. N. Panin, a reactionary. Under his influence the proposed allotments of land to peasants were diminished and the rents were increased. However, it was impossible to change the main lines of the draft. By the law of Feb. 19 (March 3), 1861, the peasant became personally free at once, without any payment, and his landlord was obliged to grant him his plot for a fixed rent with the possibility of redeeming it at a price to be mutually agreed upon. If the peasant desired to redeem his plot, the government paid at once to the landowner the whole price (in 5% bonds), which the peasant had to repay to the exchequer in 49 years. Although the government bonds fell to 77% and purchase was made voluntary, the great majority of landowners—often in debt—preferred to get the money at once and to end relations which had become insupportable. By 1880 only 15% of the peasants had not made use of the redemption scheme, and in 1881 it was declared obligatory. The landowners tried, but in vain, to keep their power in local administration. The liberated peasants were organized in village communities governed by elected elders.

Administrative Reform.—After the emancipation of the peasants, the complete reform of local government was necessary. It was accomplished by the law of Jan. 1 (13), 1864, which introduced the district and provincial *zemstva* (county councils). Land proprietors had a relative majority in these assemblies. They were given (in all Russia) 6,204 seats (48%) while the peasants were entitled to choose only 5,171 delegates and the town inhabitants 1,649 (12%). The competence of *zemstva* included roads, hospitals, food, education, medical and veterinary service and public welfare in general. Before the end of the century services in provinces with *zemstvo* government were far ahead of those in provinces without.

A third capital reform touched the law courts. The law of Nov. 20 (Dec. 2), 1864, put an end to secret procedure, venality, dependence on the government, etc. Russia received an independent court and trial by jury. The judges were irremovable; trials were held in public with oral procedure and trained advocates. Appeals to the senate could take place only in case of irregularities in procedure.

A little later came the reforms of municipal self-government (1870) and of the army (1874). Gen. D. A. Milyutin (the brother of N. A. Milyutin) reduced the years of active service from 25 to 16 and made military service obligatory for all classes. The only exemptions admitted were for reasons of education. Military

courts and military schools were humanized.

The Revolutionary Movements—The only branch of public life exempted from reform was the press. The press profited indeed by the new spirit of Alexander's reign. While in the last ten years of Nicholas' reign only 6 newspapers and 19 (mostly specialist) monthlies were permitted, during the first ten years of Alexander's there were 66 newspapers and 156 monthlies. The general tendency of the press, very moderate at the beginning, soon became very radical. The leading spirits were the nihilists N. G. Chernyshevsky, N. A. Dobrolyubov and D. I. Pisarev, the last of whom preached extreme individualism. As early as 1862 temporary measures were applied against radical periodicals. Instead of a law on the liberty of the press there appeared in 1865 new temporary rules (which remained in force for fully 40 years) compiled from Napoleon III's law of 1852. They set free from "previous censure" books of more than ten sheets, but the censors continued to seize printed books before their issue.

A new wave of revolutionary movement set in. It proceeded from the young generation of university students, who expected an agrarian revolution directly after the liberation of peasants. They were busy preparing for it workingmen, soldiers and peasants through popular education. Secret circles were formed, proclamations issued and even a revolutionary movement was attempted in connection with the Polish uprising of 1863. Finally, an attempt was made by a student, D. Karakozov, to assassinate the tsar in April 1866. All these attempts were extremely naïve; a few young revolutionaries were executed or sent to Siberia and the whole movement was stifled in its primary stage. But Alexander was frightened. Gradually he dismissed his liberal advisers, and conservatives took their place. The home office was given (1861) to P. A. Valuyev, who tried to paralyze the introduction of the emancipation law and formally prosecuted its faithful adherents. University troubles brought about the removal of the liberal minister of public instruction, A. V. Golovnin, the author of a model university statute of 1863. His successor was a reactionary, Count Dmitry Andreyevich Tolstoy, who found the means of salvation in the classics. The old chief of gendarmes, Prince V. A. Dolgorukov, had to give place after Karakozov's attack, to Count Peter Shvalov, who became the soul of reaction. The government-general of St. Petersburg was abolished and the martinet Gen. F. F. Trepov made grand master of the police. D. N. Zamyatin, minister of justice, under whom the reform of tribunals was carried through, fell a victim to his defense of this reform against an imperial whim; he had to yield to an ignorant reactionary, Count K. I. Pahlen (1867), who nearly annihilated the reform. The same was done for the press by A. Timashev who superseded Valuyev as home minister in 1868. Two radical monthlies, the *Contemporary* and the *Russian Word*, were closed (1866). M. N. Katkov, a former European liberal who now inclined to extreme nationalism and reaction, became the most influential journalist.

All this contributed to uphold and to increase the disaffection of educated public opinion. About 1869 a new young generation appeared which gave expression to that state of mind. Russian emigrants in Switzerland discussed at that time a new revolutionary doctrine later called populism (*narodnichestvo*). P. L. Lavrov was giving it a scientific basis, but Mikhail Bakunin found this too learned and plainly invited the youth to give up the study and go straight to the people with the aim of inducing disorder. He found this easy, since Russian peasants with their communes were born socialists. The youth of Russia, chiefly the young girls who went to study abroad as there were no female institutes of learning in Russia, listened to these discussions in Zürich and, of course, mostly preferred Bakunin's active optimism to Lavrov's learning. In 1873 they were all ordered back to Russia by the government, and they met, when at home, with many student circles which were busy distributing books and revolutionary pamphlets among their provincial branches and workmen. N. V. Tschakovsky, Prince P. A. Kropotkin and Sergius Stepniak (S. M. Kravchinsky) were among the leaders of that educational and (later on) revolutionary work. They decided, in the spring of 1874, to go to the people—a naïve crusade by inexperienced youth, hardly out of their teens—in order both to teach the people and to learn from

them their socialistic wisdom. Of course they were not acknowledged by the people, in spite of their peasant attire, and were easily ferreted out by the police; 770 were arrested and 215 sent to prison. They then decided to change their tactics. A regular secret society was founded in 1876 under the name of Land and Liberty (or "Will"). They still hoped to provoke a mass uprising according to the ideals of the people, but their village settlements proved useless for revolution while in the towns they soon got engaged in a lively conflict with the police. As a result the terrorist side of their activity came to the forefront. In the autumn of 1879 the terrorist group formed a separate party, the People's Will, while the remaining members led by G. V. Plekhanov—under the name of Black Partition (*i.e.*, agrarian revolution)—remained inactive. A series of terrorist acts then followed, beginning with that of Vera Ivanovna Zasulich, who fired on Trepov for his having flogged a prisoner and was acquitted by the jury (1878). In 1879 A. Solovvey fired five shots at the tsar. On Feb. 17, 1880, a workman, S. N. Khalturin, blew up the imperial dining room at the Winter palace. The police seemed powerless against the famous executive committee which directed the blows, and the government asked the loyal elements of public opinion for support. The answer was given, in the name of the Chernigov *zemstvo*, by Ivan Petrunkevich: he said that no co-operation was possible with the revolutionaries as long as public opinion was stifled. The Tver *zemstvo*, led by F. I. Rodichev, asked the tsar to "give us what he gave to Bulgaria" (*i.e.*, constitution and political freedom). After the Winter palace explosion a supreme commission was appointed under the chairmanship of M. T. Loris-Melikov, who was given a sort of dictatorial power. Loris-Melikov's design was to isolate revolutionary elements by concessions to the liberals and, after exterminating the revolutionaries, to summon a sort of consultative assembly, thus renewing certain projects of aristocratic landowners in 1861-62. He submitted to the tsar, on Feb. 9, 1881, a proposal to appoint two drafting committees for administrative and financial reforms and to submit their drafts to a general commission, where experts chosen by the *zemstvos* and municipalities should also be heard (two from each of them). The respective laws would be issued in the ordinary way by the council of state, but 15 delegates should be admitted to its session. It did not at all look like a constitution, but it might have served as an introduction to it. Fate decided otherwise: on the very day when Alexander signed Loris-Melikov's project, on March 1 (13), 1881, he was assassinated by revolutionaries, led by Sophia Lvovna Perovskaya, on his way back home.

Foreign Policy.—Alexander II was more successful in his foreign policy. He ascended the throne at a moment of great exhaustion and humiliation for Russia. The Paris treaty (1856) substituted European control for a Russian protectorate over Turkish Christians; the Russian fleet in the Black sea ceased to exist; the portion of Bessarabia nearest to the Black sea was given to the Danubian principalities. However, Russia did not permit Napoleon III to make an international question of the Polish uprising of 1863; Alexander then approached his relative William of Prussia and helped him against France in the foundation of the German empire. Russia made use of the Franco-German War to repudiate the provisions of the Paris treaty forbidding Russia to construct naval arsenals and to keep a fleet in the Black sea (1870). In 1872 the German, Austrian and Russian emperors met at Berlin and concluded the Three Emperors' league (without any formal treaty being signed; see EUROPE). However, Russia did not wish to strengthen Germany too much at the expense of France. In 1875 thanks to Russia's insistence a Franco-German conflict was averted, to the great dissatisfaction of Bismarck, who threatened the Russian foreign minister, Prince A. M. Gorchakov, with revenge. In the same year the Eastern Question was reopened by a rising of Christian Slavs in Bosnia and Herzegovina (see EUROPE and TURKEY). In 1876 (summer) began the Bulgarian uprising. Russia proposed co-operative action to the powers, but, meeting with hidden aid to Turkey from Disraeli, Alexander decided to act alone. When Serbia and Montenegro declared war on Turkey he met Francis Joseph at Reichstadt and on July 8, 1876, con-

cluded an agreement in which all possibilities of defeat, victory or the collapse of Turkey were anticipated. Austria was to receive Bosnia and Herzegovina for occupation and administration; Russia was permitted to take back the lost portion of Bessarabia. A last attempt to formulate a European program of pacification of the Balkans was made by the powers at the Constantinople conference (Dec. 1876). After its failure Count Nicholas Pavlovich Ignatiev visited the European capitals to discuss the possibility of war. Austria and England put as conditions of their neutrality, no attack on Constantinople; no Russian territorial acquisitions; no thrusting Serbia into war; Bulgaria, in case of its liberation, not to be under direct Russian control. Thus, Russia was in advance, deprived of possible gains in case of victory; as a matter of fact, Disraeli looked for its defeat. Nevertheless, Alexander went to war (see RUSSO-TURKISH WARS). Close to the walls of Constantinople the Russian army was stopped by the British fleet, and the treaty of San Stefano (March 3, 1878), favourable to the Bulgarians, was enunciated at the Congress of Berlin (q.v.). Russian public opinion, ignorant of the agreements concluded before the war, was much incensed against Bismarck, "the honest broker." Russia received the lost part of Bessarabia and Kars, Ardahan and Batum in Transcaucasia. Far more important were the acquisitions of Alexander in central Asia. From 1864 his generals were active against Kirghiz and Turkoman tribesmen who raided the unprotected frontier of Siberia. Russian soldiers marched up the Syr-darya, subjugated Bukhara and from there, through the desert of Khiva, reached the Caspian shore. In 1867 the territory between Issyk-Kul and the Aral sea was constituted into a province called Turkistan, and in 1874 another province under the title of Transcaspia was formed of territories between the Amu-darya and the Caspian sea. Russia reached the frontiers of Afghanistan and Chinese Turkistan, while in the far east by the treaty of Aigun (1858) it obtained from China territory running east from the rivers Amur and Ussuri to the Pacific seaboard, and the naval base of Vladivostok was founded. Japan ceded Sakhalin in 1875 in exchange for two Kurile islands. In 1867 Alaska was sold to the United States for \$7,200,000.

Industrial Progress.—Under Alexander II Russia made decisive steps toward industrialization. The length of railway increased from 644 mi. (1857) to 2,260 (1867) and to 11,070 (1876). Factory production grew from 352,000,000 (1863) to 909,000,000 roubles (1879); the number of workmen from 419,000 to 769,000; the export of grain from 52,800 bu. (1860-62) to 125,600 (1872-74). In 1850 and 1857 Russia (for the second time since 1819) tried the experiment of free trade, but as it brought with it an excess of imports—a thing unusual in Russia—M. K. Reutern, the minister of finance in 1862-78, returned to the protectionist system of Kankrin (1823-44). He also favoured the organization, for the first time in Russia, of private credit institutions. The 10 land banks which were in existence at the end of the 19th century were all founded in 1871-73; there were also 28 commercial banks (founded 1864-73), 222 municipal banks (1862-73) and 71 societies of mutual credit (1877).

Alexander III (1881-94).—Alexander III succeeded his father and was at first expected to continue his tradition. But the quasi-constitutional scheme of Loris-Melikov, discussed on March 8 in the Winter palace, met with the opposition of Constantine Petrovich Pobedonostsev, the former tutor of Alexander and his most trusted adviser. On April 29, 1881, appeared a manifesto written by Pobedonostsev without the ministers' knowledge, in which the tsar described himself as "chosen to defend" autocratic power. At the same time a promise was made to continue Alexander II's reforms. Loris-Melikov, with D. A. Milyutin, at once resigned and was replaced by N. P. Ignatiev, a friend of the Slavophiles, who promised to leave untouched the powers of the *zemstvos* and municipalities and to alleviate the burdens of the peasants. And indeed, in June and September 1881, Ignatiev summoned the experts selected by the government among liberal *zemstvo* men. With their help he drafted a scheme for lowering the redemption prices, abolishing the poll tax and regulating internal colonization and land rents. The new minister of finance, N. K. Bunge, assisted by opening a peasants' bank and also enacted

the first factory acts (1882) and appointed special factory inspectors to enforce their application. A special commission under M. S. Kakhanov (1881-84) prepared a reform of peasant self-government based on the principle of the equality of peasants with other social classes. In May 1882 Ignatiev proposed to Alexander to summon a *zemsky sobor* in Moscow of about 3,000 representatives from all classes, on the day of the coronation.

Here Katkov and Pobedonostsev won their victory. Ignatiev resigned; the reactionary Count Dmitri Tolstoy took his place as home minister. His tool I. D. Delyanov enacted in his former ministry a new reactionary statute for the universities (1884). He now became the mouthpiece of the nobility and gentry, a decaying class that tried to preserve as much as possible of their vanishing power and property. In 1885 a special Bank for the Nobility was opened with the aim of preserving the landed property of the gentry from final liquidation (for debt). Then Tolstoy proposed to A. D. Pazuukhin—a sworn defender of noble privileges—to revise the *zemstvo* institution with the avowed aim of making the nobles' influence paramount in the countryside. As a result two important laws were published, on July 12, 1889, on land captains and on June 12, 1890, on *zemstvo*. The composition of district assemblies was changed from the figures given above to 5,433 representatives of landed owners (57%), 1,273 municipal representatives (13%) and 2,817 representatives of village communities. However, the chief aim of the government was, rather than to favour the gentry, to incorporate both the land captains and the executive boards of the *zemstvos* in its civil service by making them subordinate to the provincial governors and destroying their representative character.

An outstanding feature of Alexander III's reign was an increased persecution of everything dissimilar to the officially accepted national type. Dissenting sects, the Uniates and the Lutherans in the western provinces, Lamaists Kalmucks and Burdats and especially Jews suffered a systematic persecution. The press was definitely muzzled, revolutionary organizations were destroyed and revolutionary movement was stifled. Public opinion was silent until the great famine of 1891; from that year symptoms of a revival appeared. The new movement was entirely different from the populism of the '60s and '70s. The Russian socialists became Marxists. Russia, they argued, was becoming an industrial country and the numbers of the industrial proletariat were speedily increasing. In fact, I. A. Vyshnegradsky, minister of finance since 1887, not only continued Reutern's policy in developing the railway (14,900 mi. at the beginning, 24,000 mi. at the end of Alexander's reign) and in protecting industry (prohibitive tariff, 1891), but tried to influence the foreign market and to stabilize the rate of exchange of the Russian rouble. He also resorted to foreign capital. In 1889-94 its influx was 5,300,000 roubles, as compared with 1,500,000 of 37 years before (1851-88). However, the position of the Russian consumer who had to pay about 34% ad valorem for imported goods, instead of 13% as before the tariff of 1891, was much worsened. The peasants especially suffered, as the price of grain, their only article for sale, fell from 1.19 roubles per *put* (1881) to 0.59 in 1894, while their allotments, which had been insufficient at the moment of liberation, further diminished (1861-1900) to 54.2%. As a result, their arrears of taxes increased more than five times compared with 1871-80. Vyshnegradsky tried to relieve the treasury by increasing enormously the customs and excise. In the decade 1883-92 taxation increased 29% while the population increased only 16%. Thus, elements of an agrarian crisis were increasing as the 19th century was nearing its end.

Alexander III's foreign policy was peaceful. He wished to be his own foreign minister; Gorchakov gave place to a submissive Germanophil, N. K. de Giers. Bismarck profited by this and, in spite of his alliance with Austria (1879) which was avowedly concluded against Russia, contrived to renew, as early as 1881, the Three Emperors' league of 1872. In 1884 it was renewed for three following years and in 1887, as Austria seceded, Bismarck concluded his famous "reinsurance" treaty with Russia. All these treaties fettered Russia in its Balkan policy but secured the country against the opening of the straits to England and even per-

mitted to it, by a secret protocol, the military occupation of the straits in case of necessity. As at the same time the Triple alliance with Italy was concluded (1882), Bismarck's policy proved too complicated for his successor, and in 1890 a Russian proposal to prolong the treaty for the next six years was rejected by Count Caprivi. Thus the way was opened to a Franco-Russian *rapprochement*, while Germany was courting England, Russia's competitor in Asia (where Alexander in 1885 took Merv, thus establishing Russia on the frontiers of Afghanistan). France opened to Russia its market for loans and its factories for armaments in 1889; a French squadron was enthusiastically received in Kronstadt in 1891; and the subsequent *rapprochement* culminated in a military convention worked out in Aug. 1892 and definitely ratified by the tsar in March 1894.

Alexander III died on Nov. 1, 1894, in Livadia, 50 years old. His robust constitution had been sapped by constant fear of the revolutionaries, which made him live at Gatchina like a prisoner, surrounded by a cordon of police agents.

Nicholas II, to 1917.—There can hardly be imagined a more tragic contrast than that of the extremely complicated situation inherited by Nicholas II and the complete nullity of the man who had to solve the problem. Like his father, Nicholas was not prepared to reign; like Alexander III, he would have preferred to live as a private man in his family circle, and he hated his exalted position which clashed with his modesty and bashfulness. However, like Alexander III, he felt it a duty to bear the burden of autocratic power and, moreover, to preserve autocracy untouched for his successor. He had to wait long for this heir, as his marriage (1894) with Princess Alix of Hesse, known as the empress Alexandra Fedorovna, brought him first four daughters, and when finally a son (Alexius) was born (1904), the parents had constantly to tremble for his life, as he inherited through his mother the dangerous disease of haemophilia. In their wish to save him at any cost they put their confidence in every kind of quack, beginning with M. Philippe, the spiritist from Lyons, and ending with the famous Gregory Rasputin. Her relations with them finally brought the nervous Alexandra to a state of religious exaltation and mystic faith in her predestined mission to save the tsar and her son from evil by obeying the precepts of God's elect.

The initial hopes of the liberals that the "leaden coffin lid" of Alexander III's reign would be raised by the new tsar were soon dispelled. When messages of congratulation on his marriage were brought to the tsar by innumerable deputations at a reception (Jan. 17 [29], 1895) the delegates asked the tsar "that the voice of the people should be heard" and "that the law should henceforth be respected and obeyed not only by the nation but also by the ruling authorities." The tsar, instructed by Pobedonostsev, answered: "I am aware that in certain *semstvo* meeting voices have been lately raised by persons carried away by senseless dreams of the participation of *semstvo* representatives in internal government. Let all know that I intend to defend the principle of autocracy as unswervingly as did my father." The liberals answered next day in an open letter: "Senseless dreams' concerning yourself are no longer possible. If autocracy proclaims itself identical with the omnipotence of bureaucracy, its cause is lost. . . . It digs its own grave. . . . You first began the struggle, and the struggle will come."

The struggle had come. In June 1896 St. Petersburg saw the first strike of 30,000 workmen. The evolutionary wing of the Marxist socialists triumphed; here at last the masses had come forward with purely economic demands. In 1898 the Russian Social Democratic Labour party was formed. However, the old leaders did not approve of this peaceful and legal economism of the young generation. In their "orthodox" organ *Iskra* (Spark), published abroad, they defended the political and revolutionary side of Marxism. In 1903, at a conference in London, their tendency, represented by V. I. U. (Nicolai) Lenin, obtained the majority and bolshevism (*Bolshevik*=majoritarian) was created. On the other hand, the People's Will party was revived under the name of Social Revolutionaries with a new program in 1898. They remained true to their two leading ideas, agrarian revolution and terrorism. Agrarian riots began two years later in southern Rus-

sia. In 1899 began also student disorders which were answered by the minister of public instruction, N. P. Bogolepov, by the menace of military service for delinquents. On Feb. 27, 1901, Bogolepov was killed by the student P. V. Karpovich. On April 15, 1902, the home minister, D. S. Sipyagin, was killed by S. V. Balmashev. Pobedonostsev recommended V. K. Plehve for his successor. Plehve had to struggle not only against the agrarian uprisings but also against moderate elements—the *semstvo* liberals and the radicals of the liberal professions (professors, lawyers, journalists, engineers, the so-called third element, officials of the *semstva*, etc.). They formed a secret Union for Liberation and from July 1902 published their weekly, *Liberation*, abroad. The number of persons accused of political crime rose from 919 (1894) to 1,884 (1899) and 5,590 (1903). The minister of finance, Serge Iulievich Witte, tried to oppose Plehve's policy but was dismissed in Aug. 1903.

The Russo-Japanese War.—Witte's removal proved especially fatal for Russian policy in the far east. William II of Germany suggested to Nicholas the idea that Russia's true mission was in Asia, not in Europe. The Trans-Siberian railway (begun 1891) presented new facilities for penetration, especially when a treaty with Li Hung-chang (May 1896) secured its extension by the East China railway; and in May 1898 a new lease was received to construct a branch through Mukden to Port Arthur, which six months before had been occupied by the Russian fleet. A chauvinistic guard officer, A. M. Bezobrazov, profited by Nicholas' confidence to cover with the tsar's protection his concession for cutting wood on the Yalu river. Many "patriotic" courtiers, grand dukes and the tsar himself acquired the bonds of the Eastern Asiatic Industrial society. Japan objected to the occupation of the left bank of the Yalu. As Prince Hirobumi Ito received no satisfaction in Petersburg, he went to London and concluded (1902) a five-year alliance with England. Russia was then obliged to withdraw its troops from Manchuria and promised to do so before Oct. 8, 1903. The promise was not fulfilled. The war party, led by Bezobrazov and Plehve, decided against Witte for war. They knew nothing of Japan's readiness for war and were stupefied by the famous night attack of Feb. 8, 1904, on the Russian fleet in Port Arthur (see RUSSO-JAPANESE WAR).

The Revolution of 1905. The revolutionary movement found new substance in Russian military defeats. Patriotic feeling began to turn against the government. The war grew extremely unpopular. Plehve, who had wished to divert public attention from the internal situation by war, was blown up with his carriage in July 1904. After much wavering Nicholas appointed on Sept. 8, 1904, Prince P. D. Svyatopolk-Mirsky as successor to Plehve. Public opinion was delighted. The liberal *semstvo* men met in Petersburg, on Nov. 19–22, 1904, in private and worked out a petition to Nicholas asking for inviolability of the person, freedom of conscience, of speech, of meeting, of press, of association and equal civil rights. The majority also asked for a regular popular representation in a separate elective body which should participate in legislation, in working out the budget and in controlling the administration. The professional groups organized banquets to support the *semstvo* program. Nicholas still wavered. His *ukase* of Dec. 12 (25) did not go beyond general promises and kept silence over the representative assembly. The chance of peaceful compromise with moderate constitutionalists was passing by. The revolution began.

On Sunday, Jan. 9 (22), 1905, many thousand workmen, led by the priest Georgii Gapon, marched with icons, singing religious songs, to the Winter palace to speak to "their tsar." But the tsar was absent; the troops fired on the defenseless crowd and killed about 1,000 people. Svyatopolk-Mirsky resigned. A. G. Bulyghin, a bureaucrat, was appointed his successor. As a reply, Grand Duke Sergius was blown up in the Kremlin of Moscow by the Social Revolutionary Ivan Kalayev. The tsar still wavered. He issued a promise merely to summon "the worthiest persons" to share in the drafting and discussing of laws.

Meanwhile, public excitement was growing, fanned by the news of Tsuchima (May 27–28). The constitutional and the revolutionary movements began to separate. Constitutionalists (*semstvo*

men and Liberation union; held their congresses and prepared drafts of constitutional laws. After Tushima they sent to Nicholas a deputation which repeated the demands of the November petition of 1904 and received (June 6 [19]) the answer that the "tsar's will was unshakable." Two weeks later Nicholas promised to another delegation of the nobility that he would keep the tradition of the past. On Aug. 6 (19) a law conceded a duma of the empire. But it was to be a consultative chamber, composed of class delegates, representing peasants (43%), landed proprietors (34%) and burgesses (23%). This duma was entitled only to prepare drafts of laws for the council of state. This, "Bulygin's constitution," provoked general indignation. Its only result was to give the upper hand to revolutionary elements (the Socialist parties). There was now no end to meetings, workmen's and students' strikes, agrarian uprisings, which finally, on Oct. 10-14, united in one general strike all over Russia. From railway employees it spread to post and telegraph personnel, factories, shops, business offices and even children in primary schools. Communication with the provinces was interrupted; Nicholas was isolated in his summer residence at Peterhof. On Oct. 14 (27) a soviet (council) of workmen's delegates was formed whose vice-chairman was L. D. Trotsky. On Oct. 15 (28) the Constitutional Democratic (Kadet) party was founded, which included the radical wing of the *zemstvo* men and the moderate elements from the Liberation union and other professional unions. The common aim of the left wing of public opinion was a constituent assembly elected on universal suffrage and leading to parliamentary government.

Nicholas thought of abdication. But he was saved by Witte, who had just concluded (Sept. 5) peace with Japan at Portsmouth, N.H., and was generally expected to become a peacemaker inside Russia. On Oct. 17 (30) Nicholas signed the famous manifesto prepared by Witte (now a count) and published it together with Witte's report, in which the necessity of concession was laid down. The manifesto promised a real inalienability of person, freedom of thought, speech, meetings and associations. No law was to be enacted without consent of the duma. But the word "constitution" was not used; the tsar retained his title of autocrat (*samoderzhets*). He openly favoured the newly formed reactionary organization, the Union of the Russian People. Then a wave of absolutist demonstrations and Jewish pogroms organized by the police followed, in a few days, the short-lived outbreak of enthusiasm elicited by the tsar's concessions.

Witte was made prime minister of a unified cabinet. But he could not persuade liberal leaders to enter his cabinet as the situation remained extremely uncertain. His minister of the interior, P. N. Durnovo, was a reactionary. Pobedonostsev resigned (Nov. 1), but Gen. D. F. Trepov was retained in proximity to the tsar. Agrarian troubles reached their height in November, and Count Witte proposed to his minister of agriculture, N. N. Kutler, to prepare a draft of law on the basis of the expropriation of the landowners. It roused against Witte the nobility, who also founded a union. On the other hand, Witte had to fight against the revolutionary movement which found its headquarters in the Petersburg soviet of workmen's delegates. The soviet published decrees and tried to play the part of a second government. Trotsky, backed by Lenin, preached a permanent revolution. However, the policy of the Socialist parties definitely alienated the sympathy of the possessing class. On Dec. 3 (16) the soviet with all its members present was arrested. Its substitutes replied by an armed uprising in Moscow (Dec. 7 [20]). Until Dec. 13 (26) there was shooting in the streets; then the guard regiments came down from Petersburg and the rebels were dispersed. There followed the so-called punitive expeditions led by Generals G. A. Min, Paul Rennenkampf and A. N. Möller-Zakomelsky which exterminated with ruthless cruelty what remained of the revolutionary movement in Russia and Siberia.

This decisive blow at the revolution weakened also the constitutional movement. Witte was losing ground. A certain extension of electoral right, especially in the towns (Dec. 11 [24]) was his last success. The predominance of peasant deputies remained untouched as the peasantry was considered more conservative and

reliable than the nobility. Witte promised to the tsar a pliant duma. He dismissed Kutler, but he refused to promise to dissolve the duma if it raised the agrarian question, a measure proposed by his competitor, the former home minister I. L. Goremykin. Nicholas was encouraged to resistance by the repression of the revolutionary movement. He assured the deputations of the Union of Russian People that "the sun of Truth will shine bright over the Russian land" (Jan. 1906) and that his "autocracy will remain unchanged as it had been of old" (March).

The First Duma.—Witte's fate was sealed when the elections, which he left comparatively free, gave the majority to the Constitutional Democrats (the Kadets) together with peasants who wanted a radical agrarian reform. The Socialists, who still hoped for a revolution resulting in a real constituent assembly, decided to boycott the elections. Witte resigned after having rendered the tsar his last service: he concluded a loan in France, which made the tsar free to deal with the duma as he liked. Just before the duma met (April 27, 1906) new fundamental laws were published which curtailed its power (*see DUMA*) while leaving to the tsar an extensive prerogative and to the council of empire equal rights in legislation and the budget. The government preserved the right of extraordinary legislation, without the duma, in emergency.

Under these conditions the struggle was unequal. The dissolution of the duma was assured when in its address to the throne it proposed its own program of embodying into laws and enlarging the liberal promises of the October manifesto. After much delay Goremykin declared the program inadmissible. He received a vote of censure, which was, however, of no consequence. There was an avalanche of questions and interpellations in order to expose and to restrain the arbitrary rule of the bureaucracy—but all in vain. The government answered by practically boycotting the duma. Then a long debate began on the agrarian project introduced by the Kadets, on the basis of partial expropriation of big landed estates. The government published a sort of counterproject and warned the country not to believe in the duma's promises. The duma replied by a declaration which was interpreted by the government as an illegal appeal to the country and served as a pretext for dissolution. On July 9 (22) the delegates found the Taurida palace locked and surrounded by army detachments and artillery. About 200 of them moved to Viipuri in Finland in order to protest and to invite the people to passive resistance should no new duma be convoked. On the other hand, the congress of the United Nobility demanded the changing for their benefit of the electoral law by the mere will of the tsar, in violation of the fundamental laws. P. A. Stolypin, who had dissolved the first duma and taken the succession of Goremykin, did not dare to do so. But he tried instead to solve the agrarian question by means of emergency legislation. His scheme was to increase the lots of the well-to-do peasants at the expense of the poorer ones by dividing the communal land at the first request of the former and thus to avert the danger of expropriating the estates of the nobles (edicts of Oct. 2 and Nov. 22). He also set up field courts-martial to pronounce death sentences against the remaining revolutionaries (Sept. 1).

The Second Duma.—The second duma, convoked Feb. 20 (March 5), 1907, in spite of all pressure on electors proved much more radical than the first. The Kadets' representation sank from 187 to 123, while the Socialists, who this time took part in the elections, rose from 26 to 83 and the Labour group (mostly peasants) rose from 85 to 97. Both extremist groups of urban and agrarian socialism thus nearly formed the majority, while on the right wing there were only 34 Octobrists (a party of landlords and rich merchants, formed soon after the Kadets with the government's connivance—they professed to be constitutionalists) and 63 nationalists and avowed autocratists. However, the new majority was not so confident as had been the first duma and shared the cautious tactics of the Kadets. The United Nobility was afraid of that moderation. They now induced Stolypin to prepare a new electoral law and only sought for a pretext to dissolve the duma. They found it in the duma's lack of desire to denounce revolutionary terrorism and in the propaganda of the Social Democratic party. On June 3 (16) the duma was dissolved and at the

same time a new electoral law was published which partly disfranchised the nationalities (especially the Poles) and gave pre-dominance to the representatives of the gentry.

The Third and Fourth Dumas.—Extreme pressure was used during the elections to the third duma (1907–12), as well as to the fourth (1912–17). However, the government did not succeed entirely in stifling the opposition groups. The party composition of the two last dumas was as shown in the accompanying table.

TABLE III.—Party Composition of Third and Fourth Dumas

Parties	Third	Fourth
Right wing		
Extreme right	52	65
Nationalists	91	88
Total	145	153
Centre		
New (Nationalist) centre		39
Octobrists	133	98
Total	133	130
Left wing (opposition)		
Poles and Moslems	26	21
Progressives	30	46
Constitutional Democrats (Kadets)	13	50
Labour group	24	9
Social Democrats	16	25
Total	140	151

At the beginning of the decade of duma activity Stolypin worked with the leading group of Octobrists and their leader Alexander Guchkov. By that co-operation Stolypin was able to pass his agrarian laws and the nationalist bills depriving Finland of the last remains of autonomy. It was the consummation of Nicholas' policy against Finland which had cost the life of his general governor, N. I. Bobrikov, in 1904. Poland was deprived of a part of Kholm territory. Measures were taken against the Ukrainian national movement and against the Jews, with the acquiescence of the duma. However, on the questions of the reconstruction of the army and navy Guchkov took a sharp line against the government and the grand dukes, which incensed the tsar and seemed an attack on his prerogative. It made Stolypin go to the side of the Nationalists—a party newly created with the pecuniary aid of the government and thus very submissive, led by Count Vladimir Bobrinsky and Pavel Krupensky. On the other hand, the Octobrists approached somewhat the Kadets and worked together on questions of foreign policy and the budget. An open conflict with Stolypin took place in 1911 over his reckless use of emergency legislation in order to break the opposition of the legislative institutions, including the upper house. As soon as Stolypin lost his credit with the duma he was no more needed by the tsar, who still cherished the hope of complete freedom from the duma. The assassination of Stolypin (Sept. 14, 1911) by a revolutionary, Dmitry Grigorevich (Mordka) Bogrov, did not elicit any expression of regret from the tsar and was ascribed by rumour to a police plot.

The elections of the fourth duma were so arranged by the government as to give an overwhelming majority of Nationalists, who would then ask for the transformation of the duma into a consultative chamber. At the court Rasputin enjoyed already a paramount influence, and the tsarina began to meddle in politics with the aim of strengthening the weak tsar against all risk of concessions to constitutionalism and also preserving autocracy unimpaired for her son. However, the results of the elections were a disappointment: the opposition increased in number and authority; the right wing of autocrats was merely equal to it; and there was no strong centre to lead the duma.

The beginning of World War I brought nearly all parties together in a patriotic cry for a sacred union. But the government did not know how to make use of this disposition of mind. It continued its exasperating internal policy and tried to do without the duma. The situation was so much the worse when the Russian retreat began and the army proved unprepared. The war minister, V. A. Sukhomlinov, and other reactionary ministers were then dismissed and the duma was summoned for Aug. 1, 1915. The duma was empowered to control the supply of munitions through its members in a special committee together with the Union of the *Zemstva* led by Prince G. E. Lvov. The duma found finally its majority, but it was the majority of a Progressive bloc which proposed to the tsar a national coalition government "pos-

sessing the confidence of the country" and a program of reforms necessary to appease the country (Aug.-Sept. 1915). Unhappily there was no Witte to advise the tsar. Goremynkin was only a courtier and he made the tsar answer by a prorogation of the duma and by the expulsion of all liberal ministers who favoured the idea of a national cabinet (Sept. 16).

Thus the last chance of a peaceful solution was lost. The duma could no more lead public opinion, which turned to revolution. The chiefs of the army were this time on the side of the duma and public opinion, as they did not believe in the possibility of victory as long as the regime lasted. The universally hated Goremynkin had to resign when the duma met (Feb. 2, 1916); but his successor—the old master of ceremonies of the court, B. V. Sturmer, an ignorant and comic figure, especially when he was made successor of S. D. Sazonov in foreign affairs (July)—only helped to discredit the whole system and to demonstrate its weakness. As the tsar had made himself commander in chief instead of the grand duke Nicholas and was absent at headquarters, the tsarina took the lead in Petrograd (the new wartime name of the capital). She surrounded herself with an adventurous crowd of irresponsible advisers, the friends of her great confidant Rasputin. The duma was at last summoned on Nov. 14. She poured her wrath on Sturmer, who had to go, and on A. D. Protopopov, her former vice-president, who passed through the antechamber of Rasputin to get the post of home minister. Sturmer's successor, A. F. Trepo, was hissed by the duma. Warning on warning came to the tsar even from grand dukes and foreign diplomats, insisting on serious concessions to the people in order to prevent revolution. But the tsar, profoundly influenced by the tsarina, would not listen. On Dec. 17 (30) Rasputin was assassinated by Prince F. F. Yusupov, husband of the emperor's niece, and V. M. Purishkevich, the leader of the extreme absolutists in the duma. Not even that blow could change the obstinacy of Alexandra Fedorovna. Protopopov seemed to wish to provoke an outbreak. In certain circles a scheme for the tsarina's arrest and the tsar's abdication was being discussed. The meeting of the duma had been postponed until Feb. 14 (27), 1917. Disorders began in Petrograd during its session, and on Feb. 26 (March 11) the duma was prorogued. The following day was the first day of the revolution.

(P. M.; X.)

THE REVOLUTION, 1917

The Russian Revolution of 1917 had two sharply contrasted phases. There were, indeed, two revolutions, those of February and of October in the old Russian calendar (which is preserved in the traditional historiography of the period), or of March and of November in the western calendar (which the Russians adopted on Feb. 1 [14], 1918). The former was the product of the discontent of the democratic forces with the conduct of war, the latter exploited war weariness in the interests of the international revolutionary doctrines of Marxism. The former revolution overthrew Russian tsardom and, through its liberalism, gave scope to those who were preparing for the latter.

The attack made by the Progressive bloc of the duma on the autocracy was in fact animated by its conviction of the double danger in which the country stood from defeat in the field and from revolution following on such defeat. It demanded the establishment of a government "invested with the people's confidence," and an underlying aim was to forestall more radical changes. Its members were indeed so opposed to any semblance of revolutionary activity on the part of the masses that again and again they refused to countenance strikes or demonstrations which had been organized with the very intention of supporting the duma's demands.

By the end of 1916 the attempt to bring down the government by constitutional means had obviously failed. This failure compelled the more active and impetuous of the liberal patriots to consider whether it was possible to realize their aims by a military coup d'état and a court revolution. The initiative in this matter was notoriously taken by prominent officers at the front who were in close touch with the headquarters staff. The propaganda in favour of a court revolution was started by Gen. A. I. Krymov, the officer who subsequently commanded the army sent by Gen.

L. G. Kornilov in Aug. 1917 to suppress the government of Alexander Feodorovich Kerensky and to establish a military dictatorship. Only a few of the Liberal leaders seem to have been personally associated with Krymov's scheme; but sufficient documentary evidence exists to prove that the Progressives in the duma were at least taken into the confidence of the conspirators and were considering the formation of a cabinet in case the plot succeeded. The complete scheme of the Krymov conspiracy was revealed by Guchkov, the war minister in the provisional government, in the evidence which he gave before the tribunal set up for investigating the criminal record of the ministers of the old regime. The idea according to Guchkov was to seize the tsar as his train was proceeding from headquarters to Tsarskoye Selo, to compel him to abdicate in favour of the tsarevich with the grand duke Michael as regent, to arrest the tsar's ministers with the help of the Preobrazhensky guards and then to proclaim the abdication simultaneously with the names of the new duma ministers. This court revolution, planned to take place in the early months of 1917, was first postponed by the strikes and unrest which prevailed at that time in the capital and was finally rendered abortive by the success of the March Revolution.

The Bolshevik party, which had been consistently against the war from the beginning, took no part in the preparations for the March Revolution. Lenin and other leaders, who were at that time abroad, were formulating views as to the possibilities of revolution which were subsequently acclaimed as prophetic. But the international antiwar conferences organized by Lenin at Zimmerwald and Kienthal had no obvious effects, and as late as Jan. 1917 Lenin, then aged 46, told a Swiss audience that it was doubtful whether "we the old would live to see the decisive battles of the coming Revolution." Anyhow, views expressed in exile could not easily be propagated in Russia, since the Bolshevik members of the duma and almost all the minor leaders had been arrested and banished to Siberia. Indeed what these statements prove is that the few Bolshevik agitators remaining in Petrograd (including G. A. Shlyapnikov, the representative of the central committee of the party) were as little aware as the Mensheviks or the Liberals that the strikes, started early in March 1917, were likely to bring about the revolution. On the contrary, as far as they could, they discouraged the idea of a revolution as premature and likely to lead to disaster and gave it their official support only after it had actually broken out.

The March Revolution and First Provisional Government.—Strikes for higher wages at some of the factories had been occurring sporadically for some time, and on March 8 no fewer than 130,000 men are said to have been out. To this number must be added a considerable figure to account for the women workers who were demonstrating on that day (the Women's day). But though the number of the strikers and of their sympathizers was large, and though several bakers' shops were demolished by the mob, neither the leaders of the duma on the one hand nor the government and the police on the other gave the matter any particular attention. The only precaution taken by the authorities was to prevent the demonstrators from reaching the centre of the city. The next day the strikers were still more numerous and probably amounted to 30% of all the workers in Petrograd. Some sections of the crowd succeeded in reaching the centre of the city and their mood soon became sinister and threatening. On that day, too, the university students joined the movement, and though the catchword of the strikers remained "bread," it is asserted that a few cries were raised denouncing the autocracy and the war.

The third day (March 10) proved the critical day. The strike became general and the strikers assumed an aggressive demeanour, raiding the police stations in the Viborg (factory) districts and disarming the police. In this quarter the police practically disappeared and the political demonstration began to assume the character of an armed rising. Meanwhile, the Cossacks, who had in the traditional way been patrolling the streets as the bulwark of the autocracy, had begun to manifest neutrality and even friendliness toward the strikers. That night Gen. S. S. Khabalov, military governor of the capital, received a telegram from the tsar, then at the front, ordering him to suppress the strike movement.

N. D. Golitsyn, the prime minister, had already decided to prorogue the duma in the hope, shared by most of the ministers, that the tsar would return to the capital, accept their resignations and form a more popular government.

The attempt to use force to put down the disorders in the capital was temporarily successful, but one regiment after another mutinied on March 11 and 12 and the situation became clearly untenable. The duma refused to disperse on March 11 when it received the prorogation order, and there were discussions among the Progressive and Labour leaders about the possibility of forming a new government. On the same day M. V. Rodzianko, the speaker of the duma, sent an urgent telegram to the tsar ending with the words "May the blame not fall on the wearer of the crown." But the tsar put it aside. Rodzianko also got into touch with the generals holding the main field commands, asking for their support.

When the tsar and his advisers at last learned that the revolt of the Petrograd troops had endangered the existence of the monarchy they immediately ordered a number of regiments from various parts of the front to proceed to the capital. The first detachments under Gen. N. Ivanov were prevented by the railways from approaching Petrograd, while the picked regiments were never sent because before they could actually be moved the revolution had developed such impetus and had gained such support even at the front that the attempt to crush it by military force was recognized as hopeless. The army indeed could no longer be relied on, and it may plausibly be assumed that even if the troops had been dispatched they would probably have mutinied and fraternized with the revolutionists.

The critical day was March 12. While the city was largely in the hands of the mutinous regiments and the mob, news came to the duma that elections were in progress by show of hands for a new soviet or council of workers' delegates such as had seized power in the capital during the revolution of 1905. The leaders of the different political groups meeting in the duma building were informed that a large crowd was on its way there and that decisive action was necessary. On the initiative of V. V. Shulgin a provisional committee was set up with the leaders of all the parties presented upon it except those of the right. Kerensky largely took charge of events and improvised some kind of guard. The cabinet met during the evening and, failing to get a definite reply from the tsar to a suggestion for the appointment of a new prime minister, simply dispersed. By that night most of the ministers were in hiding. It was only on March 14, after prolonged discussions and with considerable reluctance, that the members of the duma committee made up their minds to constitute a government. It was set up on March 15. Three considerations were obviously instrumental in leading them to this decision: first, a clear consciousness of the elemental force of the revolution; second, the apprehension that the Petrograd soviet might be tempted to assume power; and, third, the hope that by constituting themselves the ruling authority they might be able to cope with the increasing anarchy and to save the monarchy and even the dynasty.

The Soviet.—Meanwhile, the revolutionary workers had succeeded in setting up a soviet. Its first session opened in the evening of March 12, with an attendance of approximately 250 members consisting of Socialist deputies of the duma, the Worker group of the munition committee, a number of prominent worker leaders representing the various shades of revolutionary opinion, and members of strike committees who had been active during the few previous days. It managed to appoint a strong executive committee which immediately took over the business of food supplies and the strategical defense of Petrograd against any possible attack from the autocracy. It also came to the decision to change its constitution by including along with worker deputies army deputies. In this way the soviet made a palpable bid for real power.

From this very moment, enlisting as it did the support of the workers and of the Petrograd garrison, the soviet executive committee was the depository of real power. It had its headquarters in the duma building, and one of its vice-presidents was Kerensky, who constituted a link with the duma, committee and subsequently

with the provisional government. Its members had been conscious of this power and probably overestimated rather than underestimated their authority. But they made no overt or covert attempt to constitute a revolutionary government, and when the duma committee decided at last to assume the responsibility of forming the new government its decision was unanimously welcomed by the leaders of the soviet. Why the Petrograd soviet refused immediately to proclaim itself the government of revolutionary Russia can only be a matter of surmise. Speaking in the first All-Russian Conference of Soviets, which was held early in April 1917, G. Steklov, one of the prominent members of its first executive committee, ascribed the refusal to the prevailing uncertainty as to the attitude of the army. But this explanation scarcely covers the whole of the ground. An orderly government, representing a compromise between the insurgent masses and the bourgeois classes, was obviously the sole bulwark against counterrevolution, and the desire for the establishment of such a government must undoubtedly have constituted the main factor in the unopposed assumption of power by the duma. Still, fear of the outbreak of a counterrevolution cannot be regarded as an adequate explanation of the willingness of the soviet's leaders to delegate power to the duma. Their decision to step aside and to leave the formation of a government to the *bourgeoisie*, the class determined to arrest the onrush of the revolution, would be unintelligible unless the fact is recalled that most of them accepted the Menshevik view that the aim of the revolution was solely to establish a democratic regime and that any attempt to associate the movement with socialist experiments or the dictatorship of the proletariat would ruin it and so repeat the disastrous failure of 1905.

Among the members of the soviet's first executive committee were a few Bolsheviks who accepted Lenin's dictum that the Russian Revolution was the vanguard of the world socialist revolution. But so unprepared were they for taking action that when Lenin arrived in Petrograd three weeks later he found that his most difficult task was to inspire his own party with the necessary enthusiasm for deepening the revolution. The Bolsheviks, however, were in such an insignificant minority both in the Petrograd soviet and outside that their views could not possibly carry much weight. In fact, most members of the executive committee of the soviet expected and welcomed the advent of the world revolution and believed in the missionary character of their own. They refused to accept the national victory over the autocracy as the sole aim of the revolution, and they may have regarded it as merely the first step. What they never denied was that the *bourgeoisie* had a part to play in the revolution and a rightful claim to form the first national government. But, while they were prepared to stand aside and to delegate the power to the *bourgeoisie* they reserved to themselves the right to keep a steady watch on the activities of the new government, for they made no secret of their suspicion that, left to their own devices, these "bourgeois" ministers might be tempted to abuse their authority by favouring the interests of their own class.

The First Provisional Government.—The members of the duma committee, on the other hand, were not only willing to form a government with the consent of the soviet but insisted on the latter's issuing an open proclamation of support. The program of the provisional government published on March 16 was indeed largely dictated by the soviet leaders and was accepted in full by the members of the duma committee. The status of the government created as a result of this compromise was necessarily precarious in the extreme. Nominally invested with full powers and sovereign authority, the provisional government—whose principal figures were Prince Lvov (prime minister), P. N. Milyukov (foreign affairs), M. I. Tereshchenko (finance), Alexander Guchkov (war) and A. F. Kerensky (justice)—was in reality powerless and the mere creature of the soviet. Its position was bound to be unstable because the basis of the compromise which established it was vague and uncertain. But the revolutionary impetus of the masses and the constant changes in the constitution of the soviet and hence in the point of view of its leaders soon combined to render this basis even more unstable. Every day fresh groups joined the soviet and new leaders replaced old ones, with the con-

sequence that new adjustments had constantly to be made and even relative stability became difficult to maintain.

Arrest of the Imperial Family.—While negotiations between the soviet and the duma were still proceeding and before the provisional government formally took over the administration (March 16), the extremely delicate question of the position of the tsar and of the dynasty came up for settlement. That the tsar Nicholas could no longer remain autocrat was a foregone conclusion, but the leaders of the duma, dreading the idea of Russia's becoming a republic, were determined to save the monarchy and even the dynasty. They accordingly dispatched Guchkov and Shulgín, two Conservative members of the duma, to the tsar's headquarters at Pskov with the mission of obtaining the tsar's abdication in favour of the tsarevich and the appointment of his brother the grand duke Michael as regent. But the tsar declared that the illness of his son made it impossible for him to contemplate being separated from him and changed the instrument of abdication so as to provide for the succession of his brother as tsar. Such a solution was by now widely unacceptable, and, when the members of the duma committee visited the grand duke on March 16, Kerensky strongly appealed to him not to accept in the name of national unity. Despite Milyukov's strong pleas that he should ascend the throne on the ground that the monarchy was the only axle of the country, the grand duke refused. The Romanov dynasty that had ruled Russia for three centuries came to an end.

A few days later the question of the dynasty came up again in a dramatic fashion which incidentally demonstrated both the strength of the soviet and its determination when necessary to use it in defiance of the government. The tsar had requested the new ministers to arrange for the departure of himself and his family to Great Britain, a request which the leaders of the soviet heard of by mere accident. At once they called on the government to put the tsar and his family under arrest and gave orders to the railwaymen to stop the imperial train. The actual usurpation of power in this instance, however, proved unnecessary: the new ministers themselves proceeded to put the tsar Nicholas and his family under arrest.

The Army and the War, March-May.—The struggle for support that took place between the duma and the soviet was the paramount business of the next few weeks. The battle was fought out in the main on two planes, one the question of the new status of the army, the other the question of continuing or terminating the war. The leaders of the soviet championed the civil rights now claimed by the soldiers, while the duma appealed to them in the name of national safety. That the harsh conditions which had hitherto prevailed in the barracks had now to be modified was obvious enough, and Guchkov was preparing an official declaration to this effect. But, while he was for confining the liberties of the soldiers within the strict limits of discipline, the leaders of the soviet declared that these liberties must be vindicated unconditionally. This resolve to gain the adherence of the soldiers by supporting their claims at all costs was responsible for the issue on March 14 of the notorious *prihas* (order) number 1, which helped in the disintegration of the already badly shaken Russian army.

But despite all the privileges which the Petrograd soviet had granted to the soldiers, the devotion of the army at the front and even at the capital had to be secured. At first the provisional government seemed to be the body which had won the support of the army. When the ministers proclaimed the necessity of a more vigorous prosecution of the war, the army seemed to be rallying to their support. For about a fortnight regiments stationed at Petrograd as well as delegations sent by those in the provinces and

¹*Prihas* number 1 was composed by a compilation of the Petrograd soviet headed by N. D. Solodov. In the name of the Soviet of Workers' and Soldiers' Deputies it ordered that committees of soldiers were to be formed in all military and naval units in Petrograd and to send one representative each to the Fairfax palace next morning. In their political actions units were to be subject to their committees and to the soviet. Orders of the military commission of the duma were to be obeyed only when they did not contradict those of the soviet. Arms were to be under the control of the committees and on no account to be given up if demanded by the officers. Strict discipline was to be preserved when on duty. Salutes, etc., when off duty were abolished. Special titles used in addressing officers, "Your excellency" and references to the officer's noble birth, were abolished. Officers were forbidden to use the second person singular in addressing soldiers.

demonstration in favour of the transference of power to the soviet, it was in essence an attempt to stampee that assembly, a fact which its leaders were prompt to recognize. For nearly two days the gunmen were in occupation of the capital, but their lack of objective and of leadership perplexed them and paralyzed their efforts. The Bolshevik leaders in the capital (Lenin) did not return from a convalescence in Finland until July 17 were forced to assume some kind of control of the movement and to channel it toward bringing pressure on the Petrograd soviet and the central executive committee to take power. But the soviet did not respond to the mob's demands.

During the two days that the rising lasted the coalition government was absolutely quiescent. But Kerensky on the very first day proceeded to the front and procured picked troops, which arrived in the capital on the day after the movement had fizzled out. Meantime, any attempt to renew disturbances was rendered hopeless by the publication of documents which purported to prove that Lenin was a spy and a paid agent of the German general staff. The result of the disturbances was the practical suppression of the Bolshevik party. L. B. Kameney was arrested. Lenin and G. E. Zinoviev went into hiding, to the considerable dismay of their friends.

Kerensky's Provisional Government.—These events coincided with the failure of the Galician offensive and made yet another change of government inevitable. Prince Lvov was presented by the soviet members of the government with an ultimatum which required him, in accordance with the decisions of the Congress of Soviets, to declare Russia a republic without waiting for the convocation of a constituent assembly, to suppress finally the duma and the council of state and to accept the congress's policy of forbidding any sale of land before the meeting of the constituent assembly. The prince refused to comply with these demands, regarding them as a usurpation of the rights of the constituent assembly, and promptly sent in his resignation. The ministry was reconstructed on July 21, Kerensky becoming prime minister as well as minister of war and Tseretli succeeding Prince Lvov as minister of the interior. With the formation of the new ministry, not completed until Aug. 6, the Russian Revolution entered on a new phase—a phase of inaction. The record of Kerensky is indeed singularly barren. He failed to put new vigour into the prosecution of the war. He left the question of concluding peace just as he found it. He made no attempt to settle the various difficulties involved in the labour question. And he was so incapable of handling the agrarian problem that he allowed the peasants to settle it as best they could by local initiative.

In fact, the only achievements of Kerensky's administration were the declaration of Russia as a republic and the convocation in August of a spectacular state assembly representing all classes in the country and all political groups. The actual purpose which this assembly was meant to serve is obscure, but its composition and the choice of Moscow for its sittings seem to show that it was convoked with some vague hope of investing Kerensky's government with that moral authority and sanction which it had hitherto conspicuously lacked. Nothing remarkable, however, resulted from its three meetings save a series of hysterical speeches in which the prime minister announced his determination strenuously to support the revolution and ruthlessly to suppress its enemies, whether they came from the right or from the left.

After the failure of the July rising, Trotsky, who had been taking an independent line since his return to Russia on May 17, joined the Bolsheviks with his supporters. On Aug. 6 he and A. V. Lunacharsky were arrested. The Bolsheviks themselves had recast their tactics. Lenin had decided that the soviets had proved themselves unsuitable for the task allotted to them, and the slogan "All power to the soviets" was replaced at the sixth party congress (held in the second week of August) by a recognition that it was the task of the proletariat and of the poorer peasantry to liquidate the dictatorship of the counterrevolutionary *bourgeoisie*, as the provisional government was now styled by the Bolsheviks.

Meanwhile, the generals at the front and the members of the general staff in the capital began to think that their time had come. Taking stock of the anarchy prevailing in the country and of the

disorganization of the army, they began to be more and more inclined to favour the creation of a military dictatorship. Kerensky, supported Gen. L. G. Kornilov, the commander in chief, in the preliminary steps for establishing one. He quarrelled with him only when he realized that the general himself was aspiring to become dictator. Suspecting Kornilov's designs, he promptly declared him a traitor and an enemy of the revolution; to which the general replied by sending on Sept. 9 picked Cossack regiments under the command of Gen. A. I. Krymov against Petrograd with the object of intimidating Kerensky and forcibly suppressing the soviet. Thereupon Kerensky, turning his back on the right, appealed to the left for support, and the central executive committee of the soviets appealed in its turn to the workers to fight the threatened counterrevolution. The Bolshevik leaders, now released from prison, took up the challenge with enthusiasm and, recognizing that their opportunity had arisen, proceeded to arm the workers, in anticipation of the arrival of Krymov's troops. Deputies from the Petrograd workers and soldiers went to meet the Cossacks and persuaded them that they had been sent on a false errand. Kornilov, A. I. Denikin (his close colleague at the front) and three other generals were arrested and imprisoned, and Krymov shot himself after being interrogated by the prime minister.

Just as the failure of the Bolshevik rising in July proved to be the opportunity of the right, so now the collapse of Kornilov's raid gave the extreme left its chance. The first result of this revival of revolutionary fervour was a renewal of the hatred of the officer class; a new wave of massacre swept over the country, taking peculiarly ugly form in Finland, where sailors killed their admirals and officers by throwing them overboard and beating them to death in the water. The central executive committee was reduced to sending emissaries to stop these outrages; another sign of the times was that these emissaries had to be chosen from the Bolshevik ranks. The moderates were speedily losing their hold on the masses. Lenin's supporters, indeed, were now rapidly increasing their forces, so much so that by the middle of September both the Petrograd and the Moscow soviets passed for the first time Bolshevik resolutions; while the moderate leaders, who had presided over them since their creation, were soon replaced by Trotsky at the new and by V. P. Nogin at the old capital. It now became possible for Lenin to revive the slogan "All power to the soviets."

For it became increasingly evident that the next Congress of Soviets, which was summoned for the end of October, was likely to elect an all-Russian central executive committee on which the Bolsheviks would have a majority and that this majority would declare in favour of assuming the supreme power in the state. Kerensky's last improvisation was a democratic conference, which met in Petrograd on Sept. 27. Unlike the state assembly, this was confined to left-wing parties and organizations. The Bolsheviks took part against Lenin's wishes; but the impunity with which they were allowed to shout Kerensky down showed the weakness of their opponents, as did the failure of the latter to agree on the continuation of a coalition including non-Socialist elements. The existing central executive committee, though it continued to support Kerensky, who formed a new cabinet including the Kadets on Oct. 6, withdrew its representatives from his government. The united front of soviet democracy, which had seemingly been re-established by the challenge thrown out by Kornilov, was now finally broken. The Bolsheviks proceeded to declare the members of the central executive committee traitors to the revolution and at last worked openly for their overthrow and for that of the bourgeois government.

The provisional government was formally invested with full and sovereign power and was responsible neither to the Petrograd soviet nor to the recently convoked council of the republic or preparliament, which was a consultative body representing all the main parties. But actually it possessed no power at all. The real authority, then more than at another time in the revolution, was held by the soviets in the capitals and in numerous provincial towns, which openly defied the government and exercised, each in its area, legislative as well as executive powers. In many of the

provincial soviets as well as in those of Petrograd and Moscow the Bolsheviks now counted on solid majorities; and in most cases the Bolshevik provincial soviets constituted themselves quasi-independent republics.

The various nationalities, which had long been clamouring for autonomy, now began openly to secede from the state and to organize their own armies by withdrawing their nationals from the army under the plea of defending their newly created frontiers and their national flags. The whole country, town and village alike, was in a state of feverish unrest which soon developed into riots and anarchy. In the towns bread riots broke out; but the most destructive of these revolts were those of the peasants, who began to solve the land problem in their own way by expropriating the land, driving off the cattle, burning down the landowners' dwellings and barns, demolishing agricultural machinery, felling wood in the forests and wantonly destroying trees in the orchards. Landowners who delayed their flight were captured, tortured and murdered. Yet the ministers were inactive and helpless. They lacked the necessary military backing to put these disturbances down by force; even the Cossacks refused to obey orders, remembering how they had been repudiated by Kerensky in the Kornilov episode. Reprisals would in any case have proved ineffective; the only measure which might possibly have tranquillized the countryside would have been the speedy convocation of the constituent assembly with a guarantee that it would be invested with full power to solve the land question. But the government repeatedly postponed the convocation of the assembly. Closely connected with the peasants' revolt and with the general anarchy prevailing everywhere were the crimes committed by bands of armed soldiers.

At the front the army still preserved on the surface a certain degree of discipline; but the mutual distrust and hatred of soldiers and officers was so profound that at any time an open clash might be expected, especially as a shortage of food and supplies, and in some cases actually famine, made the preservation of military subordination increasingly difficult. It became obvious that the army was likely to withdraw from the field either in the autumn or at any rate before the winter had passed. The soldiers discussed this possibility openly, declaring that they cared neither for freedom nor for land but only for peace. Even leading generals such as V. A. Cheremisov (who held the northern command) advised the government that the army was unreliable and might withdraw from the field at any time.

Meantime, the Germans had been penetrating further and further into the Baltic provinces. On Oct. 12, with the support of their fleet, they occupied the island of Oesel and so secured the command of the Baltic. Petrograd was now obviously menaced, and ministers declared their intention of transferring the seat of government to Moscow. To dream of continuing the war after abandoning Petrograd, the biggest arsenal in the country, was denounced as sheer treason, and the proposal furnished the Bolsheviks with an admirable lever for stirring up the masses. Another mistake which ministers made, an attempt to replace the Petrograd garrison by more reliable troops from the front, was used by their enemies as a pretext for openly organizing military forces for an attack on them. The Petrograd soviet accordingly, under Trotsky's command, promptly came forward and countermanded the movement of troops. On Oct. 26 the leaders of the soviet constituted a military revolutionary committee which declared itself the highest military authority in the capital and province of Petrograd. This step was ostensibly taken for the defense of the capital against the enemy, but actually it was a movement for the creation of a general staff for the Bolshevik revolution. Three days earlier, after much debate, the central committee of the Bolshevik party had pronounced in favour of an armed uprising. Trotsky openly organized his forces without meeting with the slightest interference from the government.

The November (Bolshevik) Revolution.—The Bolshevik revolution was inseparably connected with the convocation of the second Congress of Soviets. The central executive committee, which consisted entirely of Mensheviks and Social Revolutionaries, supporters of Kerensky, was reluctant to convene a second congress and postponed doing so from day to day. But when

finally the Petrograd soviet threatened to convene the congress itself the committee fixed Nov. 7 as the date of convocation. It was obvious that the congress would have a Bolshevik majority. The convocation of the All-Russian Congress of Soviets was preceded by the holding of a number of regional congresses, all of which declared for a termination of the coalition and for the establishment of a Soviet government, the aim of which would be immediately to propose terms of peace, to give the land to the peasants, to establish a complete workers' control of the factories and to deal with the famine by expropriating the hoards of foodstuffs supposed to have been accumulated by the capitalists and landlords.

Meanwhile, ministers waited patiently on events, believing that nothing could happen till Nov. 7. But Trotsky gave battle two or three days before the appointed date. On Nov. 3 he confronted the general staff with a demand that all its orders should be countersigned by the military revolutionary committee. When the general staff refused this demand he ordered the Petrograd garrison to stand at arms in defense of the committee. On Nov. 4 a meeting attended by delegates from all the troops passed a resolution refusing obedience to commands of the general staff and recognizing the committee as the sole organ of power. This resolution was immediately circulated over the government telephones to all the regiments in the capital.

To these proceedings Kerensky replied on the following day by issuing an ultimatum to the committee requiring it to withdraw the resolution. The ultimatum was ignored by the committee, which promptly called out parts of the garrison and organized worker detachments (Red guards) for the defense of the Smolny palace, headquarters of the soviet and of the committee. Kerensky tried to counteract these measures by adopting the traditional method of defense, the raising of the bridges, to prevent communication between the left and right banks of Neva. He then proceeded to the Marinsky palace, where the prearrangement was holding its sessions, and demanded that it should invest him with dictatorial powers to cope with the Bolshevik revolt. They debated all night before refusing. Meanwhile, the Bolsheviks quietly and systematically took over, without firing a shot, the telegraph, the telephone and all government offices with the exception of the Winter palace and the offices of the general staff. The same night Lenin, who had been in hiding since July, appeared at the meeting of the Petrograd soviet and in glowing language congratulated the delegates on inaugurating a new era. The new regime, which established the soviet as the embodiment of supreme power in the state, was thus established one day in advance of the meeting of that soviet congress which had been proclaimed by the Bolsheviks as the sole authority competent to make such a decision. But nobody present at the meeting of the soviet seemed to care, for Lenin announced that the first step taken by the new government would be to offer belligerents a just peace.

Early in the morning of Nov. 7 Kerensky left for the front, in order to bring back troops to crush the revolt. The other members of the government decided to await his return at the Winter palace. But when they were informed that the guns of both the cruiser "Aurora" and the Peter and Paul fortress were trained on the palace, they decided to surrender. When next day the Congress of Soviets formally opened, the non-Bolshevik members and the old executive committee registered a vigorous protest against the unconstitutional methods of the Bolsheviks and withdrew from the congress to join the committee of public defense which had its headquarters at the municipal buildings.

Kerensky meantime made frantic efforts to move the troops from the front to the capital. He succeeded only in persuading the Cossack Gen. P. N. Krasnov to move. On Nov. 11 Krasnov's troops were reported outside Gatchina, about 10 mi. from the capital. Encouraged by this news and definitely expecting a crushing defeat of Trotsky's Red guards, the committee of public defense gave orders to the cadets of the military schools to arrest the military revolutionary committee and to make a general attack on all the soviet strongholds. The attack was made in the morning; but by three o'clock in the afternoon the Bolsheviks, supported by some of the cruisers of the Kronstadt fleet, decisively

repelled it and occupied the military schools. In the report of the events of the day which he sent to the Petrograd soviet Trotsky made the following declaration: "We hoped to establish a compromise without bloodshed. But now when blood has been shed there is only one way left, a ruthless fight." With these words Trotsky proclaimed the approaching civil war. The same night he proceeded to the Gatchina front. Next day he reported the repulse of Krasnov's advanced detachments, and a day later he announced that the Cossack forces had been completely defeated. Kerensky fled, and the Bolshevik regime was now for a time immune from military menace. (M. F.; M. B.)

CIVIL WAR AND INTERVENTION, 1917-21

The Petrograd Revolution of Nov. 7 swept Russia. There were a few days of street fighting in Moscow and sporadic resistance elsewhere, but by the end of the month the soviets held power throughout the country. In the urban centres the victory was won under the red flag of class warfare, with the watchword "All power to the workers' soviets." The words "land," "bread" and "peace" gave the Bolsheviks the support of the soviets of peasants and soldiers.

The soviets were the only strong political force in a social structure whose disintegration was nearly complete. They were the organs of the proletariat, upon which the Bolsheviks, taught by the Marxist doctrine of revolution, were resolved to build their state. They challenged not only the weakened capitalism of Russia but the capitalist system throughout the world. In the first days of success they exaggerated the effect of war weariness upon the masses of western Europe and underestimated the effect of war hatred. Their dream of a new proletarian utopia and their appeals to fellow workers of the world to throw off the burdens of capital and war prepared the way for the conflict that was soon to plunge the new state into a three-year fight for life.

In an all-night session on Nov. 7-8 the Congress of Soviets in Petrograd declared the power of government to be vested in the council of people's commissars, appointed mainly from the ranks of the Bolshevik central committee, with Lenin as premier and Trotsky as commissar of foreign affairs. The first act of the Soviet government on Nov. 8 was to decree that all land belonged to those who worked it, without rent or other payment. This satisfied the peasants, who had been expropriating landlords' estates for several months, and their chief political organization, the Left Social Revolutionary party, decided to collaborate with the Bolsheviks. Vigorous measures were taken to ensure a supply of food for Petrograd and other urban and industrial centres. To reinforce the victory of the industrial proletariat a universal eight-hour day was instituted on Nov. 11, and the control of the factory soviets over industry was established by successive decrees in the next two months.

The peace campaign began on Nov. 9, when Trotsky sent out a wireless invitation to all the belligerent powers to conclude an immediate armistice. The Allied governments at once protested, and their representatives in Russia tried to enlist the commander in chief of the army, Gen. N. N. Dukhonin, against the council of commissars. Dukhonin was replaced by N. V. Krylenko, a member of the Bolshevik central committee, by a soviet decree of Nov. 22. Soon afterward, the former commander was torn to pieces by a mob of soldiers. This deed showed that Lenin had gauged the temper of the army and that the Allied insistence that Russia should go on fighting would be fruitless.

The German government accepted the armistice proposal. After brief negotiations within the German lines a ten-day truce was signed on Dec. 5, 1917. The Central Powers agreed not to transfer troops from the eastern front to the western, but they moved several divisions to France before the end of the year.

Meanwhile the Soviet government was facing serious internal difficulties. The bourgeois classes, at first stunned by the success of the revolution, began to rally. Instead of armed resistance they used the more dangerous weapon of sabotage, hoping to paralyze the Bolshevik regime. With no civil service, no personnel trained in finance, transport and the management of industry, the new government was suddenly called upon to undertake the ad-

ministration.

Lenin met the bourgeois offensive with characteristic energy. Banks and some factories were nationalized, and a supreme economic council was created to manage the latter. Other decrees followed in rapid succession. Some of these were measures of immediate necessity rather than a part of the Bolsheviks' deliberate program. In a sense they were the beginnings of the later War Communism, but all the responsibility for their adoption cannot be laid upon Bolshevik shoulders. Some form of centralization was necessary to prevent economic collapse, and Lenin had previously published a pamphlet demanding nationalization of transport and state control of the means of production to save the country from chaos.

The nationalization of industries was legalized in Dec. 1917. At first it was applied haphazardly. No entire industry was nationalized until May 1918, when a department of the supreme economic council was organized to supervise the monopoly production of sugar. The following month oil production was centralized in the same way, and various other commodities were declared state monopolies. It was not until June 28, 1918, that all industrial and commercial enterprises of more than 1,000,000 roubles' capital were declared the property of the state.

The Treaty of Brest-Litovsk.—While the Soviet government was trying to cope with sabotage and weld local soviets into an administrative machine, relations with Germany were still unsettled. Peace negotiations began on Dec. 22, 1917, at Brest-Litovsk. On behalf of the soviet, Trotsky put forward the principles of no annexation or indemnity and self-determination of subject races. At first the Germans seemed willing to accept, with certain reservations. They demanded the independence from Russia of Poland, Finland and the Baltic states on Dec. 28 and the independence of the Ukraine Jan. 8, 1918. On Feb. 10 Trotsky announced the Soviet refusal to sign a "peace of annexation," but declared the war between Russia and the Central Powers at an end—the celebrated formula "No war: no peace." A week later the German general staff ordered an immediate advance.

When the Germans advanced, Lenin at once decided for peace, but acceptance of the German terms was not reached without a struggle in the central committee. Lenin still believed that a general European revolution, as the result of war exhaustion, was not far distant. His prime object, therefore, was to gain time, a breathing space, as he called it. His associates argued that to yield was to betray the revolution. It was only by a threat of resignation that Lenin beat down the adverse majority. On March 3 a new Soviet delegation accepted the German terms on behalf of the Soviet government. The so-called Independent Government of the Ukraine had already signed a separate treaty, which meant virtual German control, and this the Russians were forced to confirm. The Soviet government further agreed to pay a large indemnity or its equivalent in raw materials. Poland and the Baltic states were left in the hands of the Germans, and the armies of Count Rüdiger von der Goltz and Baron Karl Mannerheim soon crushed the revolutionaries in Finland.

Lenin had won his breathing space, but the agricultural and mineral resources of the Ukraine and the oil of the Caucasus were at the disposal of the Germans, and the German general staff was now free to concentrate its forces against the Allied front in France. Two days after the signature of the Brest-Litovsk treaty Trotsky approached Raymond Robins of the American Red Cross and the British high commissioner R. H. Bruce Lockhart as to the attitude of the Allied governments should the soviets not ratify the treaty or the German advance continue for any other reason. But nothing came of these feelers. The Congress of Soviets ratified the treaty on March 16 by a majority of 523.

Lenin used his breathing space to patch up the administrative and economic machine and to drill an army to defend the revolution. The fight against sabotage was not yet won, and the adversaries of the new regime were growing bolder. Trouble was brewing in the Cossack provinces and in Manchuria, where a hostile army was assembling on Chinese soil. The German threat against Petrograd had driven the Soviet government in flight to

Moscow. The fact that the Allied ambassadors, instead of accompanying the government, had preferred to go to Vologda, junction of the trunk lines of escape eastward to Siberia and northwest to the coast, was no good omen for future relations with the powers they represented.

In the field of foreign affairs the Soviet government had two severe handicaps. From the first the Allies suspected complicity with Germany and were inclined to regard the peace of Brest-Litovsk as a betrayal of the Allied cause. Second, neither they nor the Central Powers believed that a Soviet government in Russia could endure. The Allies declined to recognize the treaty of Brest-Litovsk, which they held responsible for Gen. Erich Ludendorff's victory in March. Their missions in Russia reported that trainloads of war supplies, leather, copper, oil and food were being shipped into Germany. Although the Bolsheviks claimed that this was part of the indemnity imposed by the treaty, the Allies saw it as aid to the enemy, to be prevented if possible. It was suspected that some of their representatives in Russia co-operated with anti-Bolshevik elements to hamper the transfer of supplies.

The Social Revolutionary Revolt.—The breach between the other political parties in Russia and the Bolsheviks had been widened by the suppression of the long-awaited constituent assembly, which met in Moscow on Jan. 18, 1918. About 62% of the votes were cast for moderate Socialists of all kinds. Most of these had gone to the Social Revolutionaries, whose lists had been made up before the Left Social Revolutionaries broke away to collaborate with the Bolsheviks in Lenin's government. The Bolsheviks had got 25% of the votes and the Kadets and other "bourgeois" parties about 13%. The election of a Right Social Revolutionary, Victor Tchernov, as president convinced the Bolsheviks that they had nothing to gain from the assembly, and it was closed by Red soldiers on Jan. 19.

The Left Social Revolutionaries continued for a time to collaborate with the Soviet government, but broke away completely after unsuccessful opposition to the ratification of the Brest-Litovsk treaty. The strength of the Social Revolutionary party was mainly drawn from the villages, which were growing increasingly restive as the Bolsheviks developed their basic program of a workers' government, class warfare and socialism. The peasants had thought that the revolution gave the land to them. They now found it was the property of the state and that its surplus produce over their needs was required for state purposes. The bourgeois groups had become more hostile still, as they realized that their very existence was menaced by the new regime.

Led by Boris Savinkov, Kerensky's former war minister, the Right Social Revolutionaries became the pivot of patriotic and anti-Bolshevik sentiment, eager to co-operate with military representatives of the Allies to nullify the effects of the treaty of Brest-Litovsk. From attempts to blow up depots of stores, railway bridges and trains carrying supplies westward, the Social Revolutionaries proceeded to the desperate coup of assassinating the German ambassador in Moscow, Count Wilhelm von Mirbach-Harff, on July 6, 1918, in the vain hope of provoking Germany to break with the Soviets. The Social Revolutionaries then tried to incite the country to rebellion.

Savinkov captured the town of Yaroslavl, 180 mi. N. of Moscow on the railway to Vologda and Archangel, with a disciplined force which he had hoped to make the nucleus of an army of insurrection. The Red troops from Moscow and Petrograd converged on Yaroslavl too swiftly, however, and retook the town after two weeks. Savinkov escaped, but the possibility of overt resistance by the Social Revolutionaries vanished.

The Czechs.—Forty-five thousand Czech deserters from the Austrian forces had been formed into an army to fight for their country's freedom beside the Russians on the Austrian front. When the Russians collapsed they remained a fighting force, and plans were made in Paris to move them round the world to the western front. In early March 1918 the Soviet government agreed to provide transport across Russia, but the Czech legationaries had continual trouble with local soviets over food supplies and right of way for their trains.

By the middle of May the entire force, moving eastward to the Pacific, was strung out in detachments across 5,000 mi. of railway from Kazan to Vladivostok, a natural prey to anxiety and rumour. On May 14 one of their detachments met a trainload of Austro-German prisoners being repatriated in accordance with the treaty of Brest-Litovsk. A fracas ensued, with bloodshed which involved the local Red forces.

Moscow at once demanded that the Czechs fulfil their pledge to surrender their arms. They refused and, on May 29, forcibly resisted attempts to carry out the disarmament order. In June they fought the Bolsheviks openly throughout Siberia, and the local soviets were powerless against their disciplined troops. At the end of the month their Vladivostok contingent overthrew the soviet there and set up an anti-Bolshevik government with the approval of the Allies. By July 31 almost all Siberia was changed from Red to White and the Czech forces were moving westward to attack the Soviet state.

Death of the Tsar.—The advance of the Czech and White Russian armies brought death to the former Tsar Nicholas II, who with his family had been held for several months at Ekaterinburg. The local soviet professed to believe that the imperial family planned to escape to Omsk, where the White Adm. A. V. Kolchak had established a counter-revolutionary government. Without a trial the soviet voted to execute "Citizen and Citizeness Romanov" and their family and did so on the night of July 16-17, 1918.

Intervention.—The month of August saw intervention in full swing. On Aug. 2 the British, who had already landed forces at Murmansk to prevent war supplies from falling into German hands, disembarked several thousand Allied troops at Archangel; they overthrew the local soviet and set up a provisional government of the north. A few days later British and French contingents landed at Vladivostok, followed by a Japanese division on Aug. 12 and by two U.S. regiments on Aug. 15 and 16. Western Siberia was already in the hands of the Czechs and a number of anti-Soviet governments. On Aug. 24 Anglo-Japanese troops crushed Red resistance in the maritime provinces in a battle on the Ussuri river. Chita was captured on Sept. 6 and organized soviet government beyond the Urals disappeared. The Czechs had seized the chief cities of the northern Volga and an anti-Soviet army was marching from the Cossack provinces of the Don.

At the beginning of the autumn the tide turned. The Bolsheviks threw back the Czechs at the end of Sept. 1918 and halted the White advance from the Don. As Germany weakened on the western front, the Baltic provinces, Finland and the Ukraine lost its support. Turkey was on the verge of capitulation, and Turkish and German control over the Caucasus was vanishing. Lenin's prediction was coming true; the Central Powers and the treaty of Brest-Litovsk were crumbling together, and the European revolution appeared to be at hand. When the German sailors in Kiel raised the red flag on Nov. 9, 1918, the Soviet government saluted the event with triumph.

The Bolsheviks had still to reckon with the Allies. The autumn of 1918 saw the reinforcement of foreign forces on Russian soil. By the end of the year there were approximately 15,000 British and U.S. troops occupying a fan-shaped area in northern Russia, at least 70,000 Japanese holding the important strategic points of eastern Siberia and the maritime provinces, 7,000 Americans protecting the Trans-Siberian and Chinese Eastern railways, and about the same number of British supporting and instructing the armies of Admiral Kolchak, who had become dictator of the so-called anti-Russian government of Siberia by a coup d'état at Omsk on Nov. 18. The French had occupied Odessa with a powerful fleet and a mixed force from Salonika.

The abandonment of the campaign by the Czechs, eager for home, counterbalanced the accession of foreign anti-Soviet forces, and the Whites were not yet in a position to strike an effective blow. When the new year began neither side could show much gain, except that the revolution had reached the Baltic by the establishment of a Soviet government at Riga on Dec. 26.

The Red Terror.—During these months of pressure the Bolsheviks had hardened. Troops were called up, grain and cattle

requisitioned, property confiscated. In the summer of 1918 to external dangers was added a deadlier enemy in their midst. After his defeat at Yaroslavl, Boris Savinkov revived against the Soviet the Social Revolutionary terrorist centre which he had formed years before to combat tsardom by assassination. On Aug. 30, 1918, one of his agents, a girl named Fanny (Anna) Kaplan, shot and wounded Lenin as he left a workers' meeting in Moscow. The following day M. S. Uritsky, chief of the Petrograd Cheka, was shot dead by Social Revolutionaries. The Bolsheviks met Savinkov's terrorism with their own Red terror. The Cheka had been organized in Dec. 1917 to deal with sabotage and other counter-revolutionary manifestations. (The word "Cheka" was formed from the initials of the Russian words meaning "extraordinary commission.") Its power grew to include summary arrest, judgment and execution. In revenge for the wounding of Lenin 500 of the most prominent figures of the old regime were shot that night in Moscow. The killing of Uritsky led to similar reprisals in Petrograd. A veritable reign of terror began.

War Communism.—The effects of this period were momentous. On the one hand it stamped deep into the minds of western countries the belief that Russia had relapsed into Mongol savagery. On the other it confirmed the Soviet leaders in their hatred of the non-Bolshevik world.

Intervention gave impetus and coherence to the work of nationalization, which had been proceeding sporadically. In some cases factories had been nationalized in order to fight sabotage by their owners or managers, in others to legalize confiscation already accomplished by the workers. Under the pressure of war the important industries were given control boards. The attempt to fix prices in a period of acute currency inflation had produced the inevitable flight of commodities from the market. As the situation grew more difficult it became necessary to control not only industry and transport but the supply and distribution of food. From that stage the step to the control of all production and distribution was not a long one for a government of Marxian Socialists.

At first, in the early summer of 1918, restrictions were not so harsh as to prevent much private trade and speculation. It happened that the beginning of the Red terror coincided with the period of greatest food shortage, before the harvest. The extraordinary orders given to the Cheka to suppress internal enemies were quickly directed against speculators seeking for profits.

From the outset an influential section of the central committee of the Bolshevik party had been advocating a full Communist program rather than Lenin's more cautious policy. Circumstances were now on their side, and by Aug. 1918 the period of War Communism which lasted nearly three years may be said to have begun. Private buying and selling were prohibited by law and offenders were severely punished. Cash wages lost their importance. Workers and other employees were given cards for food, clothing and other necessities, free lodging and free transport on trams and railways. All nonworking elements of the population were disfranchised. The peasants were subjected to requisitions of all their crops save what was needed for their households. They obtained nothing but promises in exchange, and the breakdown of distribution and the difficulties of transport in a country ravaged by war progressively diminished their return from their labour. Extreme Communists declared that money would soon be wholly abolished. This hope was perhaps a screen for the conventional motives for inflation and the unavoidable fall in the value of the currency.

Money did not become wholly worthless, and a host of bagmen and hucksters, too numerous and unimportant to be imprisoned, continued private trade. The government tried to eliminate them and by entrusting distribution to the co-operatives, which had had an extensive network in Russia for many years. In spite of these efforts much of the lesser retail trade remained in private hands.

Attempts at Peace.—Representatives of every section of anti-Bolshevik Russians, from the Social Revolutionaries Kerensky and Savinkov to the grand duke Nicholas (Nikolay Nikolayevich), former commander in chief and uncle of the former tsar, went to Paris to enlist the support of the peace conference. But the Allies

were chiefly concerned with Germany. They feared that circumstances might induce Germany and Russia to make common cause, and their first impulse was to neutralize the Bolshevik danger.

On Jan. 12, 1919, the commissar for foreign affairs, G. V. Chicherin, asked the U.S. state department to open peace negotiations. On Jan. 16 the representatives in Paris of Great Britain, France, Italy and the United States discussed a general truce plan for Russia put forward by David Lloyd George. Pres. Woodrow Wilson suggested that representatives of all Russian groups including the Bolsheviks should hold a meeting on the island of Prinkipo in the Sea of Marmora under the auspices of the Allies. The anti-Bolshevik governments in Russia refused to participate and the project was dropped.

In spite of continued hostility on the part of the French another attempt was made to reach a peaceful settlement. William C. Bullitt, attached to the U.S. delegation in Paris, was sent to Petrograd in March 1919. After a week's discussion he brought back peace terms which the Soviet government pledged itself to accept if the Allies agreed not later than April 10. The most important features of this document were a plan for the pacification of Russia on the basis of its several existing governments, a willingness by the said governments, including the Soviet, to recognize responsibility for the financial obligations of the former Russian empire, an exchange of official representatives between the Soviet government and the foreign powers and an immediate withdrawal of foreign troops. In spite of warm support by Col. Edward House and the approval of Lloyd George and V. E. Orlando this project also was shelved, perhaps because of the rapid advance of Kolchak's army, which once more strengthened the belief that the Soviet government was doomed to extinction.

Renewed Intervention.—The White armies of Kolchak in Siberia, of Denikin in southwestern Russia and of Gen. N. N. Yudenich in Estonia had been amply supplied by the Allies with money, equipment and instructors. Kolchak threatened Kazan and Samara, on the Volga, in May and planned to reach Moscow before the end of June, but strategic co-ordination was lacking, neither Denikin nor Yudenich was ready. Kolchak could not withstand the full weight of the Red army, which had now been welded into a competent fighting force. An attempt at diversion by the British in the north came too late to help him.

The next stage of the White campaign was more dangerous. Denikin made rapid progress northward in the summer, and in mid-October had taken Orel, within 200 mi. of Moscow, and was threatening the capital. Simultaneously Yudenich drove at Petrograd. His English tanks broke the weak resistance of the Reds, whose main forces were concentrated against Denikin. Yudenich's advance guard was within 10 mi. of Petrograd before the Soviet troops rallied. Then the tide ebbed. Yudenich was thrown back, and Denikin's offensive, heavily repulsed at Orel, fell to pieces. In December he was making a last stand at Novorossisk in the Kuban, and by April he had fled to Constantinople. Kolchak lost his capital, Omsk, in November and he finally resigned command a month later. The Czechs betrayed him to the Red army at Irkutsk. He was put on trial as a traitor, condemned to death and shot on Feb. 7, 1920. The bewildering collapse of the White armies was caused by the hostility of the masses in the territory they controlled no less than by military defeat.

Kolchak's execution marked the end of the intervention period; nearly all the Allied troops had been withdrawn late in 1919. Japanese troops were still in occupation of Vladivostok, however, and the maritime provinces, and Gen. P. N. Wrangel was reforming the shattered army of Denikin in the Crimea. Later, during the war with Poland, Wrangel had some successes on the mainland, but the armistice released overwhelming forces against him, and in Nov. 1920 the remnants of his army were transported by the Allied fleet to Constantinople.

The Soviet army had been progressively demobilized as the enemy weakened, but the internal economy of the country was in a chaotic state. The peasants, irritated by requisitions, had reduced the production of grain, and industry, which had been harnessed everywhere to war, had to be reconstructed on a peace basis. Trotsky, the commissar of war, proposed that the army

should be utilized directly for production. The "labour army" helped to reorganize transport and some sections of heavy industry, but discontent was generated among the workers.

War with Poland.—Before the situation became critical an emergency, war with Poland, settled the problem. The Soviet government proposed peace to Poland in Jan. 1920 on terms similar to those offered Finland and Estonia. The Poles at first seemed willing to agree, but their circumstances improved as supplies of war material from France and a food loan of \$50,000,000 from the United States strengthened their country. At the end of March they demanded all the territory west of the Polish frontier of 1772, a large cash indemnity and the occupation of the Russian town of Smolensk as guarantee. The Bolsheviks refused, and the Polish army occupied Kiev early in May. Within a month the Bolsheviks struck back. The Soviet cavalry retook Kiev in June, while the main force advanced from Smolensk through Vihnius and along the German border. The Red armies, marching forward almost without combat, converged upon Warsaw. The Polish retreat became a rout, and by the middle of August the Russians had reached the outskirts of the city.

France and England were appalled; a sovietized Poland would mean bolshevism in the heart of Europe. The French therefore sent Gen. Maxime Weygand, with a small group of officers, to Warsaw. The counterattacks beginning on Aug. 14 were completely successful, almost overnight, with little fighting, the Red armies were in retreat. A great part of the troops on the German border gave up their arms. On Oct. 11, after Polish territory had been entirely cleared, an armistice agreement was concluded at Riga. On March 18, 1921, peace was signed on terms favourable to Poland, with a new frontier which placed 4,000,000 Ukrainians and White Russians under the Polish flag. Again the Soviet government had paid a heavy price for peace. (See *RUSO-POLISH CAMPAIGN*.)

De Facto Recognition.—An improvement of relations with the new Baltic states followed the collapse of Denikin and Yudenich. In the autumn of 1919 Maxim Maximovich Litvinov was sent by the Soviet to Tartu (Dorpat) in Estonia to negotiate peace with Estonia and Finland. Peace treaties with both states were signed early in the following year on reasonable terms. A settlement with Latvia was delayed by the Lettish claim to the province of Letigalia. The Letts refused to negotiate and in a three-week campaign, Jan. 3-24, 1920, drove the Red troops from the province. Peace with Latvia was signed on Aug. 11, 1920. In the previous January the Allied blockade had been lifted. Anglo-Russian negotiations began in the winter of 1919-20 but were interrupted by the Polish war, and it was not until March 16, 1921, that a trade agreement according to *de facto* recognition to the Soviet was signed in London. In the same year similar agreements were made with Germany (May 6), Norway (Sept. 2), Austria (Dec. 7) and Italy (Dec. 26).

SOVIET AFFAIRS TO 1941

The new regime was faced with the constitutional problem of blending together the real authority of the council of people's commissars with the nominal sovereignty of the soviets. This was possible because of the prominence, in both council and soviets, of the Bolsheviks, who took the title of All-Russian Communist party (of Bolsheviks) in March 1918. The task of constitution making was fulfilled in the constitution of July 10, 1918, which remained the fundamental document of Soviet constitutionalism. It applied only to the Russian Socialist Federal Soviet Republic, which consisted essentially of the Great Russian core of the old empire together with Siberia; its federative form reflected the exploitation by the Communists of the national grievances of the non-Russian peoples embedded within it. In addition, the course of the civil war had finally resulted in the setting up of Soviet governments in the Ukraine and in White Russia and also in Georgia, Armenia and Azerbaijan—which were formed into a Transcaucasian federation in Dec. 1922. In form, the Ukraine, White Russia and Transcaucasia were independent states, linked with the R.S.F.S.R. only by treaties of a peculiarly intimate kind; but their governments owed their existence to the Red army and

were firmly under the control of the Communist party, which remained a single centralized unit.

Early in 1922 Joseph Vissarionovich Stalin (*q.v.*), the general secretary of the Communist party, was instructed as commissar of nationalities to draw up a plan of federation between these governments. In Dec. 1922 the first Congress of Soviets of the U.S.S.R. met at Moscow and confirmed the pact for the formation of a union. The Far Eastern Republic, a semi-independent buffer state closely affiliated to the R.S.F.S.R., had been merged with the latter in the preceding November.

The constitution of the new state, the Union of Soviet Socialist Republics, was accepted by the central executive committee on July 6, 1923, and became effective from that date. To the four allied republics two others were added in 1925 by the inclusion of two central Asian republics, Turkmenistan and Uzbekistan. These were formed partly of Turkistan (an area hitherto within the R.S.F.S.R.) and partly of the old amirates of Khiva and Bukhara (which had been gradually sovietized after their subjection to Soviet power in 1919-20).

As in other federal constitutions, the powers of government in the U.S.S.R. were nominally divided between the centre and the constituent republics. But the division of functions left to the central power not only the usual ones relating to external relations and defense but most of the major economic ones.

The centre's overriding authority was guaranteed in a number of ways. Indeed the whole process was little more than an extension of the R.S.F.S.R. constitution to cover the whole area under sovereign control. No real importance could be attached to the affirmation of the right of the republics to secede from the federation. Those states of the old empire which had successfully seceded and maintained their independence—Poland, Finland, Estonia, Latvia and Lithuania—had done so because non-Soviet regimes with foreign support had finally established themselves against Russian-backed Soviet movements.

The most important unifying force of the new state, which contained so many races, creeds and languages, was not mentioned in the constitution. The Communist party, with its rigid discipline and centralized authority, was destined to control each of the constituent states and to cement them more firmly together.

The Peasants and the Famine, 1921-22.—War Communism pressed heavily upon the peasants. Difficulties of transport and distribution prevented them from receiving manufactured goods in exchange for their requisitioned food products, and although their contribution to the national budget decreased proportionately as the currency emission to cover deficits grew greater, their position showed no corresponding improvement. Administrative confusion, red tape and contradictory instructions made the requisitions more onerous. Gradually the peasants reduced the area sown and concealed the harvested grain. The total harvest in 1921 was only about 40% of the average yearly harvest in 1909-13, while the area sown had decreased by almost one-half and the yield per *desyatina* had decreased by more than one-third. The decline was progressive from 1916 to 1921, except that the yield per *desyatina* improved slightly in 1921.

The Bolsheviks tried to counter this passive resistance by an extension of class warfare to the villages. They divided the rural population into three groups: rich peasants ("kulaks" or exploiters), middle peasants and poor peasants. The poor were their protégés, they said, the middle their friends and the rich their enemies. In 1918 "committees of village poor" were organized to supervise the grain requisitions and to take the part in village management which had hitherto belonged to the prosperous peasants. These were soon replaced by the village soviets, over which the Bolsheviks had established control. It was hoped that by this means kulak opposition would be overcome without antagonizing the middle peasants.

Events showed that the rural communities were no favourable terrain for class warfare. The ties of family and religion, a common dislike of tax collectors, towns and townsmen, and a sullen distrust of any central authority which took their young men as soldiers and requisitioned their grain and cattle proved stronger than arbitrary distinctions. Many of the middle peasants were

the young relatives of kulaks, whose chief aim was to become kulaks themselves; many of the poor were dependent, ignorant and shiftless. Bolshevik orators and newspapers spoke only of kulak opposition, but the attempts to apply class warfare and communism to the villages were resented by the middle peasants also.

Peasant delegates to the eighth and ninth congresses of the Communist party in 1919 and 1920 had expressed the murmurs of the villages, and there were signs that the army, largely recruited from the middle peasant class, was growing restive. The Polish war brought a new *elan* of patriotic ardour in which this sentiment was for a time forgotten, but early in 1921 it burst forth. In February the garrison of the naval fortress of Kronstadt, near Petrograd, demanded the abolition of the grain monopoly, and a mutiny followed which was suppressed only after heavy fighting. Almost simultaneously the peasants of Tambov, one of the central provinces of Russia, refused to yield their grain to requisition. Troops sent to enforce obedience made common cause with the peasants. Resentment had become revolt.

Lenin realized the danger and induced the tenth Communist congress in March 1921 to sanction a decree substituting a graduated food tax for the system of requisitions. Commodities demanded by the peasants, kerosene, salt, tools and leather, were rushed to Tambov, to be sold or bartered on a free trading basis. Those measures quickly ended the revolt. The source of trouble had been economic discontent rather than political unrest or counterrevolutionary agitation.

It is significant that both these outbreaks occurred at the end of winter, when climatic conditions had caused a failure of the autumn-sown grain and the peasants, whose reserves were depleted by requisitions, were beginning to fear one of the famines that had devastated Russia periodically. Their anxiety was well founded. A prolonged drought in the early summer ruined the spring-sown grain throughout the black earth districts of the Volga, north Caucasus and Ukraine. By the middle of July 1,000,000 peasants were in flight from their parched fields toward the centres of urban and river transport, where they were huddled in refugee camps infested with cholera and the epidemics caused by malnutrition. The crop failure was reckoned to have affected an area inhabited by 20,000,000 to 30,000,000 people. Unless help was forthcoming, at least 10,000,000 seemed doomed to die from starvation before spring.

In July the Soviet government permitted an appeal by the writer Maxim Gorky to Herbert Hoover, then chairman of the American Relief administration (A.R.A.), which had kept alive millions of hungry children in Belgium and northern France during the war and had been at work later in central and eastern Europe. Hoover agreed to help, and a *modus operandi* was soon arranged between the A.R.A. and the Soviet authorities. This example was followed by a number of European charitable organizations, but the brunt of the work was done by the A.R.A., which at the peak of its activity, in March 1922, was giving daily rations to 10,000,000 children and adults. Altogether foreign aid fed probably 12,000,000 persons, and the Soviet Relief administration maintained at least an equal number.

It was difficult to estimate the famine death toll because of the confusion between disease and starvation in the vital statistics. Deaths from actual hunger probably did not exceed 500,000. Foreign relief for the famine rendered two other important services. It allayed much of the xenophobia provoked by intervention and thus paved the way for a renewal of normal relations between Russia and the outer world. It also helped the Soviet cope with the problem of disease, especially cholera and typhus, which had been epidemic in Russia for centuries; after 1922 there was no widespread recurrence of either pest.

The New Economic Policy.—It is customary to regard the New Economic Policy instituted by Lenin in the spring of 1921 as a more or less temporary abandonment of communism to mollify the peasants. There is no question that an influential section of the Communist party saw it in that light. Lenin himself may not have shared this view. He was above all a realist, alive to the practical necessities of the moment. He had shown that he was well aware of the anachronism of an industrial proletarian revo-

lution in a country 85% of whose people were backward peasants. By force of circumstance and the exigencies of war he had been compelled to adopt a program of socialist centralization which many of his followers welcomed as the correct and natural policy of a socialist state.

Before the Communist party reached a new decision in its protracted discussion of agrarian policy in 1920 and 1921, Lenin found himself advocating not merely a change with regard to requisitions and the grain monopoly but also a general readjustment of the economic framework. The reform of industry for peace purposes would require effort and expenditure which the state was unable to provide, and finance and transport were also in a desperate position.

Lenin's influence and insistence won. His critics had no valid alternative to offer. The New Economic Policy (called N.E.P.) was confirmed by a decree published Aug. 9, 1921. It permitted freedom of trading within the country, sanctioned overtime and piecework payment for workers, offered encouragement to foreign capitalists and concessionaires and recognized by implication the rights of private property which had been abolished under War Communism. The state continued its monopoly of foreign trade into the N.E.P. period, but later a number of the more important trusts into which Soviet industry was divided were allowed to trade abroad directly.

During the period of civil war and War Communism the financial tools of capitalist states had been laid aside. Private banks, cheques, securities—all had gone. Money had depreciated rapidly as more and more of the national budget was covered by inflation; 85% of the 1920 budget was provided by the emission of notes.

If the New Economic Policy was to succeed it clearly had to have banking facilities and a more convenient medium of exchange. The shift of policy was quickly made. The state bank was established in the autumn of 1921 and given the authority to issue bank notes as well as to serve as a credit institution. On Nov. 16, 1921, it began credit operations. By a year from that time the essentials of currency reform had been prepared, and the bank began to issue notes. The monetary unit chosen for the new bank notes was the chevrontes, with a gold value of 10 pre-war roubles; that is, 119,486 gr. of fine gold or \$5.146 in United States currency. The rouble was thus given its prewar gold equivalent. The law provided that the new bank notes should be secured to 25% by precious metals and foreign currencies. For a time the chevrontes circulated side by side with the earlier *sovznaki* (government or "Soviet" notes), whose value was adjusted to the chevrontes from day to day. In March 1922 the emission of *sovznaki* was stopped and in May they passed out of circulation. Henceforth the currency system of the Soviet government was on the same general basis as that of western countries.

The reform of the currency required in turn the establishment of the state budget on a solid foundation, since the government could no longer print notes to meet the deficits. Agricultural taxation, which had been substituted for requisitions early in 1921, was again revised. In May 1922 a single tax in kind was established by decree, and the peasants were permitted to pay in specified commodities the graduated taxes imposed. In May 1923 a more extensive reform was made. Cumbersome miscellaneous taxes were swept aside, a single agricultural tax was substituted and money payments gradually replaced commodity payments. Meanwhile, urban taxation had been developed by indirect taxes and income and property taxes, so that the peasants, instead of forming the principal taxpaying body of the state, came to furnish only a small fraction of the national income.

The most radical change involved in the New Economic Policy was the restoration of the whole internal economy of the country, industry, commerce, transport, housing and employment, to a straight money basis. Instead of the vague system of accounting prevalent under War Communism, every state enterprise was compelled to issue a regular balance sheet and to show profit and loss in the old-fashioned way. Employees received a regular wage paid in cash. Housing committees were entitled to charge rent on a graduated scale in accordance with the social position and earnings of the tenant. The railways and tram companies were al-

lowed to charge fares for passengers and freight.

Communist critics of the New Economic Policy were perhaps justified in declaring it a reversion to capitalist methods. In any case, the Soviet government could not avoid the process of decentralization which was a phase of postwar reconstruction in all the belligerent countries of World War I. For them, no doubt, wartime centralization and control boards were matters of necessity rather than choice. For the Bolsheviks, choice and necessity coincided. But if centralization proved unwieldy in the advanced industrial countries of the west, it was a yet heavier burden upon the backward economy of Russia. Under the New Economic Policy a great many nationalized enterprises were released, not to former proprietors or private owners, but to face competition in the open market. The financing of such corporations was carried out by the Industrial and Commercial bank and by other new banking establishments.

As the New Economic Policy developed, industry was divided into "trusts," as they were called, such as the Oil trust, the Coal trust and the Flax trust, at first horizontal in character, but gradually becoming vertical also. With the trusts, which were organs of production, were associated syndicates, organs of sale and purchase, handling both foreign and internal trade. The trusts were later divided into sections; for example, the Oil trust subdivided into Azeft (Azerbaijan Oil), Grozneft (Grozny Oil) and Emba-neft (Emba Oil). United action and governmental control were secured by an expansion of the supreme economic council to include representatives of the trust sections, so as to form a kind of industrial general staff.

The New Economic Policy stimulated the foreign trend toward commercial *rapprochement* with the Soviet, and in the spring of 1922 an international conference was held at Genoa, It., where the Soviet envoys for the first time met foreign statesmen on equal terms. The atmosphere was at first cordial and a proposal was made to provide financial assistance to the Soviet on condition that the debts of the tsarist government were recognized. A period of haggling followed, but on April 16, 1922, Germany and the Soviet government privately signed an agreement at Rapallo, It., shelving the debt question, affirming mutual friendship and re-establishing full diplomatic relations. This unexpected event revived fears of a Russo-German combination to upset the treaty of Versailles, and the Genoa conference ended without reaching a solution. There were obvious limits to Soviet-German co-operation in the political field; but there was henceforth a silent collaboration in military matters by which the Russians received help for the reorganization of the Red army and gave Germany facilities for circumventing the disarmament clauses of the Versailles treaty. Although a meeting of experts to discuss financial matters was held in the summer at The Hague, Neth., prospects of a settlement were never bright and little was accomplished.

The Soviet government took the position that the western powers had tried to enforce a humiliating abandonment of the principle of the repudiation of tsarist debts and of the monopoly of foreign trade, which it had now come to regard as one of the main pillars of its economic system. If the stability of the new currency was to be maintained, rigid control over exports and imports was imperative. But in the first years of the New Economic Policy foreign trade was somewhat hampered by the attempt to force it all through the bottleneck of an untrained bureaucratic department. With growing experience there was a tendency to transfer the placing of orders and sales abroad to the trusts directly concerned, while the foreign trade department continued to act as control. Soviet trading corporations were established in London, Berlin, New York city and other centres. French and U.S. businessmen hesitated to allow long-term credits, but the English and Germans found them possible, and the volume of trade steadily increased. Some trade was still carried on by the Russian co-operatives, which, since they were a pre-Soviet organization, had been allowed by some western countries to trade with them in the pre-N.E.P. period. But it was much less important. The policy of industrial and mining concessions to foreign businesses was unproductive and not of long duration.

The growth of exports was the most striking change after the

introduction of the New Economic Policy. Total trade expanded, and imports, following the Soviet policy of rigid control, fluctuated widely; but exports were multiplied two and one-half times between 1922 and 1923 and were nearly doubled again in the newly established fiscal year ending Sept. 30, 1924.

The first years of N.E.P. showed a corresponding improvement in internal trade and production. Indications that turnover was multiplied by four between the summer of 1922 and the spring of 1924 were probably not far wrong. In the autumn of 1923 prices of agricultural products fell to 60% of the prewar level. Meanwhile, stimulated by the necessity for showing profits which the New Economic Policy required, the trusts and other industrial enterprises had raised the prices of manufactured goods to 80% above that level. The disproportion was so great that the peasants refused to sell grain or buy goods. Warehouses were glutted and industrial stagnation was threatened. Trotsky used the word "scissors" to describe the crisis which followed, because the graph illustrating the ratio of industrial and agricultural prices to the prewar average had the form of opened scissors, with industrial prices forming the upper blade.

To close the scissors was imperative. It was done in six months, by the sale of goods below cost price, which swept away most of the paper profits of the trusts but removed the danger of industrial stagnation, and by the progressive increase in the price of food products. Although this serious crisis was past, the task of keeping the scissors closed remained one of the major problems of the Soviet state.

The comparative liberty given to private trade under the New Economic Policy had produced a host of prosperous *nepmen*, as they were called. They were largely middlemen, retail traders and small manufacturers, for the state continued to hold the principal sources of production and wholesale business in its own hands. They doubtless served their purpose in getting the commercial machine back into running order and furnishing new accumulations of capital; but they were peculiarly repugnant to the extreme Communists and to the organized workers.

By the beginning of 1924 the New Economic Policy may be said to have justified itself as a practical measure. Currency had been restored to a gold basis, production was approaching prewar standards and agriculture had recovered from the effects of the famine and civil war. Much of the improvement had been caused by the *nepmen* and the *kulaks*. For a further discussion of the New Economic Policy see *Economic and Financial Conditions*, below.

Foreign Relations, 1924-28.—The outer world seemed ready by 1924 to believe that Russia had now entered upon an evolutionary process similar to that which followed the French Revolution under the Directory and was eager to share in the development of the country's vast resources. But it misunderstood the determination of the Soviet leaders to retain their position and their conviction that the regime could not afford to allow the growth of bourgeois elements or the survival of a landowning peasantry. Nor was the ultimate expectation of the world revolution absent at any time from the calculations of Soviet leaders of any group. Such differences of policy as emerged were concerned with means rather than ends. During Lenin's lifetime his authority served to settle most issues that arose; but already during his long last illness important fissures in the Communist party revealed themselves, and his death on Jan. 21, 1924, precipitated a struggle for the succession which lasted for several years and in the course of which the remnants of democracy in the party vanished as they had already long vanished in the organs of the state.

The effect of Lenin's death had been discounted abroad because of his long illness and absence from public affairs. The growing prosperity of the Soviet state had stimulated the interest of foreign businessmen, who were beginning to feel that trade would be improved by the establishment of regular diplomatic and consular relations with Russia. Germany had taken this step two years before. The new Labour government in England had promised to do the same as one of the means of diminishing unemployment, and the Fascist government of Italy was seeking new fields for commercial expansion. France was still preoccupied

with the memory of its lost loans to the tsarist government and with its own reconstruction problems, but French hostility to the Soviet had to some extent diminished.

On Feb. 1, 1924, the British government recognized the Soviet *de jure*. Other countries followed in rapid succession, and by the beginning of 1925 all the great powers except the United States had established diplomatic relations with the Soviet Union. The order was as shown in Table IV.

TABLE IV.—Recognition of the Soviet Government

Country	Date	Country	Date
Great Britain . . .	Feb. 1, 1924	Sweden . . .	March 15, 1924
Italy . . .	" 7, "	Denmark . . .	June 18, "
Norway . . .	" 12, "	Mexico . . .	Aug. 18, "
Austria . . .	" 30, "	Hungary . . .	Sept. 18, "
Greece . . .	March 8, "	France . . .	Oct. 28, "
Danish . . .	" 13, "	Japan . . .	Jan. 7, 1925

Japanese recognition had been delayed by their claim to compensation for a massacre of Japanese soldiers by Red partisans in the Siberian town of Novo-Nikolaevsk (later Novosibirsk) in May 1920. Although the Japanese had evacuated Vladivostok and the mainland in Nov. 1922, they retained northern Sakhalin until their claim should be satisfied. After two failures negotiations were resumed in Aug. 1924, and recognition was granted on Jan. 1, 1925. A supplementary agreement on Jan. 30 pledged the Japanese to withdraw from northern Sakhalin before the end of May and gave them important oil and coal concessions in the Russian half of the island.

The establishment of normal diplomatic relations led to an increase of foreign trade, but the absence of a settlement of tsarist debts, war debts and private claims prevented any extension of loans to the Soviet. Nevertheless, short-term credits were soon arranged in many countries, and the regularity with which Soviet bills were met gradually overcame distrust. A number of important English firms gave terms of credit running from three to five years. In 1925 Germany provided a state-assisted credit of 300,000,000 marks for a period of three years. The French and Americans were more cautious, but heavy annual purchases of cotton in the United States on a short-term credit basis were made possible by longer credits elsewhere and by the general improvement of Russia's economic situation.

Another factor, however, hampered not only financial but political relations between the Soviet and the rest of the world. It was interference in the internal affairs of foreign countries by the Third or Communist International, known as the Comintern. Founded by Lenin in March 1919, the Third International was pledged to the cause of world revolution, which had, Lenin declared, been betrayed by the Second International of Amsterdam. Its establishment completed the split which had taken place in the socialist movements of most countries during World War I. The Russians insisted that the choice be made, and almost every advanced country came to have a Communist party looking to Moscow as well as a Socialist party still affiliated to the Second International.

The Comintern was an aggregation of Communist parties, and in theory, at least, the successful Communist party of Russia was no more than *primus inter pares*. The avowed purpose of the Comintern to overthrow their regimes and institutions by violence caused foreign powers to take a different point of view. Declining to regard casuistic distinctions, they considered the Comintern and the Soviet government as vassals of one lord, the Russian Communist party.

Moreover, the Comintern extended its activities to the colonies of foreign powers and to semicolonial countries or spheres of influence, such as China. This caused ill feeling between Russia and the foremost colonial power, Great Britain, and in May 1923 Lord Curzon, as foreign secretary in the Conservative government, addressed to Moscow a note on the subject so sharply worded as to be the equivalent of an ultimatum. There were a number of points at issue, but the question of Communist propaganda in Great Britain and its colonies was the principal grievance. The Soviet government acceded to the British demands, under protest; but the propaganda ghost was not laid, and it continued to

trouble Anglo-Russian relations.

The British Labour government of 1924 took steps toward a friendly settlement with the Soviet Union. An agreement was reached in the autumn of 1924 whereby the Soviet promised to repay old debts over a long term of years in return for immediate financial aid. Before the accord could be signed there was a general election in England, in which no small role was played by a letter said to have been written by G. E. Zinoviev, president of the Communist International, giving instructions about the Communist attitude toward the election and Communist activities in the British army. The Labour party was decisively beaten, the Conservatives returned to power and the agreement with the Soviet was shelved. The stir caused by this incident might have been forgotten but for events in Asia and other colonial regions.

Asiatic Interests.—In 1919 Russia's influence was a negligible factor in Turkey and the near east, Persia, Afghanistan and China. England, on the contrary, had never held so strong a position and seemed on the verge of obtaining permanent control over what had formerly been the buffer states between its empire and the tsar's.

Three years later, however, the Soviet had signed treaties of friendship with Turkey, Persia and Afghanistan, as states independent of external influence, and established a virtual protectorate over Outer Mongolia. The central Asian principalities of Khiva and Bukhara were firmly under Soviet rule, and the new Russian republic was now ready to challenge Britain in China.

The Soviet government and the Comintern achieved this result jointly, under Lenin's guidance. The former disavowed unequal treaties, capitulations, treaty ports, protected areas and unilateral tariffs, while the latter devoted its energies to fostering not Communism but nationalism, by virtue of the Leninist doctrine of colonial slaves. This doctrine was Lenin's answer to the question which had long perplexed orthodox Marxists; namely, why the working masses of western Europe had failed to revolt, as Marx had predicted, against their capitalist masters. Lenin argued that the surplus profits from the exploitation of colonies and semicolonial countries such as China had enabled the European capitalists to maintain their "wage slaves" above the starvation level which would make revolution inevitable. To free such countries from capitalist exploitation would therefore be a long step toward the proletarian world revolution. Lenin thus reconciled three apparently contradictory forces, the nationalist aspirations of colonial and semicolonial countries, the spirit of Marxist Communism and the reborn desire of new Russia for expansion.

The Mongolian treaty of Nov. 1921 caused irritation in Peking and helped delay a full accord between the Soviet and Chinese governments until May 31, 1924. In a manifesto issued in July 1929 and formally repeated in Sept. 1920, the Soviet had affirmed in the most categorical manner its renunciation of previous pacts infringing Chinese sovereignty in any way, its abandonment of all claim to the Boxer indemnity and its willingness to treat with China on terms of full equality.

The treaty of 1924 put a Soviet ambassador, L. M. Karakhan, in the old tsarist embassy in the Legation Quarter of Peking. Meanwhile, the Communist International was at work in south China, where both Russian and Chinese Communists supported the Nationalist slogan, "China for the Chinese!" As the Nationalists advanced northward from Canton, the influence of their Russian advisers, Mikhail Markovitch Borodin (Gruzenberg) in political affairs and B. K. Galen (Blücher) in the army, grew stronger. By March 1927 the Nationalists were masters of south China, including the Yangtze valley, and the Chinese section of the greatest treaty port, Shanghai.

At this moment Chang Tso-lin, the anti-Nationalist dictator of Peking, raided the premises of the military attaché in the Soviet embassy there, with the knowledge and permission of the foreign diplomatic corps. A mass of documents was seized and a number of arrests made, including subordinate members of the Russian staff and Chinese Communists who had sought refuge in the embassy compound.

The documents published immediately showed a financial connection between the Soviet embassy in Peking and the Comintern

or unofficial activities of Borodin and Galen in south China. A rupture of relations between Moscow and Peking followed. The foreign powers, especially Great Britain, began to realize the danger of the position. Strong military and naval forces enabled the foreigners to retain the treaty ports and the Legation Quarter of Peking, but they were compelled to abandon their privileges at Hankow on the middle Yangtze, which for a time became the Nationalist headquarters.

In 1927, however, there was a break between the Nationalists and the Russians. The Communists were pressing for a more radical agrarian policy with which the Nationalist leadership had no sympathy. They were also trying to direct the whole force of the Nationalist drive against European and, particularly, British interests in China. By the end of the year, the Russian advisers had left, the Chinese Communists were being vigorously suppressed and relations between the Chinese Nationalists and the Soviet government had been severed.

Relations with the West, 1927-28.—Events in China had increased anti-Soviet feeling in Great Britain, already aggravated by Russian financial contributions to the British coal miners on strike in 1926 and in May 1927 the premises of the Soviet trading corporation in London, Arcos, were raided by the police. In this case no seized documents were made public, but the result was similar to that in Peking. Diplomatic relations between England and the Soviet were severed on May 24, 1927. This caused a reduction of English credits and imports and thus affected the internal economic situation, which had now come to depend in no small measure upon smooth relations with foreign capital and business.

The rupture with England did not, however, prevent the Soviet from taking part in international disarmament conferences at Geneva, Svitz, in the autumn of 1927 and the spring of 1928. Disarmament had long been advocated by the Soviet government, which in the winter of 1922-23 had attempted to arrange a scheme of armament limitation in a conference with its neighbours, Poland, Finland and the Baltic states. At Geneva the Soviet government proposed to begin immediately the progressive reduction of land, sea and air forces. The other European powers were distrustful and unprepared for such sweeping action, and the conferences ended without result.

Although the Geneva conferences did little to improve the relations of the Soviet with the leading powers of western Europe, and although the Soviet was excluded from the number of original signatories to the Kellogg World Pact of Non-Aggression signed at Versailles in the summer of 1928, there were signs in the following autumn that the United States, which had become a reservoir of capital for European postwar reconstruction, was beginning to modify its aloof or even hostile attitude toward the Soviet.

In the autumn of 1928 a contract between the Soviet trading corporation in New York city and the General Electric company in the United States, giving the former five years' credit on purchases, was the first real breach in the "credit blockade," as it was called, which had hampered business relations between Russia and the United States.

Internal Politics, 1924-28.—Lenin's death occurred at a time when the growing prosperity of the nepmen and the new *bourgeoisie* had begun to raise fears in the minds of many Communists that the New Economic Policy might become a surrender to capitalism. It was felt, moreover, that the state business organizations were now sufficiently strong to take the place of private enterprise and that the restoration of the currency to a sound basis would permit their being financed by the newly created state banking organizations. In the first half of 1924, therefore, private trade was loaded with heavy taxes and other restrictions. The nepmen were unpopular with the masses and the measures taken against them were not unwelcome, but the reduction of private enterprise in the towns led the extremist section of the Communist party to demand a similar suppression of "capitalist elements" in the villages. The struggle between the forces of capitalism and socialism thus provoked a sharper struggle within the Communist party itself. In the first part of the controversy, 1925-26, the opposition, led by Trotsky, tried to force the social-

izing process, which was the avowed aim of the Communist party, at too swift a pace.

In the cities the state might now hope to supplant the nepmen without economic disorganization, but in the villages it was still dependent upon the kulaks, who produced the grain surplus needed for export and to feed the urban centres. When Trotsky demanded their repression the majority of the Bolshevik leaders did not yet see how they could be replaced, and the Communist party congress of April 1925 confirmed the rights of "individual peasant producers," despite a screen of antikulak phrases to cover this compromise with Marxist principles.

A good crop in the summer of 1926, however, strengthened national food resources and brought forward a demand that the village capitalist be curbed. He was becoming dangerously strong, and the state had begun to feel, as it had about the nepmen two years before, that it could do without him. The opposition platform, therefore, was in accord with prevailing Communist sentiment, and by 1927 it had attracted such prominent figures of the Bolshevik regime as Zinoviev, the president of the Third International, and L. B. Kameney, one of Lenin's closest associates. But Trotsky's adherents declared that their arguments were perverted in the official press and that they were not given proper opportunity to state their case. They had recourse to underground methods, which the majority denounced as an attempt to split the party. The adherents of Trotsky refused to abandon their tactics and, after a hot discussion at a joint meeting of the party's central committee and control commission in Nov. 1927, were expelled from the party. At the 15th party congress in December Zinoviev and Kameney capitulated to the majority and asked to be readmitted into the party as rank-and-file members. Trotsky was sent into exile in central Asia in Jan. 1928 (he was later allowed to go abroad). Soon afterward, it became clear that the majority had adopted the opposition's program of repressing the "capitalist elements" in the villages.

The immediate reason for this step was the failure in the summer of 1927 of the state grain collections. This was the name given to the system of state purchases of grain to provide for the needs of the urban population and the army and for export. In the previous year the state had collected approximately 70,000,000 tons of cereals, of which more than 2,000,000 were exported, and it was planned to collect an equal amount in 1927-28. A renewal of the "scissors" disproportion between the prices of grain and manufactured goods caused difficulty. The peasants preferred to keep the grain for themselves and their stock, rather than sell it. Communist sentiment was already prepared for a drive against "anti-socialist forces" in the villages. During the spring and summer of 1928 vigorous measures, reminiscent of the War Communism period, were employed to extract surplus grain from the richer peasants, who were described as class enemies.

The quota was attained, but the growing needs of the towns left only a small margin for export, which fell to less than 500,000 tons. This reacted unfavourably upon the foreign trade balance, which had now become most important because in 1927 the state had embarked upon an ambitious five-year program of industrialization (that is, an attempt to build up a self-sufficient industrial production) which required heavy purchases of machines and raw materials abroad. The enforced collections of grain caused much discontent in the villages, and in July 1928 the central committee of the Communist party announced their abolition and promised that they should not be repeated. Once again Communist insistence upon class warfare in the villages had overemphasized the distinction between kulaks and the rest of the peasants.

For an account of the first five-year plan, introduced in 1928, see *Economic and Financial Conditions*, below.

(W. Dv.; M. Br.)

The Rise of Stalin.—Joseph Vissarionovich Stalin emerged as the outstanding leader of the Soviet regime during this period. Although he held no state office until the spring of 1941, when he succeeded his faithful adherent Vyacheslav Mikhailovich Molotov as premier, after being hitherto simply general secretary of the central committee of the Communist party, his power in every field, political and economic, was absolute and unquestioned. It

became almost a matter of course to ascribe every Soviet achievement, political, military, economic or social, to his genius and initiative.

Stalin's personal power was further confirmed by the political elimination and, in many cases, by the physical execution of most of the leading "Old Bolsheviks," the men who, along with Lenin and Trotsky, had played prominent roles in the first years of the revolution. Trotsky himself had first been banished to Turkistan and then sent into exile, finally taking up residence in Mexico. There he was murdered in the summer of 1940. Meanwhile, there had been three spectacular trials of prominent revolutionaries in Russia, in Aug. 1936, Jan. 1937 and March 1938. The defendants confessed various acts of treason and sabotage, and almost 50 persons were sentenced to death. Among the victims of these trials were some of the most famous names of the revolution and of the early phases of the Soviet regime. They included a former premier, A. I. Rykov; two former presidents of the Communist International, Zinoviev and Nikolay Ivanovich Bukharin; the once-dreaded chief of the O.G.P.U. (successor of the Cheka as political police), G. G. Yagoda; and many former diplomats, cabinet ministers and prominent economic executives. Marshal M. N. Tukhachevsky, one of the most gifted leaders of the Red army in the civil war, and seven generals of the Red army were shot after an alleged secret trial in June 1937. Throughout these years there were many secret executions, some of which were and others were not subsequently reported, and a far greater number of incarcerations in labour camps and administrative banishments.

The trials and the accompanying purge were a dark and debatable subject. Foreign critics emphasized the factual discrepancies in certain details of the trials which were subject to verification in foreign countries; they interpreted the whole purge as a method of ensuring Stalin's personal power and the confessions as the false self-incriminations of exhausted and broken men, who were influenced by threats against their families. Stalin's power certainly remained unshaken, and the regime stood up to the shock of war without the internal disintegration which had been predicted as a result of the purges. It is, of course, quite possible that the masses of the Russian people who were not involved in the purge viewed with relative indifference this ruthless destruction of one part of the ruling class by another.

The Constitution of 1936.—The All-Union Congress of Soviets adopted a new constitution for the U.S.S.R. on Dec. 5, 1936. This instrument provided for direct, instead of the formerly indirect, election to the new bicameral national legislature, the supreme soviet, with representation in one house based on population, in the other on nationality (there were at that time 11 soviet republics in the union).

Politically, the new constitution brought little if any change in practice. Stalin remained a dictator of unlimited powers. Only one political organization, the Communist party, remained legal, and its dominant role was for the first time given constitutional sanction. Nor was any opposition permitted to manifest itself in speech or writing after the promulgation of the constitution.

Socially, however, and in everyday life, there were considerable changes in Russia after the end of the first five-year plan. There was no reversion to private capitalism, but in the overriding interests of productivity there was toleration and even encouragement of much more material inequality than would have been found during the bleak, austere period of the first five-year plan, when the acute shortage of food and consumers' goods almost enforced a kind of equality of privation. The discrepancy between the incomes of the higher members of the bureaucracy, army and O.G.P.U. officers, industrial executives, popular authors, engineers, etc., and those of the masses of workers and peasants became greater, as also did the difference in wages between skilled and unskilled workers.

There were significant changes of emphasis in education, in literature, in cultural life. The state set the tone in all these fields; there was no tolerance for the dissenter. But the Soviet school, experimental and loosely disciplined for more than a decade after the revolution, became much stricter in its methods, with marks

and examinations, uniforms for students and more authority for teachers. Middle and higher education, formerly free, was paid for from 1940.

Up to the middle 1930s it was fashionable and, indeed, almost compulsory to deprecate the Russian past extravagantly and uncritically. But subsequently the nationalist note was often struck in newspapers and literature: tsars of outstanding personality such as Peter the Great and Ivan the Terrible were referred to with respect, instead of being indiscriminately abused.

There was an important change of attitude toward family life. Early Soviet legislation practically eliminated all restrictions on intercourse between the sexes. Divorce could be had immediately for the asking by either partner, and there was no distinction between legitimate and illegitimate children. Abortions were frequent and permitted. In the middle '30s there was a severe tightening of restrictions on divorce; the performance of abortions was made illegal and women were urged and encouraged to bear many children.

During the period from 1929 to 1933 there was a good deal of persecution of children whose class origin was suspect. Sons and daughters of priests, former aristocrats and well-to-do families were barred from universities and found it hard to get employment. After 1933 there was more social equality, more feeling that class lines within the state had been ironed out. It was perhaps not accidental that these changes of a moderate and conservative character coincided with the decimation of the ranks of the veteran revolutionaries who were identified with the more active destructive period of the revolution.

Foreign Relations, 1928-41.—Between 1928 and 1941 the U.S.S.R. passed through three fairly well-differentiated stages of foreign policy, as follows:

1. Collaboration to some extent with Germany, antagonism to Great Britain and France. This had been the general course of Soviet foreign policy after the revolution, and it continued until Adolf Hitler's rise to power in Germany in 1933. There were occasional variations in this policy, periods of coolness between Moscow and Berlin. But Soviet policy in the main was to support the German demand for disarmament, as opposed to the French thesis of security, to abstain from co-operation with the League of Nations, to depict Great Britain and France as the chief potential enemies. Soviet support of the British general strike and of the Nationalist revolutionary movement in China aggravated relations with Great Britain, and there was a suspension of British-Soviet diplomatic relations from 1927 until 1929.

2. Collective security, antifascism, united front. Hitler's rise to power on an outspokenly anticommunist program and the obviously militarist, aggressive character of the Nazi regime caused a change of orientation. Karl Radek, the well-known publicist, who was often an unofficial spokesman for the government until his arrest in connection with the treason and sabotage trials, heralded this shift in the spring of 1933 when he wrote a series of articles about the undesirability of violent change in the territorial settlement. The U.S.S.R. joined the League of Nations on Sept. 18, 1934, the year when Germany left it. Military alliances were concluded with France and Czechoslovakia and pacts of nonaggression, elaborately worded so as to exclude every form of disguised aggression, were concluded with Russia's western neighbours—Poland, Latvia, Lithuania, Estonia and Finland. The regular Soviet representative at important sessions of the League of Nations, Maxim Maximovich Litvinov, repeatedly advocated the ideas that peace was indivisible and that security must be organized on a collective basis.

The Communist International, fully in the service of Soviet policy, changed strikingly the character of its propaganda. Extreme revolutionary demands were pushed into the background, and political alliances were sought not only with Socialists but with Liberal and Radical parties and in China with Chiang Kai-shek. One result of this policy was the formation in 1936 of left-wing popular front governments in France and Spain. During the Spanish Civil War which broke out in 1936, the Soviet government, although represented on the "nonintervention committee" in the beginning, sent a considerable amount of aid in tanks, planes

and military specialists to the Republicans.

3. Abandonment of the west, aggression. A tremendous change in foreign policy occurred on Aug. 23, 1939, when Stalin and Hitler signed a pact of nonaggression. There had been signs earlier in the year that the Soviet government, which had been rebuffed and cold-shouldered at the time of the Munich conference in Sept. 1938, was considering a change of policy. Stalin in his important speech to the 18th party congress in March 1939 had spoken of unwillingness to pull foreign chestnuts out of the fire. Litvinov, apostle of collective security, had been summarily dropped from the cabinet on May 3, 1939, and replaced by Molotov. The Soviet-German agreement broke upon the world at a time when the negotiations were still proceeding between the U.S.S.R. and Great Britain and France with the object of bringing the union into a common front against Germany. In the course of these the Soviet government had made demands concerning the Baltic states and Poland which the governments of those countries found unacceptable.

During this third phase, the Soviet government pursued a policy of independent aggression, endeavouring to strengthen its strategic position and to derive benefit from the war in which the other major European powers were involved. By a secret protocol (revised on Sept. 28) to the treaty of August, Germany had agreed not to oppose Russian action in the areas in which the Soviet government declared itself to be interested. Soviet troops crossed the Polish frontier on Sept. 17, 1939, and the partition of that country with Germany was effected. Finland was attacked on Nov. 30. The Finnish resistance was unexpectedly strong, but on March 12, 1940, a peace treaty was concluded which gave the U.S.S.R. the isthmus of Karelia, the naval base of Hangö and other concessions. The Baltic republics, Latvia, Lithuania and Estonia, which had been obliged to accept "mutual aid" treaties with the U.S.S.R. admitting Soviet garrisons in their territory in Sept.-Oct. 1939, were annexed outright and organized as soviet republics in the summer of 1940. At the same time, Rumania was forced to cede Bessarabia, a former Russian province, and northern Bukovina. With some internal reorganization the number of soviet republics was now 16. (W. H. CH.; M. BR.)

By the autumn of 1940 the Soviet Union was becoming anxious at the extent of Germany's successes, and Molotov was sent to Berlin in November to attempt to strike a new bargain. But he failed to get agreement to Russian demands concerning the Balkans and the straits. The Russians had taken part in the Montreux conference of 1936, which had revised the Lausanne straits convention of 1923 much in their favour; but now they wished for physical guarantees of their security in this area. Thereafter, despite various appeasing gestures, the die was cast, and on June 22, 1941, Hitler attacked without warning. Warnings from the west that such an attack was being prepared had apparently been taken lightly.

The major success of Soviet diplomacy in the period immediately before the German attack was a nonaggression treaty with Japan, signed on April 13, 1941. By aggression in Manchuria in 1931, Japan had become a neighbour of the U.S.S.R. and of its satellite Outer Mongolia on a much wider front. The Soviet government, preoccupied by the European threat, had done its best to appease Japan by selling it in 1935 the rights in the Chinese Eastern railway that the Soviet Union had recovered in 1924 and defended against China in 1929. By helping to bring about a temporary united front of the Chinese Nationalists and Communists and by signing a nonaggression treaty with the Chinese Nationalists, it had also helped to stiffen Chinese resistance toward Japan. Nevertheless, there had been some fairly severe fighting—almost an undeclared war—along parts of the Manchurian frontier in 1938 and 1939. The nonaggression pact with Germany's ally thus removed some of the Soviet fear of a war on two fronts.

WORLD WAR II

The first five months of the war were almost fatal to the Russians. The Germans advanced rapidly, encircling great Russian forces and conquering about 500,000 sq. mi. of territory. By November all southern Russia, including the Crimea except the naval

base of Sevastopol, had been overrun, and Rostov had fallen. In the Ukraine Kharkov had fallen, and further north Tula was almost surrounded. The Germans were within 20 or 30 mi. of Moscow, whence much of the administration had been evacuated, with the foreign embassies, to Kuibyshev (Samara). Leningrad was virtually encircled—the beginning of a siege that was to take a heavy toll through famine and to rob Russia of historic monuments of its past.

The winter brought relief; Rostov was retaken and a counter-offensive in December relieved the pressure on Moscow. By the time the spring thaw of 1942 came, the Russians had made deep penetrations into several sections of the German front. The summer of 1942, however, was almost as disastrous as the preceding one. The new offensive in the south carried the Germans to the Don along most of its length and across it to the Volga at Stalingrad. Meanwhile Rostov, Sevastopol, Novorossiisk and the Maikop oil fields as well as the rich agricultural lands north of the Caucasus had all been lost, and the southeastward thrust of the German armies in this sector had almost reached the major oil centre of Grozny. In 15 months it was reckoned that the Red army had sustained 5,000,000 casualties.

The defense of Stalingrad marked the turning of the tide. Again winter came to the rescue of the Russians, and a great counter-offensive cut off a huge German army outside Stalingrad where it eventually surrendered in Feb. 1943. In the summer a new German offensive was defeated and the Soviet armies went over to the offensive, freeing Orel and Belgorod on the central front, liberating Kharkov and the Donets coal field, as well as Novorossiisk and the eastern shore of the Black sea. A sudden advance to the Dnieper cut off large German forces in the Crimea. By the beginning of November, the Red army was back in Smolensk, Gomel and Kiev. This offensive merged without a break into the winter offensive of 1943-44, in which, in addition to further gains in the south and centre, the Russians at last broke out in the north, clearing the Leningrad area and driving on toward the Baltic states. With the reconquest of the Crimea in May, the Russians had cleared most of the pre-1939 Soviet Union.

In the summer of 1944 a series of new offensives began. Finland agreed to an armistice in September, but the Germans refused to leave the country and fighting continued. In the far north the retreating Germans were pursued over the Norwegian border. Farther south big gains were made in the Baltic republics, White Russia and Poland. But the Russians failed in much-debated circumstances to relieve the Polish home army which had risen in Warsaw, and both there and on the Baltic front, where the Red army had suffered a reverse, the advance came to a halt in August. The most spectacular gains were obtained in the south. An offensive against Rumania led to the Rumanian government's accepting armistice terms and declaring war on Germany on Aug. 25; in September war was declared against Bulgaria (hitherto neutral as regards the war on the eastern front), and on Sept. 8 Bulgaria, too, changed sides and declared war against Germany. In their pursuit of the Germans into Yugoslavia, the Russians on Oct. 20 entered Belgrade simultaneously with Tito's (Josip Brozovich or Broz) partisans; in Hungary, Budapest was encircled by the end of the year and a rival Hungarian government was set up in Debrecen under Russian sponsorship. The Russians had also crossed into eastern Czechoslovakia.

A new winter offensive on all fronts began in Jan. 1945, and by the time of Germany's collapse in May, Russian armies were deep into the heart of the reich with Warsaw, Budapest, Vienna and (by inter-Allied agreement) Berlin and Prague among the capitals taken by the Red army.

In the far east the U.S.S.R. entered the war only on Aug. 8, 1945, on the eve of Japan's collapse, and rapidly overran Manchuria and northern Korea.

Internal Affairs, 1941-45.—The war provided the biggest test to date of the capabilities and stability of the Soviet regime. But any opportunity the Germans had to exploit political discontent in the occupied areas was soon thrown away by the ruthless exploitation of their resources and by the brutality which the Germans showed toward their populations. The ill treatment of the

civilian population was completed by large deportations for slave labour in the reich and by massacres of the Jews. Hatred of the invader proved a powerful welding force in adversity.

On June 30, 1941, a new state committee of defense was set up which for the period of the war was the supreme governing body under Stalin's leadership. The general line was to stress even more strongly than in the preceding period the patriotic elements in the Soviet ideology and to call upon the people to resist in the name of Russia's heroic past rather than in that of the revolution. A new measure of toleration for the Orthodox Church was part and parcel of this process. The Communist party itself, on the contrary, was allowed to fall into the background, and its ranks were widely opened to soldiers in the field and outstanding workers in the arms factories. Its membership rose from 3,876,000 in 1941 to 5,700,000 at the end of the war, despite the heavy losses in battle. The nation's gaze was concentrated on the army, of which Stalin (now commissar for defense) was in supreme control; and after the early failures of the survivors of the old guard of Communist generals, K. E. Voroshilov, S. M. Budenny and S. K. Timoshenko, new ones came to the fore: G. K. Zhukov, I. S. Konev, R. V. Malinovsky, K. K. Rokossovsky, F. I. Tolbukhin, A. M. Vasilevsky. Up till 1943, when illness caused his replacement by Vasilevsky, the chief of staff was the former tsarist officer B. M. Shaposhnikov.

In March 1944 the "Internationale" was replaced as the national anthem by a new patriotic song.

Stern measures were meted out after the German retreat to those minorities that had collaborated with them. The Volga German Autonomous Republic was abolished early in the war and its population deported into Siberia. The same fate now befell the Kalmuck, Chechen-Ingush and Crimean (Tatar) Autonomous Republics and the Karachay Autonomous Region. In 1944 the hitherto nominally independent republic of Tannu Tuva entered the Soviet Union as an autonomous region of the R.S.F.S.R.

By constitutional amendments of Feb. 1944, the republics of the U.S.S.R. were given the right of entering into direct relationships with foreign countries and of having their own defense formations. For this purpose they were to have the right to set up commissariats of foreign affairs and defense. The only practical consequence of these changes seems to have been the seats allotted to the Ukraine and to Byelorussia in the United Nations.

Foreign Relations, 1941-45.—Foreign policy during the war naturally gave the same overwhelming priority to the direct defense of the Soviet Union as was manifest in every other sphere of national life. The Communist parties abroad, which only yesterday had been sabotaging the "imperialist war" against Germany, were ordered to take a patriotic line in all countries fighting the axis and henceforth devoted themselves to trying to influence Allied strategy in such a way that the maximum burden should be lifted from Soviet shoulders. This was the origin of the clamour for the second front, and Soviet diplomacy was largely directed to the same end. In a further effort to reassure foreign opinion, the announcement was made on May 22, 1943, that the Communist International had been formally dissolved on May 15.

The Soviet Union signed a number of treaties with the Allied governments (including a 20-year treaty of alliance with Great Britain on May 26, 1942) and with Allied governments in exile. It entered into diplomatic relations with certain countries for the first time: Canada, South Africa, the Netherlands. But although the prior consideration was the immediate war crisis, the Soviet government was concerned from the beginning to safeguard its own postwar position. Unsuccessful efforts were made to get from Great Britain and the United States formal recognition of its recent annexations in the Baltic. With regard to Poland, the agreement signed with the Polish government in exile on July 30, 1941, recognized the abrogation of the territorial changes resulting from the Soviet-German pact and the rebirth of an independent Polish state. There followed a brief period of apparent Polish-Soviet friendliness during which the surviving Poles who had been deported into the Soviet Union were allowed to form an army. But relations were not cordial, and between March and April 1942 some of the Poles were withdrawn from Soviet territory to the

middle east. The Russians also formed a Communist Polish army which took a part in the later campaigns. Relations with the London Polish government were envenomed by constant controversy over the frontier question, and relations with it were broken off after it had appealed in April 1943 to the International Red Cross to investigate German allegations that the bodies of large numbers of Polish officers who had been interned in Russia but of whom no account had hitherto been given had been found in circumstances that pointed to the Russians' having massacred them. (A subsequent Russian commission naturally retorted that the Germans were responsible for the murders.)

Poland remained the main source of difference between the Allies until the end of the war, particularly when it became clear that the Russians were determined to have the new Poland governed by a regime chosen by themselves and ready to grant the U.S.S.R. its territorial demands in return for compensation at Germany's expense. This question, however, was only part of the general planning of the postwar world carried out by negotiations with the United States and Great Britain, in particular at the tripartite conferences of Tehran (Nov.-Dec. 1943), Yalta (Feb. 1945) and Potsdam (July 1945).

The three main questions involved were the treatment of the defeated countries; the new territorial settlement; and the nature of the new United Nations organization, planned at the Dumbarton Oaks conference in Aug.-Sept. 1944 and brought into being at the San Francisco conference in May-June 1945.

In regard to the first of these, the original Russian point of view was in favour of the partition of Germany into separate states; but this was not maintained at Potsdam, when a decision to treat Germany as a single economic unit was reached despite the quadripartite nature of the occupation. The Russian insistence on the punishment of war criminals was largely met by the Allies, and the Russians co-operated in the Nuremberg trials; but it was soon made clear, both in regard to "denazification" in Germany and "democratization" in Japan, that the Russians meant far greater transformations of the social structure of these countries than had been contemplated. Under Russian occupation, eastern Germany was rapidly sovietized. Of more immediate concern was the difference in the attitude toward reparations from Germany, which manifested itself at Yalta and was bridged neither by the Potsdam agreement nor by the subsequent conference of foreign ministers held in Moscow in Dec. 1945. The Russians held that the restoration of Russia through reparations in kind from Germany should be given absolute priority, whereas the western powers considered that nothing should be done to the German economy that would make the occupation a drain on their own resources. No agreement was reached on Japanese reparations either. On the other hand, the Russian war against Japan, which began only on Aug. 8, 1945, enabled them to seize as war booty much of the industrial wealth that the Japanese had built up in Manchuria. The Soviet Union also made much use of the labour of prisoners of war for reconstruction purposes.

On the territorial side, the Russians achieved their demands in Europe, acquiring part of East Prussia, including Königsberg, as well as the Baltic states, eastern Poland, Bessarabia and Bukovina. To these acquisitions a treaty with Czechoslovakia on June 29, 1945, added Sub-Carpathian Ruthenia. All independent efforts at co-operation between the eastern European states were frowned on during and after the war. In addition, of course, the Russians acquired zones of occupation in Germany and Austria and the right to garrison troops to guard their lines of communication in Poland, Hungary and Rumania. Since Aug. 1939 the effective boundaries of Russian power had shifted about 750 mi. to the west and about 600 mi. to the southwest. Russian troops in the Thuringian forest were within 100 mi. of the Rhine. There was strong pressure against Turkey for territorial concessions and for bases on the straits.

In Asia, the negotiations for Russia's entry into the war against Japan had led to the promise of concessions in Manchuria which had the effect of replacing it in the position from which it had been ousted as a result of the Russo-Japanese war of 1904-05. Port Arthur again became a Russian naval base. By a treaty

revealed Aug. 14, 1945, these positions were confirmed by the Chinese government of Chiang Kai-shek, which also accepted, subject to the formality of a plebiscite, the abandonment of claims over the Soviet satellite Outer Mongolia. Soviet influence in Sinkiang, dominant in the 1930s but relaxed in the war years, was gradually reassessed.

On the side of international organization, the Russian position was that matters should be handled in the postwar world by the continued co-operation of the three great powers, as during the war. The Soviet Union was eventually persuaded to give a formal position of equality to France, with whom a treaty of alliance had been signed on Dec. 10, 1944, and to China. The special position given to the permanent members of the Security Council and the demand for their unanimity on all decisions other than purely procedural ones reflected the Soviet attitude in the drafting of the charter of the United Nations.

POLITICS FROM 1945

There was little change in the political structure of the Soviet Union in the years after World War II. The domination of Stalin and his immediate associates in the Politburo and the council of ministers was beyond question, and apart from the death in Aug. 1948 of A. A. Zhdanov (who had played an important wartime role) and the disappearance of N. Voznesensky there was little change in its composition. From the dozen leading figures, the names of Vyacheslav M. Molotov (whose appointment as vice-premier was announced on March 4, 1949, when he was replaced as foreign minister by A. Y. Vishinsky), of G. M. Malenkov and of L. P. Beria gradually became the most prominent. No new party congress had met by the early 1950s. The supreme soviet and the soviets of the republics resumed the regular elections and sessions that had been abandoned in the war years. The chief task of the former was still the ratification of the annual budget. The chairman of its presidium, the elderly Mikhail Ivanovich Kalinin, died in 1946 and was replaced by N. K. Shvernik, till then head of the trade-union organization.

There was a sharp reversal, beginning even before the end of the war, of the emphasis laid on the state and on the army at the Communist party's expense. The names of the leading Soviet marshals largely disappeared from the foreground and some of them, including Zhukov, the conqueror of Berlin, seem to have been relegated to relative obscurity. This represented, on the top level, part of the process by which the links between east and west, built up perforce during the war, were broken down again. Anxiety was shown as to the effect that contact with the higher standards of living of central Europe might have on the Soviet troops in occupation, and propaganda for their re-education was undertaken. The party itself was subjected to a purging process to get rid of persons who had entered during the war and who did not show sufficient political aptitude for its peacetime tasks; the old standards of indoctrination were demanded once more.

Another process begun during the war involved a modification of the old policy toward the problem of nationalities, with which the name of Stalin was particularly connected. A new emphasis was laid on the Great Russian element in the Soviet Union. It became official doctrine that even pre-revolutionary Russia had been a progressive force in relation to the subordinate nationalities absorbed within the Russian empire, and the histories of the latter were rewritten in accordance with this. The language policy exalting the role of Russian, for which a theoretical basis was given in Stalin's attack on the philological theories connected with the name of Nikolay Marr, must also be noted in this connection.

The most effective antidote to the survivals of "bourgeois nationalism" which were regularly castigated in the Soviet press was biological rather than cultural. The policy of large-scale population movements for economic and political reasons would tend to break up the national homogeneity of all the republics and in the long run to create a single undifferentiated Soviet type.

In cultural matters, the same general trend toward Russian self-sufficiency was seen. Much emphasis was laid on the priority of Russian scientists in discoveries in all important fields.

Zhdanov began a campaign against all signs of "servility" toward western cultural models in 1946, and this continued in subsequent years. "Cosmopolitanism" became a general term of abuse directed against all tendencies in literature and the arts which did not have as a direct purpose the support of the national effort. Science also was forced to conform to the dominant ideology, a high light in the process being the formal proscription in 1948 of all theories of genetics other than those of the L. V. Michurin-T. Lysenko school—the repudiation, in fact, of all the accepted views of genetics in favour of theories which gave greater scope to the influence of environment and so seemed better fitted to the Soviet attempt to "remake nature."

Foreign Policy after World War II.—The disagreements between the Soviet government and its wartime allies which had become apparent before the end of the war were soon to assume a shape that made further co-operation impossible. Although the Soviet representatives continued to take part in the work of the United Nations (except for the period Jan.-Aug. 1950 when they absented themselves as a result of the dispute over the membership of Communist China), that organization was in fact little more than a forum where the disagreements between the Soviet Union and its associates on the one hand and the rest of the world on the other could be aired. On the matter of disarmament, both conventional and atomic, no agreement was reached. Although Vishinsky had declared in Nov. 1949 that Soviet work on atomic energy was exclusively directed to peaceful purposes, the fact that the Soviet Union was experimenting with atomic bombs was admitted by Stalin in Oct. 1951.

In Europe, a conference in Paris was held in 1946 for discussion of the draft treaties with Italy, Rumania, Hungary, Bulgaria and Finland; these were finally signed in the following year. But there was no agreement either on Austria or on Germany. Continued friction with the western powers over policy in the occupied countries, particularly in Germany, culminated in the effort to dislodge them from Berlin in 1948 through an economic blockade that was frustrated by the air lift. An attempt to deal with the outstanding issues led to a long, fruitless four-power conference of foreign ministers' deputies at Paris in the spring of 1951.

The U.S. offer of support to Greece and Turkey and of economic aid to Europe in 1947, and the refusal of the Soviet Union to participate in the organization for its distribution or to allow either Poland or Czechoslovakia to do so marked the turning point of the postwar period. The success of the European Recovery program made the triumph of Communism in western Europe unthinkable without direct Soviet aid. In eastern Europe the result was to accelerate the Soviet effort (which had already gone a long way) to convert the whole area into a series of Communist-ruled satellites that would be totally dependent on the Soviet Union economically, politically and militarily as well. The last point was well brought out by the appointment in Nov. 1949 of the Soviet marshal Rokossovsky as Polish defense minister.

The symbol of the new situation was the creation in Sept. 1947 of the Communist Information bureau or Cominform, with its headquarters in Belgrade, Yugoslavia, linking together the Communist parties of Europe and being the successor to some extent to the defunct Comintern. Its formal and overt expression was the series of treaties between the Soviet Union and the eastern European countries: Czechoslovakia, Dec. 12, 1943; Yugoslavia, June 8, 1946; Albania, July 1947; Poland, Jan. 26, 1948; Rumania, Feb. 4, 1948; Hungary, Feb. 18, 1948; Bulgaria, March 18, 1948; Finland, April 6, 1948. Treaties between many of these states were also concluded. The eastern German government set up by the Russians in Oct. 1949 belonged for many purposes to the same grouping, though there was no indication that its creation meant the abandonment of hopes for a Germany united on Russian terms.

In 1948 two crucial developments took place. Czechoslovakia, which (though less independent than Finland) had retained a democratic form of government, was forced in a crisis in February to accept Communist rule and rapidly began to travel the same Soviet path as its neighbours. In June the friction between Marshal Tito of Yugoslavia and the Russians over the methods of control adopted by the latter broke into the open. The Soviet-

Yugoslav treaty was denounced by the Soviet government and Yugoslavia was expelled from the Cominform, which moved its headquarters from Belgrade to Bucharest, Rumania. Thereafter hostility to the Yugoslav regime became a dominant feature of Soviet policy. The breach reduced the representation of the Soviet bloc in the United Nations to five: the U.S.S.R., the Ukraine, Byelorussia, Poland and Czechoslovakia. The veto of the United States kept the other governments of the Soviet sphere outside, while the Soviet veto was exercised against Italy, Ceylon and several other states.

From 1948 relations with the western powers were dominated by the Soviet objections to their rearmament and to all agreements between them on defensive matters, in particular to anything that looked like the remilitarization of a revived western Germany. For the purposes of propaganda in favour of the main thesis of Soviet foreign policy a new organization, the World Peace Movement, was set up in March 1950.

The Far East.—The end of World War II saw Russia entrenched in Manchuria and North Korea facing the United States as the occupying power in Japan and South Korea. Officially, as has been seen, the Soviet government fully accepted the claims of the Nationalist government of Chiang Kai-shek to rule in liberated China. But the presence of Soviet troops in Manchuria was used in such a way as to give certain advantages to the Chinese Communist forces when they advanced into it from their strongholds in the north. For a long time, as the Chinese civil war developed, the Russians gave no outward indication of a change in their formal relations with the Chinese government, perhaps calculating that they could not hope for more than that the Chinese Communists should become strong enough to force Chiang Kai-shek to abandon his alignment with the United States, the country that was increasingly regarded as the Soviet Union's main enemy in the post-war world.

The picture was changed by the Communist victories in 1948-49. On Oct. 2, 1949, the Soviet government broke off relations with the Chinese Nationalists and recognized the government set up at Peking by Mao Tse-tung. The Chinese leader went to Moscow in December, and on Feb. 14, 1950, a series of new agreements was signed, closely linking the two states and making, at least on the face of it considerable concessions to the Chinese in Manchuria.

Elsewhere in Asia the Russians showed full sympathy with all movements against restoring the prewar position of the main colonial powers and, when national independence had been wholly or largely achieved, with the Communist movements. These Communist movements had gained ground particularly in southeastern Asia and took to open violence in Indochina, Burma, the Philippines and Malaya. When North Korea attacked South Korea in June 1950, the Russians took the view that the attack had in fact been launched by the South Koreans at U.S. instigation, and they showed approval of Chinese intervention later in the year. In 1951 it became clear that the Chinese were receiving considerable assistance from the Russians in the shape of aircraft and other weapons.

Death of Stalin and Malenkov's Accession.—After it was officially announced that Joseph Stalin had died on March 5, 1953,

G. M. Malenkov was named head of the Soviet Union. He became chairman of the council of ministers and a member of the presidium of the central committee of the Communist party, which was reorganized as a committee of ten members and four alternates. (In Oct. 1952, after the 19th congress of the Communist party had met in Moscow, a new presidium of 25 members, which absorbed the functions of the former Politburo and Orgburo, had been named.) The ten-member secretariat, also established in Oct. 1952, was replaced by a new one of three members. Other changes included the appointment of L. P. Beria as head of the ministry of internal affairs, which combined the former ministries of internal affairs and state security; V. M. Molotov as foreign minister; N. A. Bulganin as head of the war ministry; and K. E. Voroshilov as president of the presidium of the supreme soviet. L. M. Kaganovich, Beria, Molotov and Bulganin became first deputy chairmen of the council of ministers.

POPULATION

The population of the U.S.S.R. is shown in Table V. Although the third largest of any state in the world, it is small in comparison with the vast area over which it is spread. According to the census of 1939, two-thirds of the country was occupied by only 6% of the population, while 48% of the population was concentrated in 6% of the territory. This is partly explained by the existence of vast areas unsuitable for close settlement; the great belts of tundra and taiga in the north of Russia and the deserts of central Asia, for instance, can never be heavily populated.

TABLE V.—Population of the U.S.S.R. according to the Censuses of Dec. 17, 1926, and Jan. 1939

Republics	Rural population			Urban population			Total population			Area*		Density of population per sq. mi.

*According to an official Soviet computation (1939).

It is partly explained also by the fact that the people were until recently almost wholly devoted to agriculture and, unlike the densely populated monsoon lands of southeast Asia, the Russian agricultural regions, where climatic conditions prevent all-the-year-round production, will not support a dense population. If allowance is made for these factors, however, it must still be noted that except for certain small areas in the black soil belt the Russian agricultural lands are far from having reached saturation point. The obstacles to more intensive settlement in the past were primitive methods of agriculture, uneconomic distribution of land, lack of transport facilities and backwardness in industrial development.

The reasons for Russian backwardness are primarily historical. Lack of natural frontiers encouraged invasion, and the Slav population was engaged in a long struggle with Asiatic invaders. In the 13th century the Tatar hordes overran the country and held it in subjection for nearly 300 years. This long isolation from western Europe was the most important of many factors which caused the people to fall far behind European standards. The history of Russia from this time up to the 20th century had been the history of sporadic endeavours to catch up with Europe in industrial and social development.

The Soviet government's planned resettlement, begun in 1925, led to a striking redistribution of population. But while this resettlement reduced in some small measure the concentration of population in European Russia and was accompanied by a great development of Russian industrial resources and transport facilities, the vast country remained sparsely populated and capable of supporting a far greater population.

Vital Statistics.—The first Russian census was taken in 1897 and recorded a population of 129,200,200. In 1929 the population was 146,980,460 despite the loss of densely populated areas in the west and despite the high death rate which resulted from World War I, the civil war, famine and epidemics. The census of 1939 recorded a population of 170,467,186. In the years 1939-40 Soviet annexations in Europe increased the population by 21,800,000. The official estimate of the population for 1946 was 193,000,000 (E. Davydov in *Bolsheva Sovetskaya Entsiklopedia: S.S.S.R.* [Moscow, 1948]). An estimate published in *Pravda* on Jan. 23, 1946, by G. F. Alexandrov, then propaganda chief of the All-Union Communist party, gave the same figure. This figure, if correct, implied that by 1946 Soviet losses in World War II had been made up by the natural increase in population. The only official estimate of numbers killed in fighting was 7,000,000 (A. A. Zhdanov in a speech on Nov. 6, 1946). Gen. Augustin Guillaume, chief of the French military mission to the Soviet Union during World War II, estimated the number of soldiers killed at 7,500,000, of severely wounded who died later at 3,000,000 and the number of civilians who were killed or died from hunger or exhaustion at 11,000,000.

The rate of increase of the population had been high for many years and was increasing. At the beginning of the 20th century the percentage of births over deaths in the Moscow region was 34. The percentage dropped during the civil war and the famine and epidemics that followed, but rose sharply thereafter. In 1938 there were 195 births to every 100 deaths. In the period 1926-39 the rate of growth of population increased by 15.9% in contrast with the average increase of 8.7% in the countries of western Europe during the same period. One of the results of this high birth rate's being coupled with a fairly high death rate is that the proportion of young people is large. In 1939 more than 45% of the population was under 19 years of age; in England the percentage was less than 30.

In the past the high death rate was the result of harsh living and working conditions, undernourishment, absence of medical services and ignorance of hygiene. The Soviet government effected considerable improvements, particularly through the provision of medical services and of instruction in hygiene; but the unsatisfactory living and working conditions still applying to the majority of the population contribute to making the death rate higher than is common in the countries of western Europe and of North America.

Under the Soviet regime the infant mortality rate was greatly reduced. It was calculated that in the 18th century up to 400 out of every 1,000 children born died before reaching the age of one year. The Soviet government achieved much in town and in country centres in its struggle against this high mortality rate. In Moscow the rate had been 23 per 1,000 in 1913 but was 13 per 1,000 in 1925; this figure declined mainly after 1922, having naturally been high during World War I and the revolution. The mortality rate of children in their first year of life for the whole country fell from 177 per 1,000 in 1924 to 135 per 1,000 in 1925. This was achieved despite poor housing conditions, mainly through the establishment of crèches, clinics and maternity hospitals, through campaigns of pictorial as well as written instruction in hygiene and through financial encouragement given to large families. It was claimed that from 1913 to 1934 the infant mortality rate had been reduced by 44% and that it was later reduced further, but exact figures were not available.

Ethnic Groups.—In ethnographic character the population of the U.S.S.R. is remarkably varied. The Soviet Academy of Sciences represented the country as being inhabited by 169 ethnic groups, divided into ten major divisions as follows: Indo-European 36 groups, Caucasians (Japhetic) 40, Semites 6, Finns 18, Samoyedes 1, Turks 48, Mongols 3, Tungus-Manchurian tribes 6, Palaeo-Asiatics 9 and groups of tribes from the far east with an ancient culture 4. (See Table VI.)

TABLE VI.—U.S.S.R.: Population by Nationality, 1939, Compared with Population by Ethnic Group, 1926

Designation in 1939	Number, 1939, in corresponding group	Number, 1926	Ratio of 1939 to 1926

Source: F. Lorimer, *The Population of the Soviet Union* (1946).

According to the census of 1939, Russians form 53.4% of the population, Ukrainians 16.6%, Byelorussians 3.5%, Uzbeks 1.9%, Tatars 2.5%, Kazakhs 1.8%, Jews 1.8%, Azerbaijanians 1.34%, Georgians 1.33% and Armenians 1.27%. No other nationality numbers 1%. Thus three branches of the Slavs form 78.1% of the total population. To this figure should be added the Slav populations of the territories gained by the Soviet Union in 1939, 1940 and 1945. The Ukrainian areas increased the Ukrainian pop-

ulation by 5,640,000 while the Byelorussian territory brought an additional 1,458,000 Byelorussians into the Soviet Union, thus swelling the large proportion of Slavs.

The distribution of these races varies with the different regions of the country. The Slavs comprise about three-quarters of the population of the R.S.F.S.R. and are most dense in European Russia. In Asiatic Russia they have spread in a dense belt through the cultivable lands lying south of latitude 55° N. as far as the Yenisei river. East of the Yenisei Slavonic colonization has been mainly in ribbons along the rivers or concentrated in mining and industrial districts. In the 20th century Slavonic colonization of Asiatic Russia was intensified, and with the opening up of the mineral resources of this vast area the flow of Slavonic settlers was bound to increase.

After the Slavs the Turki peoples are the most numerous and important. The Turki race (Uzbeks, Turkmen, Kirghiz, Kazakhs etc.) is most continuous in the central Asiatic republics. The Mongol peoples are mainly to be found south and east of Lake Baikal; the Kalmuck (Kalmyk) region on the lower Volga represents a Mongol intrusion far to the west, separated from its original base by a wedge of Turki settlement. The Yakuts of the Lena represent a northeastern spread of the Turki element, now much intermingled with Slavonic blood.

The Finnish aboriginal population, Karelians, Mordvinians, Marii, Votyaks, Permyaks, Komi and the allied Samoyedes, were increasingly pushed outward by the Slavonic settlement. Finns are to be found mainly in the north and west and also in a belt of Finnish settlement in Asiatic Russia, lying north of the main Slavonic belt and extending to the Yenisei, again much intermingled with the incoming Slavonic population. East of the Yenisei the Finns form an insignificant element in the population. Scattered Cossack Ukrainian and trading settlements exist even in the tundra zone and in Kamchatka. These Slavonic settlers have tended to amalgamate to a marked degree with the natives in a region where the difficulties of the environment made unity of human effort essential. An interesting feature of Russian settlement is the greater density of population in high latitudes in comparison with other parts of the world.

Movements of Population.—The institution of serfdom restricted the tendency of the people to wander and to colonize, and after the abolition of serfdom in 1861 movements of the population greatly increased. The existence of large areas that were unsettled or sparsely populated encouraged colonization, but in the 19th and early 20th centuries political discontent was so great that large numbers of non-Russians emigrated abroad. In the period 1891–1900, for instance, 594,000 Russian subjects (mainly Poles and Jews) emigrated to the United States, and between 1900 and 1909 the number of these emigrants rose to 1,400,000. There was also during these years a considerable movement of people inside Russia from the more thickly populated regions of European Russia, in particular from the black earth belt and from the western and southwestern Ukraine, to the south and southeast—and beginning in the last quarter of the 19th century—to the Urals, Siberia and the far east. The government's policy of encouraging migration to the Urals, initiated at the end of the 19th century, resulted in the following increases: 300,000 in 1861–85, 450,000 in 1886–94, 1,440,000 in 1895–1905 and 3,274,000 in 1906–13. In the same period there was a greater flow of people to the towns: between 1863 and 1897 the increase of population in the towns was more than double the increase on the land.

The Soviet policy of planned resettlement, which was a part of the intensive policy of industrialization and of collectivization of agriculture, resulted in considerable movements of population. Between 1926 and 1939 more than 3,000,000 people were resettled in the Urals, Siberia and the far east. In certain areas the population increased by 33%. In the Sverdlovsk and Novosibirsk regions the increase was 53%, while in the Khabarovsk territory the population increased by 136%. World War II accelerated the movement eastward as industrial areas in the west were evacuated in the face of advancing German armies and whole factories were moved beyond the Urals.

Simultaneously with the settlement of the east there was a flow

of people to the industrial regions. In the period 1926–39 about 3,500,000 moved to the Moscow region, 1,300,000 to the Leningrad region and 350,000 to the Gorki region. In the Stalin period the population increased by 91% and in the Voroshilovgrad region by 37%. The republics of central Asia received about 1,700,000 settlers, thus increasing their population by 38%.

The third migratory stream in the Soviet period flowed north. Though on a smaller scale, this settlement of the extreme north—where in the past the population had been negligible—was important. The Murmansk region up to 1917 had a population of about 10,000; in 1928 it was about 22,000 and in 1939 it was 291,200. This growth of the population in the north was accompanied by industrial development, planned as part of the first and second five-year plans.

Following World War II the continued policy of intensive industrialization in the Moscow region, the Ukraine, the Urals and the Kemerovo region undoubtedly led to further increases in the urban population and to further movements of population to industrial areas, particularly in the east. Figures were not, however, available after 1939.

Colonisation of Siberia.—Furs were the prize which drew the Russians beyond the Urals and led to the conquest of Siberia. Siberian furs were in demand not only in Moscow but in Europe and provided Moscow with an important source of revenue. It was not until the 18th century that the fur trade ceased to be the dominating attraction of Siberia and the peasant settler and the miner became important. Peter the Great initiated the official policy of mining development and in particular the exploitation of the rich mineral deposits which in the 19th century gave rise to the Siberian gold rushes.

The conquest of Siberia began late in the 16th century. Kuchum, the last khan of the Siberian Tatars, challenged the Stroganov family, whose members, as the Russian lords of the Ural frontier, were encroaching on Tatar territory. The Stroganovs called on Yermak Timofeyevich, the Cossack leader, to meet this challenge. In 1581, with a small company, Yermak took Sibir, the Khan's chief settlement, from which the name of Siberia is derived. From this start the Russian advance continued rapidly, making full use of the vast web of rivers which covers Siberia. The first settlements were Tyumen (1585) on the Tura river and Tobolsk (1586) on the juncture of the Tobol and Irtysh rivers. From these two bases the Slavs advanced northward and eastward. Early in the 17th century they crossed the Yenisei river and founded Yeniseisk (1618) and Krasnoyarsk (1627). Within a few years they had reached the Lena river and by 1632 they had founded the fortified post of Yakutsk. The first Russian settlement on the Sea of Okhotsk was founded in 1639. This advance had been opposed by the Kazakhs and by the Kalmucks (Kalmyks) but had been halted only in the Amur basin, where it had come against the Chinese empire under the new Manchu Ch'ing dynasty. In 1689 the first treaty between China and Russia was signed.

The task of administering so vast an area was formidable, and for many years the government was able to provide only a rudimentary administration which left nearly all power in the hands of the corrupt local officials. The problem of populating Siberia was equally difficult. Throughout the 17th century colonists were sent beyond the Urals to settle. By the end of the century a policy of exile as a means of colonization had gained acceptance and, like the convicts transported to the British colonies in the 18th and 19th centuries, men were sent to Siberia for trifling offenses. Old Believers, after the great schism in the Russian Orthodox Church, the rebel palace guards under Peter the Great, and after the Northern War, Swedish prisoners of war were sent to Siberia. The Polish confederates under Catherine II, the Decembrists under Nicholas I, nearly 50,000 Poles after the insurrection of 1863 and whole generations of Socialists, including 45,000 political exiles after the 1905 revolution, were also exiled to Siberia. In the early days they were driven in herds from village to village and often left to die of starvation on the road. In the 19th century the conditions were slightly improved, but the hardships of the journey and of climatic and living conditions continued to cause many

deaths. Between 1823 and 1898 no fewer than 700,000 exiles with 216,000 voluntary followers went to Siberia. In 1900 exile as a means of political persecution was abolished, but it was restored again in 1904 because of the increasing political unrest.

The Soviet government continued the policy of sending political and criminal prisoners to Siberia, but on a far greater scale than before. It was officially stated that "forced labour is one of the basic measures of punishment of Soviet Socialist criminal law" (*Bolsheya Sovetskaya Entsiklopediya*, vol. 47, p. 36 [Moscow, 1940]), and the Corrective Labour code of the R.S.F.S.R. of Aug. 1, 1933, provided that political opponents of the regime and "class-hostile elements" be punished by forced labour. In addition to the penal and political motives of Soviet policy there are also the economic motives. Molotov, as chairman of the council of people's commissars, stated in 1931 that forced labour was employed in "highway construction, in the building industry, in peat exploitation, in timber works, in mining, stone quarries, gravel and stone crushing, on transportation projects." These projects resulted in the organization of large forced labour camps in regions, such as the extreme north of Siberia and the Kazakh desert, where the climate is too severe for normal colonization and the work under primitive conditions is too arduous to attract voluntary labour. Evidence on the size of the population of forced labour camps in the Soviet Union is conflicting. The British undersecretary of state for foreign affairs gave on May 3, 1949, an estimate of this population on the basis of evidence in the hands of the British government as between 5,000,000 and 12,000,000.

The notoriety of Siberia as a place of exile has tended to overshadow the role of free settlers in colonizing the vast area. The first settlers were hunters, seeking the furs of the sable, fox, ermine and squirrel. But runaway serfs and fugitives from religious persecution and from conscription, which in the reign of Peter the Great had become particularly severe, were soon the most numerous colonists. Many intermarried with the Yakuts and Buriats; their descendants were called *Siberyaks*. At the beginning of the 20th century these colonists were rapidly outnumbered by waves of voluntary settlers seeking their fortunes in Siberia. The completion of the Trans-Siberian railway (1891-1903) encouraged and facilitated further settlement. Between 1909 and 1913 more than 350,000 families were settled there, and of these few returned to European Russia. In 1913 the number of settlers was 234,877. During the revolution of 1917 and the civil war colonization virtually ceased, but it quickly revived. In 1925 a special commission of the Soviet government drew up a five-year plan for settling 1,200,000 colonists in Siberia; rebates from taxation and exemption from conscription were offered to encourage suitable settlers. Between 1926 and 1939 nearly 3,000,000 settlers went to Siberia, and after World War II the flow of settlers was no doubt revived, although no figures were available.

The rate of colonization of Siberia is illustrated by the growth of the towns. The population of Novosibirsk, for instance, was 5,000 in 1897 and had grown to 405,589 by 1939; Omsk increased from 37,470 to 280,716 (1939) and Vladivostok from 28,896 to 206,432 (1939). An even more striking illustration was the creation of new towns in the Kuzbas coal basin, some of which had populations of more than 100,000: Stalinsk (Kuznetsk) 169,538, Kemerovo 132,978 and Prokopyevsk 107,227. Karaganda and Magnitogorsk did not exist in 1926, but in 1939 had 165,937 and 145,870 inhabitants, respectively.

Towns and Settlements.—The census of 1926 showed that there were 30 towns with populations of more than 100,000. All these had grown considerably since the census of 1897, with the exception of Odessa, which had declined because of the diminished trade in the Black sea and the loss of Bessarabia to Rumania. Two cities had more than 1,000,000 inhabitants according to the census of 1926; these were Moscow (2,029,425) and Leningrad (1,690,065). Kiev, Baku, Odessa and Kharkov had more than 400,000 inhabitants, while Gorki (Nizhni-Novgorod), Tbilisi (Tiflis), Dnepropetrovsk, Saratov, Tashkent and Rostov-on-Don had more than 200,000 inhabitants.

The census of Jan. 17, 1939, showed that the cities had grown

lation of more than 500,000. It was probable that there was considerable growth in the populations of these cities after 1939, but figures were not available. (See Table VII.)

The growth of the town population in Russia after the beginning of the 20th century was striking. Between 1897 and 1914 it increased from 15,825,600 to 24,686,600; i.e., from 14.8% to 17.7% of the total population. From 1926 to 1939 it rose from 26,314,100 to 55,999,900; from 17.9% to 32.8% of the total. This leap in the rate of increase was a result of the Soviet government's policy of intensive industrialization.

The most rapid growth took place during the first two five-year plans (1928-32 and 1933-39). In this period the number of towns with 50,000 inhabitants or more increased almost four and one-half times. The number of towns with a population of 100,000 or more increased almost six times, while 10 new towns with a population of more than 100,000 and 20 with a population of more than 50,000 appeared.

The source of this new urban population between 1926 and 1939 was estimated as follows: from country to town, 18,500,000 (69.5%); natural growth of population, 5,300,000 (17.9%); villages converted into towns, 5,800,000 (19.6%).

In certain areas the growth of the town population was especially noteworthy. The Donets basin in 1926 contained a large number of small mining settlements and only eight towns, of which the largest were: Stalino (Yuzovka), 174,230; Makeyevka, 79,421; and Voroshilovgrad (Lugansk), 71,765. By 1939 the region had about 60 towns, of which 13 had more than 50,000 inhabitants and 5 more than 100,000, including Stalino with 462,395, Makeyevka with 240,145 and Voroshilovgrad 213,007. Similarly, in the Urals the town population in 1926 was 1,251,500, concentrated in 27 towns of which only 3 had more than 50,000 and 2 had more than 100,000 inhabitants. By 1939 the town population had grown to 3,513,200, living in 47 towns of which 11 had more than 50,000 and 5 more than 100,000 inhabitants. The same rapid growth of the towns was to be found in the Kuznetsk basin; whereas in 1926 not one town there had more than 30,000 inhabitants, in 1939 there were five towns with more than 50,000, three of them having more than 100,000.

The pattern of the old Russian towns reflected something of the long struggle against invaders, particularly against Asiatic nomads. This pattern was concentric with radiating streets and at the centre a *kremi*, kremlin or fort, built originally of timber, but later of stone. Another feature of Russian towns was the low wooden house on the outskirts of the same type as the peasant *izba* or hut. The smaller towns were distinguished by a single broad main street which in spring and autumn was a sea of mud. A few of the cities in the west obtained the Magdeburg rights under Polish rule (notably Kiev in 1499), and traces of western influence still remain in some towns. The influence of Byzantium was, however, far stronger throughout European Russia, and evidence of it may be found in all the older towns. The modern Soviet towns were planned with a water supply, electricity and sanitation. In the centre, at least, of these towns roads are laid and the houses no longer follow the old Russian pattern but are of brick and are severely utilitarian in design. But in both new and old towns the overcrowding is serious and the living conditions of the people are often primitive.

Housing.—The housing shortage in the cities and towns is acute. During World War I many towns suffered damage, and in the disastrous period 1920-22 wooden houses were torn down for fuel. The climate limits the building season, and the shortage of building materials and of skilled labour as well as the greater priority given to industrial development all aggravated the housing shortage. The rapid increase in the urban population during the first two five-year plans added further complications to the already serious overcrowding. In 1939 it was estimated that in the cities the average dwelling space per person was approximately five square metres, a figure from one-third to one-fifth below the average in western Europe. Large-scale destruction of housing in European Russia during World War II added to the severity of the problem. It was officially estimated that in the areas afflicted

cities and 3,500,000 out of a total of 12,000,000 houses in the rural areas were destroyed. It was further estimated by N. A. Voznesensky that 60,000,000 sq.m. of dwelling space were required for rehabilitation in the urban areas.

Soviet policy after the first five-year plan gave absolute priority to industrial development almost to the exclusion of consumer goods, including housing. Not until the fourth, or first postwar, five-year plan was there provision for an extensive building program, calling for repairs and construction of urban dwellings to a figure of 10,350,000. The plan was reported to have been overfulfilled in urban areas, 100,000,000 sq.m. being constructed; but in rural areas only 2,700,000 houses were built, just one-fifth of the plan's figure. In 1951 there was a further advance in the provision of urban housing, although the construction of rural housing continued to be inadequate. Thus by 1951 reconstruction in urban areas had more than made up for wartime destruction; and in rural areas 90% of the destruction had been made good. The output of building materials, which had seriously slowed up the building program, was stepped up and was considerably higher than before World War II; in 1950 the output of cement was 80% greater than in 1940, of glass 90% greater, of slate 115% greater and of timber 36% greater. There remained however, the serious countereffect of obsolescence and the task of providing housing for a population rise of 15% in the period from 1940 to 1951.

GOVERNMENT AND ADMINISTRATION

The Party.—The constitution of 1936 described the All-Union Communist party as the leading core of all organizations of the working people, both public and state. Stalin referred to the Communist party as the basic guiding force in the system of the dictatorship of the proletariat and stated that not a single important political or organizational question was decided without directions from the party. This indicated the importance of the Communist party in the U.S.S.R., where it acquired a monopoly of political power, all real and potential opposition having been exterminated since the revolution.

The party wields its power through its central committee and through the Politburo, the Orgburo and the secretariat. The central committee is elected at the party congress, which was formerly convened annually but after 1925 met at increasingly longer intervals. This committee from 1927 consisted of 71 full members and 68 candidate members. It meets on an average three times a year when it receives reports from the Politburo and

TABLE VII.—Population of Major Cities in the U.S.S.R. by the Censuses of 1897, 1926 and 1939*

City	Population			Increase, 1926-39
	Jan. 26, 1897	Dec. 17, 1926	Jan. 17, 1939	
Moscow (Maukva)	988,014	2,020,425	4,137,018	103.9%
Leningrad (Petergrad, St. Petersburg)	1,867,023	1,609,065	3,101,304	88.8
Kiev	247,432	513,037	846,203	94.8
Charkov	172,826	417,247	533,452	90.7
Gorki (Nizhni-Novgorod)	175,753	433,331	800,337	78.5
Odessa	95,124	222,156	644,110	180.7
Tashkent	409,041	500,963	745,213	48.6

Orgburo on past and future work. The Politburo is the most important organ of the central committee and exercises enormous power over every aspect of public policy, including foreign affairs. The Orgburo is responsible for the organizational side of the central committee's policy, but is overshadowed by the Politburo and the secretariat. Joseph Stalin, appointed secretary-general of the central committee in May 1922, so increased the importance of this post that it became the control point in the work of the party and thus of the Soviet Union itself. (See Table VIII.)

The Communist party grew greatly in size, although its membership was limited. From 800,000 in 1917 it had grown by 1946 to a membership of more than 6,300,000. To this figure should be added the membership of certain auxiliary bodies such as the Young Communist league (Komsomol) for young people between

*Years of appointment in parentheses, in columns 1 and 2 dates so far as ascertainable.

†Also chairman of the Adlgrop (Board for propaganda and agitation) and director of the foreign secretariat providing a link with foreign Communist parties and supervising the activity of the Cominform.

‡Also secretary-general of the council of people's commissars from 1930 to 1941.

§Also chairman of the V.T.S.F.S. (Vsesoyuznyy Tsentrallyy Sovetskoykh Soyuzov, or All-Union Central Council of Trade Unions).

||Also secretary-general of the V.L.K.S.M. (Vsesoyuznyy Leninitsky Kommunistichesky Soyuz Molodezh or All-Union Lenin League of Communist Youth).

¶Also chairman of the party control commission, with Shkiryatov as deputy chairman.

the ages of 15 and 25 which, in 1945, had a membership of about 15,000,000, and the Pioneers for children between the ages of 10 and 16, with a membership well over 11,000,000.

The Police.—The task of eliminating political opposition to the Communist party in the Soviet Union was originally in the hands of the All-Russian Extraordinary Commission for Repression of the Counterrevolution and Sabotage (V.Ch.K. or Cheka). On Feb. 6, 1922, the Cheka became the United General Political Administration (O.G.P.U.). On July 10, 1934, the people's commissariat of internal affairs (N.K.V.D.) replaced the O.G.P.U. On Jan. 31, 1941, the N.K.V.D. was itself divided into two commissariats (or ministries from March 1946): the ministry of state security (M.G.B.) and the ministry of internal affairs (M.V.D.). It is thought that the M.G.B. took over the secret police functions of the former N.K.V.D., while the M.V.D. has jurisdiction over the military formations of the interior, the militia or local police, the administration of labour camps and the local registries of births, deaths and marriages.

The first chief of the Cheka and later of the O.G.P.U. was Felix E. Dzerzhynski (Dzerzhinsky); in 1924 he was succeeded by Vyacheslav R. Menzhinsky, who died in 1934; the next chief of the N.K.V.D. was G. G. Yagoda, who was dismissed in Sept. 1936 and shot in April 1937; N. I. Yezhov was the chief of the N.K.V.D. until Dec. 1938 when he, too, was shot and L. P. Beria was appointed his successor.

The Supreme Soviet.—The constitution of 1936 vested all legislative power in the supreme soviet of the U.S.S.R., but this power was so widely delegated that it can only be regarded as nominal. All citizens over the age of 18 years who are not insane and have not been deprived of their civil rights by a responsible tribunal are entitled to vote in the elections of deputies, which take place every four years. Every citizen over the age of 23 years is eligible for election as a deputy.

The supreme soviet consists of two chambers: the council of the union and the council of nationalities. The election of deputies to the council of the union is by electoral districts on the basis of one deputy for every 300,000 citizens. The election of the

TABLE IX.—Elections to the Supreme Soviet of the U.S.S.R.

Item	1950	1946
Number of registered electors	111,116,373	101,717,686
Electors who went to the polls	111,090,010	101,450,037
Percentage of the total electorate	99.89%	99.10%
Electors who voted against the official candidates	300,446	819,600
Percentage of electors who voted	0.27%	0.81%
Number of deputies		
Council of the union	618	682
Council of nationalities	638	557

council of nationalities is by republics, autonomous regions and national districts on the basis of 25 deputies from each union republic, 11 deputies from each autonomous republic, 5 deputies from each autonomous region and 1 deputy from each national

district. The two chambers have equal rights and all acts must be passed by a majority in both chambers—except amendments to the constitution, which require a two-thirds majority in each chamber. The supreme soviet is convened twice yearly by the presidium of the supreme soviet. (See Table IX.)

The Presidium.—At a joint session of the two chambers the supreme soviet elects the presidium, which consists of a chairman, 16 vice-chairmen, a secretary and 15 members. The functions of the presidium, as defined by article 49 of the constitution, are that it

(1) convenes the sessions of the supreme soviet of the U.S.S.R.; (2) issues decrees; (3) gives interpretations of the laws of the U.S.S.R.; (4) dissolves the supreme soviet of the U.S.S.R. in conformity with article 47 of the constitution of the U.S.S.R. and orders new elections; (5) conducts nation-wide referendums on its own initiative or on the demand of one of the union republics; (6) annuls decisions and orders of the soviet of ministers of the U.S.S.R. and of the soviets of ministers of the union republics if they do not conform to law; (7) in the intervals between sessions of the supreme soviet of the U.S.S.R. releases and appoints ministers of the U.S.S.R. on the recommendation of the chairman of the soviet of ministers of the U.S.S.R., subject to subsequent confirmation by the supreme soviet of the U.S.S.R.; (8) institutes orders and medals and titles of honour of the U.S.S.R.; (9) awards orders and medals and confers titles of honour of the U.S.S.R.; (10) exercises the right of pardon; (11) institutes military titles, diplomatic ranks and other special titles; (12) appoints and removes the high command of the armed forces of the U.S.S.R.; (13) in the intervals between sessions of the supreme soviet of the U.S.S.R. proclaims a state of war in the event of military attack on the U.S.S.R. or when necessary to fulfil international treaty obligations concerning mutual defense against aggression; (14) orders general or partial mobilization; (15) ratifies and denounces international treaties of the U.S.S.R.; (16) appoints and recalls plenipotentiary representatives of the U.S.S.R. to foreign states; (17) receives the letters of credence and recall of diplomatic representatives accredited to it by foreign states; (18) proclaims martial law in separate localities or throughout the U.S.S.R. in the interests of the defense of the U.S.S.R. or of the maintenance of public order and the security of the state.

The Soviet of Ministers.—At its first session after election the supreme soviet of the U.S.S.R. appoints the soviet of ministers (Russian abbreviation *Sovmin*), which consists of a chairman, a number of vice-chairmen, the ministers of the U.S.S.R. and the chairmen of a few state committees. Members appointed to the soviet need not necessarily be deputies of the supreme soviet. (See Table VIII.)

The soviet of ministers is the highest executive and administrative organ in the Soviet Union and is answerable only to the supreme soviet or, when it is not in session, to its presidium. The ministries of the Soviet Union are of two types: all-union ministries and the union-republican ministries. The all-union ministries are common to all federal republics. The union-republican ministries function in Moscow and in the capitals of the federal republics. Both types are almost annually merged, divided or suppressed by decrees of the presidium of the supreme soviet, the

Article 49 of the constitution defines the functions of the soviet of ministries as being that it

(1) co-ordinates and directs the work of the all-union and union-republican ministries of the U.S.S.R. and of other institutions under its

jurisdiction; (2) adopts measures to carry out the national economic plan and the state budget and to strengthen the credit and monetary system; (3) adopts measures for the maintenance of public order, for the protection of the interests of the state and for the safeguarding of the rights of citizens; (4) exercises general guidance in the sphere of relations with foreign states; (5) fixes the annual contingent of citizens to be called up for military service and directs the general organization of the armed forces of the country; (6) sets up, whenever necessary, special committees and central administrations under the soviet of ministers of the U.S.S.R. for economic and cultural affairs and defense.

The federal republics have parallel organs of government and administration. Each republic has a supreme soviet which appoints a presidium and a soviet of ministers. The constitution reserves to each republic the right to secede from the Soviet Union (article 17), but it is doubtful that this right could be exercised. The federal republics, autonomous republics and autonomous regions prepare their own budgets, which are incorporated in the single state budget for the whole Soviet Union. But the soviet of ministers of the U.S.S.R. determines taxes and revenues for the whole union; it can also, if necessary, overrule the decisions of a republican soviet of ministers. (I. Gv.; X.)

The Judicial System.—An early result of the revolution was the decree of Dec. 7, 1917, abolishing all existing general legal institutions and sweeping away the imperial legal system. Two new types of courts were created in their place, the ordinary courts and the revolutionary tribunals. The ordinary courts had jurisdiction in civil and criminal cases. The revolutionary tribunals had special jurisdiction in matters of counterrevolution, sabotage, abuses of officials, etc. This system proved unsatisfactory and was replaced in 1922 by a new hierarchy of courts headed by a supreme court in each republic and with the supreme court of the U.S.S.R. at the apex. Article 104 of the constitution charged the supreme court of the U.S.S.R. "with the supervision of the judicial activities of all the judicial organs of the U.S.S.R. and of the union republics."

The ordinary courts in the new hierarchy fall into four groups: (1) the people's courts; (2) the regional, provincial, territorial courts, the courts of the autonomous regions and the supreme courts of the autonomous republics; (3) the supreme courts of the union republics; (4) the supreme court of the U.S.S.R. The judges in all courts are either permanent judges or people's assessors. Judges of the people's courts are elected by all the citizens within the jurisdiction of that court. The respective soviets of the autonomous republics or other areas appoint the judges to the courts of the second group. The supreme soviets of the union republics and of the Soviet Union appoint the judges to the courts in groups 3 and 4.

Article 112 of the constitution states that "judges are independent and subject only to the law," but this does not mean that

they are independent of government policy; in practice they must follow and seek to enforce that policy whether explicit in published laws or not. Judges may be relieved of their duties if recalled by their electors. An appeal lies from all courts, except from the supreme courts of the U.S.S.R. and of the union republics, to the court next above.

A judicial office of great power is that of the procurator-general, which was established in June 1933. Article 113 of the constitution states that "supreme supervisory power to ensure strict observance of the law by all ministries and institutions subordinated to them, as well as by officials and citizens of the U.S.S.R. generally, is vested in the procurator-general of the U.S.S.R." It is noteworthy that the procurator-general, who is appointed for a term of seven years by the supreme soviet of the U.S.S.R., and the procurators, appointed by him for a five-year period throughout the republics and regions of the Soviet Union, are independent of the supreme court and of other courts.

Certain special courts exist in addition to the ordinary courts referred to above. These include the military tribunals, which have jurisdiction over criminal matters in the Soviet armed forces, and the water-transport courts and railway-transport courts, which deal with crimes involving obstruction of the efficiency of the service or of labour discipline. There are also comrade's courts set up primarily in large industrial undertakings at which fellow workers sit as judges in cases of petty crimes.

EDUCATION AND RELIGION

In tsarist Russia schools were few in number and education was possible for only a small proportion of the population. Illiteracy was widespread: in 1897 about 76% of the people could neither read nor write. Successive governments had paid scant attention to the improvement of education, to the building of schools and universities and to the training of teachers. Their policy was one of inactivity, and they seem to have been content that the mass of their people should remain backward and ignorant. In 1895 there were in Russia only 9 universities with 13,976 students and 29,241 primary schools with 1,935,076 pupils.

During the period of 1895-1904, some development of educational facilities, mainly in the field of technical training, took place. These were years of industrial expansion, and the new industries created a need for technicians who could handle machinery. The plentiful unskilled peasant labour which had served Russian needs in the past was no longer adequate. In this period the numbers of medium and primary technical institutes increased from 51 to 93, of handicraft schools from 91 to 237, of communal schools from 6 to 139. But these and other developments directly concerned the technical needs of the new industries and did not greatly affect the general problem of illiteracy in Russia. The Soviet government found itself confronted with this problem and achieved in many respects remarkable success toward solving it.

By 1951 there were in the U.S.S.R. 220,000 primary and secondary schools with a total of 38,000,000 pupils and 1,250,000 teachers. In 1939, within the frontiers of 1921, there had been 31,517,000 pupils. In 1914, within the same frontiers, there had been 7,260,000 pupils in 93,311 elementary and 764,600 in 459 secondary schools. The totals for 1951 include about 3,700 secondary technical schools with 1,094,000 pupils. In 1914 there had been only 295 schools of this type with a total of 35,800 pupils.

There were, by 1951, 31 universities and 856 other institutions of higher education (V.U.Z.), including 375 teachers' colleges, with 1,356,000 students, including 467,000 taking correspondence courses. In 1938 there had been 23 universities and 727 V.U.Z. with 602,900 students. In 1914 there had been 10 universities and 81 institutions of higher education with a total of 112,000 students. A further illustration of the Soviet government's achievement is to be found in the figures for illiteracy: the percentage of illiterates had been reduced to 48.9% by 1926 and to 18.8% by 1939. This latter figure was further reduced after 1939, universal education at least to the extent of the elementary four-year school being achieved in most of the republics of the Soviet Union.

Early Soviet Measures.—The Bolshevik revolution of 1917

was followed by the destruction of all tsarist institutions and systems. The old ministry of education was replaced by two new bodies, the people's commissariat for education and the state commission for education, the latter being headed by Anatoly V. Lunacharsky. Within a week of the revolution Lunacharsky published an "exhortation to the citizens of Russia on national education" in which the tasks in the field of education were summarized as follows: abolition of illiteracy as quickly as possible; introduction of universal, compulsory and free education; establishment of institutes and seminaries for the training of "people's teachers." A fourth point might have been added concerning the association of the church with education. Militant atheism was proclaimed by the Communist leaders as part of their policy. It was therefore to be expected that the church schools would be taken over by the government and that all forms of religious instruction in schools would be forbidden. In Dec. 1917 the people's commissariat for education issued an ordinance bringing under its authority all church schools, seminaries and academies. This step was followed on Jan. 21, 1918, by a decree of the council of people's commissars disestablishing the church and introducing secular education. Another important innovation of this period was the introduction of coeducation by decree dated May 31, 1918.

A decree issued on Oct. 16, 1918, codified the educational measures introduced after the revolution. The declaration of the state commission for education attached to this decree gave the name "united labour school" to all schools under the people's commissariat for education. The new school was divided into two grades: grade I for children 8 to 13 years of age, and grade II for children 13 to 17 years of age. Education in both grades was free and compulsory, although in practice the great shortage of schools and of qualified teachers made it impossible for more than a small proportion of children to attend. Further innovations were the abolition of the old forms of discipline and punishment, of homework and of examinations. Schools were to be run by school Soviets in which senior pupils took part. Teachers, whose hands were tied by these Soviets, were in future to be known as school workers and were to concentrate on breaking away from the old tsarist methods and on practising Communist methods of teaching.

The "liquidation of illiteracy" was recognized by the new regime as one of its basic tasks, and on Dec. 26, 1919, the council of people's commissars passed a decree directing that "the entire population of the republic between the ages of 8 and 50; unable to read or write, be obliged to become literate in either their native or the Russian language, according to their preference." But the implementation of this decree proved most difficult, particularly in a country rent by civil war. The anxiety of the government over the slow progress made in reducing illiteracy was shown in the series of decrees and exhortations that was issued. Finally on Jan. 26, 1930, the central executive committee of the party and the council of people's commissars issued a joint ordinance setting up special local committees for the liquidation of illiteracy to be attached to each regional and district executive committee.

University education also received close attention in the post-revolutionary period. On Aug. 2, 1918, a decree of the council of people's commissars abolished all higher educational establishments, as they were called, to all citizens, without respect to nationality or sex, simply on condition that they should be over the age of 16 years. In Sept. 1919 universities were directed to provide special courses, known as "worker's facilities," to prepare workers and peasants for higher education.

The Educational Reform.—It was soon found that most of these innovations were unsatisfactory. Teachers were unable to enforce discipline, and conditions in schools were chaotic. Nor were the new teaching methods found to equip the young Russian or non-Russian citizen to assist in the reform and development of the country along the lines laid down by the party. The new methods tended to produce undisciplined and untrained youths of little use in industry or otherwise.

An order of the central committee of the party issued on Sept. 5, 1931, contained the first suggestion of change. The order pointed

to "certain serious defects" in soviet education and specified changes to be made in the syllabus for schools. The central committee issued a further and more important order on Aug. 35, 1932, which called for a recasting of the programs of schools and for a revision of the syllabuses. A routine was laid down to be followed in all schools. The brigade system of teaching was abandoned and teachers were directed to give individual instruction. Examinations and discipline were revived although not so strictly as was to be required by subsequent decrees. This order together with the subsequent order of May 16, 1934, abolished the innovations of the postrevolutionary period and established a system of education incorporating many of the principles and practices in force in Europe.

The order of May 16, 1934, replaced the united labour school with the general educational school, divided into three stages. The elementary school contains four classes and is known as the four-year school. Until the publication of the ordinance of the council of people's commissars on Sept. 8, 1943, compulsory education began in the four-year school at the age of eight years, but the ordinance reduced it to seven. The second stage is the seven-year school or the incomplete secondary school, containing seven classes. The third stage is the secondary school proper, known as the ten-year school and containing ten classes. The government in its attempts to achieve universal compulsory education was faced with many difficulties, particularly the shortage of teachers and of school accommodation. It was nevertheless claimed by Stalin at the 16th party congress in 1930 that universal compulsory education had been introduced throughout the U.S.S.R. It would seem, however, that only four-year education, the equivalent of European elementary education, had been introduced. The 18th party congress, held in 1939, proclaimed that the aim must be to achieve universal ten-year or complete secondary education in towns and workers' settlements and universal seven-year education in the country. World War II prevented the realization of this aim and it was made one of the tasks of the fourth five-year plan (1946-50). The Soviet government released little factual information after World War II on the success or failure of these plans, but an announcement on Aug. 17, 1949, stated that the school year 1949-50 would see in the R.S.F.S.R. "seven-year education on a very wide scale." This suggested that even in the towns of the most highly developed of the republics the ten-year school was not common, while in the less well-developed areas even the seven-year school was far from universal.

Introduction of Fees.—An important amendment to the strongly proclaimed Communist principle of free education as a right of all citizens was the introduction of fees in the senior classes of secondary schools and in higher educational establishments of the U.S.S.R. as laid down in the ordinance of Oct. 2, 1940, of the council of people's commissars. The fees are payable in the three senior classes of the complete secondary school and in higher educational establishments at rates specified by the ordinance. Free education and stipends are allowed in these grades only to students of outstanding ability. Three subsequent ordinances exempted from payment of fees students in military faculties and in national theatrical and musical studios and national groups of ballet schools in Moscow and Leningrad. Exemption was also extended to the children of noncommissioned members of the army and navy and in certain circumstances to the children of persons drawing invalid pensions. The reasons for this change in the government's policy were not clear. It has been suggested that it was due to anxiety to divert the younger generation from higher education to factory work and to military training and to meet the urgent need for medium-grade experts. It is probable that this was one of the purposes behind the introduction of fees, which must certainly have restricted the number of students able to enter higher educational establishments.

Mention should also be made of the abolition of coeducation which had been regarded in the early postrevolutionary period as an important innovation. This change was effected by the ordinance of the council of people's commissars issued on July 16, 1943, which called for separation of the sexes in secondary schools as rapidly as facilities would permit.

Higher Education.—The educational system includes the specialized secondary educational establishments and the higher educational establishments. The former serve to train technicians and specialists of the middle grade, which includes elementary school teachers. Pupils who have completed the seven-year school are eligible for these establishments, at which they receive stipends, free training and subsistence allowances.

The higher educational establishments comprise the universities and certain institutes which train top-grade specialists. These institutions are charged with the task of training intellectuals and in particular technicians whom the party can entrust with the carrying out of its policies and above all its policy of intensive industrialization. The two most important pronouncements affecting higher education were the resolution of the party central committee of July 17, 1938, on improving the training of new specialists and the joint ordinance of June 23, 1936, issued by the party central committee and the council of people's commissars on the work of the higher educational establishment. The former devoted considerable attention to the development of new cadres and specified that by 1932 the number of engineering and technical specialists in heavy industry should be doubled. The ordinance of 1936 in many respects produced a reorganization of higher education. Students to be eligible for higher educational establishments had to complete the full ten-year school and also to pass a special entrance examination. The ordinance then laid down the conditions applying to professorial staff, the examining of students and the granting of grade I and II diplomas.

A further change was made by a joint ordinance of Dec. 1935 abolishing the ban against the admission of people of undesirable social origin and of the children of parents with "limited social rights" to higher educational establishments. This reform was part of the general abolition of proletarian class privileges which came with the introduction of the new Stalin constitution of 1936.

The Content of Education.—All education in the Soviet Union is permeated by the ideology and directed by the needs of the Communist party. The following quotation from the editorial of *Pravda* of Sept. 1, 1949, illustrates the nature of this influence:

To bring up active fighters for the cause of Communism, all-round educated people, possessing thorough and firmly-based knowledge, such is the main task of our schools, such is the law of their life. All must be subordinated to this task; the process of education, extra-school occupations, propaganda among parents, the work of the Young Communist and Pioneer organizations in the schools.

Equally plain is the following injunction published in the *Literaturnaya Gazeta* of Sept. 3, 1949:

The country entrusts the school with its most treasured possession, its children, and no one should be allowed to indulge in the slightest deviation from the principles of the Communist materialistic upbringing of the new generation.

The party ideology informs all activities in the general secondary schools, and indeed the daily lives of Russian children and adults, but instruction in Marxism-Leninism and in dialectical and historical materialism is included in the curriculums only of the higher educational establishments, where a considerable amount of attention is devoted to them.

Religion.—Under the tsars the Orthodox Church was the established church to which the vast majority of the people belonged. Other religions were permitted but did not enjoy the same freedom as the established church, and adherents of certain religions, as, for example, the Unite rite of the Roman Catholic Church, Islam and Judaism, were at times actively persecuted. At no time, however, had religion in Russia been subjected to such organized persecution as under the Soviet regime. The reason for this is that the Communist party is based on an ideology materialistic in character and militantly atheistic in action.

The first campaign of persecution lasted from 1917 to 1923. The Orthodox Church was disestablished; church property was seized and confiscated; divine service was allowed only under certain highly restrictive conditions; religious instruction was prohibited in schools and for groups of children under the age of 18 years. In an attempt to weaken the Orthodox Church the government sought to create a schism by supporting a new religious organization, the so-called "Living Church," but this collapsed

through lack of popular support. In May 1922 the patriarch was imprisoned, with a large number of bishops and priests; his release in June 1923, the result of popular protests, marked the end of the first campaign. The second period of persecution lasted from 1923 to 1930. It differed from the first period in that direct attacks on the clergy more or less ceased, and the party concentrated on antireligious propaganda. A special publishing house called Bezbozhnik ("The Godless") had been set up in Feb. 1922 to print and disseminate antireligious material. An antireligious seminary was opened, and the celebration of Christmas and Easter in 1923 was marked by mock processions and services designed to hold religion up to ridicule. The foundation of the League of Militant Atheists on Feb. 7, 1925, which became the centre of violent antireligious propaganda, was the most important step in the government's campaign. In the third period the persecution took the form of a renewal of attacks on churches and on the clergy. Hundreds of priests were arrested and many were sent to the dreaded Solovetsky concentration camp in the White sea. But despite the innumerable restrictions, the imprisonment of the clergy and the wide use of antireligious propaganda, the church retained its large following, and it was apparent that the campaign for atheism had failed. The persecution seems to have been most intense in the years 1937-38, when the church leaders were denounced officially as "the implacable enemies of social reconstruction" and arrested in large numbers.

Signs of a new policy toward religion were noticeable in 1939 and developed into what has been called the government's New Religious Policy. This new policy was confirmed on Sept. 5, 1943, when Stalin received the acting patriarch Serghey and subsequently on Sept. 12, 1943, when Serghey was officially installed as patriarch of Moscow and all-Russia. From this date numerous concessions were made to the church, although its activities continued to be severely circumscribed. In 1949 Karpov, the head of the council of the Russian Orthodox Church, which had been established by the Soviet government as the liaison body between church and state, announced that the Orthodox Church had a patriarch, 3 archbishops and 67 bishops, while 22,000 churches and 89 monasteries and convents were functioning normally.

It was clear that the Soviet government's policy since 1939 had been more lenient toward the Church; at the same time it was to be noted that the party had not in any respect departed from its basic teaching that religion and communism must always be incompatible. The profession of atheism continues to be a condition of membership of the party. Religious instruction continues to be prohibited in schools, although antireligious propaganda informs much of the teaching—a situation in accordance with article 124 of the constitution; namely, "In order to ensure to citizens freedom of conscience, the church in the U.S.S.R. is separated from the state, and the school from the church. Freedom of religious worship and freedom of antireligious propaganda is recognized for all citizens."

It is noteworthy that the party continues to pay particular attention to the promotion of atheism in the Young Communist league. The party's policy is summed up in the injunction published in June 1947 in the *Komsomolskaya Pravda*, the official organ of the league: "Young Communists must be not only convinced atheists and opposed to all superstitions, but must actively combat the spread of superstitions and prejudices amongst youth." (I. Gv.)

DEFENSE

The prerevolutionary Russian army was strong in manpower but otherwise reflected all the weaknesses of the political, social and economic order of the imperial regime. Although traditionally the Russian soldier is a hard fighter, with exceptional powers of endurance, the quality of the recruits was lowered by the fact that four in five were illiterate. Despite some progress in industrialization at the end of the 19th and at the beginning of the 20th century, the country was still backward; in 1913 it produced only 30 kg. of pig iron per head as compared with 254 kg. in Germany; the army had only 60 batteries of artillery against German's 350; the extent of the railway system in European Russia alone was

1 mi. of railway to 60 sq. mi. of territory, or one-tenth the German figure. Though there was no lack of talented generals and patriotic officers, both alike were helpless under a system undermined by corruption and nepotism. Participation in World War I against Germany and Austria-Hungary led to appalling losses and ultimately to the complete collapse of the old army. Imperial Russia had a peacetime army of 1,100,000 and 42,000 officers; from 1914 to 1917 it mobilized 12,000,000 men, of whom 1,700,000 were killed, 4,950,000 wounded and 2,500,000 taken prisoners of war.

The revolution of March 1917 in the midst of a war for survival resulted in a rapid dissolution of all fundamental institutions and notions. The minister of war in the provisional government, Alexander Guchkov, strove to stop the decline of discipline in the army but in May resigned in despair. He was succeeded by Kerensky, an eloquent speaker who assumed that by personal magnetism he would be able to counteract the progress of defeatist Communist propaganda (see *History*, above). The Communists alone were unequivocally against the continuance of the war, and this attitude greatly contributed to the success of their revolution of Nov. 1917, which ended a short-lived attempt to create a Russian democracy. The conclusion of the oppressive treaty of Brest-Litovsk with the Central Powers, on which Lenin insisted, was necessary because the appeals of the more impatient Communists and left-wing Socialists for "revolutionary war" fell on deaf ears.

Formation of the Red Army.—On Jan. 15, 1918, the council of people's commissars issued a decree creating a Workers' and Peasants' Red army on a voluntary basis. The first units distinguished themselves against the Germans at Narva and Pskov on Feb. 23, 1918, which date became the Soviet Army day. By April 22, 1918, the Soviet government felt strong enough to decree compulsory military training for workers and peasants who did not employ hired labour. This was the beginning of the Red army. Trotsky, from March 1918 people's commissar for war, was its founder and Mikhail Frunze, Mikhail Tukhachevsky and S. M. Budenny were among the most successful of its commanders in the field. It was an army based on the class principle; people who belonged to the *bourgeoisie* were ineligible for combatant service.

The problem confronting every revolutionary army, that of creating a competent and reliable officers' corps, was solved by Trotsky by mobilizing former officers of the imperial army, allowing them tolerable material conditions and warning them that their families would be held as hostages in the event of treason or desertion. Altogether about 50,000 such officers served in the Red army up to 1921 and the overwhelming majority remained loyal to the Soviet regime. To ensure the officers' reliability a political adviser, *politichesky rukovoditel* or *politruk*, was attached to every unit. These officials, who were Communists, not only kept the officers under observation but also carried out political propaganda in the ranks to stimulate morale. As the war went on, a more reliable type of young officer began to emerge from the short-term officers' training schools that were set up.

After the Riga peace treaty with Poland the Red army was demobilized and reduced to a more efficient and manageable force. At the end of 1920 it had 5,300,000 effectives; the number was reduced to 1,800,000 by Sept. 1921 and to 825,000 a year later. In 1925 the permanent strength of the Soviet armed forces was 562,000, and for nine years it remained at this level. Trotsky, losing his contest for power with Stalin, had to resign as people's commissar for war in Nov. 1924 and was succeeded by Frunze. On the latter's death Oct. 31, 1925, K. E. Voroshilov, trusted friend of Stalin, became commissar for war, remaining in this post until May 8, 1940.

Between 1925 and 1933 the percentage of All-Union Communist party members among the ranks increased from 19% to 49%; the percentage of party members among the officers was much higher. By this time only a few officers from the imperial army remained on active service. All the commanders were graduates from Soviet military academies and officers' training schools, where only candidates recommended by the Komsomol or Communist Youth League, by the Communist party and by the security services could

be accepted as pupils.

The fight against all who were critical of Stalin's leadership extended also to the army, where a drastic purge took place in May 1937. On June 13 Marshal Tukhachevsky, first deputy people's commissar of war, and seven other prominent generals of the Red army were shot, having been accused of spying to betray the Soviet Union to the Japanese and Germans. Gen. Ian Gamarnik, second deputy people's commissar in charge of political education, was said to have committed suicide. Many other generals were either sent to forced labour camps or cashiered.

Gen. B. M. Shaposhnikov, a graduate of the Imperial academy of the general staff, who had served in the Red army from May 1918 and been chief of the general staff in 1929-31, was again appointed to that position in 1937. The Japanese intervention in China and the German rearmament compelled the Soviet Union to increase its peacetime armed forces; it had 940,000 men in 1934, about 1,300,000 in 1936 and about 1,600,000 under arms at the beginning of 1939. The country was then divided into 13 military areas and the army was composed of 87 infantry divisions and 32 cavalry brigades.

The Red Army in World War II.—When the German armies attacked the Soviet Union on June 22, 1941, their early successes caused general surprise. By October they had covered three-quarters of the distance separating Moscow from the German frontier and had taken more than 2,050,000 prisoners of war and a vast haul of war material. A hard winter, as well as Russian heroism, halted them at the gates of Moscow. Nevertheless, in 1942 they were able to push as far as Stalingrad. The epic resistance of Stalingrad should not hide the fact that when the Soviet armies started their counteroffensive there were 800,000 Soviet citizens, former prisoners of war, serving in the German army, the most prominent of them being Lieut. Gen. Andrey Vlasov, one of the two army commanders (the other being K. K. Rokossovsky) who had stopped the Germans before Moscow but who, defeated by the Germans east of Leningrad, had surrendered in Aug. 1942. Although for years Soviet propaganda had denounced them as "fascist beasts," the Germans were welcomed as liberators in many parts of the Soviet Union, especially in those with a non-Russian population. Without underestimating the resilience of the Soviet regime and of the Soviet army, it should be recorded as a historical fact that one cause of the German defeat in Russia was Hitler's blunder in maintaining the *kolkhozes* detested by the peasants, and in discouraging the non-Russian nationalisms, in particular that of the Ukrainians.

By the end of World War II the Soviet armed forces were estimated at 11,000,000 men and 360 divisions. According to Voznesensky, they had 5 times as much artillery, 15 times as many tanks and 5 times as many aircraft as in 1941. Demobilization started by the end of 1945, but by 1952 the postwar armed forces were about three times as strong in numbers as they were in 1939. On Oct. 3, 1946, the word "Red" was officially discarded from the title of the Soviet armed forces.

Allied Aid to the Soviet Union.—The Soviet government was always unready to acknowledge the extent of Allied aid in weapons, munitions of war, strategic raw materials and foodstuffs received from the United States and Great Britain during World War II. Voznesensky maintained that the Allied deliveries were only 4% of the domestic production during the war. Lend-lease to the Soviet Union amounted to \$10,982,089,000 from the United States and to £428,000,000 from Great Britain. From Oct. 1941 to Aug. 1945 the United States delivered 375,883 trucks, 51,503 jeeps, 7,056 tanks, 8,075 tractors, 35,170 motorcycles, 2,328 ordnance service vehicles, 14,795 aircraft, 189,000 field telephones with 670,000 mi. of wire, considerable railway equipment (1,900 steam locomotives, 66 diesel locomotives, 9,920 flatcars, 1,000 dump cars, 120 tank cars and 35 heavy machinery cars), 4,478,116 tons of foodstuffs, 2,670,371 tons of petroleum products and quantities of boots, aluminum, copper, explosives, etc.

Great Britain likewise, between Oct. 1941 and March 1945, shipped 7,410 aircraft, 5,218 tanks, raw materials, machinery, industrial plant, foodstuffs and medical supplies, which were sent to the U.S.S.R. in 40 convoys by the northern route; despite con-

siderable risks and hardships involved, 92.6% of the supplies arrived safely in Russian ports.

The Soviet Forces after World War II.—A British estimate of July 1951 placed the Soviet armed forces at 4,600,000 men. The army comprised 2,100,000, the forces of the interior 1,100,000, the air force and anti-aircraft defense 800,000 and the navy 600,000. There were 175 divisions, excluding 40 artillery and anti-aircraft divisions. In his report published April 2, 1952, Gen. Dwight D. Eisenhower, the North Atlantic Treaty organization supreme commander, gave a similar estimate for the Soviet divisions, and estimated the forces of the European Soviet satellite powers at 60 divisions. Speaking before the U.S. senate's foreign relations committee on March 24, 1952, Gen. Alfred M. Gruenther, chief of staff at supreme headquarters, Allied powers in Europe, added that while the size of the Soviet armed forces had remained static in the postwar years, the high command had concentrated on improving and perfecting them; 65 out of 175 divisions, for instance, had been armoured and mechanized.

The armed forces of the Soviet Union in the early 1950s were divided into the army, the air force, the anti-aircraft defense, the navy and the forces of the interior. The army was composed of four types of division: (1) the infantry division, consisting of three rifle regiments on foot, one horse-drawn artillery regiment of 72 guns and howitzers and one tank regiment (full strength, 11,000 men); (2) the motorized division, that is, an infantry division with lorry (truck)-borne infantry and motorized artillery; (3) the armoured division, designed for short-range combat in co-operation with infantry, consisting of three medium tank regiments of about 200 tanks, one mixed regiment of about 50 heavy tanks and 25 heavy self-propelled guns, and a motorized rifle regiment (full strength, 10,500 men); and (4) the mechanized division, designed for more independent action, comprising three regiments of motorized infantry, two tank regiments (medium and heavy), one howitzer regiment and rocket, anti-aircraft and reconnaissance battalions (full strength, about 13,000 men). There were also mountain and cavalry brigades. The typical Soviet artillery division (150 guns and howitzers, 10,000 men) was controlled directly by army headquarters.

The air force in the Soviet organization was not an independent arm but was divided between the army and the navy, about 90% of the first-line air strength belonging to the former. According to General Gruenther, the Soviet air force had 20,000 operational aircraft in 1952, including 4,000 jet planes. The highest formation was an air army composed of a number of divisions, each containing from three to four regiments of about 50 aircraft each. According to Asher Lee, there were two air armies, each of about 1,000 operational aircraft, attached to each of the army group headquarters of Leningrad, Minsk, Odessa, Tbilisi, Tashkent and Chita. In addition, there were air divisions in eastern Germany and an independent long-range air force. The air force also comprised a certain number of parachute brigades.

The anti-aircraft defense or P.V.O. (Protiv-Vozdushnaya Oborona) was an independent arm composed of anti-aircraft artillery divisions and fighter divisions.

The Workers' and Peasants' navy was created by a decree of the council of people's commissars on Feb. 14, 1917. Until Dec. 31, 1937, the navy was administered by the common people's commissariat for war and navy. On that date a navy commissariat was created; but on Feb. 25, 1946, it disappeared when by a decree of the presidium of the supreme soviet a people's commissariat of the armed forces was organized. (In March 1946 the name "people's commissariat" was dropped in favour of "ministry.") Although *Pravda* commented that this decision emerged from the whole experience of World War II, a navy ministry was restored on Feb. 25, 1950. Adm. I. S. Yumashev, the first minister, was succeeded on July 23, 1951, by Adm. N. G. Kuznetsov, who had been people's navy commissar from 1937 to 1946. According to Adm. William Fechteler, U.S. chief of naval operations, the Soviet navy consisted in 1951 of 3 old battleships, about 15 cruisers, 45 or 50 destroyers and about 300 submarines. Approximately 60 of the submarines were former German U-boats and about 100 were of a small coastal type.

The forces of the interior were divided into frontier guards and security troops administered by the ministry of the interior. They were not intended for the front, although equipped in every way, down to tanks, artillery and aircraft.

Military service extended for two years in the army (three years for noncommissioned officers), three years in the air force and anti-aircraft defense, four in the navy and 27 months in the forces of the interior. Conscription age was 18 for men with secondary education and 19 for all others. From 1946 about 1,200,000 men were conscripted yearly.

Up to Oct. 1946 described as "Red army man" (*krasnoarmeets*), a Soviet soldier was afterward termed a "ranker" (*ryadovoy*). Discipline in the Soviet army was strict and punishments were severe, transgressors being sent to penal battalions, which in World War II were set almost exclusively tasks. Pay and privileges rose rapidly with rank. Thus, while in the U.S. army a general's pay was in the ratio 15 to 1 to a private's, in the Soviet army a marshal's pay was in the ratio of 114 to 1 to a private's. The officer's corps was a separate caste, and the times when a private could address a colonel simply as *tovarishch* were long forgotten; he would now say *tovarishch polkovnik* (comrade colonel) and give the once-outlawed salute not only to officers but also to noncommissioned officers.

Until Sept. 1951 there existed three organizations for pre-military training, one for the army, one for the air force and one for the navy. It was announced on Sept. 26 that the three organizations had merged into one All-Union Association for Voluntary Assistance to the Army, Air Force and Navy (D.O.S.A.A.F.); this provided military training for young men from the age of 15 years onward.

The proportion of the total estimated expenditure allocated to defense rose between 1951 and 1952 from 18.5% to 21.3%. This declared expenditure was, however, not the whole picture; a great proportion of the military expenditure was detectable under the guise of investment in national economy, while the cost of military academies and schools was included in expenditure on education.

The nominal head of the Soviet land and air forces was the minister of war. After K. E. Voroshilov had ceased to be people's commissar in May 1940, this post was occupied by Marshal S. K. Timoshenko (May 8, 1940–July 20, 1941), Marshal Joseph Stalin (July 20, 1941–March 3, 1947), Marshal N. A. Bulganin (March 3, 1947–March 24, 1949) and Marshal A. M. Vasilevsky (from March 24, 1949). The minister had under his command the chief of the general staff. After B. M. Shaposhnikov's resignation in the summer of 1940 on the ground of ill health, the post was occupied for a few months by Marshal Kiril Meretskov, then by Marshal G. K. Zhukov (Feb. 24–Oct. 31, 1941), then again by Shaposhnikov till he was replaced in Nov. 1942 by Marshal Vasilevsky (Shaposhnikov died on March 26, 1945). From Nov. 12, 1948, Gen. Sergey Shtemenko was chief of the general staff.

There were six deputy ministers of war and each was in charge of an arm or a service. The post of commander in chief of the air force was occupied during World War II by Marshal A. A. Novikov, from 1946 by Marshal K. A. Vershinin and from July 1950 by Col. Gen. P. F. Zhigarev. (K. Sm.)

COMMUNICATIONS

Russia is well endowed with navigable waterways and has throughout most of its area a flat surface which lends itself to railway construction, but the country has always lacked an adequate system of communications. The railways were unevenly distributed, being concentrated in the central and southern industrial regions of European Russia. Vast areas remained unserved. In 1913 the whole of Asiatic Russia had only 15% of the country's railways. Another difficulty was the long and uneconomic haul of freight from the south to Moscow, and before the revolution it was cheaper to import coal to St. Petersburg from abroad than to haul it from the Donets basin. The severe continental climate meant a heavy seasonal demand on the railways and other means of transport, and this invariably resulted in congestion and serious delays. Quantities of freight were hauled by wagons drawn

by horses, mules or oxen, but this slow method was further handicapped by the fact that roads were virtually nonexistent. Many rivers have been constantly used to transport freight, but little attempt was made until after the revolution to make full use of the great networks of waterways. The Soviet government gave priority to the construction of railways, canals and roads, and the development of the system of transport went ahead rapidly.

Railways.—The first Russian railway—from St. Petersburg to Tsarskoye Selo—was laid down in 1837, but despite this early start the nation lagged behind in railway construction. It was not until 1851 that the first main line—from St. Petersburg to Moscow—was laid. The two great periods of expansion of the railways were 1868-74 and the 1890s; the Trans-Siberian railway was built in 1891-1903 and had been double-tracked by 1936. In 1913 the length of railways per 10,000 inhabitants was about one-fourth that of England, and in quantity and quality the engines and rolling stock were far inferior to those in use in England.

The main trunk lines were constructed before the revolution, and the Soviet government concentrated on developing and extending them, while modernizing equipment. During the period 1920-40 the total length of Soviet railways increased from 35,700 mi. to 64,200 mi. In 1937 the railways hauled almost four times as much freight as in 1913. Much was done to eliminate long and uneconomic hauls. Imports of coal from distant basins such as the Donbas, Kuzbas and Karaganda were reduced by utilizing local coal deposits near Moscow, in the Urals and in the Caucasus. The creation of a second oil base between the Volga and the Urals meant a considerable decrease in the long hauls of oil. The shipment of lumber from the forests of northern European Russia to the central and southern regions and from Siberia to central Asia also reduced costly hauls.

The construction of the Turkistan-Siberian (Turksib) railway, completed in 1930, linking Novosibirsk with Kazakhstan and central Asia, was by mid-20th century the most important achievement of Soviet railway policy; not only were great difficulties of engineering overcome but also it made possible the direct exchange of cotton from central Asia for grain and timber from western Siberia.

A South Siberian (Yuzhsib) line, branching off from the Trans-Siberian at Kinel (east of Kuibyshev), linked the steelworks of Magnitogorsk with the coal basin of Karaganda. By 1950 the line was extended farther east from Akmolinsk to Barnaul (where it crossed the Turksib), and continued eastward to Stalinsk, in the Kuzbas (already linked to the Trans-Siberian via Kemerovo). From Stalinsk the line was being extended to Abakansk, source of supply in iron ore and manganese for the Kuzbas steelworks, and was expected to join the Trans-Siberian at Tayshet, east of Krasnoyarsk. Before World War II work had been begun on a new railway across eastern Siberia, branching off the main line at Tayshet and passing north of Lake Baikal to Kirensk, Cherkunda, Komsomolsk and Sovetskaya-Gavan (on the Sea of Japan). By 1950, with the exception of the link Kirensk-Cherkunda, this line was believed completed.

The outlets from the Donbas were greatly increased by the laying of new lines or the double-tracking of existing lines. Action was also taken in modernizing rolling stock and equipment. L. M. Kaganovich, appointed people's commissar for transport in 1935, organized a campaign for technical improvement. More powerful engines were brought into service with rolling stock of greater capacity. About 38% of the entire network of rails was relaid to allow for this heavier traffic. In regions where hydroelectric power was available some lines were electrified; for example, Murmansk-Kandalaksha and Tbilisi-Batum. Serious losses of rolling stock were suffered in World War II, but these were later made good.

The following are the chief freight routes in the U.S.S.R.: Donbas to Krivoi Rog; Donbas and the northern Caucasus to Moscow and Leningrad; Donbas to the Volga region; Murmansk to Leningrad; Archangel to Moscow; Leningrad to the Urals; Moscow to the Urals; Moscow to central Asia; the Urals to the Kuzbas; Siberia to the far east; and Siberia to central Asia.

Waterways.—Russia is covered by a dense network of waterways, most of which are navigable. They provide an invaluable means of transport in a country of such vast distances. Before the revolution little was done to develop the waterways, but in 1913 about 48,900,000 tons of freight were hauled by this means, chiefly in the Volga basin. By 1937 this figure had risen to 66,900,000 tons.

The disadvantages of river transport are that all Russian rivers are frozen over and closed to navigation for four or five months of the year and, second, that freight must of necessity follow the natural flow of the rivers. The Soviet government planned to overcome the latter disadvantage by the construction of canals and dams, and it appeared that eventually the European and Asiatic waterways might be linked in this manner. Three canals were completed: (1) the Moscow-Volga canal, opened in 1937, connecting Moscow with the whole Volga basin; (2) the Volga-Baltic water route (Mariinsk system), allowing transport by small vessels from the Volga river to pass through a series of rivers, canals and lakes to Leningrad; (3) the White sea-Baltic canal, opened in 1933 and leading to important developments in the north and, by connecting the White sea through Lake Onega with the Mariinsk system, contributing greatly to the exchange of goods between north and south.

The importance of the Dnieper river for transport had always been reduced by the rapids just south of the great bend in its course. The construction of a dam and canals as part of the "Dneproges" (Dnieper hydroelectric station) made the rapids navigable. By 1952 much was being done to make the Don river navigable, including the construction of the Volga-Don canal. In Siberia and the far east the main rivers—the Ob, the Irtysh, the Yenisei, the Lena and the Amur—are all navigable throughout most of their courses and are chiefly utilized for moving timber. In addition to constructing dams and canals, much was done to deepen and improve the waterways so that they would allow the use of larger barges and more powerful river fleets.

Maritime Transport.—The principal ports are in the White, Barents and Black seas. Of these Murmansk in the north and the ports of the Sea of Azov and the Black sea are ice-free the year round. The southern ports handle more than half the total seaborne cargo destined for foreign or for other Soviet ports. Modern tanker fleets are in commission in the Black and Caspian seas, transporting oil from Batum in the former and from Baku to Astrakhan and Krasnovodsk in the latter sea. After the revolution maritime transport grew in importance, particularly with the development of the northern sea route, which allows the direct shipment of timber from Siberia to European Russia and the more rapid transport of machinery and manufactured goods from the White sea to Siberia and the far east.

Roads.—In Russia transport had always relied primarily on the railways and rivers and in winter on the use of sledges. Lack of stone for road construction, except in the Urals, has been one of the difficulties, and before the revolution such roads as had been built were so primitive as to be often impassable. The real demand for surfaced roads was created by the sharp increase in the number of motor vehicles manufactured in the new Soviet factories. Before the revolution there were about 9,000 motor vehicles in the whole of Russia; the number had grown to 19,000 by 1928 and to 760,000 by 1938. In 1950 the production of motor vehicles was said to amount to 65,000 cars, 6,400 buses and 428,000 trucks.

The roads constructed by the Soviet government proved their value during World War II when, making use of fleets of trucks, mainly provided by the Soviet Union's western allies, they relieved the railways of some of the heavy wartime burden. Before World War II highways were built to link many of the most important centres, as, for example, Moscow-Leningrad, Moscow-Minsk, Moscow-Kiev, Leningrad-Vitebsk-Kiev in the eastern parts of the Soviet Union; the Tashkent highway system in central Asia; and the reconstructed Georgian military highway running from Dzudzhikau (Vladikavkaz) across the Caucasus mountains to Tbilisi and Erivan. These highways are of strategic importance.

Air Transport.—After 1923 air transport became an impor-

tant part of the Soviet transport system. By 1940 more than 88,000 mi. of airways were in regular operation, carrying passengers, mail and freight to all parts of the union. The Moscow-Vladivostok arterial air line crosses the entire country and is of particular importance also for the branch lines which connect it with Magnitogorsk, Karaganda, Alma Ata, Yakutsk, Komsomolsk and Sakhalin. The arterial air lines Moscow-Kharkov-Rostov-Baku-Tbilisi and Moscow-Kybyshyev-Aktubinsk-Tashkent are also of considerable importance. After World War II, in the vast regions where other methods of transport remained undeveloped, new air routes were established.

In 1923 the air lines carried 200 passengers, 1,800 kg. of mail and 100 kg. of freight; in 1939 they carried 307,000 passengers, 11,500 tons of mail and more than 40,000 tons of freight.

(I. Gy.)

ECONOMIC AND FINANCIAL CONDITIONS

In its economy, as in many other aspects of its life, Russia before World War I was a land of contrasts. It was predominantly agricultural, with a small class of wealthy and well-to-do landowners and a majority of peasants, who lived, with few exceptions, in poor and primitive circumstances. The industrial revolution had come late to Russia, but the country was rich in mineral and agricultural resources, in coal, iron, oil, manganese, cereals, cotton, flax and sugar beets, among other products. And, although industry played a less important part in the national economy than was the case in western Europe, about half its industrial workers were employed in large plants with more than 1,000 workers.

This was largely attributable to the fact that foreign capital, French, British, German, Belgian and U.S., in this order of importance, had been flowing into Russia rapidly since the last quarter of the 19th century. The foreign capitalist often found it profitable to put up a big factory, equipped with the latest machinery. So Russian industry was only partially the result of the slow accumulation of capital by pioneer Russian companies. It was the hot-house fruit of foreign investment. About one-third of the capital invested in Russian stock companies in 1914 was of foreign origin.

After the conclusion of the Franco-Russian alliance in 1897, Russian loans, state and municipal, found a ready market in France. French capital was strongly interested in the Russian mining and metallurgical industries. French money was heavily invested in the coal and iron industries of the Donets basin. British capitalists specialized in the Caucasian oil fields and in the textile industries which grew up in the neighbourhood of Moscow. Germans were active in the electrical industry. A number of Russian streetcar lines were built with Belgian capital. There was some British and U.S. mining and engineering development in the Ural mountains and in Siberia.

Partly because of the stimulus of an inflow of foreign capital that averaged 200,000,000 gold roubles (about \$100,000,000) annually during the years before World War I, partly because Russia was a new country, from the industrial standpoint, with great possibilities of development, the pace of industrial advance during the last decades of the 19th century and especially during the first decade of the 20th was very swift.

Russian industry before World War I was located mainly in four areas, Moscow, St. Petersburg, the Donets basin and the Urals. (The Polish industrial basin of Dabrowa-Sosnowiec was a fifth area until Aug. 1914, when it was occupied by the Germans; in Nov. 1918 it became part of Poland.) St. Petersburg and Moscow, the two largest cities in Russia, were natural markets for industrial goods. St. Petersburg developed, in the main, heavy industries, of which the Putilov metalworks was one of the largest. Moscow specialized in textiles and consumers' goods. It was able to draw on the coal field southeast of Moscow for fuel. The Donets basin, with its coal deposits, and the adjacent iron ore of Krivoi Rog formed the natural basis for an iron and steel industry. The Urals possess iron, coal, copper, asbestos and other valuable minerals.

The outbreak of war in 1914 interrupted Russia's industrial

progress and placed a heavy strain on its growing but inadequate economy. Russia was largely isolated from its allies, France and Great Britain, and its industries and its transport system could not measure up to the needs of the huge army that was mobilized. Production for civilian use declined and inflation began to make itself felt in the later years of the struggle. While Russia was normally self-sufficient in staple foodstuffs and exported large quantities of cereals to western Europe, the overloading of the railway system and the tendency of the peasants to hold back their products from the market as they found that they could not buy a normal equivalent in manufactured goods led to food shortage in the towns, where the population had swelled because of the growth of the munitions industry. Food riots in Petrograd were the beginning of the overthrow of the imperial regime in 1917.

The national economy deteriorated rapidly during the eight months which elapsed between the March Revolution of 1917 and the Bolshevik revolution of Nov. 7. The bases of social and economic order were shaken to their foundations. The peasants began to seize the land of the larger owners. There were continual workers' strikes and demonstrations, partly for political reasons, partly because the provisional government proved unable to check the inflationary trend and there was a continual rise in the cost of living. A good deal of class hatred entered into the strikes and in some cases unpopular employers and engineers were driven away from the factories, which the workers undertook to operate themselves. The Bolshevik revolution brought into power the most extreme group of Russian Socialists. It was immediately followed by a decree nationalizing the land and expropriating all large holders. A decree of Nov. 27 subjected industry to a system of workers' control. The banks were nationalized on Dec. 27.

War Communism.—It was not the immediate purpose of the Bolsheviks to nationalize all industry and trade. Lenin recognized Russia's technical backwardness and the difficulties of abruptly instituting full-fledged socialism in a land where the peasants constituted the great majority of the population. For a few months after the conclusion of the treaty of Brest-Litovsk with the Germans in March 1918, Lenin was inclined to emphasize the necessity for labour discipline and skilled management; he asserted that it would be profitable for the new regime to hire bourgeois specialists in order to obtain a smooth flow of production.

But as the civil war became more intense, the Soviet government found itself driven from one measure to another in the direction of establishing complete control over the industrial plant, the manpower and the labour of the country. The factory owners, as a class, were naturally hostile to the new regime; many of them fled, abandoning their enterprises. The sugar industry was nationalized on May 2 and the petroleum industry on June 17, 1918. A decree of June 28 clearly pointed the way to the expropriation of the private industrialist; it provided for the nationalization of the largest undertakings in the mining, metallurgical, metalworking, textile, electrotechnical, pottery, tanning and cement industries. A decree of Nov. 29, 1920, completed the process by declaring nationalized all enterprises that employed more than ten persons, or more than five if motor power were employed.

Foreign trade was nationalized (it practically ceased to exist during the years of civil war and blockade) and on Nov. 21, 1918, private trade within the country was forbidden. In theory, Russia was supposed to live under a gigantic rationing system, with city dwellers receiving food products and manufactured goods on ration cards and the peasants delivering up their surplus produce in exchange for manufactured goods from the towns.

In practice, this system could not and did not work out effectively, because the government lacked both the goods and the technical organization to make it function with even passable efficiency. There was a good deal of surreptitious barter between city and village, and town dwellers obtained about as much food from those theoretically illegal operations as they received on their ration cards.

New organizations came into existence to administer this new system. One of the most important of these was the supreme

economic council, established on Dec. 15, 1917. Originally, it had been conceived as a body which would supervise the whole economic life of Russia, but its functions were gradually restricted to the management of industry.

The council of labour and defense (S.T.O.) assumed considerable powers, it may be described as a kind of war economic cabinet. The food commissariat, which took charge of the distribution not only of food but also of manufactured goods, occupied a key position in the scheme of War Communism. The commissariat for transportation operated the railways and waterways on semimilitary lines; the commissariat for agriculture, especially in the later phases of the War Communism period, tried to direct the peasants as to their selection of crops and their sowing.

Money tended to lose all value under this system. The rouble had declined considerably in buying power when the Bolsheviks came into power. Unchecked use of the printing press and the fact that the distribution of both food and manufactured goods was supposed to be on a rationed basis soon led to an inflation as sweepingly destructive as that of Germany. A new currency had to be built up when a new policy was adopted. Toward the end of the period of War Communism, such things as housing, transport and public services were supposed to be supplied free to all citizens.

Another feature of the period was the attempt of 1920 to use armies, under military discipline, for labour tasks. This was a pet idea of Trotsky, who believed that the terrific jam in production could be broken by the same methods that had led to the defeat of the Whites in the civil war: mobilization of labour under conditions of stern discipline, accompanied by fiery emotional appeals. The labour armies, however, proved a fiasco and were soon discarded.

Considered as an economic experiment, War Communism was a disastrous failure. There are few parallels in history for the collapse that overtook Russia's productive forces. By 1920 the big industries were producing 18%, the small industries 43%, of their prewar output. The prostration was most complete in the heavy industries. Pig iron was down to 2.4%, iron ore to 1.7%, of the prewar figure. The output of copper ceased entirely. The railways, which suffered from the depredations of both sides during the civil war, crawled along with an ever-increasing percentage of damaged and disused locomotives and freight cars. In Jan. 1917 there were 537,328 freight cars in the country, of which 4.2% were out of use; by the end of 1919 the number of freight cars had diminished to 244,443, of which 16.6% were damaged. There were 20,394 locomotives (16.5% out of commission) in Jan. 1917 and 8,955 (47.8% unfit for use) at the end of 1918.

Wages and productivity of labour declined tremendously, while a large part of the city workers dispersed to the villages in search of food. The average wage of the Russian worker during these bleak years was little more than one-third what it has been under the tsars. Productivity of labour in 1920 was only 26% of the average of 1913.

Agriculture was also hard hit by the crisis, although the peasants, until actual famine devastated a great area of the Volga valley and of the Ukraine in 1921-22 (see *History*, above), suffered less from hunger than did the city dwellers. The Russian harvest of cereals, which had averaged about 80,000,000 metric tons in the pre-1914 years, declined to 50,000,000 tons in 1920. The tendency of the peasants was to concentrate on food crops and to cease planting other market crops, or at least to cut down the acreage substantially. By 1920 the area under flax had declined by 50% as compared with the prewar average, that under sugar beets by 74%, that under cotton by 87% and that under tobacco by 90%.

The cities of northern and central Russia lost more than one-third of their population between 1916 and 1920. Many Russian town dwellers, especially among the labouring classes, had friends and relatives in the country, and there was a widespread impulse to go back to the villages, where, in spite of the requisitions, there was more chance of getting food.

The effect of War Communism was temporarily to frustrate the realization of almost every Communist economic ideal. Lenin and his associates believed in a state order based on the industrial proletariat as the ruling class and were eager to see Russia

take and surpass the leading capitalist countries in quantity and efficiency of production. They were also convinced, as Marxists, that large industrial units would supplant small and medium ones. The actual circumstances of life under War Communism tended to contradict all these ideals. The working class was dispersing and a good many of the workers who remained in the factories turned into small speculators, making little objects of daily use which could be sold or exchanged for food. The big factories in many cases stood idle or worked at a fraction of their normal capacity for lack of machinery and raw material. The Communists in theory were worshippers of modern efficiency, of the machine. But the storm of social revolution and civil war had destroyed most of what little efficiency and mechanization had formerly existed in Russia and threatened to throw the country back into extremely primitive forms of economic life.

It would be incorrect to regard War Communism as an experiment undertaken entirely for its own sake. Many of its features were almost inseparably associated with the hard exigencies of civil war. It was impossible, for instance, for the Soviet government to give the peasants any adequate supply of manufactured goods when the factories, often cut off from sources of raw material, were unable to work at normal capacity and when war needs took precedence over everything else. Requisitioning evoked much bitterness in the villages and was accompanied by many abuses. But the army and the cities could not have been given even a minimum food ration without requisitioning.

The New Economic Policy.—An uprising of sailors in the important naval base of Kronstadt in March 1921 sounded the doom of War Communism. There had already been sporadic peasant revolts in the Ukraine, in Tambov province, in Siberia. But the revolt in a fortress so close to Petrograd, a fortress which had always been considered a stronghold of Communism, was interpreted by Lenin as a definite warning that other economic methods must be tried. The tenth congress of the Communist party, which met in Moscow in March 1921 and was strongly affected by the news of the Kronstadt rebellion, adopted without opposition Lenin's proposal that a tax in kind, of about one-tenth of the peasant's produce, should be substituted for the former arbitrary requisitioning of all the peasants' surplus. This was the cornerstone of the New Economic Policy, or N.E.P., as it was generally called; a number of other changes inevitably followed.

Since the peasant was given the right to sell his produce, private trade within the country automatically became legal. A whole new class of so-called *nepmen*, shrewd and cunning speculators who had survived all the rigours and repressions of War Communism, emerged from hiding and commenced to play a conspicuous part in Soviet life. Small private business was again permitted. The slack accounting and financial methods of War Communism were revised, and the trusts or organs of management for the state industries were required to balance their budgets and, if possible, show a profit. Payment of rent and taxes and charges for public services were restored.

The rouble was stabilized at its old value of 51 2 cents (U.S.) and for a short time this new Soviet currency was freely interchangeable for foreign currencies. This situation soon came to an end, however; both the export and the import of roubles into Russia were forbidden and the Soviet currency remained strictly reserved for internal use. There was a vast discrepancy between the official value of the rouble and its quotation on the black market.

The adoption of the New Economic Policy, coinciding as it did with the end of the civil war, broke the many vicious circles in which Soviet economy had become entangled. The curve of industrial production, of agricultural output, of wages and of productivity turned upward. Houses were repaired and made habitable. The cities again filled up. The light industries which produced goods for everyday use were first to recover; but in time the coal and iron mines of the Donets basin and Krivoi Rog, the oil wells of Baku, the metal and machine factories of Leningrad and Kharkov and other industrial centres were again able to set their wheels in motion and to work up to normal productivity.

and the syndicates. A trust, which was entirely state-owned, administered an industry or part of an industry, and in some cases a number of trusts combined and vested selling functions in a syndicate. The supreme economic council continued to function as a general state board of direction for industry. A body that began to acquire more importance in the late '20s was the Gosplan, or State Planning commission. Originating as a commission attached to the council of labour and defense, it assumed the function of endeavouring to plot the graph of the national economic development by publishing so-called control figures, in which the output of the coming year in every branch of national economy was laid down. There were distinct limits to this planning under the N.E.P., because the peasants, the private traders and small businessmen were outside its scope. But it acquired increased significance in the third phase of Soviet economic life, that of planned economy.

It had been a part of the New Economic Policy to grant concessions to foreign capitalists and businessmen. While the Soviet government refused either to restore integrally the properties of foreign business firms which it had seized or to pay compensation for the seizures, it professed willingness to lease various mines and factories, which it lacked resources to operate itself, to foreign concessionaires. The two largest concessions which were granted were for the exploitation of gold fields in the Lena river region of Siberia and for the development of manganese mines in the region of Chiatura in Georgia. An Anglo-U.S. group obtained the first concession, the Averell Harriman interests the second. Concessions enjoyed their most flourishing period during the years of the N.E.P. They never, however, played an important role in Soviet economic development. They were practically all wound up and liquidated during the first five-year plan. Russia's industrialization was financed entirely by the sacrifices which were imposed on the Russian people.

Although the New Economic Policy was a period of industrial and agricultural progress and of a rising standard of living after the appalling depression of War Communism, it contained some features that were disquieting to the Communist party. There was a feeling that capitalism was undermining the bases of socialist economy. Elbowed out in the struggle for power that went on behind the scenes after Lenin's death, Trotsky directed criticism against the alleged compromising of socialist principles by Stalin, who emerged more and more as the outstanding leader of the Communist party and, consequently, of the Soviet regime.

While the New Economic Policy was an immense improvement, from the peasants' standpoint, over War Communism, it did not prove able to adjust satisfactorily the relations between city and village. The theoretical buying power of the peasant was considerably increased, for two reasons. With the recent memory of inflation and worthless paper money, he had little incentive or desire to save. He could not use his money, as the thrifty peasant before 1914 would have done, to buy land and enlarge his farm, for the purchase and sale of land remained forbidden. Consequently, the peasant's instinct was to spend his surplus money for consumers' goods, and the light industries were never able to satisfy his needs. Shortage of manufactured goods, high prices and poor quality became constant peasant complaints, and by 1928 there was already a tendency for the peasants to carry out a kind of slowdown strike, to raise less for the city market, which did not seem able to give them a fair equivalent in exchange.

Perhaps the basic cause of the liquidation of the N.E.P. was the fundamental incompatibility between socialist industry for the towns and small peasant proprietorship in the villages. One system or the other had to be greatly modified, and Stalin decided that it would be possible both to cut the ground from under the feet of his critics within the party and to find a way out of the economic crisis by driving toward the double goal of a highly industrialized state and an agriculture that would be mechanized and placed under strong state control. For a political account of the N.E.P. see *History* above.

First Five-Year Plan.—Industrialization and collectivization of agriculture dominated Soviet life during the first five-year plan, which was shortened to four and a quarter years and ran from

Oct. 1928 until the end of 1932. The task which the government had set was a formidable one and could probably only have been realized by a regime which possessed absolute political power and the will to use that power with utter ruthlessness. Labour under the N.E.P. had been free and there were between 1,000,000 and 2,000,000 unemployed who received state and local relief. The effect of the five-year plan, with its many new factories and tremendous demand for labour, was to wipe out unemployment and to create a labour shortage. This led to a growing tendency to attach the worker or the engineer to his job, to forbid him to leave under threat of legal penalties. Forced labour on a large scale was introduced for the classes which were doomed to economic extinction under the new policy, the kulaks and the nepmen. The O.G.P.U., or political police, was constantly carrying out roundups of suspected elements in the cities, a familiar penalty being an administrative sentence to work on one of the new enterprises; and there were mass deportations of kulaks and their families from their native villages to timber camps and new industrial plants, where they were set to work at unskilled labour for bare subsistence rations.

A marked characteristic of Russia throughout the first five-year plan was the acute shortage of foodstuffs and of manufactured goods. There were several reasons. Agriculture was in a state of turmoil and upheaval. The dispossessed kulaks, being the better farmers, had produced a larger than normal share of food and other crops. Their elimination left a vacuum that was not immediately filled. Moreover, everything was subordinated to the needs of the heavy industries. Foodstuffs that were very short in Russia were shipped abroad to obtain foreign exchange to finance the purchases of machinery and equipment for the new industrial plants. Transport was under a heavy strain, and food products were often not brought from places where there was a surplus to places where there was a lack. There was a vast influx of peasants into the cities and new industrial towns, and this meant an increased demand on all sources of supply.

Rationing, unknown since the end of the civil war, was reintroduced. Money to a very considerable extent became devalued. The insufficient supplies in the state and co-operative shops were distributed on a rationed basis and a system grew up under which every institution or factory had its own shop or its own restaurant, exclusively for the use of its own employees. Private trade again became illegal, in fact if not in law, the supply of goods in the private markets diminished and prices soared. The purchasing power of the rouble in free trade shrank by 90% or more. How much money a man earned became less important for his well-being than what type of shop or restaurant he was permitted to patronize.

Some observers, both in Russia and abroad, foresaw disaster in this reversion to some practices of War Communism. But this third phase of the Soviet economy developed under much more favourable auspices than the primitive experiment of 1918-21. There was no distraction by war and all the mobilized energy of the country could find expression in new industrial construction. A younger generation had grown up under the influence of the Soviet schools and the Young Communist league, indoctrinated with the ideas of the new regime and willing to endure hardship and to smash pitilessly any opposition. The Soviet Union was no longer blockaded and cut off from the outside world. It was possible to engage the services of thousands of foreign engineers and technicians, mostly Americans and Germans, to direct the building and the first stages of operation of the factories, mines and electrical power plants which were part of the scheme of industrial development.

So, although the human and material costs of this experiment in planned economy were prodigious (there were millions of deaths from famine and related diseases in the Ukraine and in the northern Caucasus in 1932-33, and the casualties among the deported kulaks and other "class enemies" of the Soviet regime were considerable), the political structure successfully withstood the strain. By the time the plan was completed a considerable stride had been taken toward the goal of making Russia industrially self-sufficient.

Some industries that had been nonexistent or negligible before

the five-year plan, such as the manufacture of tractors, automobiles and motor trucks, were put on a mass production basis. Indeed, the advance of the tractor and agricultural machinery industries was intimately bound up with the Soviet scheme for the collectivization of agriculture. Beginning in 1929, a mass drive was launched to induce the peasants to give up their individual holdings and organize themselves into collective farms (kolkhozes). It was made inconvenient not to join these collective farms; anyone who opposed the change was likely to be denounced and sometimes arrested and deported as a kulak.

Co-operative farming had not been unknown in Russia before this great change in the national agricultural system. While the overwhelming majority of the peasants farmed their allotments on an individual basis, restricted only by the prohibition against buying or selling land, there were a few communes and a somewhat larger number of *artels*. The members of a commune (*mir*) usually lived together in a common dwelling and shared equally the produce of their labour. The *artel* was a looser form of association, in which land and working animals were pooled, the members retained their own homes and the output was shared in proportion to the amount of labour and equipment which each member contributed. It was the *artel* that furnished the approved model for the collective farm. A typical collective farm included about 100 peasant families as members, with between 1,000 and 1,500 ac. of land. A small village would often be transformed into a single collective farm, while a larger village would be divided into several collective farms.

The collective farms went through several changes of organization. The type of organization that prevailed before World War II was as follows: the collective farm was an inalienable unit; its boundaries could not be changed; the members possessed the right to cultivate individual gardens and to possess cows and keep pigs, fowl, sheep and goats. Their main work, however, was supposed to be for the collective farm and they were paid, partly in kind, partly in cash, on the basis of the quantity and quality of the work performed. The president of the collective farm was elected by the members, but, as in all Soviet elections, the local Communist cell, or group, exercised a good deal of influence in the selection. The larger machines, tractors, harvesting combines, threshing machines, were not sold directly to the collective farms. They were placed in machine-tractor stations, state-controlled organizations which undertook to cultivate the land of the collective farms within a given radius of territory. Payment for this service was made in kind. Receipts from the machine-tractor stations and from the fixed quantities of grain, cotton, sugar beets and other products, which the collective farms were required to sell to the state at a price so low as to be practically nominal, assured the food supply of the cities and of the army. After deductions of the payments in kind for tax and debt obligations, the peasant might sell his share of the crop, so far as this was not required for his own needs, either individually or through a co-operative to which he might belong. He was also free to sell his vegetables, poultry, eggs and small animals.

The unfamiliarity of this system, together with the lack of trained organizers and the excesses of zeal on the part of some local officials, made its first years very difficult and led to a tremendous destruction of livestock that depleted the country's normal output of meat and dairy products for several years to come. The ravages of civil war, which had been generally more than made good by 1929, were repeated on an even larger scale during the stormy first years of collectivization. As the peasants became resigned to the inevitability of the new system, as the supply of machinery increased and managerial capacity improved, collective farming struck firmer roots in the Russian soil.

The degree of realization of the first five-year plan was mixed and spotty. Heavy industry certainly received a powerful impetus and the ground had been prepared for further progress by the erection of such large factories and hydroelectric power installations as the Magnitogorsk iron and steel works, the Kuznetsk iron and steel plant, the tractor factories at Stalingrad and Kharkov, the Moscow and Gorki automobile plants, the agricultural machinery works at Sverdlovsk, the chemical plants at Berezniki and

Stalinogorsk and the Dnieper dam and power plants, which were designed to supply power to several newly built factories. On the other hand, the desired figures of agricultural production were not realized and the parts of the plan which had provided for an increased standard of living, even specifying the increased amounts of meat, eggs and butter which should be available, were entirely unfulfilled. General living conditions during the war first five-year plan were bleak and hard, more suggestive of war than of peace.

(W. H. CH.; X)

Second and Third Five-Year Plans.—The second five-year plan, covering the years 1933–37, was followed by a third plan for 1938–42 which was interrupted by World War II. During the first five-year plan 17 new blast furnaces, 45 open-hearth furnaces and many rolling mills were built. During the second five-year plan 20 blast furnaces, 86 open-hearth furnaces and 49 rolling mills were built. Compared with the period before World War I (1913=100) the index number of industrial production stood at 380.5 in 1933 and rose to 908.8 in 1938. Reporting to the 18th congress of the All-Union Communist party on March 10, 1939, Stalin stated that as regards the technique of production and the rate of growth of industry the Soviet Union had already "overtaken and outstripped" the principal capitalist countries. He insisted, however, that the economic power of a country's industry was expressed not by the volume of industrial output alone but also by the volume of production per head of population. In this respect, the U.S.S.R. was still lagging behind because in 1938, the first year of the third five-year plan, the country produced only 87 kg. of pig iron per head, as compared with 145 kg. in Great Britain. In order to outstrip the United States, Stalin said, the Soviet Union should aim at a yearly pig-iron production of 50,000,000 or 60,000,000 tons.

As to the collectivization of agriculture, by 1938 there were 242,400 kolkhozes uniting 18,843,000 peasant households, or 93.5% of the total, and holding together a crop area of 289,000,000 ac.; that is, 85.4% of the total. The total crop area, which was 259,500,000 ac. in 1913, had increased by 1938 to 338,300,000 ac., of which 253,000,000 ac. were under grain, 27,300,000 ac. under industrial crops, 23,200,000 ac. under vegetables and 34,800,000 ac. under fodder. The total number of tractors employed increased between 1933 and 1938 from 210,000 to 483,500, of which 394,000 were in 6,350 machine-tractor stations and 85,000 in sovkhoses, or state farms.

The sovkhoses, created under the first five-year plan, were worked by hired labour under a state-appointed management. Through their new techniques they were meant to have a propaganda value among the peasants unwilling to join the kolkhozes; their purpose was also to produce high-quality grain for sowing, to promote the breeding of pedigree livestock and to produce marketable foodstuffs to be sold in state-owned shops. By 1934 the sovkhoses owned a total area of 207,974,000 ac. of land, and their sown-area amounted to 35,568,000 ac. In 1936 it was decided to reduce the latter area. By 1938 there were 3,961 sovkhoses with a total cultivated area of 30,628,000 ac.; they were employing 1,300,000 workers. While mixed farming was reserved to kolkhozes, the sovkhoses specialized in certain lines of production. In 1938 they were distributed as follows: grain 478; meat and dairy produce 769; pigs 659; sheep 204; horses 119; poultry 102; other livestock 62; fruit and vegetables 474; market gardening (near the larger cities) 723; industrial crops and other types 371.

World War II and the Soviet Economy.—Russian losses during World War II were staggering, for the German armies rapidly overran the most productive areas of the country. According to figures subsequently given by N. A. Voznesensky, head of the State Planning commission, about 40% of the population of the Soviet Union lived in the areas overrun by the Germans in 1941; these areas also accounted for about 66% of Soviet heavy industries, 38% of its grain and 30% of its cattle. In the following year, the loss of the Malkop area involved an important centre of high-grade fuel extraction, and in general it was estimated that the output of oil fell from 31,000,000 tons to 18,000,000 tons between 1940 and 1942. Between one-fifth and one-quarter of the

capacity of the engineering industry and 40% of the capital equipment of the food industry was also reckoned as lost.

According to Voznesensky the number of workers in the occupied areas was reduced by the end of the war to a mere 1% of the former figure and the number of industrial plants to 13%. Almost two-thirds of the cattle and four-fifths of the horses had been lost. Productive resources destroyed included 31,850 factories employing 4,000,000 persons, 98,000 collective farms, 137,000 tractors, 49,000 combines, 13,000 railway bridges. In addition, the homes of perhaps 25,000,000 people, together with schools, hospitals, cultural and scientific establishments and every form of material wealth had been ground to rubble; in all, about two-thirds of the entire capital of the occupied areas.

The evacuation at high speed of much industrial plant to the eastern regions away from the war fronts was a fundamental factor in the Soviet war achievements. The population evacuated to work in the new and expanded industries, which may even have numbered more than 12,000,000 persons, suffered terrible hardships from the severe climatic conditions and from the lack of housing as well as from food shortages. Such, however, was the lot of the civil population throughout the U.S.S.R. The industrial and agricultural output in the Urals, Siberia, central Asia and the Volga area rose sharply. The coal production of the Kuzbas and at Karaganda was increased to make up for the loss of the Donbas, and, in the actual output of guns, tanks, aircraft and ammunition, Soviet industry seems to have been able to meet the demands of the great offensives of the later years of the fighting.

Postwar Five-Year Plan.—The major task of the Soviet Union in the postwar years was that of reconstructing its internal economy. The advances made in the eastern areas were not abandoned and were indeed extended, much importance being attached particularly after 1950 to new projects for hydroelectric works and irrigation. But the overrun European provinces of the Soviet Union had also to be restored. Reparations were exacted from the former enemy states, and favourable trade treaties with the Soviet Union's western neighbours brought other foreign resources to her aid; but the decision to reject aid from the European Recovery program after the Paris conference in July 1947 meant that the main basis of reconstruction was the work of the Soviet peoples themselves.

*Russia before World War I in 1913 frontiers.

†Including the annexed territories in the west.

‡Number of goats (in million head) was 8.2 in 1913, 6.8 in 1922 and 13.5 in 1930.

During the postwar period the methods of economic organization pursued were not substantially different from those of the 1930s. A new five-year plan (1946-50) was adopted by the supreme soviet in March 1946. Apart from electricity and coal the output targets were lower than those which were to have been reached in 1942 but for the German attack.

In a speech of Feb. 9, 1946, Stalin directed that in the shortest possible time the Soviet Union must heal the wounds inflicted by the enemy and not only recover the prewar level but even surpass this level in the near future. "We must," he said, "achieve a situation wherein our industry is able to produce annually up to 50,000,000 metric tons of pig iron, up to 60,000,000 tons of steel, up to 500,000,000 tons of coal, up to 60,000,000 tons of oil. Only under such conditions can we regard ourselves as guaranteed against any accidents. This will require perhaps three five-year plans, if not more. But this task can be accomplished, and we must accomplish it."

On the whole the published figures suggest that the 1946-50 plan was successful, many of the targets originally set being reached by the end of 1949. During the period of the plan, the output of coal rose by roughly 75%, that of oil and electricity by 100%, that of pig iron and ingot steel by more than 100% and that of rolled steel by nearly 150% (indicating the great emphasis placed on machinery). The figures all show the eastward trend in the main centres of output as regards coal, steel and oil, with obvious strategic implications for any would-be attacker of the Soviet Union's western frontiers. In estimating the effect of these achievements on the lives of the people it is necessary to bear in mind the growth in population, the relative neglect of consumer-goods industries, the lag in rehousing and certain marked failures on the agricultural side, particularly as regards livestock. An ambitious scheme of afforestation announced in 1948 and the plans for irrigation were directed clearly toward improving the position, by making more land available for cultivation and by eliminating the periodic droughts.

The war and the destruction of much agricultural machinery had forced some relaxation of agricultural collectivization—a development seemingly welcome to much of the peasant population. Measures were taken to restore the prewar system in full vigour, and in 1950 a campaign was started for amalgamating the kol-

khoses into larger units and for assisting thereby in the ultimate Communist objective of assimilating rural and urban labour conditions.

By the beginning of 1950 a drive was started by N. S. Khrushchev, a member of the Politburo, for building of "agrotowns" (*agrorodny*); that is, barracks for proletarianized peasants working in the "large grain factories" of which Stalin dreamed in 1929. But by April 1951 all propaganda for the vision of agrotowns had ceased, and the project was temporarily abandoned because the building industry could not fulfil its part of the new program.

After World War II collectivization of agriculture was ruthlessly enforced upon the populations of the areas annexed to the Soviet Union. By Jan. 1950 the total number of kolkhozes had increased to 254,000 and that of sovkhoses to 4,540. Many smaller kolkhozes were merged to form bigger ones and by March 1951 their total number was reduced to 123,000. All this

was being done with a triple aim in mind: first, to crush the recalcitrant peasantry, which might undermine socialist agriculture by passive resistance; second, to release more manpower for industry; and, third, to increase agricultural production.

The insufficiency of the agricultural output remained the most striking weakness of the Soviet economy. Between 1940 and 1950 the gross output of Soviet industry was said to have increased by 73%; in the same period agricultural production was said to have increased only by 7%. In 1950 the total sown area was about 360,766,000 ac., which was only 22,485,000 ac. more than in 1938 (that is, before the 1939-45 annexations) and 30,000,000 ac. less than envisaged in the 1946-50 plan. The total grain production in 1950 allegedly amounted to 124,700,000 tons; that is to say, to 2,300,000 tons less than planned but to 5,700,000 more than in 1940. But if the Soviet statistics in general are not reliable, those concerning agricultural production are especially misleading. In 1933 the Soviet Union turned to estimating its grain yields and crops in the fields before harvest. The yields and crops thus established are called "biological." According to the analysis by Naum Jasny, the actual grain yields and crops in the years 1933-39 were thus exaggerated by 20%. After 1947 the only official estimates were those made, in general figures, by the central government; for grain crops they were about 25% higher than the actual crops.

The year 1951 was the last of a special three-year plan for the development of animal husbandry; but from a report published by the Central Statistical administration of the U.S.S.R. it was known that by the end of 1951 the Soviet Union had fewer cattle and fewer sheep than the prerevolutionary Russia, and fewer pigs than in the smaller territory of 1938.

Five major hydroelectric schemes were started in 1950 and 1951, including two power stations on the Volga, at Kuybyshev and Stalingrad, and one near Kakhovka on the Dnieper, with respective capacities of 2,000,000, 1,700,000 and 1,200,000 kw. In connection with these schemes work was begun on two big canals: the Volga-Don canal for ocean-going ships and the South Ukrainian canal which was to continue as a North Crimean canal through Dzhankoy to Kerch. The construction of the main Amu-darya-Krasnovodsk canal was calculated to alter fundamentally the situation in western Turkmenistan. A system of water reservoirs and smaller waterways would irrigate 3,700,000 ac. in the Ukraine and the Crimea; an area equal to that of England between the lower Volga and the Ural rivers; and about 20,000,000 ac. in Turkmenistan. The planting of forest shelter belts along the watershed between the Volga and Ural rivers, west of the Volga from Stalingrad to the Caucasus and across the Don and Donets was also started to protect southern Russian and the Ukraine against the desiccating power of the *sukhovey*, a hot, dry east wind.

For the development of the Soviet Union's industrial and agricultural production and for the numbers of its livestock, both as contrasted with prerevolutionary output and as affected by the five-year plans, see Tables XI, XII and XIII. (K. Sm.)

Fishing and Hunting.—The fishing industry was completely reorganized by state trusts after the revolution and achieved a high degree of efficiency. At all the main fishing centres there are collective stations which supply motorboats, equipment of all kinds, repair facilities and trained mechanics. On the eve of World War II the fishing industry employed about 220,000 fishermen and about 130,000 other workmen, the total annual catch being 1,600,000 metric tons of fish.

The Caspian sea provides rich fishing grounds and yields more than one-third the total annual Soviet catch. Ashtrakhan at the mouth of the Volga is the chief centre of the industry, whence pike, bream, perch, roach, herring and sturgeon are dispatched by the Volga waterways to the densely populated regions of European Russia. The sturgeon from which is obtained the renowned Russian black caviar is caught in the lower reaches and delta waters of the Volga.

The far east became the second most important centre of the industry in the union after the revolution. The main fishing grounds are near the mouth of the Amur river and off the shores of Kamchatka, and large catches of herring, salmon and other fish

are landed. The development of these far eastern fisheries was at first delayed by a number of factors, chiefly by the great distance from the areas of consumption in the west, by lack of labour and by the acute shortage of salt (which had to be brought from the Black sea). Rich salt deposits were later discovered in northern Siberia near the Khatanga river, and salt is shipped from Kozhennikov (Nordvik), at the mouth of the Khatanga, to the far east via the Arctic and Pacific oceans. There are large canneries and refrigeration plants, and most of the catch is canned and some of it exported.

The northern fishing industry is centered on Murmansk, which has a large trawl-fishing station and also important canning and refrigeration plant. Cod and herring are the main catch. Archangel and Kandalaksha are also important centres, both possessing large canneries. The rivers and seas of the Soviet Union abound in fish, and fishing is a supplementary occupation in many regions, particularly in the Black sea, the Sea of Azov and at the mouths of the Ob, Yenisei and Lena rivers in Siberia. Breeding ponds for fresh-water fish were constructed near Moscow and Leningrad to supply the large urban markets.

Hunting and fur trading were reorganized by the government on a co-operative basis. At suitable points in the valleys of nearly all the rivers of Siberia fur-trading stations were established. Originally the native tribesmen had been the hunters and had traded their furs to Russian merchants. Gradually the Russians themselves became the main hunters, but the tribesmen were still active; in 1925 a congress of native hunters in the far east met to discuss better methods of hunting and barter. Trading in furs is closely supervised by the government as furs continue to be a valuable export. The furs of greatest importance in order of total value are squirrel, wolf, ermine, hare, fox, skunk, bear, marten, Siberian skunk, lynx, wildcat and sable. Seals and beavers are also hunted, but the sable, once so numerous and important, has been almost exterminated. Hunting normally continues from October to March, and closed seasons are enforced. In the far east and also in Siberia farms have been established for breeding fur-bearing animals, and in the north of Siberia a number of reindeer state farms operate.

Economic Divisions.—The U.S.S.R. may be considered as comprising the following economic areas:

1. *The northwestern area*, comprising the Karelo-Finnish S.S.R. and the Leningrad, Novgorod and Pskov regions, contains extensive forests and valuable mineral resources which were developed greatly after the revolution. The transport facilities include railways, the White sea-Baltic canal and the two well-equipped ports of Murmansk and Leningrad, which made this development possible. The timber industry and pulp, paper and cellulose manufacture are the most important industries of the area, three-quarters of which is covered by dense forests. More than 30% of the Soviet Union's paper is manufactured at Kondopoga, Leningrad, Kandalaksha and other towns in the area, which yields also about 20% of the entire Soviet timber export (and the quantity exported was by 1952 eight times greater than it had been in 1912). In Karelia about 60% of the population is engaged in the timber industry.

The area is studded with lakes into which flow rivers and streams suitable for generating hydroelectric power. A number of these rivers were harnessed, and of the 24 hydroelectric stations operating in 1939 in the Soviet Union seven were in the northwestern area. The development of industries and the working of the mineral resources was formerly restricted by a lack of coal, but the provision of adequate electric power removed this obstacle. Electric power is largely used by the factories of Leningrad, but peat fuel and brown coal mined near by are also used, as well as coal (see below). In the Kola peninsula near Lake Imandra rich deposits of apatite are worked, as also is nepheline, from which aluminum can be produced. Kirovsk, the centre of these mines, is a new town with a population approaching 50,000. Nickel, copper and iron are also mined, while in the east of the peninsula there are deposits of mica. In the southern industrial part of the area the towns of Tikhvin and Zvanka are important, the former as the centre of the valuable bauxite mines and the latter for the manu-

facture of aluminum from the bauxite. Pitkyaranta on the shore of Lake Ladoga was developed as a centre of the metallurgical industries. The deposits of iron ore in this area would, when fully exploited, make the industries of Leningrad independent of the supplies of iron ore which are hauled at heavy cost from the Ural mines.

Leningrad ranks as the third most important industrial centre in the Soviet Union, although it is almost completely lacking in raw materials. Coal, once imported from Great Britain, is hauled by rail or brought by barge from the Donbas and the Urals. Such long hauls are expensive and the industries of Leningrad began to make increasing use of local peat deposits and of hydroelectric power. Leningrad is not only the chief western port of the Soviet Union but also a great engineering centre, producing nearly 25% of the total Soviet industrial output. Machine tools, precision instruments, electrical equipment of all kinds, ships, textiles, paper and fertilizers are among the more important products of the Leningrad region.

Agriculture is restricted by the extreme climate, but much has been done to extend its northern limit. A large state farm near Kirovsk produces vegetables. Extensive use is made of the apatite fertilizers to increase the amount of land under cultivation. In Karelia the cultivated land amounted to no more than 3%, but in the Leningrad region it was more than 25%. Potatoes, oats, rye and flax are grown, and near Leningrad dairying has been developed as part of the policy to reduce the amount of foodstuffs brought long distances.

2. *The Baltic Republics.*—The Estonian republic has moderately fertile lands with rye and barley as the main crops. Dairying is the most important industry, and dairy products are sent to the Leningrad region and to Moscow in the central area. The oil shale industry, developed before World War II, is concentrated in the northeastern part of the republic. It was believed that by 1948 the oil production had reached 358,000 tons; that is, twice as much as before 1939. Tallinn (Reval) is the leading transit port of the republic and is kept open in winter by the use of icebreakers. Pärnu is a centre of woollen mills, and cotton mills are located at Narva. Lumbering is an important occupation and a certain amount of timber is exported through Tallinn and other ports.

The Latvian republic has a rich agriculture, oats, rye, barley and potatoes being the main crops. As in Estonia dairying is an important industry. Riga, Liepaja and Ventspils are the chief ports, being more or less ice-free in winter. It has been part of Soviet policy to develop the industries of Latvia and the production of agricultural machinery and of building materials has grown in importance.

The Lithuanian republic is primarily agricultural, industry having been little developed. The chief crops are wheat, oats, rye, potatoes and sugar beets, while cattle rearing, dairying and lumbering are important occupations. Vilnius, the capital of the republic, is at the junction of railways running from Moscow, Warsaw, Liepaja and Leningrad and is a market for wool, flax, timber and dairy produce. Kaunas and Klaipėda are also noteworthy, the latter being an ice-free port.

3. *The northern area* includes the lands within the Pechora basin in the east and the Northern Dvina basin in the west. The whole region suffers from long cold winters (with an average of 200 days of frost yearly) and short hot summers. Navigation on the four main rivers—the Onega, the Northern Dvina, the Mezen and the Pechora—begins in May and ends in September. It is during this period that logs are floated down to the ports whence they are exported or sent to mills for pulping or preparation for other uses. Dense forests cover 77% of the area and lumbering is the most important occupation. The region produces 15% of the total Soviet output of sawn timber and 33% of the timber for export. Archangel is, after Leningrad, the chief Soviet timber exporting port and an important centre of the woodworking industries. Other centres of these industries are Syktyvkar, Mezen, Vologda, Kotlas, Shenskursk, Ukhta and Vorkuta. The tundra zone in the northeast occupies about 20% of the region. Apart from reindeer farms, of which there are several, fishing is the main occupation, and Naryn-Mar at the mouth of the Pechora river is the chief fishing centre in the east. Only 3% of the region is under cultivation, and agriculture tends to be concentrated in the southwest where the climate is slightly less severe. The chief crops are rye, oats, flax and hay, the latter serving as fodder for dairy cattle.

The northwestern section, with Archangel as its centre, is the most important part of the area and contains 95% of the population. In addition to numerous sawmills, it contains pulp, paper and wood chemical industries. The tanning and dressing of hides and the construction of small ships are also carried on. Fish canning and salting are important, salt being obtained from plentiful deposits on the White sea coast to the west of Archangel. Electricity for these industries is generated locally. Coal is either imported by sea from Spitsbergen or transported by railway from the Vorkuta basin to Kotlas. The area is also served by the Archangel-Vologda railway and by another line running from Kotlas to Kirov (Vyatka).

4. *The western area*, bordered in the west until 1939 by Poland and Latvia and in the east by the central area, comprises Byelorussia and the Russian western regions of Smolensk, Bryansk and Vlodjiki. Lumbering is an important occupation in the region, although about two-thirds of the forest lands have been cleared for agriculture. The comparatively small forests remaining have the economic advantage of being close to markets and the even greater advantage of growing varieties of timber not found in the vast forest expanses farther to the north. Agriculture is a valuable industry in this area, and the land under cultivation was increased from 6,000,000 ac. in 1913 to 10,000,000 ac. in 1937. On the whole the soil is poor, but through the extensive use of chemical fertilizers and through the mechanization of agriculture the yield per acre was increased. Large crops of hay, grass, potatoes, oats and barley are grown as fodder for the expanding dairying and cattle and pig breeding industries. Hemp and flax are grown extensively and the area provides about 30% of the raw materials for the whole Soviet linen industry.

The industries of the area are numerous and are mainly centred on Minsk, Bryansk, Smolensk, Vitebsk and Gomel. After the revolution the industrial output of these centres increased greatly; the volume of manufactured goods produced in the Byelorussian factories, for example, was by 1939 about 30 times greater than in 1913. The industries include important linen mills as well as the production of alcohol, starch, treacle and acetone from potatoes and the manufacture of shoes, boots, matches, textiles and dairy products. The paper and cellulose mills at Bobruisk are among the largest in the Soviet Union. At Orsha, another important textile-manufacturing centre, a dam was planned to raise the level of the Dnieper river and allow river steamers to dock in Smolensk. In addition to its historical significance as one of the old Russian merchant towns, Smolensk is an important transport and textile centre with one of the largest Soviet linen mills. In the south Bryansk contains the largest locomotive and rolling stock works in the Soviet Union, as well as cement and glass works and sawmills.

The western area has no rich mineral resources, although valuable phosphate deposits are worked at several points in the eastern part. Some brown coal is mined near Smolensk, at the southern extremity of the Moscow coal basin. Electricity is generated for the various industries by regional power stations which make use of the large quantities of peat found throughout the region. The power stations at Bryansk, Oslonovsk, Minsk and Gomel burn peat fuel exclusively.

Western Byelorussia, annexed by the U.S.S.R. in Nov. 1939, is little developed and sparsely populated. It has a damp climate and poor soils. In the north, some rye and potatoes are grown and pig breeding is of importance. In the south, marsh and forest cover large areas and agriculture is restricted. Dairy farming is carried on where possible, and oats, rye and flax are sown. Much of the southern part of this area, extending into the western Ukraine, is covered by the Pripiet marshes, broken only by sandy patches and by pine forests. Marsh and bog account for about 5,000,000 ac. of land in the Byelorussian republic. 5. *The central area* includes Moscow, Vladimir, Ivanovo, Kalinin (Tver), Yaroslavl, Kostroma, Ryazan, Kaluga, Tula, Tambov, Orel, Kursk, Voronezh and Rostov regions. It is a densely populated area with more than 28,000,000 inhabitants by 1939, and is for historical, geographical and economic reasons the heart of the Soviet Union. Moscow, the capital, is the centre of an industrial area which is responsible for one-seventh of the total Soviet industrial output. The growth of the city has been striking, its population having increased from 1,618,000 in 1917 to 4,319,078 inhabitants in 1939.

The area is divided by the river Oka into the northern part which is predominantly industrial and the southern part which is predominantly agricultural. The distribution of population illustrates this division. According to the 1939 census, 50% of the population of the Moscow region and 30% of that of the Ivanovo region were in the city; in the Voronezh region 11.5% and in the Orel and Kursk regions only 8.5% of the population was urban. Agriculture is nevertheless important in the north, developed to supply vegetables and, by means of an expanding dairying industry, dairy products to the towns. Potatoes comprise more than 40% of the crop of the Rostov-Yaroslavl region and a large proportion of the crop in the Moscow region. Fodder crops for dairy cattle are widely sown. In the south, where the soils are more fertile and the climate milder, grain is a more important crop and potatoes are grown primarily as fodder for the pig-breeding industry. The Black Earth area to the south of the Oka river is extremely fertile, and the number of crops was increased to include sugar beets, hemp, potatoes, tobacco and sunflowers. A large part of this area has been devoted to fodder crops for pigs, poultry and cattle. The Kursk region became the second most important source of sugar in the Soviet Union.

Moscow and the central industrial area date from prerevolutionary Russia, when the area produced nearly half the industrial output of the whole country. The industries in this area have continued to expand, and many new ones were added, but because of the Soviet policy of developing industry throughout the country the central area no longer contributes so large a proportion of the total industrial output of the country. The raw materials in this area are available locally, and the bulk of the raw materials has always had to be brought from other parts of the country, even coal being brought from the Donbas. Under the Soviet government the large deposits of brown coal in the Moscow basin have been mined, and by 1938 the annual output of brown coal from this area had reached 7,800,000 tons. Peat has also been mined from this area, and the output of peat has increased. The power stations at Yaroslavl, Orekhovo-Zuev, Ivanovo and Shatura, while brown coal is used almost exclusively by the power stations at Kashira and Stalinogorsk. By 1939 two-thirds of the fuel consumed by industry and the electric power stations of the central area were produced locally. The power for the factories of the central area is supplied by a number of electric power stations which are joined in a great grid system covering such centres as Tula, Kalinin, Yaroslavl, Ivanovo and Gorki (Nijni-Novgorod).

Iron ore has been mined at Tula since Peter the Great began exploiting these rich deposits early in the 18th century. Tula and also Kursk and Lipetsk have continued to be important sources of iron ore for the heavy industries, the machine-building and engineering industries, still in full flight from the Ukraine. The heavy industries of the Moscow region produce motor vehicles and also printing, textile, agricultural, electrical and transport machinery, as well as machine tools, tubes and ball bearings. Moscow has always been important as a textile-producing centre, supplying much of the Soviet Union with a wide range of fabrics. The textile industry of the Soviet Union is opening new mills near to the sources of raw materials in central Asia, Siberia and Transcaucasia largely satisfied local consumption with the result that the Moscow mills are able to concentrate more on the production of special industrial fabrics and high-grade cloths. The development of the chemical industry is noteworthy in Moscow. Another important centre of cotton and linen mills is Ivanovo, which produces about 40% of the total Soviet cotton fabric output and has a number of supporting industries producing dyes, starch and chemicals. Kalinin is also the centre of a number of important cotton and, more particularly, linen mills and has a reputation for producing high-quality fabrics. The linen fabric production in the Soviet Union. Kalinin is further of importance as a centre of heavy industry; its plants produce 16% of the freight cars and 28% of the coaches for the Soviet railways. Another centre of heavy industry, specializing in the production of locomotives and rolling stock, is located at Kolomoia. Other noteworthy centres of heavy industry are: Rybinsk, producing synthetic rubber, machinery and motor vehicles; Rybinsk, producing printing machinery; and Voronezh, producing agricultural and textile machinery. The synthetic rubber industry, using potatoes as raw materials, has plants at Yefremov, Kursk, Tambov and Voronezh, and at Yaroslavl the plant manufacturing rubber tires for vehicles has an annual output of 100,000 tires. The rubber industry in the Soviet Union, the central area is the most highly developed in the Soviet Union.

6. The upper Volga area comprises the area to the south of the northern areas which is drained by the upper Volga and its tributaries: the Volga, Kama, Vyatka, Sura and Vetluga. A large part of this region is covered by forests and logs are floated by river to Moscow. The main types of timber are the coniferous and deciduous. The points along the rivers prepare such of the timber as is required for local industries. Near Gorki the Balakhna paper mills are of considerable importance. Paper, cellulose and woodworking plants have also been located in the Moscow region, in the Marii A.S.S.R. and in Shumlin in the Chuvash A.S.S.R. In outlying districts of the republic oak and other deciduous trees provide timber for the furniture industry. The climate and poor soils of the region restrict agriculture. Potatoes, flax, rye and oats are the main crops. Pigs, cattle and sheep are reared. A number of industries dependent on materials produced in the region are located in the area. In the Vyatka tanning and the manufacture of boots and shoes, as well as the flax and hemp industries, make use of locally produced materials. At Kirovo (Vyatka) sheepskins are prepared and sheepskin coats are made. In the village of Pavlovo woodworking and metalwork are carried on by handworkers.

Gorki, formerly Nijni-Novgorod, has been an important centre of trade and communications throughout Russia's history. After the revolution Gorki also was developed as a centre of heavy industry. Motor vehicles, tractors, diesel engines, aeroplane engines, barges and river steamers are its main manufactures. The iron ore required for these industries has had to be brought over long distances from the Donbas or from the Urals, but local deposits of iron ore are being worked near Murom on the Oka river and also to the north of Omutninsk.

7. *The Ural area (with Bashkir A.S.S.R.)* includes northern country, between the rivers Pechora and Ob, that naturally resembles other lands in the far north of the Soviet Union both in climate and in the occupations of the people. The long cold winters prevent utilization of the land, so that fur hunting, fishing and lumbering are the main ac-

tivities. The central and southern parts, similar to the neighbouring lands of the Volga and western Siberian areas, were long undeveloped and so not of great economic importance. In the 20th century, however, with the full appreciation and exploitation of the fabulous mineral wealth of the Urals, this country became one of the most valuable of Soviet industrial areas.

The iron ore deposits are virtually inexhaustible. Whole mountains such as Mt. Vysokaya and Mt. Magnitnaya are composed of magnetite ore, the latter mountain having ore with an iron content of 60% and with total deposits amounting to 450,000,000 tons. Rich deposits of nickel, manganese, copper, zinc, wolfram, lead, silver, platinum, bauxite, dolomite and other minerals are also located in the Ural area. Some coal is mined at Kizel, Yergoshino and Chelyabinsk, but deposits are small and coal is brought from Karaganda in Kazakhstan. In fact, the Urals lack fuel resources; but oil has been found and the claim is made that the new oil fields would be developed into a second Baku.

[illegible]

Sea Urchins to the north of Murmansk is the center of production and has many types. Copper is mined and refined in several points, mainly Chibuk, Kirovograd and Kovda. While high-grade ores and alloys are produced in these and other towns, Murmansk is still the main base for tools and equipment for steel mills and light industries. The city is also a center for the production of various types of polyethylene on the world markets. In the USSR, medicine is being made. Under the plan World War II five new plants, new centers of activity were opened up in the Ural. Kuznetsk is the main center of the steel and iron industry, and heavy deposits are being explored at Sverdlovsk (old city) and Alpaevsk. In the Urals had also been a center of the production of various types of fertilizers and chemicals, making use of the salt, potassium and phosphate deposits near by.

The Bashkir Autonomous Republic has been linked with the great industrial combines of the Urals. Manganese, chrome, iron ore, copper and gold are mined, and the oil industry has been rapidly developed. Oil from Ishimbay and Tuymaza is sent to the cracking plant at Ufa, which is also a valuable industrial centre producing machinery, barges, river steamers and rolling stock.

8. The middle Volga area includes the Uliyanov, Penza and Saratov regions and the Tatar A.S.S.R. It is predominantly an agricultural area, although industry has been developed considerably since the revolution. Agriculture flourishes to a greater extent in the lands on the west bank of the Volga river than in those on the east bank, where the climate is more continental. The average annual rainfall at an altitude of between 600 and 1,200 ft. and secure a good rainfall for the area. This plateau also possesses fertile soils suitable for agriculture. The main occupations are the rearing of dairy cattle, poultry and pigs, while crops include sugar beets, potatoes, flax and hemp. The rainfall is not sufficient to ensure the growth of cereals to great increases in the yields of food products. On the east bank the rainfall is the rainfall inadequate and droughts frequent. Wheat is the main crop, and, as irrigation has been developed, agriculture mechanized and drought-resisting seed sown, it has been possible to increase the acreage under wheat. Other crops are still, however, mainly pasture. Sheep and cattle are reared, but are not so numerous as in the other areas.

The industries of this area are of late growth. Paper, ordnancing and wood chemical works of considerable size are located at Kondopok and at other points on the river and depend on the timber floated downstream from the northern forests. Leather is tanned and shoes are made in the city, while wool is used in local factories to produce textiles and hats. Kuznetsk is the center of the middle Volga area and not only produces cement in great quantities but also has metal industries utilizing nickel, copper, chrome and iron brought from the Urals. Kazan, the administrative center of the Tatar Autonomous Republic, is the other important industrial center, producing chemicals, wood products, machinery and river steamers.

Electric power, which the industries mainly depend, is transmitted on a grid system and supplies such industrial centres as the woollen and clothing factories at Penza and Ulianovsk and the metal industries at Kuybyshev. Deposits of combustible shale at Kashpir to the south-east of Kuybyshev and at Urdor to the north of Ulianovsk provide the fuel for generating electricity. Peat as well as Donbas coal and Baku oil are also used as fuel. Two powerful hydroelectric power stations were under construction at Kuybyshev in the early 1950s, to provide power for the whole region.

9. *The Ukraine and Moldavia.*—The Ukraine is one of the richest and most densely populated areas of the Soviet Union. The population in 1939 was 30,960,221 (in 1946 it was estimated at 40,548,310).

The oil deposits are located near Grozny and Maikop, Krasnodar and Neftegor'sk and at Makhachkala. The Grozny oil wells have the second largest output in the Soviet Union, and Grozny has become an important manufacturing centre, producing machinery and chemicals. Other important industries are the mining of lead, silver, copper and zinc near Ordinsk (Ordzhikani) and also the manufacture of cement near Novorossiisk.

The Caucasus mountains have valuable forests and their oak, ash and beech are used in industry. Fertile lands in the valleys grow cotton, soybeans and good crops of fruit. Sheep and cattle graze on the mountain slopes. The Sulak and other rivers were harnessed to produce hydroelectric power, and a number of new industries were established, notably at Makhachkala and in the Derbent district.

The mountainous country of Transcaucasia supports a great variety of crops, including cotton, tobacco, maize, tea, fruits and vegetables, while dairy farming and cattle and sheep rearing are important occupations. Nearly all the Soviet tea crop comes from this area, in particular from Adzharia and the subtropical districts of Azerbaijan. The area under tea has been greatly expanded; output was 6,400 tons in 1938. Adzharia also produces more than two-thirds of the Soviet citrus fruit crop. Other important crops of this district are silk and tobacco.

Hydroelectric stations, which are numerous in the Caucasus, are the main source of power both for transport and industry. In addition, coal is mined in Georgia, and the oil wells at Baku are of considerable importance.

Transcaucasia is rich in minerals. The manganese deposits at Chiaturi are among the richest in the world. Armenia has valuable copper deposits (mined and refined at Alaverdy and Kafan) and also valuable deposits of magnetite iron ore (mined at Dashkasan). Iron and steel are produced at Tbilisi and supplied to local industries.

Transcaucasia has an important textile industry. Leninsk, Kirovabad and Baku are centres of cotton spinning, while silks are woven at Tbilisi, Nukha and Kutais. Tbilisi is also noteworthy for clothing manufacture and for the production of chemicals, films and vegetable oils. There are throughout Transcaucasia important centres for food processing and canning and for the treating and packing of tea and tobacco. It also has a valuable timber industry based on the great variety of deciduous and coniferous trees in the Caucasian area, particularly oak, beech, maple and chestnut.

12. *Soviet Central Asia*—The vast area of the Kazakh S.S.R. is in the main barren desert land and the home of nomads but with oases. The broad area of the Irtysh valley is, however, like an oasis, being extremely fertile and producing fruits and other crops. The irrigation of some areas in the southeast of Kazakhstan has resulted in an intensive cultivation which yields rich crops of rice, cotton, fruits, tobacco and sugar beets. The Tien-shan mountains contain rich deposits of silver, gold, zinc, lead, copper and iron.

The development of industries in the Kazakh republic followed the exploitation of its rich deposits of coal, iron ore, nonferrous metals, oil and salt. Kazakhstan possesses about 50% of the entire nonferrous metal deposits of the Soviet Union and supplies copper, zinc and lead to the industrial centres of the Urals and of the Kuznetsk basin. The Karaganda coal basin is the third most important coal field in the Soviet Union and has an annual output of more than 4,000,000 tons. Other coal mines are at Pavlodar, Mangyshlak and near Karsakpays. The great industrial development of the republic has been accompanied by considerable improvement in its communications, particularly in the railway system which links Kazakhstan with the Urals and the Kuznetsk basin.

The southern republics of central Asia are the Turkmen, Uzbek, Tadzhik and Kirghiz. They occupy a varied area of mountains, desert and steppelands. The cultivated areas are mainly in the south, where the soil is fertile but arid. Cattle and sheep are reared, but the greater part of the population is concentrated in the irrigated lands, which occupy little more than 10% of the total area but which are highly cultivated. Rice, cotton, fruits, raw silk and grain are the chief crops in these irrigated lands. The most noteworthy irrigation scheme is that of the Ferghana canal in the Uzbek republic which waters about 12,000 ac. Plans were adopted for extending the area of irrigation there and in other districts. Hydroelectric power is supplied by a number of stations constructed to make use of the many swift-flowing rivers in the mountainous districts. A number of coal mines are worked, particularly in the Kirghiz republic, which in 1939 had an output of 1,500,000 tons. Oil deposits are being utilized in the Ferghana valley of Uzbekistan and at Nefte Dag on the shores of the Caspian sea.

13. *The southern Siberian area* is for the greater part divided into dry steppelands, mountainous regions and coniferous forests. Development may in fact be dated from the construction of the Trans-Siberian railway. The area possesses great mineral wealth and considerable agricultural resources and has been intensively developed.

To the east the Chita region, containing fertile soils, produces good crops of wheat, oats, rye, flax and hay. The dairy industry is important. Iron, brown coal, zinc, lead, molybdenum and other mineral deposits are worked between the Shelka and Amur rivers. Ferrous and nonferrous metallurgical industries have been established at Petrovsk and in the neighbourhood of Chita. The Buriat Mongol A.S.S.R. is another area which was greatly developed under the prewar five-year

plans. At Ulan Ude (Verkhne-Udinsk) a large engineering plant has been established and the mineral wealth of the republic is being exploited. In the Irkutsk region coal, manganese and iron ore are mined and there has been considerable industrial development. Irkutsk itself has become an important industrial centre where machine tools, aircraft engines and mining machinery are manufactured, and it is the largest industrial town on the route of the Trans-Siberian railway, which connects it with the Chita region and with the Kuznetsk industrial basin.

Southwestern Siberia contains the Kuznetsk coal basin, which, making use of local deposits of iron, copper and manganese and being linked with the resources of the Urals, has become the second most important area for coal and metallurgy in the Soviet Union. The mines are well equipped, and more than 25,000,000 tons of coal were being produced annually by 1940, representing about 15% of the total Soviet coal output. The great steel industry at Stalinsk makes use of iron ore from the Magnitogorsk mines of the Urals and has an output of more than 2,000,000 tons of steel a year. Iron ore deposits are worked near Stalinsk and also at Minusinsk and Kemerovo. An important chemical industry has been developed to make use of the by-products of the coking plants. Industries producing machine tools, mining equipment, locomotives and rolling stock and agricultural and textile machinery have been established throughout the area and particularly at Novosibirsk, Leninsk, Barnaul, Prokopyevsk, Omsk and Tomsk. Communications have been developed to serve these industries, and railways were constructed in the Novosibirsk area to feed the Turkistan railway (Turkibak).

14. *The central Siberian area* lies in the basin of the middle and lower reaches of the Yenisei river, which, being navigable by river steamers and barges as far as Krasnoyarsk, has facilitated development. The mineral deposits include gold, nickel and, particularly in the Lower Tunguska and Kureyka valleys, considerable resources of coal, which are mined and sent to the industrial areas southward through Krasnoyarsk and north through Igarka. The area has rich deposits of gold, platinum and copper, and nickel is mined at Norilsk, a settlement near Dudinka. The native population depends for its livelihood on hunting, fishing and the rearing of reindeer. It has been Soviet policy to organize the reindeer industry into state farms, where more economic and scientific methods can be employed, and there are several of these farms in the central Siberian area. Fur hunting is an important occupation, and marten and sable in particular constitute a valuable export. The fishing industry has been highly developed, and collectives have been established at suitable points along the rivers and along the coast to supply equipment and handle the catch. Ust Yeniseisk has a refrigeration and canning plant, and along the lower reaches of the Yenisei fish is cured for winter food and also sent to the industrial areas in the south.

The Yenisei and its tributaries the lumber industry is important. Logs are floated down to Igarka and other points. Igarka has special importance as the main port of the northern sea route; by 1939 its population had grown to 20,000 inhabitants. It has sawmills, but in summer the timber assembled there is shipped to other centres of the timber industry. As shipping must be clear of the Arctic ocean by October, the loading must be done in September-October. This brief period is one of intense activity, and during the winter logs are sawed and stacked ready for loading in summer. Interesting experiments have been made in growing grain and vegetables in the region of Igarka and of other towns; some oats, barley, vegetables and hothouse tomatoes have been produced. Poultry, pigs and dairy cattle are reared in small numbers under special conditions. It is necessary, however, to transport flour and other supplies to Igarka by sea in summer.

Aviation has proved of great value in the development of the vast frozen expanses to the north. Aircraft regularly fly on routes linking Igarka with Krasnoyarsk, which is on the established routes to the far east.

15. *The northern Siberian area*, bitterly cold, has neither roads nor railways and is almost uninhabited. The greater part of the region lies in the basin of the Ob river, which is navigable only by small boats. The lack of mineral wealth and the difficulties of lumbering in the swampy land restrict the small native population to hunting, fishing and reindeer rearing for a livelihood.

16. *The Yakut S.S.R. and the northeastern Siberian area* consist of vast plateau lands including the basins of the Lena, Yana, Indigirka and Kolyma rivers. The rivers are of particular importance; in an area lacking railways and roads they provide the only means of communication. Except in the tundra zone of the far north the whole region is covered with dense forests predominantly of pine (although in the south the variety of trees is greater and includes alder, aspen and larch). The whole area is sparsely populated and the main occupations are fishing, fur hunting and reindeer breeding. At the mouth of the Lena there are deposits of silver, lead and coal; in the Yana valley silver and lead mines are worked; and in the mountains of the upper Kolyma a gold-mining industry has been developed. Verkhoyansk, on the right bank of the Yana, is the chief trading post of the area; the furs and mammoth ivory collected there are sent by sledge to Yakutsk in winter.

The plains and valleys of the middle reaches of the Lena and its tributaries are cultivated in parts; more than 250,000 ac. were sown

to barley, oats, rye and wheat in 1936. A certain industrial development has been achieved in the Lena coal basin, although the output of coal is small. Iron ore deposits are worked in the Vilyuy and Lena valleys, and gold is also mined. Plans were made to develop the lumbering industry, and the utilization of the enormous timber resources of the area was attempted on a small scale.

17. *The far eastern area*, comprising the basins of the Amur, Ussuri and Sungari rivers, has, in the Trans-Siberian railway and local lines and in its numerous waterways, good communications with southern Siberia and with the Pacific coast, where it is served by Vladivostok, the main Soviet port on the Pacific ocean. Much of the area is cultivated, and the rich mineral and timber resources have been greatly developed. Coal and lead are mined in the Zeya valley and in the Bureya valley, while the plateau between the two valleys has valuable deposits of gold. At Khabarovsk, extensive fisheries and also an iron and steel industry have been established. Blagoveshchensk, a highly industrialized town, has important engineering works. The population of the region is in the main concentrated in agricultural and industrial areas where the main occupations are coal mining, lumbering and woodworking, metallurgy, leather tanning and dairying. The far eastern fisheries are extremely important to the economy of the area and of the Soviet Union itself, for they produce nearly one-half of the total Soviet catch. Vladivostok and Nikolaevsk-on-Amur, the two chief centres of the industry, have large canning factories from which fish is exported or sent to the more densely populated areas in the west. (I. Gv.)

Foreign Trade.—The management of foreign trade, a state monopoly, is in the hands of the Soviet government. Not yet a fully developed country, the Soviet Union has little to export. Early in the 1930s, when it was necessary to pay for machinery and heavy equipment imported from the United States and from Germany and other industrialized countries of Europe, the Soviet Union exported oil and oil products, but with the progress of industrialization the home consumption of oil increased and the exportable surplus was negligible. Other main items of export were timber, grain, furs, flax and caviar. From its great forest wealth the Soviet Union theoretically could export any quantity of timber, but in fact the home market was acutely in need of timber, the shortage being caused by a lack of essential machinery, of skilled lumberjacks and of transport. Even in 1930, when they reached their highest level, the value of Soviet exports amounted only to 3.5% of that of the total Soviet production; in 1938 the proportion fell to 0.8%.

Soviet imports were strictly limited to raw materials and machinery necessary to equip expanding industries. Items described as machinery, apparatus and parts, nonferrous metals and goods, iron and steel goods, and electrical equipment formed 34.7% of imports in 1930, then 66.1% in 1933 and 57.0% in 1938.

Among the trading partners of the U.S.S.R., Germany held the predominant part up to 1933; in that year it supplied 42.5% of Soviet imports and took 17.3% of Soviet exports. In 1938 the chief suppliers were the United States (28.8%) and Great Britain (16.9%). Great Britain was also the best customer, taking 17.6% of Soviet exports in 1933, then 32.7% in 1937 and 38.4% in 1938. (See Table XIV.)

After World War II the Soviet Union was able to exploit the economic resources of its satellites, buying from them at much cheaper rates and selling to them at much higher rates than the world market prices. The Soviet government declared the statistics of foreign trade a state secret, presumably because publication of the value and weight of foreign trade would inform the world at large about Soviet home shortages and would bring to the knowledge of the Soviet people the sales of grain to the United States and other countries where there was a shortage of food, and of timber in spite of acute domestic need for housing; as also such data would expose to the satellite nations the fact that their economies were being exploited. (See Table XV.)

A. I. Mikoyan, deputy prime minister and the member of the Politburo in charge of foreign trade, wrote in *Pravda* on Dec. 21, 1949, that the volume of Soviet trade with the capitalist countries had decreased to one-third of the prewar total; on the other hand, trade

with the people's democracies had grown, on an unprecedented scale, to two-thirds of that total. In 1938 the United States and ten countries of western Europe took 64% of Soviet exports and supplied

6% of Soviet imports; Soviet trade with the countries of eastern Europe was negligible. In 1949 the Soviet Union took only 0.6% of British exports and supplied 0.7% of British imports; in the same year 0.66% of U.S. imports came from the Soviet Union, which received only 0.07% of U.S. exports. (K. Sm.)

Finances.—The completely different economic organization of the Soviet Union makes the national budget distinct in character and far wider in scope than the budgets of countries where private enterprise prevails. The financing of industry, transport, commerce and agriculture, which is arranged mainly through private channels in non-communist countries, is an item in the Soviet budget. The character of revenue is equally distinctive and unusual by comparison with the revenue of western countries. (See Table XVI.)

Revenue in 1950, for example, derived from the following sources: turnover tax, 236,069,000 roubles; profit tax, 40,374,000,000 roubles; direct taxes, 35,771,000,000 roubles; state loans, 31,013,000,000 roubles; unspecified income, 78,867,000,000 roubles. It will be noted that the biggest item of revenue, accounting for nearly 55% of the total revenue, was the turnover tax, levied on the proceeds of retail trade in grain, alcohol, oil, sugar, meat, cotton tissues, petroleum and other commodities.

Expenditure in 1950 was grouped under the following headings: grants to national economy, 157,312,000,000 roubles; social and cultural, 116,813,000,000 roubles; defense, 82,857,000,000 roubles; state administration, 13,843,000,000 roubles; unspecified, 41,850,000,000 roubles. Defense expenditure in 1950 amounted allegedly to about 21% of the total expenditure, which may be compared with 32.5% expended on defense in the war budget of 1940. It is not possible, however, to estimate even approximately what percentage of the Soviet national income this represents, since real Soviet expenditure on defense is not confined to the ministries of war and navy but is distributed among the budgets of many other ministries.

Inflation developed in the Soviet Union during World War II but was drastically arrested by a decree of Dec. 24, 1947, whereby 10 roubles of the old currency in cash were exchanged for 1 new rouble. Control of consumer prices and of wages together with the application of the turnover tax can be counted upon to regulate actual demands in accordance with the availability of consumer goods. The practically compulsory state loans serve to absorb surplus purchasing power. A further weapon against inflation was the policy of distributing the benefits of increased productivity by lower prices rather than by higher wages.

The official rate of exchange of the rouble was revised by a decree of March 1, 1950. This decree "raised" the value of the rouble to the high and fictitious rate of 4.00 to the U.S. dollar and of 11.20 to the pound sterling.

The Statistical office of the United Nations calculated that the national income in the Soviet Union on a per capita basis amounted in 1949 to \$308 as compared with \$145 in the United States and \$778 in the United Kingdom. (I. Gv.)

*Estimate.

RUSSIA, CAMPAIGN IN NORTH. The campaign in north Russia must not be regarded as an isolated incident of World War I, but as a definite part of the Allies' plan for the defeat of the Central Powers.

Allied Expeditionary Force.—The original force consisted of 150 British marines who landed at Murmansk in April 1918. They were followed by 370 more at the end of May, with a further reinforcement of infantry and machine-gunners to the number of 600 on June 23. The strength of the forces gradually grew till the maximum strengths reached were: White Russians, 20,000; British, 18,400; U.S., 5,100; French, 1,800; Italian, 1,200; Serbian, 1,000. Maj. Gen. F. C. Poole, commander in chief of the Allied forces in north Russia, arrived at Murmansk on May 24, 1918, and found that the Allies were holding the Kola peninsula with detachments at Kandalaksha. He pushed southward down the Petrograd railway, and by the end of June had secured Kem and Soroka, the point where the road to Archangel via Onega branched eastward. The ice-free port of Murmansk was thus fully protected against any possible raid by German forces in Finland. On Aug. 3 Poole occupied Archangel with a force of 1,500 men, supported by British and French warships and a force of Serbs and Russians under Col. Thornhill moving overland via Soroka and Onega. Early in Oct. 1918 Gen. Poole proceeded to England, and in November Maj. Gen. W. E. Ironside, formerly chief general staff officer in north Russia, succeeded him. The commands of Archangel and Murmansk were then made independent of one another. The question of the maintenance of the Allied forces in north Russia had been early considered by the authorities. Murmansk, being an ice-free port, could be used all year round, and the troops based upon it could be withdrawn at any time. But with Archangel the case was different. The port becomes frozen from early November till late April. It was of the utmost importance to prevent the resources of Russia becoming available to the Germans, should they be able to continue fighting throughout 1919. The decision was therefore made to remain at Archangel during the winter.

The expedition to north Russia in the summer and autumn of 1918 undoubtedly did much to complicate the plans of the Germans. There is definite evidence that the German military authorities were unable to continue the transference of troops from east to west in the final stages of the World War of 1914-18, despite the urgent demands of Hindenburg and Ludendorff. The original object of the expedition was therefore fully achieved.

Peculiar Difficulties of the Campaign.—The armistice in Europe came just at the closing of the White sea with ice. For the north Russian force a new campaign was beginning, and all knew that relief could not come for at least six months. The feeling that demobilization was being carried out on all other fronts had a demoralizing effect upon all ranks of the force. Furthermore, the object of the campaign was obviously no longer the same. Germany as an enemy had disappeared from the scene, and the Allied troops were never again quite clear as to the reasons for the continuance of the fighting. In their efforts to reconstruct the Eastern Front, the Allies had espoused the cause of the White Russians and had called upon the Czech ex-prisoner of war units in Siberia to march westwards to join them. It was thus that the Bolsheviks became the new adversaries of the Allies.

For the British authorities the campaign was a serious responsibility. Food, clothing and munitions had to be unified so far as possible for the simplifying of supply. The town of Archangel contained at least three times its normal population owing to the influx of refugees, and it was impossible to let the population starve. Large supplies had to be imported for this purpose.

Winter of 1918-19.—The transition stage from summer to winter proved a difficult period for the Allies. The freezing of the Dvina came unusually late in Nov. 1918 and the Allied gunboats were withdrawn too soon for wintering in Archangel. The Bolshevik gunboats were thus enabled to descend the river from their more closely situated winter quarters and bombarded the Allied positions with their long-range guns. The situation was at one time critical, British and Americans, supported by Canadian artillery, fighting desperately to maintain their positions.

At Archangel during the winter the attitude of the Allies was purely defensive, covering the mobilization and training of the new troops of the north Russian provisional government. In the Murmansk area their task was to maintain a perpetual threat towards Petrograd and to divert as much of the Bolshevik forces as possible from Archangel. Fighting continued throughout the winter in both areas at irregular intervals, the Bolsheviks growing more efficient and exerting greater and greater pressure on the Allied columns. Nevertheless all the main Archangel positions were maintained intact against the repeated attacks of a superior enemy. In the Murmansk area, Gen. Maynard's troops succeeded in seizing the northern end of Lake Onega, thus making their threat against Petrograd an effective one, and containing a considerable force of active Bolshevik forces.

Arrival of Relieving Force.—The general thaw commenced in the first week of May, and by the 12th the river was free of ice. Two relief brigades under Brig.-Gens. Grogan and Sadlier-Jackson arrived at Archangel on May 26 and June 10 respectively, and evacuation of all troops which had spent the winter in north Russia commenced at once. The old contingents were embarked in turn, the British being the last to leave. Then followed those elements of the population which had elected to leave the country. In all, some 17,000 persons were transported from north Russia in British ships. By the end of July nothing remained but the fighting troops of the relief force and a few necessary administrative services.

A gradual substitution of Russian for British troops and administration was commenced, the process being accompanied by several outbreaks of mutiny amongst the new troops. The fronts of the various columns were cleared by vigorous action on the part of Brig.-Gens. Graham and Sadlier-Jackson, ably supported by the naval flotilla under Capt. Altham. By August 10 the withdrawal of the British troops to the inner defences of Archangel commenced.

Gen. Lord Rawlinson arrived at Archangel on August 12 and approved of the plans already arranged. Withdrawal continued without a hitch, and on September 27 the last 5,000 men were embarked simultaneously from 13 different points and the evacuation of Archangel was complete. The long withdrawal in the Murmansk area was then completed under the direction of Brig.-Gen. H. C. Jackson, who had replaced Gen. Maynard on September 20 owing to the latter's illness, the last man leaving the port on October 12.

RUSSIAN ARCHITECTURE. Historically, Russian architecture may be divided into two principal periods: the first, from the 10th to the end of the 17th century; the second, from about 1700 to the present. This chronological division is a consequence of the revolutionary activities of Peter the Great (1689-1725), whose drastic political and social reforms, intended to bring Russia into close contact with western Europe and its civilization, broke with the traditional conservative tendencies of Russian life and in architecture caused a shift from a deeply national style to the forms of western Europe. The architecture of the pre-Christian period was almost exclusively wooden, and, mainly due to the unlimited supply of lumber, the majority of buildings remained of timber during the era immediately following Russia's conversion to Christianity in 988. Typical peculiarities of this early wooden architecture are a horizontal disposition of wall logs and steeply pitched roofs.

Christianity found a fertile soil among the tribes inhabiting the widespread territories of what was to become the Russian empire, and an intensive building of churches set in after the acceptance of the new faith. The rulers of the various feudal principalities into which Russia was divided became defenders and champions of the church, and the building of a church became the central event in the reign of each of the numerous princes who, apart from religious considerations, wished to demonstrate

their power and wealth with splendour eclipsing that of predecessors and neighbours. Russian life centred in these churches; there new leaders were installed; the most important public questions were decided there; the prince kept his treasury in the church; the church was the last haven of refuge from invaders. Until the 17th century religion dominated Russian architecture which, nevertheless, was also closely connected with the fates of rulers and the geographical locations of the centres of political power. During this first period the most important schools of architecture were those of Kiev, Novgorod-Pskov, Vladimir-Suzdal and Moscow.

Early Centres.—The beginning of organized political life found Russia somewhat unified under the rule of the princes of Kiev, a city on the Dnieper river, the first capital of Christianized Russia. The Christian missionaries from the Eastern Church had brought their Byzantine culture with them, and this transplanted Byzantine art (*see* **BYZANTINE AND ROMANESQUE ARCHITECTURE**; **BYZANTINE ART**) was the starting point for the development of the new national architecture. In the different parts of Russia, Byzantine art, interpreted in different ways, developed into distinct forms. Sometimes, as in the neighbourhood of Novgorod-Pskov (in north-western Russia), Byzantine influence is scarcely perceptible; at others it flowered into exquisite forms representing a happy combination of the two cultures, as in the Vladimir district.

The oldest church in Kiev, still existing in part, is the Desiatinnaya church, begun in 991; it was the reproduction of a Byzantine church, rectangular in plan, with three altar-apses. The cathedral of St. Sophia in Kiev (1017), with five apses and crowned by 13 cupolas, is the next in age and the largest built during the first two centuries after conversion; the principal parts of this cathedral are still extant, but later additions have considerably changed its exterior.

The erection of churches in the Novgorod-Pskov district, which was to play an important part in the development of a national Russian architecture, began only a few decades later. An independent and distinctive school of architecture appeared there in the 12th century. Here Byzantine art lost its influence much quicker than in Kiev, where it was applied with only insignificant structural changes. The influence most responsible for the appearance of this deeply national art was that of the thoroughly original local wooden architecture which affected both design and construction. The two-storey cross-shaped church appeared with one-storey lateral additions. The church with only one apsis replaced the church with three apses. In conformity with climatic conditions, the arched roof became one that sloped. The spherical cupola gave way first to the helmet-shape; then it assumed the characteristic bulb-shape, a form similar to that which had developed centuries before and spread over Asia with the influence of Buddhism. The entrance took the form of a kind of porch; the belfry appeared, first as only an opening for bells on top of the wall, but later as an independent, high tower in which bells were hung in several tiers. The Byzantine cubic form of the church was broken up into a picturesque group of buildings, reflecting, like most of the innovations, national tastes that had been educated on wooden architecture. The rich Byzantine ornamentation either disappeared completely from the austere and simple walls of Novgorod churches, or else gave way to a plainly modelled geometric pattern, accentuating here and there the picturesque smoothness of the walls. The treatment of the stucco shows a characteristic feature. The lines and contours of the architectural forms were finished freehand, and are uneven, as is the surface of the walls, which lends the buildings a singular and effective charm.

In the principalities of Vladimir and Suzdal in the Central part of Russia we find, in the 13th century, not only Byzantine influences but partly Romanesque (*see* **BYZANTINE AND ROMANESQUE ARCHITECTURE**) brought there from Italy. The former manifests itself in the general form of the churches, the latter mainly in their decoration. The Romanesque arched gallery on the level of the second storey of the church was introduced as a decorative element in the form of an ornament of arches. In general the archi-

ture of Vladimir is characterized by a love for ornamentation that accentuates architectural masses. The walls of St. George in Youryev, wholly covered with ornaments of Romanesque origin, but strongly influenced by motifs of the native wood-sculpture for which Vladimir was famous, are typical. In the native wooden architecture projecting beams were carved, and the whole length of the crest of a building was sometimes ornamented by such beams projecting through. When stone became common in buildings designers drew inspiration from these forms.

Moscow.—The dominance of Moscow's architecture increased gradually with its political ascendancy. Masters from Novgorod and Pskov worked there, and the Russian national architecture reached its highest development in Moscow during the 14th and 15th centuries. The application of the motifs of the wooden architecture to stone building found its best expression in the tented church. As in the wooden, the square plan of the stone church was transformed by a system of little arches of peculiar form (*bokoshniki*) into an octagon, the basis of the tent. This turret-shaped church was frequently used during the 16th and 17th centuries; the tent was also widely applied to the roofs of belfries and towers. The basic elements of the Moscow church architecture took final form in the 16th century, and thereafter attention centred on structural ornamentation, some of which is comparable in richness to the best examples of the Florentine Renaissance. A reaction followed, characterized by pettiness of form and excessive flourishes, and sometimes erroneously regarded as the typical Russian style. One typical feature, however, is evident even in this period of decadence: the grouping of buildings in ensembles in whose composition as well as that of the individual buildings picturesque effects were produced. Many of the old monasteries, which, being surrounded by towered and crenellated walls, frequently resemble little fortresses, are interesting specimens of such ensembles.

In the majority of Russian cities of the period their central part was surrounded by strong walls with towers and battlements and sometimes by embankments and water-filled moats. This was called the Kremlin. It contained the ducal palace, government buildings, houses for the dignitaries and ducal guard and the principal cathedrals and churches. The Kremlin was really a fortress and was usually located on an elevation dominating the surrounding territory. Beginning with the austere lines of the fortress wall and ending with a group of majestic cathedrals whose golden cupolas sparkled in the sun, it generally made an extremely picturesque composition. The Moscow Kremlin is probably the best preserved. Although rebuilt many times it nevertheless presents a true picture of an ancient Kremlin; at the same time having a considerable number of Italian details, it is a good example of the Russianizing of foreign architectural forms.

St. Petersburg.—At the beginning of the 18th century, while Moscow and the rest of Russia continued to live according to tradition, Peter the Great (1689-1725) undertook to build a new capital, St. Petersburg, in the far north of his empire—a move which at once involved extensive and imposing building and a radical change from an isolated political existence to closer contact with western Europe. A new epoch in Russian architecture began. Being an innovator in everything, Peter strove from the first to create a new architecture. Instead of employing Moscow masters, he enlisted an army of architects, engineers and craftsmen from all parts of Europe. Their work resulted in the erection of incongruous buildings in western European forms. A degree of order came into this architectural chaos only after Peter's death, when Russian architects became educated in western European art, and Russian architecture, although it could look back on nearly eight centuries of national traditions, turned toward classicism. Thereafter its evolution was divided into two currents, one characteristic of the new capital, St. Petersburg, the other of Moscow, the old. All subsequent architectural periods and fashions were perceived and developed differently in each. In St. Petersburg, the official capital, which grew rapidly, building progressed on a large scale. Architectural ensembles grew up along whole tracts of streets and quays and around vast squares. Most of the new buildings erected by the Government, its

officials and the aristocracy were palatial, solemn and somewhat haughty. In Moscow, which had then dropped out of political life but where the charm of the traditions of a great past still existed, the buildings were simple, noble and showed a certain intimate affinity.

The influence of the Renaissance (*see RENAISSANCE ARCHITECTURE*) scarcely reached Russia, but an outgrowth of it, the Baroque (*see BAROQUE ARCHITECTURE*), made a strong and lasting impression on Russian architecture, leaving numerous examples, which were, however, sometimes considerably affected by peculiar local conditions. In Moscow a wonderful specimen in this style is the church of Our Lady in Fili, representing a further evolution of the tented church. Here the tent loses its continuity and consists of several tiers of octagons diminishing in size and put one above the other. In St. Petersburg and in the provinces the Baroque was widely used by the court architect, Count V. V. Rastrelli, one of the greatest architects of the time, whose talent created an epoch for the development of the Baroque. One of the principal reasons for the great success of the Baroque in Russia was its picturesqueness, a quality after which Russian architecture had always striven.

Catherine the Great.—In all Europe, the middle of the 18th century was a period of reaction against the pretentious forms of the Baroque and of reawakening interest in the austere and noble forms of classic architecture. In Russia, the brilliant reign of Catherine the Great (1762-96) was favourable for the development of this movement and it found an immediate response. A multitude of architects, both Russian and foreign, invited by the court, carried on the beautifying of the new capital, surrounding its vast squares with rows of classic columns, with elegant porticoes and with majestic façades. Catherine's interest in architecture was exceptional. Peter influenced the direction of Russian architecture; she assisted the development of the new school itself. With an energy equal to Peter's, she continued to create the capital, not only personally examining the designs but also, according to contemporaries, giving instructions and even supplying sketches for proposed buildings. During her reign the classic style was so intimately mixed with the creative genius of Russia that it occupied almost the same position as the traditional Russian style prior to the 17th century. An inexhaustible supply of serf labour allowed ambitious building programmes to be carried out. The ruling class, the aristocracy and gentry, living on estates scattered throughout the vast country, kept in close touch with the capital and, anxious to keep abreast of its fashions, built many mansions in the fashionable classic style whose solemnity and austerity fitted the epoch to perfection. Considering the numerous and diverse structures built in the classic style, it would be no exaggeration to call Russia of the 18th and 19th centuries a country of classic architecture.

19th and 20th Centuries.—The beginning of the 19th century inclined to even more austere forms, the Corinthian column gave way to the Doric, Rome seemed not simple and severe enough and early Hellenic forms came into favour. The Temple of Paestum became an ideal for the artist and the so-called Russian Empire style, very different from the dry and formal designs of Persier and Fontaine, appeared. Its characteristic traits are a Paestum-like archaism combined with great flat planes, here and there accentuated by severe but pithy ornamentation. The architecture of this period may be regarded as the climax of the Russian classic style. Under Nicholas I. (1825-55) the character of the building activity in St. Petersburg changed and from the erection of grandiose palaces, turned to more practical and commonplace problems. Porticoes and great wall surfaces with few window-openings which did not respond to the practical requirements gradually lost favour. Petty, unnecessary details were frequently applied with the intention to conceal by their display the shortcomings of a weak composition. Russian architecture, with frequently changing artistic tastes, declined steadily during almost the whole second half of the 19th century. At one time designers turned to the old Russian national style, but inspiration was sought from its most decadent period, the end of the 17th century; fortunately this tendency was of short duration and

left no deep traces.

With the end of the 19th and the beginning of the present century the advent of industry introduced a new and rapidly growing factor. A period of active building began and symptoms of a renaissance of the best of the old Russian architecture appeared. Aside from current buildings a number of large factories were constructed. Residences no less splendid than the old palaces of the dignitaries of Catherine were built for the new kings of industry. At this time when the modernistic style prevailed in Europe, two more architectural currents were evident—one purely national, traditionally Russian, founded on the early and best sources of Russian art; the other classical, suggested by the severe and elegant architectural forms of Palladio. These two logically reflected the main traditions and the historical development of Russian architecture as though representing its two main courses of development. The World War and the subsequent revolution interrupted building for a whole decade.

(W.O.J.)

Post Revolutionary.—Since the World War, many attempts have been made to create a national architecture from existing European styles, but these have been found unsuitable to represent the revolutionary ideas of the nation. All modern fads have been tried—"cubism," "futurism," "new art," "the heroic," but these have gone their way. The form of architecture in favour in 1929 and employed in all the new government buildings is based entirely on what the Russians call "mechanical technical" facts. The aeroplane, motor car and modern battleship are their inspiration, and all decoration other than the "scythe and hammer" the Bolshevik coat of arms, is eliminated. As Ladovski, the professor of the department of "modern architecture" at the Moscow academy has stated, "The future belongs to those who have remarkably little talent for the Fine Arts." Their desire is to create a new form of architecture devoid of any traditional inspiration, one which is essentially practical and suitable for its purpose. In other words they design the plan according to the requirements of the building on a purely constructional basis, and consider the result will produce its own beauty.

Lack of capital is another determining factor in this new form of architecture. Reinforced concrete has replaced stone and granite and everything is being designed and carried out with the greatest economy and simplicity. Russia prides itself in being a nation of workers and considers that its factories and business buildings should look like "work shops" and not like the mansions and palaces of an aristocracy. While the need for economy is evident in all modern Russian buildings, it is commendable that the new Government has not allowed the ancient buildings to fall into decay. Domed palaces and minarets have been painted and regilded. Mansions, now the headquarters of Government departments or of bakeries and other commercial industries, have been redecorated as originally designed. Churches of artistic merit have been repaired, and theatres, the pride of the people, receive particular attention.

Construction is of reinforced concrete throughout, painted in revolutionary red and grey. Walls are reduced to a minimum sufficient only for constructional purposes, while enormous glass areas are introduced to give the maximum window space to the workers. Flat roofs and balconies for the recreation of the workers are also considered essential. These new conditions produce their own problems in a country where the temperature is often 30° F below zero and the snow-fall great. To overcome the cold in winter elaborate heating systems have to be introduced. The windows are covered with a network of heating pipes placed behind the glazing bars, while double glazing is provided for all windows to keep out the cold. The greatest problem is that of the flat roof, as during winter the roof with its parapet walls forms a tank for the snow, with the resultant danger from leakages and burst pipes when thaw sets in. There are various methods of roof construction but the best is that in which a double concrete slab is used with an air space between.

Russia is still in a state of transition. Lack of materials and skilled craftsmen makes it difficult for their advanced dreamers and architects to carry out their conceptions. Nitski, one of the

able Bolshevik art critics, has said that the dreams of Lenin could not be realized for at least 100 years. Some of the most recent buildings carried out in the modern manner are: the Centrosyos warehouse; the new Telephone building; the Telegraph building and the Gostorg State building.

RUSSIAN ART. A comprehensive essay on the art of Russia implies a survey of the art of many races, beginning from remote antiquity. This article, therefore, deals with those artistic activities that have been manifested in Russia proper since her appearance as an organised and independent state under St. Vladimir (972-1015).

Premonogolian and Mongolian Period.—As with their religion, the Russians took their art from Byzantium and up to the 14th century they preserved in their icons all the austerity and simplicity of design and also the economy of colouring of the Byzantine frescoes of the 11th and 12th centuries. The centres of activity during this period were at Kiev, Novgorod and Suzdal, and in all probability a great number of artists were Greeks. A very fine example from this period is the Odigitry Madonna (12th century) in the Riabushinsky collection at Moscow.

Novgorod School.—The 14th century marks the beginning of a new style and icon-painting at that time flourished in Novgorod. The new elements may be due to a fresh influx of Greek and perhaps Serbian painters, for there are certain characteristics in the Russian icons and frescos of this period which are common to the 14th century frescos both at Mistra (Greece) and in Serbia. However, in such works as the "Ascension" (1363) at Volotovo there is a sense for line and a simplicity of rendering not present in the Greek and Serbian frescos. In this work and also in the St. Theodore Stratiotes (1370) and the "Nativity" in the same monastery, can be clearly discerned all the great qualities which distinguish the Novgorod school in the following century. At the end of the 14th century (1378-1405) a Greek painter referred to by Russian chroniclers as "Philosopher Theophanos the Greek" did works in various churches and monasteries in Moscow and Novgorod.

The golden age of Russian art, the 15th century, is marked by so much grace that some scholars attempt to ascribe it to Italian influence. The chief means by which this elegance is obtained is continuity of outline of the design and either rhythmical linear repetition or symmetrical linear opposition of the movement, imposed on the central figure by the artist's interpretation of the action in the subject. The colouring too shows improvement. Instead of slightly tinted drawings as were the earlier icons, we have icons with clear and harmonious colouring distributed in flat surfaces and emphasised by lines marking the light. The most accomplished master of this period—and indeed in the whole history of Russian art—is Andrea Rublyov (1370-1430), probably a pupil of "Philosopher Theophanos the Greek," one of whose very few preserved works is the Holy Trinity (1408) in the Troitza Cathedral of the Troitza-Sergios monastery near Moscow (even the authenticity of this example is doubted by Kandakov). Another master whose name is frequently mentioned in old records together with Rublyov is Dionysios who worked at the Theraponte monastery. Some fine examples of the icons from this period are in the collections of B. E. Channenko at Kiev and E. S. Ostruchov and S. P. Riabushinsky at Moscow.

Moscow and Stroganovsky Schools.—After the inclusion by Ivan the Terrible of Novgorod province into the Russian Empire the centre of artistic activity shifts to the capital of the new Empire, Moscow. Design in icons loses simplicity and the figures lose their dignified proportions. Colouring becomes dull and practically identical in all icons, and even their sizes tend

towards standardisation. The Byzantine architectural motives in the backgrounds of icons are supplanted by Russian ones, and even the type of faces bears a strong national character. In short, the Moscow school abandoned the high standards of its predecessor and came into closer touch with national life. Gradually icon-painting turned into more a manufacture of devotional objects than art. Meanwhile between the end of the 16th and the beginning of the 17th century sprang up the Stroganovsky school which combined to some extent some of the elements of both its predecessors. The craftsmanship is certainly of a very high grade, but the harshness of design, the somewhat exotic brilliance of colour, the lack of relationship between the national architectural forms in the background and the semi-Byzantine figures, the insistence on detail and finally—especially so in the later stages—the presence of undigested Western influence makes this school very inferior to the Novgorod school. However, it found great favour among the upper classes and became the most appreciated school in Russia. A great number of icons from this school are preserved; an inferior example is hung at the National Gallery. The best known masters from this school are Istoma and Nikifor Savin, Procopiy Tschirin, Ivan Prokopiev and Spiridon Timoviev.

The efforts of Peter the Great to introduce Western civilisation into Russia gradually brought to an end an art which had flourished for over six centuries and Western influence became paramount. Among the first artists of the new era are S. Ushakov, Th. Abrosimov, Ivan Bezmin and Saltanov.

THE NEW ERA

The 18th and the first half of the 19th centuries form an epoch of foreigners in Russia. Just as in the beginnings of Russian religious art the Byzantine artists were predominant, so now Italian, French, Dutch and German artists were working for the Russian court and were laying the foundations of Russian secular painting. Among the great number of foreign painters were four English artists, Walker, Atkinson, Miles and Richard Brompton. While foreign artists were well treated, the conditions under which most of the native artists worked were lamentable. The land owners were closely imitating the Court and had their own architects and painters. These were conscripted from their serfs and remained serfs. It was not unusual for an artist to be flogged because his master was not satisfied with his work. The artist had also to perform other duties, such as valet, kitchen work, farm work, etc. In spite of this, native artists quickly attained the standards of their European teachers, but strictly speaking, we must acknowledge that Russian art as such was dead and that since the beginning of the 18th century art in Russia was nothing more than a minor branch of European art. Thus we have the various European schools, e.g., Classical, Romantic, Realistic. The most prominent artists of the Classical school are Akimov, Ugrumov, Egorov and Shebuev. Among the Romantics are Kiprensky, Tropinin, Brullov, Prince Gagarin, Alexander Ivanov, Vasnetsov and Vrubel, and among the Realistics are Venetizianov, Vereshchagin, and Repine. The best known landscape painters are Lebedev, Ayvazovsky, Levitan and Syerov. Naturally, as soon as modern art arose in Europe, Russia followed suit. The most important modern artists are V. Kandinsky, Roerich, Larionov, Gontsharova, Chagal, Ostrumova, Punin, Iacovlev and Anrep.

Sculpture.—Sculpture never flourished in Russia owing to the fact that the Orthodox Church does not allow sculpture in churches. There are very few examples of ancient carving extant. Probably the best that can be seen is at Yuryev Polsky on St. George's Cathedral. Among modern sculptors the best-known are Prince Troubetsky, Orlov, Archipenko, Lipshitz, and Zadkin.

Minor Arts.—Among the lesser arts silver-work was turned out for centuries at Novgorod and Tula. From the 18th century onwards there has been a flourishing porcelain industry in many places in Russia, the most important factories being the Imperial Factory, Garder and Popov. (See RUSSIAN ARCHITECTURE.)

RUSSIAN LANGUAGE AND LITERATURE. The Russian language is the Slavonic language of Russia. Understood in the widest sense, i.e., including also Little Russian or Ukrainian and White Russian, Russian forms the Eastern group of the Slavonic languages. In philological works the term Great Russian is generally used to designate the language which the world at large calls Russian, and, except where expressly stated, Russian in the course of this article stands for Great Russian—the language of Tolstoi and the other great writers so well known to Western Europe.

The main phonetic characteristics of Russian are:—I. Common Slav (C.S.) half vowels *ǫ* and *ǐ* have disappeared as such: *ǫ*, which was written at the end of words until the recent Bolshevik orthographical reform, was mute and served but to show that the foregoing consonant was not palatalized. Where a vowel was indispensable to facilitate the pronunciation of a group of consonants, *ǫ* and *ǐ* have been replaced by *o* or *e*, but these vowels sometimes appear without such justification (e.g., *ogonǐ*, Lat. *ignis*); *ǐ* when so needed becomes *e*, otherwise it disappears or else leaves a trace in the palatal quality of the preceding consonant, in which case it is still written: C.S. *sǫmǔ*, "sleep" and *dǐnǐ*, "day"; R. *son, denǐ* (*d'en*).

II. C.S. *y*—a sound not unlike the *y* in "rhythm"—has survived, as also in Polish. After gutturals it has become *i*.

III. Treatment of liquids: retention of *r* and of hard *l* (not unlike English *l* in "wall"); helping out of sonant *r* and *l* by a vowel put in before the *r* or *l*; especially the so-called full vocalism, by which, e.g., C.S. *gorǫdǔ*, "town," and *melko*, "milk," became *gorod* and *molo*.

IV. C.S. nasal vowels: *o* and *e* (like French *on* and *in*) became *u* and *i*: C.S. *gǫbǔ*, "way"; *pǫstǔ*, "five"; R. *putǐ*, *pastǐ*.

V. Palatalization (or softening): C.S. *tǫ*, *dǫ* gave R. *tš*, *ž*, C.S. *svǫtǫ*, "candle"; *medǫtǫ*, "boundary"; R. *světa*, *měta*. Before C.S. soft vowels *e*, *ǫ*, *ǐ*, *ǫ*, *ǐ* consonants were affected, the tongue being raised in anticipation of the narrow vowel, and so not making so clear a contact with the palate. Then what amounted to a new *j* developed in R., as *j* became practically *j*; *e* and *i* came to sound as *je*, *ji* as *je* at the beginning of a syllable, and all together with *j* began very much to soften the preceding consonant. In literary R., however, this new *j* never broke down the consonant into a palatalized sibilant or affricate, though it had this effect in White Russian (Wh.R.) and Polish.

The result is that almost every consonant in Russian can be pronounced "hard" or "soft," a distinction which is very difficult for a foreigner to make, as his tendency is to overdo the softness and pronounce a full *j* after the consonant, instead of the palatal element melting into it. A soft consonant in its turn narrows the vowel before it, e.g., the vowel in *jelǐ*, "fir," is like *o* in "Yale"; that in *jilǐu*, "ate," like *e* in "yell."

VI. Great Russian has kept *g* where Little Russian and Wh.R., like Czech and High Sorb, now have *h*.

VII. A specially Russian point is that *je* and *ji* beginning a word, appear in R. as *o* and *u*: C.S. *jesero*, "lake"; *jutro*, "morning"; R. *ozero*, *utro*.

VIII. Russian has lost the distinctions of quantity which survive in Czech and S. Slav, but its accent is free as in S. Slav. The accent is extremely capricious, often falling differently in different cases of the same noun, or persons of the same tense, also it is an expiratory accent, so strong that the unaccented syllables are much slurred over and their vowels dulled.

The above phonetic peculiarities mark Russian as far back as we can trace it. In the earliest documents it appears with an apparatus of grammatical forms practically identical with that ascribed to primitive Slavonic. The history of the language is not so much that of its phonetic decay as that of its morphological simplification and syntactic development. The tracing of this process is rendered difficult by the fact that Old Bulgarian was the ecclesiastical and literary language until the 17th century, and though in the end the O.B. texts suffer modifications, producing the Russian form of Church Slavonic, the Russian forms appear in them only by accident. Russian is better represented in additions made by

the scribe, as in the colophon of the Ostromir gospel (A.D. 1056-57), the oldest dated ecclesiastical ms. In a certain number of legal documents dating from the 12th century onwards Russian forms definitely predominate, but the subject-matter is too limited to offer much material.

Borrowings.—The effect of the Church language upon Russian has been very strong, comparable to that of Latin upon French or English: O.B. forms of words and suffixes, betrayed by their phonetic peculiarities though pronounced more or less *à la russe*, have in some cases ousted the native forms, in other cases the two exist side by side; the old Slav. form generally has the more dignified or metaphorical, the Russian the simpler and more direct sense: even some of the grammatical terminations (e.g., pres. part. act.; certain forms of the adj., etc.) are Slavonic; but speakers are quite unconscious of using anything that is not Russian, and not till the 18th century did even grammarians understand the difference. Less important elements have been the Tatar, which gave names for many Oriental things such as weapons, jewels, stuffs, garments and some terms concerned with government, and the Polish, which during the 17th century supplied many terms needed to express European things and ideas. In the 18th century such importations were made from Latin and all the Western European languages, in Peter's time mostly from German and Dutch (for nautical terms, English supplied some), in Catherine's rather from French, which had become the language of the aristocracy. During the first quarter of the 19th century modern Russian found itself and discarded superfluous Slavonic and European borrowings alike. Since then fresh loan-words have mostly belonged to the international quasi-Greek terminology, though like German R. sometimes prefers analogous compounds made from its own roots.

Literary Russian as spoken by educated people is the Moscow dialect (see p. 751) modified by these influences. It is still a highly inflected language, comparable in that respect rather to Latin and Greek than to the languages of western Europe, though during historic time it has lost many of the grammatical forms whose full development we can study in O.B., and whose presence we can assert in the scanty remains of Old R. This process has relieved it of the dual number, save for certain survivals; in the nouns, of the vocative case (save for certain ecclesiastical forms), and many of the distinctions between the declensions, especially in the plural, the oblique cases of the simple, and the more cumbersome forms of the compound, adjective; in the verbs, of the supine, the imperfect, the aorist and the conditional (now reduced to a participle); but this simplification leaves it with six cases, Nom., Acc., Gen., Dat., Instrumental and Locative, three genders, three substantial declensions, -*o*, -*o*, -*o*, and traces of -*u* and consonantal stems, a special pronominal declension with many tricky forms, a special adjective which takes its place between them, and a system of numerals in which a compromise between grammar and logic has produced a kind of maze. The forms of the verb are easier, as only the present indic. has three persons, the imperative, has but the 2nd, and the past is a participle, which, having discarded the copula, distinguishes only gender and number.

The infinitive and four participles offer no special difficulty, but the gerundives or verbal adverbs, from the old masc. non. sing., are troublesome. The curious mechanism by which these few verbal forms are by means of the aspects made to express most of our tenses and other shades of meaning of which even English is incapable, is briefly explained under SLAVONIC LANGUAGES. On the whole the syntax is simple, the periods which imitation of Latin and German once brought into fashion having given place to the shorter sentences of French and English models.

Dialects.—The dialects of Great Russian fall into two main divisions, which do not greatly differ from each other, Russian being an amazingly uniform language when the vast extent over which it is spoken is considered. These dialect groups are the northern or *o* group and the southern or *u* group. The line between them runs roughly E.S.E. from Pskov to the Oka and then eastwards to the Urals. The northern group is the more conservative and pronounces very nearly according to the spelling, unaccented *o* remaining *o*, but *o* is in general rather like *u*, while *e*

before hard consonants is apt to be *jo* and before soft consonants *i*. The southern part of this group, comprising most of the governments of Vladimir and Yaroslavl with adjoining parts of Tver and Kostroma, are alone free from a further peculiarity, a tendency to mix up *e* and *i* which can be traced in the ancient documents of Növgorod and has spread with the Növgorod colonists across the whole of N. Russia to the Urals and Siberia. These distant dialects have adopted many words from the Ugro-Finnish natives. The southern or a group of dialects pronounces unaccented *o*, *e* and even *i* as *a* or *ja*; with this goes a tendency to pronounce *g* as *h*, and to mix up *a* and *u*.

The Moscow dialect, which is the foundation of the literary language, really covers a very small area, not even the whole of the government of Moscow, but political causes have made it the language of the governing classes and hence of literature. It is a border dialect, having the southern pronunciation of unaccented *o* as *a*, but in the *jo* for accented *e* before a hard consonant it is akin to the North and it has also kept the northern pronunciation of *g* instead of the southern *h*. So too unaccented *e* sounds like *i* or *ji*.

White Russian.—The present literary language arose in the 14th century and is based on one of the central dialects. The tendency of some modern writers to break with the earlier tradition and make their language different from Great and Little Russian has introduced into the vocabulary many foreign elements which have no real existence in the popular dialects. The language presents certain features which occur also in Ukrainian but in general character it agrees more closely with South Great Russian (being an *a*, not an *o* dialect, and distinguishing *y* from *i*, etc.). It is spoken in the whole or parts of the governments of Grodno, Suwalki, Vilna, Minsk, Vitebsk, Mogilev, Smolensk and in the N.W. part of Chernigov.

Little Russian or Ukrainian.—The literary language arose towards the end of the 18th century and has no genetic connection either with the ecclesiastical language of the S. Russian writers of the previous period or with the attempts of the preceding three centuries to write in Lit.R. The language is founded on the western dialects and the earlier writers avoided the use of such words as did not there occur. During the last quarter of the 19th century Lit.R. was persecuted in Russia and the Austro-Hungarian government seized the opportunity to encourage it in Galicia. Lwów (Lemberg) became a recognized literary centre and the refuge of writers who were expelled from Russia. The character of the literary language soon changed considerably and a number of Polishisms were adopted. After 1906, when the oppressive measures against the language in Russia were removed, the tide turned and the foreign elements were held in check. As a result of these conflicting tendencies the literary language is not yet stabilized.

Phonetically, Little Russian is characterized by itacism; for original *y* and original *i* have coincided in a sound between *i* and *y* not unlike the Eng. short *i*, and original *ě*, also *e* and even *o* after having been lengthened in compensation for lost semi-vowels are now represented by *i*.

Further, Little Russian has reduced the common Russian softening, only keeping it before *a* and *o* and *i* for *ě* and *o*, and hardening the consonant before *e* and original *i*. In common with Wh.R. it has *h* for *g*, a vocative case, gutturals made sibilant before *i* (for *ě*) in oblique cases, 3rd sing. generally without the *t*, 3rd plur. in *-ti*, 1st plur. in *-mo* and *-me* instead of *-mi*, *ni* for *ni*, *h* for *ij*, *it* for *ij*, *w* for *u*, and hard *t*, but all these occur more or less throughout S. Russian and only tend to a superficial resemblance.

These phonetic peculiarities are not universal, but the presence of the narrowed *ě*, *e* and *o* is sufficient to mark a dialect as Little Russian. The Russian alphabet is modified for Little Russian use as *ř* = *h* and hence *ř* = *g*; *ě* is used for the *e* which does not soften the preceding vowel, *u* for the thick and *i* for the pure *i*.

BIBLIOGRAPHY.—DICTIONARIES: *Dict. of the R. Language*, published by the Second Section of the Academy of Sciences (St. Petersburg, 1895, etc.); four vols. have so far appeared reaching to the letter *L*; V. I. Dal', *Explanatory Dict. of Living Great R. Language* (4 vols., St. Petersburg—Moscow, 1893-99); I. I. Szezevskij, *Materials for a*

Dict. of Old R. Language (3 vols. St. Petersburg, 1893-1912); A. Alexandrow, *R.-Eng. and Eng.-R. Dict.* (2 vols.); J. Pawlowsky, *R.-Deutsches Wörterbuch* (Riga, 1912). The standard, but not quite completed, etymological dictionary is that by A. Proobrazhenski (Moscow, 1910-1917).

LITTLE RUSSIAN DICTIONARIES: E. Zelenchowski, *Ruthenisch-Deutsches Wörterbuch* (Lemberg); B. Hirtenko, *Slovar' ukr. movy* etc. (Kiev, 1908-09).

GRAMMARS: Historical.—N. Durnovo, *Sketch of the Hist. of R. Lang.* (in Russian, Moscow, 1924); A. Sachmatov, *Sketch of the earlier period of the Hist. of R. Lang.* (in R., St. Petersburg, 1915); A. Sobolevskij, *Lectures on the Hist. of R. Lang.* (4th ed., St. Petersburg, 1908); K. M. Meyer, *Hist. Gram. der russ. Sprache* (Bonn, 1923). Descriptive and Practical—the best in English is the *Russian Grammar* by N. Forbes. The *Russ. Grammatik* by E. Berneker and M. Vasmér (1927), though short, is excellent. For Little Russian consult S. Smal' Stockij and F. Gartner (*Gram. d. ruth. Sprache*, Vienna, 1913) and Smal' Stockij's *Ruth. Gram.* in the *Sammlung Österreichischer* for miscellaneous information concerning the White Russians and their language the authoritative work is by E. Karasij—*Étymologie* (3 vols., 1903 etc.), which also gives a map of the White Russian territory.

DIACLECTS: *The Attempt at a Dial. Map of the Russ. Lang. in Europe etc.* (Moscow 1915) by Durnovo, Sokolov and Usakov is most complete.

RUSSIAN PRONUNCIATION: M. V. Trofimov and D. Jones, *The Pron. of Russian* (1913).

RECENT LINGUISTIC DEVELOPMENTS: A. M. Selishev, *The Lang. of Revolutionary Russia* (Moscow, 1918) is useful. (N. B. J.)

LITERATURE

The literature begins in the 11th century, about 50 years after introduction of Christianity into Russia, as an offshoot of the "Church Slavonic" literature of the Balkans. The "Church Slavonic" language, created in the 9th century by St. Cyril and Methodius, became the literary language of Russia. Though based on a Bulgarian dialect it was from the first used almost exclusively for translations from the Greek and is thus permeated with Greek syntactic and lexical influence. The overwhelming majority of Russian-Slavonic writings consists of translations of Christian books from the Greek. The secular literature of the Greeks remained practically untranslated. There was no literary contact with the West till much later. Original writings form only a small minority of the Old Russian mss. preserved. Printing was introduced in Moscow in 1564, but did not come into general use till the 18th century.

The first cultural and literary centre was Kiev, which retained its leading rôle till about 1200. The most important of the ecclesiastical writers of the period were the sacred orators, Ilarion, metropolitan of Kiev (d. 1053) and Cyril, bishop of Turov (later 12th century), brilliant and imaginative disciples of the Byzantine school. Of secular writings the most extensive are the *Chronicles (Letopisi)*. They are anonymous and have been preserved only in later compilations. The contemporary entries go back to about 1040. The account of the preceding period is based partly on oral tradition, but consists partly of the conjectures of a learned monk of about 1100. Besides its invaluable historical importance the chronicle possesses considerable literary merits. The story of the blinding of Vasilko (1096) and the account of the years 1146-54 are particularly noteworthy, as well as the Galician chronicle of the 13th century. Imaginative literature is represented by an isolated masterpiece, the *Discourse (Slovo) of the Campaign of Igor*, an anonymous political prose-poem on an unsuccessful campaign of one of the border kings against the Cumans (1185). It was discovered in 1795, and first published in 1800. Its poetical qualities, magnificent diction and rich imagery give it a unique place in Old Russian literature. Only insignificant fragments of works in a similar style have been preserved from the 12th and 13th centuries, but its influence is clearly apparent in later works such as the stories of the battle of Kulikovo (1380).

After the middle of the 13th century north-eastern Russia was politically and culturally separated from the south and west. From the end of the 14th century Moscow became the leading centre of the north. Literature became more exclusively ecclesiastical and more Byzantine in spirit. A new style of standardized and impersonal rhetoric becomes obligatory and is extensively cultivated in the numerous lives of saints and in the, now official,

chronicles. By the side of these we find also more personal writings, polemical and historical. Of the former we may mention the correspondence exchanged between the oligarchic politician Prince Andrew Kurbsky (1528-83) and the Tsar Ivan the Terrible (1530-84), who was a pamphleteer of genius. The greatest of all Muscovite writers was the Archbishop Avvakum (c. 1620-81), the leader of the schism of the Old Believers (see *RUSSIA: History*). He wrote several epistles denouncing religious and cultural innovations, and encouraging his followers to resistance, and a *Life of Himself* (1673, Eng. trans. by Jane Harrison and Hope Mirrlees, 1924), which reveal a powerful personality. He was the first writer to reject literary Slavonic, and to use the vernacular for literary purposes. He remains unsurpassed in the wonderful use he made of it.

The later Muscovite period saw the beginnings of Russian fiction which developed from several distinct roots,—legendary and didactic stories related to the lives of the saints; romances imported from East and West, but which received free fairy-tale treatment; and picturesque tales of Muscovite manners.

Folk Literature.—The "oral literature" of the Great Russian people is rich and varied. The so-called *byliny* are narrative poems in unrhymed, unstanzed stress-verse, intoned (not sung) by specially trained reciters. Their subject-matter is either historical, referring to events that go back to the taking of Kazan (1552); or legendary, dealing with the exploits of heroes (*bogatyry*), who are usually represented as grouped round the figure of Prince Vladimir. Their exploits are partly of the fairy-tale, partly of the *fabliau* type. The oldest texts of *byliny* (all on historical subjects) were written down in 1620 for the Englishman, Richard James (ms. in the Bodleian library). Next in antiquity comes the large collection ascribed to Kirsha Danilov, made in the mid-18th century in Siberia, and first published in 1804 (later, and more critical editions 1813 and 1901). In the latter 19th century the *byliny* were discovered to be still extensively preserved in northern Russia, especially among the fishing population of lake Onego and Pechora. Large collections of them were published by Rybnikov (1861-67), Hilderberg (1873), Markov (1901), Onchukov (1902) and Grigoriev (1904-10). Other poems surviving in the north of Russia are the laments for the dead, recited by professional wailing-women (collection by Barsov, 1872). Related in style to the *byliny* are the so-called *Spiritual Verses* (*Dukhovnye Stikhi*) recited by wandering mendicants. Their subject-matter is strongly influenced by Byzantine apocryphal literature. Among the Old Believers and mystical dissenters there developed a very remarkable lyrical poetry, devotional and mystical, often of great beauty. The lyrical, elegiac and choric songs are numerous and varied (principal collection by Sobolevsky, 1895-1902). Within the last decades a new type of improvised song, the *chastushka* (usually consisting of four rhymed lines), has received an extraordinary development among the peasants and working class. Of the prose forms of folklore *charms* can probably claim the greatest antiquity. *Folk-tales* cover a great variety of subject-matter, and display marked originality of treatment (collections by Afanasiev 1870, Onchukov 1903). An interesting branch of folklore is the popular drama. It goes back to 17th and 18th century literary sources, but the treatment, based mainly on wordplay, is characteristic (collection by Onchukov, 1913).

Beginning of Western Influence.—About 1650 Ukrainian and White Russian scholars and clerics began to introduce their new latinized scholasticism to Muscovy (see *UKRAINIAN LITERATURE*). Symeon of Polotsk was the first to publish books of rhymed didactic verse in Moscow. In the reign of Peter the Great two prelates of Ukrainian extraction and education, St. Demetrius Tuptalo, metropolitan of Rostov (1651-1709), and Theophan Prokopovich, archbishop of Novgorod (1681-1736), were prominent men of letters. Both wrote plays and possessed real poetical talent; Prokopovich was famous as the greatest orator of his day. His oratory like that of his successors in the reign of Elizabeth is markedly italianate and baroque.

Parallel to the Latin-Ukrainian invasion, another current, coming from Germany, brought a new secular literature. Plays from

the repertory of the German strolling actors were performed before Tsar Alexis as early as 1672. From 1675 onwards numerous translations of Latin romances were made and circulated in ms. and by the end of the century the writing of amorous verses had become the fashion among the young Muscovites. The reforms of Peter the Great confirmed the conquest of the Russian upper classes by the West. Culture was secularized. "Church Slavonic" was replaced by a clumsy Russian, larded with indigestible bits of every kind of European idiom. The romances, plays and songs of the first 30 years of the 18th century, however interesting as symptoms of a great cultural revolution, can hardly be described as literature. Modern Russian literature begins only with the birth of the direct influence of the metropolitan literature of Europe, that of France. Parallel to the French-influenced literature of the upper classes there existed, however, throughout the 18th century a curious popular literature. It includes, besides a variety of narrative chap-books, an interesting series of inscriptions in rhymed doggerel, on cheap woodcuts (collection by Rovinsky, 1881).

The Age of Classicism.—The first pioneers of French classicism were Prince Antioch Cantemir (1708-44) (g.v.), whose Horatian satires mark the advent of conscious artistic realism into Russian literature, and Vasilii Trediakovskiy (1703-69), whose reputation as the type of the poetaster should not overshadow his real services in the reformation and study of Russian prosody. The actual founder of modern Russian literature was Mikhail Lomonosov (c. 1711-65) (g.v.). He was a man of encyclopaedic genius; in letters, his influence as lawgiver of the literary language and founder of the new prosody cannot be exaggerated. A minor pioneering figure by his side was Alexander Sumarokov (1717-74) who created the Russian dramatic repertory, and was the first literary critic and the most gifted song-writer of the century. The hierarchy of literary genres, as established by Lomonosov, placed tragedy, the heroic poem, and the solemn ode uppermost. In the first two genres nothing was produced of lasting value, although Sumarokov pretended to the title of a "Russian Racine," and Michael Kheraskevich's (1733-1807) epic *Rusnada* (1775) earned him, for a generation, that of the "Russian Homer." The ode proved a more vigorous growth. Lomonosov's odes are still almost unrivalled in the language for solemn majesty and mightiness of diction. Gavriil Derzhavin (1743-1816) equalled Lomonosov in the gift of lyrical oratory, but his originality and the visual splendour of his imagery make him an even greater poet. Often harsh and rugged, his poetry is full of untamed vitality, and his classicism is the classicism of a barbarian.

In the "lower" genres classicism was above all a school in which Russian literature could develop what later became its most characteristic virtue. The burlesque epics of Vasilii Maykov (1728-78), the fables of Ivan Khemnitser (1744-84), the comic operas and comedies of Alexander Ablesimov (1742-1823), Yakov Knyazhnin (1742-93), and Vasilii Kapnist (1757-1823) display a rough and unrefined, but vigorous and lively realism, and are more interesting than the clumsy rococo graces of the once enormously popular adaptation of La Fontaine's *Psyché*, by Ippolit Bogdanovich (1742-1803). The same realism, with a higher degree of talent, is seen in the famous comedies of Denis Fonvizin (1744-92). The *Minor* (1782), especially, a clever satire of the boorish provincial squires, contains the first great creation in Russian literature. The classical-realist tradition culminated in the work of the great fabulist Ivan Krylov (1768-1844) (g.v.), whose first book of *Fables* appeared in 1800.

In prose, satirical journals started in 1769 in imitation of Steele and Addison present the same kind of realism. Those edited by Nicolas Novikov (1744-1816) were marked by a high degree of public-spiritedness and contain much courageous criticism of existing social conditions. They were suppressed in 1773 by Catherine II. Novikov, who was a freemason and a pietist, represents the right wing of Enlightenment. Its left wing is represented by Alexander Radishchev (1749-1802), a disciple of Rousseau. His *Journey from Petersburg to Moscow* (1790, burnt by the hangman) is a powerful, if over-rhetorical, vindication of freedom against both serfdom and autocracy. ☐

The movement started about 1791 by Nikolai Karamzin (1765-1826) (*q.v.*) continued the secularizing and enlightening work of the 18th century. Karamzin's reform of the literary language consisted in an extensive elimination of such "Church-Slavonic" as had been preserved by Lomonosov, in the wholesale translation from French of new words to denote modern ideas and feelings, and in a general tendency to follow French syntactic and stylistic models. The Karamzinian movement was also a reaction against the roughness and ruder force of the age of Derzhavin in favour of the "middle" literary genres and of a softer and more fluent style. Finally Karamzin was the pioneer of the "new sensibility" of Rousseau, and of the early forms of the romantic revival. He was opposed by a group of literary conservatives, the enemies of French influence and of "soft" poetry. Their leader was Admiral Alexander Shishkov (1754-1841). His followers, Semen Bobrov (*c. 1769-1810*) and Prince Sergius Shkirinskii-Shikhmatov (1783-1837), were devotional and metaphysical poets of talent, but their archaic manner was against the grain of the time. Of the followers of Karamzin the most gifted were Vasilii Zhukovsky (1783-1852) and Constantine Batiushkov (1787-1855). Batiushkov was a pupil of the French and Latin elegiac poets and of Tasso. His elegies are classical and sensuous with few traces of sentimentality. Zhukovsky was imbued with German and English influences. He wrote little original verse though some of his lyrics are among the purest gems of Russian poetry. As a translator he has few equals in any language. Up to about 1825 he translated modern, chiefly pre-romantic poets; in his old age he turned to the great epics, Indian, Persian and Greek. His complete version of the *Odyssey* appeared in 1847. A no less excellent version of the *Iliad*, by Nicolas Gnedich (1784-1833), had preceded it in 1830.

PUSHKIN AND HIS SUCCESSORS

Pushkin.—Zhukovsky and Batiushkov were the immediate forerunners of Pushkin (1799-1837) (*q.v.*), whose apprenticeship was passed in the French and anti-Slavonic school of the Karamzinists. Later he freed himself from French influence, but his style always remained lucid and classical. His greatest popularity lasted from the appearance of his first "Byronic" poem in 1822 to about 1830. The work of his later years in which, discarding his earlier fluency and softness, he aimed at a severer and more impersonal style, met with little contemporary recognition. Only his tragic death reinstated him in public opinion and made him a national classic. He has since become to Russia what Dante is to Italy and Goethe to the Germans. The cult rendered to him has not always been kept this side of idolatry, and has tended to obscure the fact that he is an end rather than a beginning. His work is the culminating achievement of the period of the cultural ascendancy of the self-owning nobility, rather than the fountainhead of later Russian literature. Of all his work only the "novel in verse" *Eugeni Onegin* (1825-33) with its central characters of Onegin and Tatiana had a considerable influence on the writers of the following age.

Pushkin was surrounded by a whole galaxy of poets, usually referred to as "The Pushkin Pleiad." The most notable of them were Eugene Baratynsky (1800-44), a philosophical poet of profound and noble originality, second only to Pushkin himself as a master of words, and Nicolas Yazykov (1803-46), whose verse his contemporaries liked to compare to champagne, and who possessed a poetical momentum of exceptional force. Other remarkable poets were Denis Davydov (1784-1839), a hero of the Napoleonic wars, and the author of some sincere and vigorous lyrics of war and love; Prince Peter Vyazemsky (1792-1878), a master of poetical wit, and one of the most influential critics of the '20s; Baron Antony Delvig (1798-1831), an exquisite artist in classical and antique forms; the revolutionary Kondrati Ryleev (1795-1826, hanged as the head of the Decembrist conspiracy), who in his civic verse continued the noble oratorical tradition of Lomonosov; Dmitri Venet'kinov (1805-27), whose early death was a great loss to the generation; and Fedor Glinka (1788-1880), a devotional poet who combined striking and effective simplicity with elevated mysticism. The movement of which Pushkin

and Vyazemsky were the recognized heads began by calling itself romantic, but was in reality much rather classical in spirit. Though they rejected the authority of Boileau they remained entirely free from romantic vagueness, from all "intercourse with the infinite," and from all aspirations after the unknown. The most general characteristic of even the minor poets of this Golden Age is a complete mastery of technique and a perfect adequacy of form to content.

After 1830 poetry begins to lose the sense of words, and to degenerate into untransformed emotion or shrill rhetoric. This is already the case with Alexander Polezhaev (1805-38), a pupil of Hugo and Byron and the direct forerunner of Lermontov in the passionate rhetoric of revolt. Lermontov himself (1814-41) (*q.v.*) was often merely a gushing emotionalist, or a thundering rhetorician. But at his highest moments of inspiration he reached summits of romantic vision that stand isolated in Russian poetry, while towards the close of his tragically ended life he was well on the way towards forming a sober and realistic style of great distinction and force. The general decline of poetry is not reflected in the work of Theodore Tyutchev (1803-73) whose compact and concentrated lyrics, though most of the best appeared as early as 1836, were not fully appreciated till much later. His poetry combines a penetrating pantheistic vision of the universe with the severe discipline of 18th century classicism. He has come to be generally regarded as Russia's second greatest poet. An interesting by-current was the artificial folk-song. It was cultivated already in the 18th century, but reached its highest development in the work of Alexis Koltsov (1808-42), the most famous of the Russian "uneducated poets." For all their artificial and literary antecedents his songs breathe a genuinely popular spirit.

The Russian drama of the first third of the century, though often quite competent for production on the stage, possesses small literary significance. Quite apart from the common run of plays stands the one comedy of Alexander Griboyedov (1795-1826) (*q.v.*), *Goré ot Uma* (*Woe from Wit*, 1825), one of the major classics of Russian literature. Historically it forms a connecting link between the classical realistic tradition that culminated in Fonvizin and Krylov, and the social realism of the later 19th century.

Russian prose-fiction remained for a long time without much vigour or originality. The only early novelist worth mentioning except Karamzin is Vasilii Narezhny (1780-1825), a robust realist in the tradition of Le Sage and Smollett. From the end of the '20s the writing of fiction became more intense, though remaining largely imitative. Romances of Russian history in the manner of Scott by Michael Zagoskin (1792-1853) and Ivan Lazhechnikov (1792-1869) were particularly popular. The "Byronic" romanticism and smartness of Alexander Bestuzhev (pseud. Marlinsky, 1797-1837) also had a great success. The more refined forms of German romanticism were cultivated by Prince Vladimir Odoevsky (1804-69) and by Alexis Welmann (1800-69), a gifted disciple of Jean-Paul. Pushkin himself, after 1830, began to pay more attention to prose than to poetry, elaborating a prose style that avoided all unnecessary ornament, and a narrative technique that discarded all that was not strictly relevant to the story. Lermontov's one masterpiece, *A Hero of Our Times* (1840), links the Russian psychological novel to the French analytical novel, while one of the stories included in it contains, *in nuce*, all the short-story technique of Chekhov.

The years 1832-45 are swayed by the genius of Gogol (1802-52) (*q.v.*). Much of his best work is distinctly romantic, and in a certain sense Gogol even marks the high-water mark of romanticism in Russia. But he was also a realist by his extraordinary power of visual convincings, and in the way he opened to literature large regions of the vulgar and the ugly that had been taboo. Psychologically, he was not a social satirist—the grotesquely lifelike creations of his imagination were exteriorizations of his own inner fauna. But the state of the nascent Russian intelligentsia in the later '30s was such that it could only accept Gogol's work as a satirical criticism of contemporary Russia. His comedy *The Government Inspector* (*Revizor*, 1836) and his comic "epic" *The Dead Souls* (1842) became the main landmarks in the awakening of

Russian society from the political torpor it had been plunged into after the suppression of the Decembrist rebellion (1825).

The Intellectual Revolution.—The great intellectual revolution that led to the formation of the "intelligentsia," as we now understand the term, began outside the political sphere in an awakened interest in general and philosophical ideas. The generation of 1825-40 was intoxicated with the metaphysics of Schelling and Hegel. At the same time, in spite of a savage censorship, journalism began to aspire to the leadership of opinion. *The Moscow Telegraph*, the organ of advanced romanticism edited from 1825 to 1834 by Nicolas Polevoy (1796-1846), is particularly noteworthy in this connection. Towards the end of the '30s the intellectual fermentation began to take on a political and social colouring and to express itself in a general disapproval of existing conditions. By 1840 the intellectuals had formed themselves into two camps: the Slavophiles who criticized contemporary Russia for abandoning those of their ideals they discovered in Old Russia and in the religious traditions of the people; and the Westernizers whose faith was in rational progress on European lines. The most notable of the former were Alexis Khomyakov (1804-60), a man of brilliant gifts, a devotional and religious poet of talent, and the greatest theologian ever produced by Russia; and the brothers Aksakov, Konstantin (1817-60) and Ivan (1823-86). The influence of the Westernizers was stronger. Their chief leaders were the literary critic Vissarion Belinsky (1811-48) and Alexander Herzen (or Gersien, 1812-70, see HEZEN). The former started his career as a romantic and aesthetic idealist. After 1840 he began to place social problems foremost and to demand a social significance of all literary work. His critiques became enormously influential, and he may be considered as the spiritual father of Russian Radicalism. The activity of Herzen, who emigrated in 1847, was chiefly political. In literature he owes his high standing to such work as *From the Other Shore*, a series of dialogues and essays in which he gave expression to his disillusionment in the revolution of '48, and *My Past and Thoughts* which is a great autobiography.

After the general political awakening of the country that followed the Crimean War the tradition of Belinsky was carried on by Nikolay Chernyshevsky (1828-89), Nicolas Dobrolyubov (1836-61) and Dmitri Pisarev (1840-68). They still further identified literary criticism with social politics. They rejected all non-utilitarian values, while Pisarev even condemned all art that was not directly and simply useful. About 1870 Russian Radicalism entered on a new phase, less rationalistic and more ethical, which proclaimed service to the people in atonement for the sins of serfdom, the only way of virtue open to the educated classes. These Radicals are known as the *narodniks* (populists). Their chief spokesman was Nicolas Mikhaylovsky (1842-1904), whose influence over the Radical intelligentsia was for about 20 years almost unlimited. The other camp was less influential (except in the purely political sphere where the brilliant journalism of Ivan Aksakov was a great power) but richer in original and independent personalities. The critic Apollon Grigoriev (1822-64) was excessively prolific and hot-headed, but at his rare best he displayed an imaginative understanding of the highest order. He is also the author of a few songs of strange and poignant beauty. A no less striking personality was that of Constantine Leontiev (1831-91), whose political philosophy of extreme conservatism is a curious amalgam of religious, aesthetic and biological considerations, that presents certain affinities with Nietzsche. Nicolas Strakhov (1828-96), was a good critic but a personality of less significance.

Rise of the Realistic Novel.—The Russian realistic novel grew up under the presiding influences of Gogol and of the idealistic social realism of French writers, especially of George Sand. The note of social revolt, echoed from France, is first heard in the *Three Tales* (1835) of Nicolas Pavlov (1805-64), and in the naïve and sincere work of Elena Hahn (pseud. Zinaida R-va, 1814-43). The influence of Gogol dominates the work of Yakov Butkov (c. 1815-56) and of Count Vladimir Sollogrub (1814-82). These first groupings were followed by the great creative outburst of 1845-47, when in the course of a few months Turgenyev, Dos-

toievsky, Goncharov and others gave the world their first works. The main characteristics of the new school were: the realistic rendering of contemporary Russian life; an interest concentrated on social problems; a critical attitude to existing social conditions; an avoidance of all extremes of the grotesque and the romantic; and an endeavour to write as simply and "transparently" as possible, so that words should be only a reflection of things. In these two latter points they distinctly broke away from Gogol, whose disciples they otherwise claimed to be. The most successful novelists during the first 15 years of the movement were Ivan Goncharov (1812-1891) (q.v.) and especially Ivan Turgenyev (1818-1883) (q.v.). The former in his second novel, *Obolomov* (1858) achieved one of the greatest masterpieces of social realism; the figure of Obolomov is at once strictly realistic and immensely symbolical, the imaginative quaintness of a characteristic aspect of the self-owning intelligentsia. Turgenyev is, of all his contemporaries, most closely related to Pushkin: most of his characters are developments of Onegin and Tatiana, the weak man and the strong woman. His novels, from *Rudin* (1856) to *Fathers and Sons* (1862), realize the perfect type of the "social" novel that is at once relevant to the solution of social problems and full of human significance. His style, realistic without rudeness, and poetical without emphasis, answered to perfection to the aesthetic ideal of the age, and was proclaimed the exemplar of Russian prose.

A different literary type is presented by the "philanthropic" fiction that sought to awaken sympathy with the poor and oppressed. Some writers (including the young Dostoevsky) took their subject matter from the life of the poorer urban classes, the "poor clerk" being a particularly favourite character; others devoted themselves to the peasant. The unquestionable masterpiece of the latter group is Turgenyev's *A Sportsman's Sketches* (1847-52). Other writers of peasant fiction were Dmitri Grigorievich (1822-1900), whose first novels were among the literary events of 1846-47; and Marko-Vovchok (pseud. of Mme. Markovich, née Velinsky, 1834-1907), whose best work was done in Ukrainian (see UKRAINIAN LITERATURE). Another group of novelists chose the uneducated classes for their heroes, not as objects of compassion, but as the depositories of characteristic Russian qualities and of a moral strength that had been forfeited by the gentry. The best stories of this kind were written by Alexey Pisemsky (1820-81), especially *The Petersburgers* (1853). His novels of "genteel" life (e.g., *A Thousand Souls*, 1862) are full of a bitter contempt for the educated classes. His characters are powerfully drawn and there is more masculine vigour in his narrative art than in that of any of his contemporaries. The novels of Nicolas Melnikov (pseud. A. Pechersky, 1819-83) contain more valuable ethnographical information than literary merits. Sentimentality, tempered by humour, marks the stories of Mme. Sokhansky (pseud. Nadezhda Kokhanovsky, 1825-84) who took her material from the life of the provincial squiresdom of the back-steppes.

Sergei Aksakov, a much older man (1791-1859), realized his possibilities only under the influence of Gogol and of the new realism. After several books on sport and animal life he published *Chronicles of a Russian Family* (1856), describing with extraordinary objectivity and vividness the life of the East Russian squires in the 18th century. It was followed by *Years of Childhood of Bagrovgrandson* (1858) where he tells the story of his first eight years with a minuteness of convincing detail that has been rivalled only by Proust. Aksakov's Russian is remarkable for its purity and plasticity. His works have been admirably translated into English by J. C. Duff.

The two novelists now unquestionably classed as the greatest of their age, Tolstoy (q.v.) and Dostoevsky (q.v.), produced their chief work between 1854 and 1880. Both are somewhat unrepresentative of their time in that their interest was in the permanent entities of the soul rather than in current social problems. Dostoevsky was moreover unlike his contemporaries in the dramatic power and sense of tragedy revealed in his great novels. But Tolstoy's *War and Peace* may be regarded as the fulfilment of an ideal common to all the Russian realists: a form of fiction

REPRESENTATIVE RUSSIAN WRITERS, 18TH-20TH CENTURIES

- | | | |
|-----------------------------------|----------------------------------|---|
| 1. Mikhail Lomonosov (c. 1711-65) | 5. Nikolai Gogol (1809-52) | 9. Leo Tolstoy (1828-1910) |
| 2. Ivan Krylov (1768-1844) | 6. Theodore Dostoevsky (1821-81) | 10. Anton Chekhov (1860-1904) |
| 3. Mikhail Lermontov (1814-41) | 7. Nikolai Nekrasov (1821-77) | 11. Maxim Gorki (Alexey Pashkov, 1868-1936) |
| 4. Alexander Pushkin (1799-1837) | 8. Ivan Turgenev (1818-83) | 12. Dmitri Merezhkovsky (1865-1941) |

The most famous of these was Mikhail Artsibashev (1878-1927), the author of the notorious *Savin* (1907, Eng. trans. 1915), a drearily didactic novel that preached the gospel of complete obedience to social impulses, in a style unintelligently aped from Tolstoy. S. Sergeyev-Tsensky (b. 1876), another pessimist, is a much more genuine writer, and the master of an individual style. His novel *Movements* (1910) is one of the most powerful stories of dying and death written after *Ivan Ilyich*. Ivan Bunin (1870-1953) (*q.v.*) may also be classed with the pessimists. His most important works, *The Village* and especially *Sukhodol* (1912), give an impressive picture of the spiritual decay and cultural poverty of the peasantry and provincial gentry of central Russia.

before the Revolution. Numerous novelists practising a more or less "modernized" realism came up in the years preceding the World War of 1914-18. Two deserve mention: Ivan Shmelev (1875-), whose story *That which happened* (1921, Eng. trans. 1926) was perhaps the best Russian story inspired by the war; and Boris Savinkov (q.v.) (pseud. V. Ropsin, 1879-1925), author of *The White Horse* (1909, Eng. trans. 1915), a striking revelation of the terrorist mentality.

Chekhov's innovations in dramatic technique carried to its logical end the anti-artificial and "anti-theatrical" realism of Turgenyev and Ostrovsky. Gorki and Andreyev attempted to imitate his plays, but failed to master their inner, "musical" construction which alone makes them what they are. Andreyev also wrote "modernist" plays which are nothing but a succession of rhetorical clichés, and crude symbolism.

The "religious-philosophic" movement had its roots in the Christianity of Dostoevsky and in the gnostic idealism of Vladimir Soloviev (1853-1900) (q.v.). Soloviev, a brilliant dialectician and polemist, was not a creative philosopher, but his influence was very great. As a writer he is best remembered, apart from his mystical poetry, for his last work, *Three Dialogues on War, Progress and the End of the History* (1900, Eng. trans. 1915), an apocalyptic treatise in the form of a brilliantly witty conversation. Of his numerous followers we need only mention Father Paul Florensky, a writer of extraordinary subtlety and sophistication, and Nicolas Berdyaev (1874-1948), an impulsive thinker, more stimulating than profound. A very different kind of philosopher was Vasilii Rozanov (1856-1919), one of the greatest masters of modern Russian prose. By rejecting what he called the "Gutenberg" style he made his Russian as flexible and spontaneous as spoken language. He was a convinced enemy of Reason, in theory as well as in practice. His religion was mainly a religion of sex and procreation, but he had a deep emotional sympathy with the traditions of Russian Christianity. One of his most characteristic books, *Solitaria* (1912), was translated into English (1927). Leo Shestov (1866-1938) was also an irrationalist, but in his war on Reason he used the weapons of his enemy with consummate skill. He had an intimate affinity with Dostoevsky and Tolstoy (Eng. trans. Anton Chekhov, 1916; *All Things Are Possible*, 1920).

Symbolist Poetry.—The literary movement of the '90s, dubbed "modernism" by its opponents, had for its principal components aestheticism and individualism. Dmitri Merezhkovsky (1865-1941) (q.v.) was one of the earliest and most influential mouthpieces of "modernism." He did excellent work at first as the interpreter of foreign values. But his historical novels reveal no originality, and as a religious thinker he was a long-explored nonentity. The most important literary expression of the "modernist" movement was the poetry of the Symbolists. In the first stages their poetry was largely derivative from foreign sources. The work of Constantine Balmont (1867-1943) (q.v.) and Valery Bryusov (1873-1924) (q.v.) has a translated and un-Russian flavour. But they contributed a great deal to raising the standards of poetic workmanship and the general level of literary culture. Other poets more original and at the same time more organically rooted in the Russian tradition were Fedor Sologub (1863-1927) (q.v.); Zinaida Hippits (1869-1945) (q.v.), an intellectual poet of great technical originality; Innocent Annensky (1866-1909), whose small posthumous book *The Cypress Chest* (1910) contains lyrics of the most quintessential beauty; and Vyacheslav Ivanov (1866-1949), a gnostic metaphysician, a classical scholar, saturated with culture, the master of a magnificent ornate, Alexandrine style (*Cor Ardens*, 1911), as well as a splendid producer of ornate prose. The younger generation of Symbolists produced the greatest poet of the movement in Alexander Blok (1880-1921) (q.v.). His early mystical lyrics were purely mystical and immaterial. Later when he lost his mystical visions, his poetry became more full-blooded and realistic. It is romantic in substance, but instinct with a grim and hopeless irony. His last poem, *The Twelve*, written immediately after the October revolution, is a sublime symphony made out of realistic dirt. Blok's contemporary Andrei Bely (pseud. of Boris Bugaiev, 1880-

1934), was the most original and "advanced" of the younger Symbolist poets. His poetry is mystical in content, experimental in form and often humorous. Of the minor and later Symbolists there are Maximilian Voloshin (1877-1932), and Vladimir Khodasevich (1886-1939). The exclusively metaphysical character of Symbolism produced a reaction towards more concrete and less sophisticated poetry. Michael Kuzmin (1875-

) was its first herald. About 1912 it crystallized into a movement whose leader was Nicolas Gumilev (1886-1921). His poetry is a strange mixture of gaudy aestheticism and manly romanticism. The poetry of Anna Akhmatova (Eng. trans. *Twenty-Seven Love Poems*, 1927) is also an assertion of human and concrete emotion as against the mysticism and metaphysics of Symbolism. Osip Mandelstam (1891-) (*The Stone*, 1916) is more concerned with culture than with sentimental values. His technique is a curious combination of classical eloquence with an illogical associationism akin to that of the *surréalistes*.

The Symbolist Novel.—Of the elder Symbolists who attempted prose fiction Sologub (q.v.) is easily first. *The Little Demon* (1907) is one of the greatest Russian novels since Dostoevsky. Superficially it is a story of Russian provincial life, in the realistic tradition, but its symbolism has a metaphysical rather than a social significance. Other poets like Bryusov and Kuzmin tried to renovate Russian prose by adopting old and foreign styles. Bryusov's romance of witchcraft, *The Fire Angel* (1907), for instance, imitates the manner of a 16th century German memoirist. Russian prose was revolutionized by Andrei Bely (see above) and Alexei Remizov (1877-) (q.v.). They aimed at the maximum of verbal expressiveness, thus reviving the true tradition of Gogol and continuing the work of Leskov. Bely achieved this by a variety of means, among which rhythm, bold metaphor and verbal creation are most prominent. His novels, from the first, *The Silver Dove* (1909), to *Moscow* (first parts 1926), reveal a creative genius of a very rare order. Remizov's Russian is more colloquial; he continues the work of Avvakum and Rozanov of "de-latinizing" the language. His writings present an enormous variety of kind and subject. But most important of all are his stories of provincial life (*The Story of Stravinskoy*, 1909, and *The Fifth Pestilence*, Eng. trans. 1927) which introduced a new type of grotesque realism and a new technique. They had a considerable influence on the rise of a new realism which used Russian life not as a peg on which to hang social or metaphysical problems, but as purely aesthetic material. Alexei N. Tolstoy (1882-1945) was the most popular and lively of these writers, the master of an admirable narrative manner, free from any kind of sophistication. His masterpiece is *The Childhood of Nikita* (1922). Michael Prishvin (1873-) is the author of the best animal stories in the language (*The Beast of Krutoyarsk*, 1913). Eugene Zamiatin (1884-1937) began as a disciple of Remizov, but later developed a complicated expressionist manner of his own.

The War of 1914-18 and Revolution.—World War I. did not profoundly affect Russian literature. The intellectual classes kept aloof from it. The Revolution of March 1917 remained almost equally alien to the Russian imagination, but not the Bolshevik revolution of eight months later, or the ensuing civil wars. Their external result was the division of intellectual Russia into two hostile camps, which after 1920-21 became a geographical division between those who remained in U.S.S.R. and the *émigrés*. The older generation of writers was pretty equally divided between the two sides. But the young generation of *émigrés* produced no valuable work with the possible exception of the historical novelist, Mark Aldanov (1889-) (q.v.). In the literature of ideas the *émigrés*, however, gave birth to the vigorous movement of the "Eurasians," with Peter Sluyseveldt and Prince Nicolas Trubetskoy as leaders. Of the Bolsheviks, Kenin was an orator and a political writer of genius. Trotsky was a brilliant pamphleteer and his book, *Literature and Revolution* (Eng. trans. 1925), discussing the literary policy of the Communist Party, is of interest. But the strictly literary men of the party were very second-rate. Anatoly Lunacharsky (1875-1933) (q.v.) was a conspicuous mediocrity, and Demian Bedny (pseud. of E. A.

Pridorov, 1883-1945), the Communist poet laureate, was no more than an able and sometimes witty writer of rhymed propaganda.

During the years of civil war and blockade (1918-21) Russian prose writers almost ceased from production and poetry ruled supreme. Of the "advanced" poetical groups, the Futurists were the most prominent. The Futurist movement began about 1912 as a revolt against the hieratic mysticism of the Symbolists. It united several fundamentally different tendencies, and there is little in common between its two principal representatives, Victor Khlebnikov (1885-1922) and Vladimir Mayakovsky (1893-1930), besides the common desire to give poetry a more rugged and virile accent and to tear it away from the withering hold of traditional poetical associations. Khlebnikov was a recluse and a stammerer, a mole who lived, as it were, at the linguistic roots of poetry. His work is caviare to the general public, but highly appreciated by fellow poets. Mayakovsky was an open-air orator. Much of his verse is revolutionary propaganda. Though totally lacking in the "finer touch," it is intensely original and highly craftsmanlike. Boris Pasternak (b. 1890), unquestionably the greatest living Russian poet (principal book of lyrics, *My Sister, Life*, written 1917, published 1928) is externally connected with some aspects of Futurism, but in substance he is nearer to the traditions of Tyutchev and Fet. His poetry is marked by an absolute freshness of perception and diction combined with a tensile lyrical emotion that is to be found only in the greatest. His prose (*Tales*, 1925) is also of the highest order, and being concerned with the realities of the soul stands apart from that of his contemporaries. Next to Pasternak the most significant recent poet was Marina Tsvetayeva (an *émigrée* since 1922), whose poetry is marked by an exceptional variety and richness of rhythmical imagination, and an exuberant vitality. Sergius Esenin (1895-1925) (q.v.), the favourite poet of the post-revolutionary intelligentsia, was at one time connected with "advanced" movements, but in reality he is a poet of sentiment of an essentially "19th century" type. After 1921 poetry began to lose its ascendancy. None of the poets who came forward after that time are of any very great significance, though the "proletarian poet" Vasilii Kazin has a genuine gift of song, and Nicolas Tikhonov (1896-) and Ilya Selvinsky (1890-) are consummate and original masters of technique.

Post-Revolutionary Prose.—The period of the "New Economic Policy" (inaugurated 1921) saw the rise of a whole host of prose writers who, while remaining outside the pale of party Communism, sympathized with the Communist Revolution. They have been given the name of *poputchiki*, which means "fellow-travelers up to a certain point." The first of the *poputchiki* were strongly under the influence of the "ornamental" style of Bely and Remizov, and of the "formalist" school of criticism, which insisted on the complete reduction of all literary facts to form. The most prominent of the "formalists" was Victor Shklovsky (b. 1893), a vivacious and clever critic, and the author of a very remarkable book of reminiscences of World War I and the Revolution (*A Sentimental Journey*, 1923). The young "ornamental" novelists laid all their emphasis on style and formal originality, almost abandoning all pretence of narrative. The spirit of the Revolution expressed itself in their work in their treatment of mass movements. In the early novels of Boris Pilnyak (b. 1894) (q.v.) and of Vsevolod Ivanov (b. 1895) there are no individual characters, only vast movements of masses, crowds or peoples. Ivanov has overcome the limitations of "dynamism" and his later stories show more grit. The tales of Isaac Babel (b. 1894) are "intensified anecdotes" with a maximum of artistic concentration. He is a supreme master in the imaginative treatment of slang and mongrel dialects, and the most perfect artist of the younger generation. His best stories are about the Polish War of 1920. Leonid Leonov (b. 1899) is a more old-fashioned writer, related in tone and subject-matter to earlier masters, and full of sympathy for the underdogs of the Revolution. Other novelists tried to remedy the lack of narrative interest inherent in "ornamental" and "dynamic" fiction. Ilya Erenburg (b. 1891), who had been made famous by *The Adventures of Julio Verne* (1922), a satire of Capitalist

Europe, won still greater fame by crude novels of melodrama and adventure. Constantine Fedin (b. 1892) is a more serious writer; his novel *Cities and Years* (1924), a powerful story of war and revolution, restored to a place of honour the ethical conception of human conduct, as opposed to the elemental dynamics of the masses. After about 1925 "soviet workdays" replaced the civil war as the chief subject of fiction. Most of this new fiction of "soviet manners" is not above the level of good journalism. Among those who represent soviet life in a satirical light the most popular is Michael Zoshchenko (1895-), but Sergey Zayaitzky is the only writer of this description to have shown real imaginative power. Other writers like Lydia Seyfullina (b. 1889), in a curious type of best seller, try to answer the soviet typist's demand for "uplift." Recently there has grown up a great interest in the historical novel. Those by Yuri Tynyanov and by Olga Forsch (b. 1879) are works of real and solid merit.

By the side of the *poputchiki*, the "proletarian" novelists at first cut a rather inferior figure. The work of Yuri Libedinsky (b. 1898; *The Week*, Eng. tr. 1923), of Theodore Gladkov (b. 1883; *Cement*, 1926) and of D. Furmanov (d. 1926) is hardly literature, but it is interesting as reflecting the optimistic energy of the men who won the civil war and shouldered the work of reconstruction after it. The younger proletarian generation has produced writers of real talent. Artem Vesely (b. 1898) carried the "dynamic" novel to its highest perfection (*My Native Land*, 1926), infusing into it a vitality and cheerfulness entirely alien to its *poputchiki* initiators. A. Fadeyev and Sergey Semenov, on the other hand, are more interested in individual and ethical man. Fadeyev's *The Defeat* (1927) and Semenov's *Natalia Tarpeva* (1927) are works of great merit and still greater promise.

The drama, in spite of the continued vitality of the theatre, has produced little of importance. The realistic tradition has been abandoned. The plays of Nicolas Evreinov (b. 1879), a leading theatrical producer, have many points in common with Pirandello's. The Futurists at one time attempted to create a high-standard, boldly Aristophanesque propaganda play; but the only successful venture was Mayakovsky's *A Mystery-Bouffe* (1918). The dominant type of drama is a kind of conventional puppet-play with characters stripped of all reality and humanity. Such are the crude and mediocre plays of Lunacharsky (Eng. tr. *Three Plays*, 1923). Only the plays of the regretted Leo Lunts (1901-24) are on a much higher level. They are simplified tragedies of pure action, full of a genuine heroic spirit.

Historians.—Modern Russian historiography begins with V. N. Tatishchev (1686-1750); his history of Russia is a laborious but uncritical compilation from the chronicles. Gerhard Friedrich Müller (1705-83), a German member of the Petersburg academy and a pioneer in many fields, was the first to open up the jungle of official acts and records. A critical spirit was first introduced by another German, August Ludwig von Schloetzer, and by the amateur historian I. N. Boltin (1735-92). Karamzin's (q.v.) *History of the Russian State* (12 vol., 1818-26) summed up the work of the 18th century, to which it essentially belongs: it is moralizing and rhetorical, and devoid of all "sense of period." Its conception of autocracy as the only constructive and beneficent force in the Russian past made it the bible of official and conservative Russia. But before Karamzin was dead new ideas were abroad; and acquaintance with Niebuhr and Hegel demanded a new approach to Russian history. Nicolas Polevoy (see p. 754) in his *History of the Russian People* (1830-33) attempted to supply the demand, but being no more than a journalist, failed. Michael Pogodin (1800-75), who did much to advance a critical and detailed knowledge of Russia's past, was prevented from achieving a synthesis by the provincial conservatism of his outlook. The younger Slavophiles were more imaginative, and being convinced that the chief hero of history was the people and not the state, concentrated their attention on the history of the masses. Their best historian was I. D. Belyaev (1810-73). The same predilection for social history and for the masses marks the work of the radical historians, N. I. Kostomarov (1817-85), the most "literary" and widely read historian of the time, and A. P. Shchapov (1830-76), who tried to apply to Russian history the

methods of Buckle. The moderate and Liberal Westernizers, on the contrary, devoted themselves to the history of the State, which appeared to them as the only civilizing force, and of its legislation. The most industrious of them, S. M. Soloviev (1820-79), compiled what is the most complete detailed history of Russia (29 vol., 1851-79). It is little more than a transcript of the sources, interspersed with a few historical discussions, reflecting the ideas of Hegel. Russian historiography was freed from philosophy and party bias by K. N. Bestuzhev-Ryumin (1829-97) and V. O. Klyuchevsky (1841-1911). Klyuchevsky, especially, introduced a more intimate study of the sources, resulting in a more general reconstruction of the past; and his monographs on the pre-Muscovite and Muscovite period have become classics. His *Course of Russian History* (4 vol., 1904) has charmed many readers by its literary form, but is handicapped by the absence of a sincerely considered point of view. Bestuzhev-Ryumin became the master of a whole school of historians, among whom S. Th. Platonov (1860-1932) was the most eminent. *The Time of Troubles* (1899) is a masterpiece of knowledge and presentation. Apart from the main schools stand V. I. Sergeyevich (1838-1909), whose *Antiquities of Russian Law* is a brilliant work of criticism, written in a concise and trenchant style; and E. E. Golubinsky (1834-1912), whose *History of the Russian Church* presents a strange mixture of great critical acumen and quaint stolidity. The old Westernizing tendency survives in the work of P. N. Milyukov (1859-1943): *Studies in the History of Russian Civilization*, whose leading idea is to prove the poverty and inferiority of old Russian civilization. N. P. Pavlov-Silvansky (1869-1908) was a Westernizer of a different type, who tried to prove the essential similarity of the historical process in Russia and the West. The rise of Marxism has led to the rise of a school of Marxist historians, who aim at reducing Russian history to universally applicable methods of dialectic materialism. Their patriarch, M. N. Pokrovsky (1868-1932), was a historian of great gifts whose treatment of historical problems did much to renovate our ideas of the Russian past.

The Study of Literature.—The study of literature began in the 18th century in the form of biographical compilations and bibliographical indexes. Novikov being the principal pioneer. Towards 1830 literary studies came under the influence of German philosophical idealism. Stepan Shevryev (1806-64), a highly cultured critic and a right-wing Slavophile, was the first to attempt, without much success, a scholarly presentation of Russian literature. The journalistic surveys of Belinsky were much more influential in establishing a generally accepted *vulgate* of literary history. In the second half of the 19th century Russian folklore attracted considerable learned attention, almost invariably influenced by the romantic theories of Grimm. An extreme form of such romanticism is apparent in the work of Orest Miller (1838-89). Theodore Buslayev (1818-97) was a more circumspect idealist, and the first to attempt to bring together the study of old Russian literature and old Russian art. In the following generation A. A. Potebnya (1835-91) tried to place the study of folklore on a broad basis of linguistic psychology. Alexander Veselovsky (1838-1906) directed his efforts towards a strictly scientific study of comparative literature. Old Russian literature remained in the hands of philologists and its study was conducted on somewhat narrowly academic lines. The foremost representatives of this line of study today are V. N. Peretts (1870-) and V. M. Istrin, whose history of Kiev literature (1922) is the most authoritative survey of the period. Less moderate is the work of A. M. Pypin (1833-1904) whose *History of Russian Literature* is a scholarly and industrious attempt to represent old Russian civilization in the poorest possible light. The work of most historians of modern Russian literature is marked by a strong party bias and an absence of literary understanding. *The History of Russian Literature after 1848*, by A. M. Skabichevsky (1838-1910), and the writings of S. A. Vengerov (1855-1920), literary editor of the Brockhaus-Efron Encyclopaedia (1890-1907) and of numerous other publications, are best known and most frequently utilized. The Marxists introduced a fresh note by subordinating the study of literature to that of economics. Of the

early Marxists, the gifted Eugene Soloviev (pseud. Andreyevich, 1863-1905) wrote a *Philosophy of Russian Literary History* (1905) which is certainly worth reading. The canons of Marxist literary history were established by G. V. Plekhanov (1856-1918). Since 1917 Marxism is the official doctrine in literary history. The opposition is provided by the "formalists," whose influence on literary development has already been alluded to. Their most notable workers in the field of literary history are Boris Eichenbaum and Yuri Tyunyanov. On the whole, Russian literary history is in a far from satisfactory state, and there is no single adequate presentation of it. For the ancient period (including the 18th century) the student will be best guided by such collections of extracts as the *Chrestomathy* of Brodsky, Mendelson and Sidorov (3 parts, Moscow 1922-23). For the 19th century and later he will have to find his own way with the aid of existing bibliographies.

Bibliography.—Works in Russian: Meizer, *Russian Literature, 11th to 18th century* (2 parts, 1899, 1902); Peretts, *Short Outline of Methodology of Russian Literature* (1922); Vladislavlev, *Russian Writers of the 19th and 20th centuries* (4th ed. 1924); Piskunov, *Two Centuries of Russian Literature* (18th and 19th centuries) (2nd ed. 1925).

Works in English: M. de Vogüé, *Le Roman Russe* (1888; Eng. trans. 1900); A. Waiskewski, *A History of Russian Literature* (Eng. trans. from French, 1900); Prince P. Kropotkin, *Russian Literature* (1905; 2nd ed. 1916); A. Brückner, *A Literary History of Russia* (Eng. trans. from German, 1908); M. Baring, *Landmarks in Russian Literature* (1910) and *An Outline of Russian Literature* (Home University Library, 1915); Mme. N. Jarintzov, *Russian Poets and Poems* (1917); Prince D. S. Minsky, *Modern Russian Literature* (The World's Manual, 1918); *Contemporary Russian Literature* (after 1881) (1926), and *A History of Russian Literature* (to 1881) (1926); L. Wiener, *The Contemporary Drama of Russia* (Boston, 1924); J. Lavrin, *Russian Literature* (1927).

Anthologies: J. Bowring, *Specimens of the Russian Poets* (2 parts, 1821, 23); L. Wiener, *Anthology of Russian Literature* (2 parts, 1902-03); Deutch, Babette and Yermolinsky, *Modern Russian Poetry* (1922); *The Oxford Book of Russian Verse*, Russian text, ed. with introd. by Maurice Baring (1925).

White-Russian Literature.—White-Russian was, by the side of Latin, the official language of the Grand Duchy of Lithuania from the 14th century to its absorption by Poland, but apart from a few chronicles and a few translated romances it produced no literature. In the 19th century White-Russian literature did not rise above the level of provincial amateurishness. But in the present century a literary movement of which the chief names are Yanko Kupalo (b. 1882) and Michael Bagdanovich (Bagdanovich, 1892-1917) has resulted in the formation of a national literature. White-Russian folklore is less varied than either great Russian or Ukrainian, and has no narrative poetry. Its lyrical song however is rich, and some of it presents archaic features. White-Russian studies are now centred in the White-Russian State university at Minsk (founded 1921).

See N. Karsky, *The White-Russians* (in Russian, Warsaw, 1903 etc.); M. Haretsky (Goretsky), *History of White-Russian Literature* (in White-Russian, Minsk, 1926). For Ukrainian (or Little-Russian, or Ruthenian) literature see UKRAINIAN LITERATURE. (D. S. M.)

RUSSKY, NIKOLAI (1854-1918), Russian General, was educated at the infantry military school in St. Petersburg, graduated from the academy of the general staff in 1881, and by 1896 had reached general's rank. During the war with Japan (1904-5) he was the head of the staff of the II. Army, and planned the offensive carried out by General Gripenberg which led to the prematurely abandoned offensive of Sandepu. In 1914 he commanded the III. Army which attacked in Galicia, and advanced to Lvov (Lemberg) through which it passed in the further advance to the San-Dniester line. The dramatic entry of the III. Army into Lvov created for General Russky a prestige out of proportion to the real importance of his success. In Oct. 1914 he was appointed commander-in-chief of the north-western and afterwards of the northern armies. He continued to hold the command in spite of ill-health, and it was at his headquarters that the final scenes of Nicholas II.'s reign and his abdication took place in March 1917.

Soon after the Revolution General Russky retired, and in 1918 he was reported killed by the Bolsheviks.

RUSSO-JAPANESE WAR (1904-05). The seizure by Russia of the Chinese fortress of Port Arthur, which it had a few years previously, in concert with other powers, compelled Japan to relinquish, was from the Russian point of view the logical outcome of its eastward expansion and its need for an ice-free harbour on the Pacific. The extension of the Trans-Siberian railway through Manchuria to Port Arthur and a large measure of influence in Manchuria followed equally naturally. But the whole course of this expansion had been watched with suspicion by Japan, from the time of the Sakhalin incident of 1875—when the island power, then barely emerging from the feudal age, had to cede its half of the island to Russia—to the Shimomoseki treaty of 1895, when the powers compelled it to forego the profits of its victory over China. The subsequent occupation of Port Arthur and other Chinese harbours by European powers, and the evident intention of consolidating Russian influence in Manchuria, were again and again the subject of Japanese representations at St. Petersburg (Leningrad), and these representations became more vigorous when, in 1903, Russia seemed to be about to extend its Manchurian policy into Korea. No less than ten draft treaties were discussed in vain between Aug. 1903 and Feb. 1904, and finally negotiations were broken off on Feb. 5.¹ By the fourth negotiation Japan had decided to use force, and its military and naval preparations kept pace with its diplomacy.

This was in fact an eventuality which had been foreseen and on which the naval and military policy of Japan had been based for ten years. It, too, had its projects of expansion and hegemony, and by the Chino-Japanese War it had gained a start over its rival. The reply of the western powers was first to compel the victor to maintain the territorial integrity of China, and then within two years to establish itself in Chinese harbours. From that moment Japanese policy was directed toward establishing its own hegemony and meeting the advance of Russia with a *fait accompli*. But its armaments were not then adequate to give effect to a strong-handed policy, so that for some years thereafter the government had both to impose heavy burdens on the people and to pursue a foreign policy of marking time, and endured the fiercest criticism on both counts, for the idea of war with Russia was as popular as the taxes necessary to that object were detested. But as the army and the navy grew year by year, the tone of Japanese policy became firmer. In 1902 its position was strengthened by the alliance with England; in 1903 its army, though in the event it proved almost too small, was considered by the military authorities as sufficiently large and well prepared, and the arguments of the Japanese diplomatists stiffened with menaces. Russia, on the other hand, was divided in policy and consequently in military intentions and preparations. In some quarters the force of the new Japanese army was well understood, and the estimates of the balance of military power formed by the Russian minister of war, Alexei Kuropatkin, coincided so remarkably with the facts that at the end of the summer of 1903 he saw that the moment had come when the preponderance was on the side of the Japanese. He therefore proposed to abandon Russian projects in southern Manchuria and the Port Arthur region and to restore Port Arthur to China in return for considerable concessions on the side of Vladivostok.

His plan was accepted, but "a lateral influence suddenly made itself felt, and the completely unexpected result was war." Large commercial interests were in fact involved in the forward policy, "the period of heavy capital expenditure was over, that of profits about to commence," and the power and intentions of Japan were ignored or misunderstood. Thus Russia entered upon the war unprepared in a military sense. To the guards and patrols of the Manchurian railway and the garrisons of Port Arthur and Vladivostok, 80,000 in all, Japan could, in consequence of her recruiting law of 1896, oppose a first-line army of about 270,000 trained men. Behind these, however, there were scarcely 200,000 trained men of the older classes, and at the other end of the long Trans-Siberian railway Russia had almost limitless resources.² The

strategical problem for Japan was how to strike a blow sufficiently decisive to secure its object before the then insignificant forces of the East Siberian army were augmented to the point of being unassailable. It turned, therefore, principally upon the efficiency of the Trans-Siberian railway and in calculating this the Japanese made a serious underestimation. In consequence, far from applying the "universal service" principle to its full extent, they trained only one-fifth of the annual contingent of men found fit for service. The quality of the army, thus composed of picked men (a point which is often forgotten), approximated to that of a professional force; but this policy had the result that, since there was no adequate second-line army, parts of the first-line had to be reserved, instead of being employed at the front. And when for want of these active troops the first great victory proved indecisive, half-trained elements had to be sent to the front in considerable numbers—indeed, the ration strength of the army was actually trebled.

Objects of Japanese Attack.—The aim of the war, "limited" in so far that the Japanese never deluded themselves with dreams of attacking Russia at home, was to win such victories as would establish the integrity of Japan itself and place its hegemony in the far east beyond challenge. Now the integrity of Japan was worth little if the Russians could hope ultimately to invade it in superior force, and since Port Arthur was the station of the fleet that might convoy an invasion, as well as the symbol of the longed-for hegemony, the fortress was necessarily the army's first objective, a convincing Sedan was the next. For the navy, which had materially only a narrow margin of superiority over the Russian Pacific squadron, the object was to keep the two halves of that squadron at Port Arthur and Vladivostok respectively separate and to destroy them in detail. But in February weather these objects could not be pursued simultaneously. Prior to the breakup of the ice, the army could disembark only at Chemulpo, far from the objective, or at Dalny under the very eyes of its defenders. The army could therefore, for the moment, occupy only Korea and try to draw upon itself hostile forces that would otherwise be available to assist Port Arthur when the land attack opened. For the navy, instant action was imperative.

On Feb. 8, the main battle fleet, commanded by Vice-Adm. Heihachiro Togo, was on the way to Port Arthur. During the night his torpedo boats surprised the Russian squadron in the harbour and inflicted serious losses, and later in the day the battleships engaged the coast batteries. Repulsed in this attempt, the Japanese established a stringent blockade, which tried the endurance of the ships and the men to the utmost. From time to time the torpedo craft tried to run in past the batteries, attempts were made to block the harbour entrance by sinking vessels in the fairway and free and deadly use was made by both sides of submarine mines. Though not destroyed, the Port Arthur squadron was paralyzed by the instantaneous assertion of naval superiority.

Alexeev and Makarov.—Adm. Evgeni Alexeev, the tsar's viceroy in the far east and the evil genius of the war, was at Port Arthur and forbade the navy to take the risks of proceeding to sea.³ For a time, when, in place of Admiral Starck (who was held responsible for the surprise of February), Adm. Stepan Makarov, an officer of European reputation, commanded the fleet, this lethargy was shaken off. The new commander took his ships to sea every day. But his energetic leadership was soon ended by a tragedy. A field of electromechanical mines was laid by the Japanese in the night of April 12-13, and on the following day the Japanese cruisers stood inshore to tempt the enemy on to the mine field. Makarov, however, crossed it without accident, and pursued the cruisers until Togo's battle fleet appeared, whereupon he went about and steamed for port. In doing so he recrossed the mine field, and this time the mines were effectual. The flagship "Petropavlovsk" was struck and went down with the admiral and 600 men, and another battleship was seriously injured. Then the advocates of passivity regained the upper hand and kept the squadron in the harbour, and henceforward for many months the Japanese navy lay unchallenged off Port Arthur, engaging in minor oper-

¹Belated declarations of war appeared on Feb. 10.

²The total Russian army on a peace footing was almost 1,000,000 strong.

³A vivid picture of the state of affairs in the navy at this period is given in Semenov's *Rasplata* (Eng. trans.).

ations, covering the transport of troops to the mainland, and watching for the moment when the advance of the army should force the Russian fleet to come out. Meantime seven Japanese cruisers under Vice-Admiral Kaimamura went in search of the Russian Vladivostok squadron; this, however, evaded them for some months, and inflicted some damage on the Japanese mercantile marine and transports.

Landing of Japanese 1st Army.—The Japanese had not waited to gain command of the sea before beginning the sea transport of that part of their troops allotted to Korea. The roads of that country were so poor that the landing had to be made not on the straits of Tushima, but as far north as possible. Chemulpho, nearer by 50m. to Port Arthur than to Japan, was selected. On the first day of hostilities Rear-Admiral Uriu disembarked troops at Chemulpho under the eyes of the Russian cruiser "Variag," and next day he attacked and destroyed the "Variag" and some smaller war-vessels in the harbour, and the rest of the 1st Army (Gen. Kuroki) was gradually brought over during February and March in spite of an unbeaten and, under Makarov's régime, an enterprising hostile navy. But owing to the thaw and the subsequent break-up of the miserable Korean roads, six weeks passed before the columns of the army (Guard, 2nd and 12th Divisions), strung out along the "Mandarin road" to a total depth of six days' march, closed upon the head at Wiju, the frontier town on the Yalu. Opposite to them they found a large Russian force of all arms.

The Russian commanders, at this stage at least, had not and could not have any definite objective. Both by sea and by land their policy was to mass their resources, repulsing meantime the attacks of the Japanese with as much damage to the enemy and as little to themselves as possible. Their strategy was to gain time without immobilizing themselves so far that the Japanese could impose a decisive action at the moment that suited them best. Both by sea and by land such strategy was an exceedingly difficult game to play. But afloat, had Makarov survived, it would have been played to the end, and Togo's fleet would have been steadily used up. One day, indeed (May 15), two of Japan's largest battleships, the "Hatsuse" and the "Yashima," came in contact with free mines and were sunk. One of them went to the bottom with 500 souls. But the admiral was not on board. The Russian sailors said, when Makarov's fate was made known, "It is not the loss of a battleship. The Japanese are welcome to two of them. It is *he*." Not only the skill, but the force of character required for playing with fire was wanting to Makarov's successors.

Plans of Kuropatkin.—It was much the same on land. Kuropatkin, who had taken command of the army, saw from the first that he would have to gain three months, and disposed his forces as they came on the scene, unit by unit, in perfect accord with the necessities of the case. His expressed intention was to fight no battle until superiority in numbers was on his side. He could have gained his respite by concentrating at Harbin or even at Moukden or at Liao-Yang. But he had to reckon with the fleet! at Port Arthur. He knew that the defences of that place were defective, and that if the fleet were destroyed whilst that of Togo kept the sea there would be no Russian offensive. He therefore chose Liao-Yang as the point of concentration, and having thus to gain time by force instead of by distance he pushed out a strong covering detachment towards the Yalu. But little by little he succumbed to his *milieu*, the atmosphere of false confidence and passivity created around him by Alexiev. After he had minutely arranged the eastern detachment in a series of rearguard positions, so that each fraction of it could contribute a little to the game of delaying the enemy before retiring on the positions next in rear, the commander of the detachment, Zasulich, told him that "it was not the custom of a knight of the Order of St. George to retreat," and Kuropatkin did not use his authority to recall the general, who, whether competent or not, obviously misunderstood his mission. Thus, whilst the detachment was still disposed as a series of rearguards, the foremost fractions of it stood to fight on the Yalu, against odds of four to one.

*Not, as is often assumed, the fortress itself.

Battle of the Yalu.—The Japanese 1st Army was carefully concealed about Wiju until it was ready to strike. Determined that in this first battle against a white nation they would show their mettle, the Japanese lavished both time and forethought on the minutest preparations. Forethought was still busy when, in accordance with instructions from Tokio, Kuroki on April 30 ordered the attack to begin at daybreak on May 1. For several miles above Antung the rivers Yalu and Aihwé are parallel and connected by numerous channels. The majority of the islands thus formed were held and had been bridged by the Japanese. The points of passage were commanded by high ground a little farther up where the valleys definitely diverge, and beyond the flank of the ill-concealed positions of the defence. The first task of the right division (12th) was to cross the upper Yalu and seize this. To the Guard and 2nd Divisions was assigned the frontal attack on the Chiuliencheng position, where the Russians had about one-half of their forces under Maj.-Gen. Kashtilinski. On April 30, Inouye's 12th Division accomplished its task of clearing the high ground up to the Aihwé. The Russians, though well aware that the force in their front was an army, neither retired nor concentrated. Zasulich's mediaeval generalship had been modified so far that he intended to retreat when he had taught the Japanese a lesson, and therefore Kuropatkin's original arrangements were not sensibly modified. So it came about that the combined attack of the 2nd and Guard Divisions against the front, and Inouye on the left flank and rear, found Kashtilinski without support. After a rather ineffective artillery bombardment the Japanese advanced in full force, without hesitation or finesse, and plunging into the river stormed forward under a heavy fire. A few moments afterwards Zasulich ordered the retreat. But the pressure was far too close now. Broken up by superior numbers the Russian line parted into groups, each of which, after resisting bravely for a time, was driven back. Then the frontal attack stopped and both divisions abandoned themselves to the intoxication of victory. Meanwhile, the right attack (12th Division) encountering no very serious resistance, crossed the Aihwé and began to move on the left rear of the Russians. On the side of the defence, each colonel had been left to retire as best he could, and thus certain fractions of the retreating Russians encountered Inouye's advancing troops and were destroyed after a most gallant resistance. The rearguard itself, at Hamatan, was almost entirely sacrificed, owing to the wrong direction taken in retreating by its left flankguard. Fresh attempts were made by subordinates to form rearguards, but Zasulich made no stand even at Fêng-hwang-chêng, and the Japanese occupied that town unmopposed on May 5. The Japanese losses were 1,200 out of over 40,000 present, the Russian (chiefly in the retreat) at least 2,500 out of some 7,000 engaged.

The Yalu, like Valmy, was a moment in the world's history. It mattered little that the Russians had escaped or that they had been in inferior numbers. The serious fact was that they had been beaten.

Distribution of Russian Forces.—The general distribution of the Russian forces was now as follows: The main army under Kuropatkin was forming, by successive brigades, in two groups—1st Siberian Corps (Stakelberg), Niu-chwang and Kaiping; and Siberian Corps, Liao-Yang. Zasulich (3rd Corps and various other units) had still 21,000. In the Port Arthur "fortified rayon," under Lieut.-Gen. Stössel (4th Corps), were 27,000 men, and Gen. Linievich around Vladivostok had 23,000. These are, however, paper strengths only, and the actual number for duty cannot have been higher than 110,000 in all. The Trans-Siberian railway was the only line of communication with Europe and western Siberia, and its calculated output of men was 40,000 a month in the summer. In October 1904, therefore, supposing the Japanese to have used part of their forces against Port Arthur, and setting this off against the absence of Linievich and Stössel, Kuropatkin could expect to have a sufficient superiority in numbers to take the offensive. His policy was still, "No battle before we are in superior force."

Landing of Japanese 2nd Army.—For the moment it was equally Japan's interest to mark time in Manchuria. Still intent upon the Russian Port Arthur squadron, she had embarked her

2nd Army (Gen. Oku, 1st, 3rd, 4th and 5th Divisions) during April, and sent it to Chinampo whence, as soon as the ice melted and Kuroki's victory cleared the air, it sailed to the selected landing-place near Pitszewo. Here, under the protection of a continuous chain of war-vessels between the Elliot islands and the mainland, Oku began to disembark on May 5. But the difficulties of the coast were such that it took three weeks to disembark the whole and to extend across the peninsula to Port Adams. Oku then, leaving the 5th Division behind, moved down with the rest towards Kinchow, and after storming that place found himself face to face with a position of enormous strength, Nanshan hill, at the narrowest part of the peninsula, where part of a Russian division (3,000 only out of 12,000 were actually engaged) had fortified itself with extreme care. On May 26 took place the battle of Nanshan. The Japanese attack was convergent, but there was no room for envelopment; the Russian position moreover was "all-round" and presented no flanks, and except for the enfilade fire of the Japanese and Russian gunboats in the shallow bays on either side the battle was locally at every point a frontal attack and defence. The first rush of the assailants carried them up to the wire and other obstacles, but they were for many hours unable to advance a step farther. But the resolute Oku attacked time after time, and at last the 4th Division, on his right, assisted by its gunboats, forced its way into the Russian position. The Russians had just begun to retreat, in accordance with orders from higher authorities. But it was a second undeniable victory. It was, moreover, a preface to those furious assaults on Port Arthur which, because they were the expression of a need that every soldier felt, and not merely of a tactical method, transcend all cool-blooded criticism. The Japanese losses were 4,500 out of 30,000 engaged, or 15%, that of the Russians fully half of the 3,000 engaged. The victors captured many guns, but were too exhausted to pursue the Russians, whose retirement was not made in the best order.

The transports were now conveying the 6th and 11th Divisions to Pitszewo; these were to form the 3rd Army (Nogi) for operations against Port Arthur. Oku exchanged his 1st Division for the 6th. The 2nd Army then turned northward (3rd, 4th, 5th and 6th Divisions). The 10th Division, forming the nucleus of the 4th Army, had begun to land at Takushan on May 19. The 2nd and 4th Armies were the left wing of a widespread converging movement on Liao-Yang. Oku had the greatest distance to march, Kuroki the smallest. The latter therefore had to stand fast in the face of the Russian eastern detachment, which was three days' march at most from Feng-hwang-cheng and could be supported in three more days by Kuropatkin's main body, whereas the pressure of Oku's advance would not begin to be felt by the Russian southern detachment until the twelfth day at earliest. It was necessary therefore for the first objective to make a slight concession to the second. Oku had to start at the earliest possible moment, even though operations against Port Arthur were thereby delayed for a week or two. In fact, Oku's march began on June 13, Kuroki's on June 24; the moves of the intermediate forces at various dates within this time.

Meanwhile Kuropatkin, assembling the main army week by week, was in a difficult position. His policy of gaining time had received a severe blow in the failure of his executive officer to realize it, and that officer, though his unpursued troops quickly regained their *moral*, had himself completely lost confidence. On the news of the battle (coupled with that of a fresh army appearing on the Korean coast), Kuropatkin instantly sent off part of his embryo central mass to bar the mountain passes of Fenshuiling and Motienling against the imagined relentless pursuit of the victors, and prepared to shift his centre of concentration back to Moukden. The subsidiary protective forces on either flank of Zaulich had promptly abandoned their look-out positions and fallen back to join him. But the commander-in-chief, soon realizing that the Japanese were not pursuing, reassessed himself, sent the protective troops back to their posts, and cancelled all orders for the evacuation of Liao-Yang. From this time forward Kuro-

patkin allowed his subordinates little or no initiative. A few days later, Zaulich's persistent requests to be allowed to retreat and the still uncertain movements of the 2nd Army induced him once more to prepare a concentration on Moukden. But on May 6 he learned that the Japanese 1st Army had again halted at Feng-hwang-cheng and that the 2nd Army was disembarking at Pitszewo, and he resumed (though less confidently) his original idea. The eastern protective detachment, now strengthened and placed under the orders of Count Keller, was disposed with a view to countering any advance on Liao-Yang from the east by a combination of manoeuvre and fighting.

Alexeev and Kuropatkin.—It was at this moment of doubt that Alexeev, leaving Port Arthur just in time and profoundly impressed with the precarious state of affairs in the fleet and the fortress, gave the order, as commander-in-chief by land and sea, for an "active" policy (May 19). Kuropatkin, thus required to abandon his own plan, had only to choose between attacking the 1st Army and turning upon Oku. He did not yield at once; a second letter from the viceroy, the news of Nanshan, and above all a signed order from the tsar himself, "Inform General Kuropatkin that I impose upon him all the responsibility for the fate of Port Arthur," were needed to induce him to execute a scheme which in his heart he knew to be perilous. The path of duty for a general saddled with a plan which he disapproves is not easily discoverable. Napoleon in like case refused, at the risk of enforced resignation, and so did Moreau; the generality of lesser men have obeyed.

Stakelberg's 1st Siberian Corps was therefore reinforced towards the end of May up to a strength of above 35,000. But it remained a detachment only. The Liao-Yang central mass was still held in hand, for the landing of the 4th Army—really only a division at present—at Takushan and the wrong placing of another Japanese division supposed to be with Kuroki (really intended for Nogi) had aroused Kuropatkin's fears for the holding capacity of Keller's detachment. Moreover, disliking the whole enterprise, he was most unwilling to use up his army in it. The Russians, then, at the beginning of June, were divided into three groups, the southern, or offensive group (35,000), in the triangle Neuchwang-Haicheng-Kaiping; the eastern or defensive group (30,000), the main body of it guarding the passes right and left of the Wiju-Liao-Yang road, the left (Cossacks) in the roadless hills of the upper Aihw and Yalu valleys; the right (Mishchenko's Cossacks and infantry supports) guarding Fenshuiling pass and the road from Takushan; the reserve (42,000) with Kuropatkin at Liao-Yang; the "Ussuri Army" about Vladivostok; and Stüssel's two divisions in the Kwantung peninsula.

On the other side the 1st Army was at Feng-hwang-cheng with one brigade detached on the roads on either hand, the left being therefore in front of the Takushan division and facing the Fenshuiling. Oku's 2nd Army (four divisions or 60,000 combatants) was about Port Adams. This last was the objective of the attack of Stakelberg's 35,000. Kuropatkin's orders to his subordinate were a compromise between his own plan and Alexeev's. Stakelberg was to crush by a rapid and energetic advance the covering forces of the enemy met with, and his object was "the capture of the Nanshan position and thereafter an advance on Port Arthur." Yet another object was given him, to "relieve the pressure on Port Arthur by drawing upon himself the bulk of the enemy's forces," and he was not to allow himself to be drawn into a decisive action against superior numbers. Lastly, on June 7, while Stakelberg was proceeding southward on his ill-defined errand, Kuropatkin, imposed upon by the advance of the Takushan column to Siu-yen, forbade him to concentrate to the front, only removing the veto when he learned that the 4th Army had halted and entrenched at Siu-yen.

Battle of Telissu.—On the 14th, all his arrangements for supply and transport being at last complete, Oku moved north. Although he was still short of part of the 6th Division, he was in superior force. He had, moreover, the perfectly definite purpose of fighting his way north, and at Telissu or Wangfong on June 14, as he expected, he came upon Stakelberg's detachment in an entrenched position. On the 14th and 15th, attacking sharply on

¹This was the 2nd Army, waiting in the port of Chinampo for the moment to sail for Pitszewo.

the Russian front and lapping round both its flanks, Oku won an important and handsome victory, at a cost of 1,200 men out of 35,000 engaged, while the Russians, with a loss of at least 3,600 out of about 25,000 engaged, retired in disorder. Thus swiftly and disastrously ended the southern expedition. Meantime, except for the movement on Siu-yen already mentioned¹, and various reconnaissances in force by Keller's main body and by Rennenkampf's Cossacks farther inland, all was quiet along the Motienling front. Kuroki entrenched himself carefully about Fêng-hwang-chêng, intending, if attacked by the Russian main army, to defend to the last extremity the ground and the prestige gained on May 1.

From this point to the culmination of the advance at Liao-Yang, the situation of the Japanese closely resembles that of the Prussians in 1866. Haicheng represents Münchengrätz, Liao-Yang Gitschin, and the passes east of Liao-Yang Nachod and Trautenau. The concentration of the various Japanese armies on one battlefield was to be made, not along the circumference of the long arc they occupied, but towards the centre. Similarly, Kuropatkin was in the position of Benedek. He possessed the interior lines and the central reserve which enables interior lines to be utilized, and a stroke of good fortune prolonged the period in which he could command the situation, for on June 23 an unexpected sortie of the Russian Port Arthur squadron paralysed the Japanese land offensive. In the squadron were seen the battle-ships damaged in the February attacks, and the balance of force was now against Togo, who had lost the "Yashima" and the "Hatsuse." The squadron nevertheless, tamely returned to harbour, Togo resumed the blockade and Nogi began his advance from Nanshan, but the 2nd and 4th Armies came to a standstill at once (naval escort for their seaborne supplies being no longer available), and the 1st Army, whose turn to advance had just arrived, only pushed about a few miles to cover a larger supply area. On July 1 the Vladivostok squadron appeared in the Tsushima straits, and then vanished to an unknown destination, and whether this intensified the anxiety of the Japanese or not, it is the fact that the 2nd Army halted for 21 days at Kaiping, bringing the next on its right, 4th Army, to a standstill likewise. Its next advance brought it to the fortified position of Tashichiao, where Kuropatkin had, by drawing heavily upon his central reserve and even on the eastern detachment, massed about two army corps.

Tashichiao.—On the 24th Oku attacked, but the Russian general, Zarubayev, handled his troops very skillfully, and the Japanese were repulsed with a loss of 1,200 men. Zarubayev, who had used only about half his forces in the battle, nevertheless retired in the night, fearing to be cut off by a descent of the approaching 4th Army on Haicheng, and well content to have broken the spell of defeat. Oku renewed the attack next day, but found only a rearguard in front of him, and without following up the retiring Russians he again halted for six days before proceeding to Haicheng to effect a junction with the 4th Army (Nozu), which meantime had won a number of minor actions and forced the passage of the mountains at Fenshuiling South².

The 1st Army, after its long halt at Fêng-hwang-chêng, which was employed in minutely organizing the supply service—a task of exceptional difficulty in these roadless mountains—reopened the campaign on June 24, but only tentatively on account of the discouraging news from Port Arthur. A tremendous rainstorm imposed further delays, for the coolies and the native transport that had been laboriously collected scattered in all directions. The Motienling pass, however, had been seized without difficulty, and Keller's power of counter-attack had been reduced to nothing by the dispatch of most of his forces to the concentration at Tashichiao. But Oku's 2nd Army was now at a standstill at Kaiping, and until he was further advanced the 1st Army could not press forward. The captured passes were therefore fortified (as Fêng-

hwang-chêng had been) for passive resistance. This, and the movements of the 4th Army, which had set its face towards Haicheng and no longer seemed to be part of a threat on Liao-Yang, led to the idea being entertained at Kuropatkin's headquarters that the centre of gravity was shifting to the south. To clear up the situation Keller's force was augmented and ordered to attack Kuroki. It was repulsed with a loss of nearly 1,000 men in the action at the Motienling (July 17), but it was at least ascertained that considerable forces were still on the Japanese right, and upon the arrival of a fresh army corps from Europe, Kuropatkin announced his intention of attacking Kuroki. And in effect he succeeded in concentrating the equivalent of an army corps, in addition to Keller's force, opposite to Kuroki's right. But having secured this advantage he stood still for five days, and Kuroki had ample time to make his arrangements. The Japanese general occupied some 20m. of front in two halves, separated by 6m. of impassable mountain, and knowing well the danger of a "cordon" defensive, he met the crisis in another and a bolder fashion. Calling in the brigade detached to the assistance of Nozu as well as all other available fractions of his scattered army, he himself attacked on July 31 all along the line. It was little more than an assertion of his will to conquer, but it was effectual. On his left wing the attacks of the Guard and 2nd Divisions (action of Yang-tzu-ling) on the Russian front and flank failed—the frontal attack because of the resolute defence, the flank attack from sheer fatigue of the troops. Count Keller was killed in the defence. Meantime on the Japanese right the 12th Division attacked the large bodies of troops that Kuropatkin had massed (Yu-shu-ling) equally in vain. But one marked success was achieved by the Japanese. The Russian 35th and 36th Regiments (10th European Corps) were caught between two advancing columns, and, thanks to the initiative of one of the column leaders, Okasaki, destroyed. At night, discouraged on each wing by the fall of Count Keller and the fate of the 35th and 36th, the whole Russian force retired on Anping, with a loss of 2,400 to the Japanese 1,000 men.

Russian Retirement on Liao-Yang.—This was the only manifestation of the offensive spirit on Kuropatkin's part during the six months of marking time. It was for defence, sometimes partial and elastic, sometimes rigid and "at-all-costs," that he had made his dispositions throughout. His policy now was to retire on Liao-Yang as slowly as possible and to defend himself in a series of concentric prepared positions. In his orders for the battle around his stronghold there is no word of counter-attack, and his central mass, the special weapon of the commander-in-chief, he gave over to Biderling and to Zarubayev to strengthen the defence in their respective sections or posted for the protection of his line of retreat. Nevertheless he had every intention of delivering a heavy and decisive counterstroke when the right moment should come, and meantime his defensive tactics would certainly have full play on this prearranged battlefield with its elaborate redoubts, bomb-proofs and obstacles, and its garrison of a strength obviously equal (and in reality superior) to that of the assailants. The Japanese, too, had effected their object, and as they converged on their objective the inner flanks of the three armies had connected and the supreme commander Marshal Oyama had taken command of the whole. But instead of boldly pushing out the 1st Army to such a distance that it could manoeuvre, as Molke did in 1866 and 1870, he attached it to the general line of battle. It was not in two or three powerful groups but in one long chain of seven deployed divisions that the advance was made.

Battle of Liao-Yang.—On Aug. 25 the 2nd and 4th Armies from Haicheng and the 1st Army from the Yin-tsu-ling and Yu-shu-ling began the last stage of their convergent advance. The Russian first position extended in a semicircle from Anshantien (on the Liao-Yang-Hai-cheng railway) into the hills at Anping, and thence to the Taitse river above Liao-Yang; both sides had mixed detachments farther out on the flanks. The first step in the Japanese plan was the advance of Kuroki's army to Anping. Throughout the 25th, night of the 25th-26th, and the 26th of August, Kuroki advanced, fighting heavily all along the line, until on the night of the 26th the defenders gave up the contested ground at Anping. Hitherto there had only been skirmishing on a

¹The occupation of Siu-yen was chiefly the work of the brigade pushed out to his left by Kuroki. Only a portion of the 10th Division from Takushan helped to drive away Mishchenko's Cossacks.

²The 5th Division of the 2nd Army had been sent to join the 10th as the latter approached Hsinmüchong. The Guard brigade of Kuroki's army which had served with Nozu in the advance had now returned to Fêng-hwang chêng.

large scale on the side of Hai-cheng. Kuropatkin having already drawn in his line of defence on the south side towards Liao-Yang, the 2nd and 4th Japanese Armies delivered what was practically a blow in the air. But on the 27th there was a marked change in the Japanese plan. The right of the 1st Army, when about to continue the advance west on Liao-Yang, was diverted northward by Oyama's orders and ordered to prepare to cross the Taitseho. The retirement of the Russian southern force into its entrenchments emboldened the Japanese commander-in-chief to imitate Moltke's method to the full. On the 28th, however, the 1st Army made scarcely any progress. The right (12th) division reached the upper Taitseho, but the divisions that were to come up on its left were held fast by their opponents. The 29th was an uneventful day, on which both sides prepared for the next phase.

The Russians' semicircle, now contracted, rested on the Taitseho above and below the town, and their forces were massed most closely on either side of the "Mandarin" road that the 1st Army had followed. Opposite this portion of the line was the Guard and the 4th Army. Oku was astride the railway, Kuroki extending towards his proposed crossing-points just beyond Kuropatkin's extreme left (the latter was behind the river). On the 30th the attack was renewed. The Guard, the 4th Army and the 2nd Army were completely repulsed.

On the night of the 30th the first Japanese troops crossed the Taitseho near Lien-Tao-Wun, and during the 31st three brigades were deployed north of Kwan-tun, facing west. The Russian left wing observed the movement all day, and within its limited local resources made dispositions to meet it. Kuropatkin's opportunity was now come. The remainder of the Japanese and Division was following the 12th, leaving a nine-mile gap between Kuroki and Nozu, as well as the river. It was not into this gap, but upon the isolated divisions of the 1st Army that the Russian general proposed to launch his counterstroke. Reorganizing his southern defences on a shorter front, so as to regain possession of the reserves he had so liberally given away to his subordinates, he began to collect large bodies of troops opposite Kuroki, while Stakelberg and Zarubayev, before withdrawing silently into the lines or rather the fortress of Liao-Yang, again repulsed Oku's determined attacks on the south side. But it was not in confidence of victory that Kuropatkin began the execution of the new plan—rather as a desperate expedient to avoid being cut off by the 1st Army, whose strength he greatly overestimated.

On the morning of Sept. 1—the anniversary of Sedan, as the Japanese officers told their men—Oyama, whose intentions the active Kuroki had somewhat outrun, delivered a last attack with the 2nd and 4th Armies and the Guard on the south front, in the hope of keeping the main body of the Russians occupied and so assisting Kuroki, but the assailants encountered no resistance, Zarubayev having already retired into the fortress. North of the Taitseho the crisis was approaching. Kuroki's left, near the river, vigorously attacked a hill called Manjuyama which formed part of the line of defence of the 17th Corps from Europe. But the right of the 1st Army (12th Division) was threatened by the gathering storm of the counterstroke from the side of Ventai mines, and had it not been that the resolute Okasaki continued the attack on Manjuyama alone the Japanese offensive would have come to a standstill. Manjuyama, thanks to the courage of the army commander and of a single brigadier, was at last carried after nightfall, and the dislodged Russians made two counter-attacks in the dark before they would acknowledge themselves beaten. Next morning, when Kuroki (who had conceived the mistaken idea of a general retreat of the Russians on Mukden) was preparing to pursue, the storm broke. Kuropatkin had drawn together seven divisions on the left rear of the 17th Corps, the strength of the whole being about 90,000. On the extreme left was Orlov's brigade of all arms at Ventai mines, then came the 1st Siberian Corps (Stakelberg), the 10th Corps, and finally the 17th. But Orlov, perplexed by conflicting instructions and caught in an unfavourable situation by a brigade of the 12th Division which was executing the proposed "pursuit," gave way—part of his force in actual rout—and the cavalry that was with him was driven back by the Kobi (reserve army) brigade of the Guard. The fugitives

of Orlov's command disordered the on-coming corps of Stakelberg, and the outer flank of the great counterstroke that was to have rolled up Kuroki's thin line came to an entire standstill. Meantime the 10th Corps furiously attacked Okasaki on the Manjuyama, and though its first assault drove in a portion of Okasaki's line, a second and a third, made in the night, failed to shake the constancy of the 15th Brigade. Misunderstandings and movements at cross-purposes multiplied on the Russian side, and at midnight Kuropatkin at last obtained information of events on the side of Ventai mines. This was to the effect that Orlov was routed, Stakelberg's command much shaken, and at the same time Zarubayev in Liao-Yang, upon whom Oku and Nozu had pressed a last furious attack, reported that he had only a handful of troops still in reserve. Then Kuropatkin's resolution collapsed, although about three divisions were still intact, and he gave the order to retreat on Mukden.

Russian Retreat on Mukden.—Thus the Japanese had won their great victory with inferior forces, thanks "in the first instance to the defeat of Gen. Orlov. But at least as large a share in the ruin of the Russian operations must be attributed to the steadfast gallantry of the 15th Brigade on Manjuyama." The losses of the Japanese totalled 23,000, those of the Russians 19,000. Coming, as it did, at a moment when the first attacks on Port Arthur had been repulsed with heavy losses, this successful climax of the four months' campaign more than restored the balance. But it was not the expected Sedan. Had the two divisions still kept in Japan been present Kuroki would have had the balance of force on his side, the Russian retreat would have been confused, if not actually a rout, and the war might have been ended on Japan's own terms. As it was, Kuropatkin drew off the whole of his forces in safety, sharply repulsing an attempt at pursuit made by part of the 12th Division on Sept. 4. The railway still delivered 30,000 men a month at Mukden, and Japan had for a time outrun her resources. At St. Petersburg the talk was not of peace but of victory, and after a period of reorganization the Russians advanced afresh to a new trial of strength. But the remainder of the Manchurian campaign proved little more than a series of violent and resultless encounters of huge armies—armies far larger than those which had fought out the real struggle for supremacy at Liao-Yang.

Naval Actions.—At this time the siege of Port Arthur had progressed only so far that the besiegers were able to realize the difficulties before them. Their exertions and sacrifices were not crowned with success until the year had run its full course, and meantime the repeated frustration of their hopes had a moral reaction on the main struggle in Manchuria, apart from keeping one of their armies away from the decisive theatre. At sea, however, the Japanese navy scored two important successes. After months of blockade and minor fighting, the Russian Port Arthur squadron had been brought to action on Aug. 10. Admiral Vitheft, Makárov's successor, had put to sea shortly after the appearance of the 3rd Army on the land front of Port Arthur. The battle opened about noon, 20m. south of the harbour; the forces engaged on each side varied somewhat, but Togo finally had a superiority. As the Russians became gradually weaker, the Japanese closed in to within 3m. range, and Prince Ukhomsky (who succeeded to the command on Vitheft being killed) gave up the struggle at nightfall. The Russians scattered, some vessels heading southward, the majority with the admiral making for Port Arthur, whence they did not again emerge. All the rest were either forced into neutral ports (where they were interned) or destroyed, among the latter being the third-class cruiser "Novik," which had already earned a brilliant reputation for daring, and now steamed half round Japan before she was brought to action and run ashore. The victors blockaded Port Arthur, until near the close of the siege when, after going ashore and examining the remnant of the Russian fleet from 203-Metre hill, Togo concluded that it would be safe to return to Japan and give his ships a complete refit. Kaimura's squadrons, after various adventures, at last succeeded on Aug. 14 in engaging and defeating the Russian Vladivostok squadron (Admiral Jessen). Thus the Russian flag disappeared from the Pacific, and thenceforward only the Baltic

fleet could hope seriously to challenge the supremacy of the Japanese navy.

The remainder of the war on land, although it included two battles on a large scale and numerous minor operations, was principally a test of endurance. After Liao-Yang there were no widely extended operations, the area of conflict being confined to the plain of the coast side of the Hun-ho and the fringe of the mountains. Japan had partially accomplished her task, but had employed all her trained men in this partial accomplishment. It was questionable, even in Oct. 1904, whether she could endure the drain of men and money if it were prolonged much further. On the other hand, in Russia opposition to the war, which had never been popular, gradually became the central feature of a widespread movement against irresponsible government. Thus, while the armies in Manchuria faced one another with every appearance of confidence, behind them the situation was exceedingly grave for both parties. A state of equilibrium was established, only momentarily disturbed by Kuropatkin's offensive on the Sha-ho in October, and by the Sandepu incident in the winter, until at last Oyama fought a battle on a grand scale and won it. Even then, however, the results fell far short of anticipation, and the armies settled down into equilibrium again.

Battle of the Sha-ho.—After the battle of Liao-Yang Kuropatkin reverted for a moment to the plan of a concentration to the rear at Tieling. Politically, however, it was important to hold Mukden, the Manchurian capital, and as the Japanese, as on previous occasions, reorganized instead of pursuing, he decided to stand his ground, a resolution which had an excellent effect on his army. Moreover, growing in strength day by day, and aware that the Japanese had outrun their powers, he resolved, in spite of the despondency of many of his senior officers, to take the offensive. He disposed of about 200,000 men, the Japanese had about 170,000. The latter lay entrenched north of Liao-Yang, from a point gm. west of the railway, through Yental station and Yental mines, to the hills farther east. There had been a good deal of rain, and the ground was heavy. Kuropatkin's intention was to work round the Japanese right on the hills with his eastern wing (Stakelberg), to move his western wing (Bilderling) slowly southwards, entrenching each strip of ground gained, and finally with the centre—i.e., Bilderling's left—and Stakelberg, to envelop and crush the 1st Army, which formed the Japanese right, keeping the 4th Army (Nozu) and the 2nd Army (Oku) fixed by means of Bilderling's main body. The manoeuvre began on Oct. 5, and by the evening of the 10th, after four days of advanced-guard fighting, Stakelberg was in his assigned position in the mountainous country, facing west towards Liao-Yang, with his left on the Taitszeho. The advance of Bilderling, however, necessarily methodical and slow in any case, had taken more time than was anticipated. Still, Bilderling crossed the Sha-ho and made some progress towards Yental, and the demonstration was so far effectual that Kuroki's warnings were almost disregarded by the Japanese headquarters. The commander of the 1st Army, however, took his measures well, and Stakelberg found the greatest trouble in deploying his forces for action in this difficult country. Oyama became convinced of the truth on the 9th and 10th, and prepared a great counterattack. Kuroki, with only a portion of the 1st Army, was left to defend at least 15m. of front, and the entire 2nd and 4th Armies and the general reserves were to be thrown upon Bilderling. On the 11th the real battle opened. Kuroki displayed the greatest skill, but he was of course pressed back by the four-to-one superiority of the Russians. Still the result of Stakelberg's attack, for which he was unable to deploy his whole force, was disappointing, but the main Japanese attack on Bilderling was not much more satisfactory, for the Russians had entrenched every step of their previous advance and fought splendidly. The Russian commander-in-chief states in his work on the war that Bilderling became engaged *à fond* instead of gradually withdrawing as Kuropatkin intended, and at any rate it is unquestioned that in consequence of the serious position of affairs on the western wing, not only did Stakelberg use his reserves to support Bilderling, when the 12th Division of Kuroki's army was almost at its last gasp and must have yielded to fresh

pressure, but Kuropatkin himself suspended the general offensive on Oct. 13. In the fighting of Oct. 13-16 the Russians gradually gave back as far as the line of Sha-ho, the Japanese following until the armies faced roughly north and south on parallel fronts. The fighting, irregular but severe, continued. Kuropatkin was so far averse to retreat that he ordered a new offensive, which had fair success on the 16th-17th. Kuropatkin wished to continue the offensive, but his corps commanders offered so much opposition to a further offensive that he at last gave up the idea. The positions of the rival armies from Oct. 18, the close of the battle of the Sha-ho, to Jan. 26, 1905, the opening of the battle of Sandepu (Heikoutai)—a period almost entirely devoid of incident—may be described by the old-fashioned term "winter quarters."

In Jan. 1905 the Russians, 300,000 strong, were now organized in three armies, commanded by Generals Linievich, Gripenberg and Kaulbars; the total strength of the Japanese 1st, 2nd and 4th Armies and reserve was estimated by the Russians at 220,000. Towards the end of January Kuropatkin took the offensive. He wished to inflict a severe blow before the enemy could be reinforced by the late besiegers of Port Arthur, and sent Gripenberg with seven divisions against Oku's two on the Japanese left. The battle of Sandepu (Heikoutai), fought in a terrible snow-storm on Jan. 26 and 27, 1905, came near to being a great Russian victory. But after two days' severe fighting, although Gripenberg had not been checked, Kuropatkin, in face of a counterattack by Oyama, decided to abandon the attempt.

Battle of Mukden.—Both sides stood fast in the old positions up to the verge of the last and greatest battle. Kuropatkin was reinforced, and appointed Kaulbars to succeed Gripenberg and Bilderling to the command of the 3rd Army vacated by Kaulbars. On the other hand, Nogai's 3rd Army, released by the fall of Port Arthur, was brought up on the Japanese left, and a new army under Kawamura (5th), formed of one of the Port Arthur and two reserve divisions, was working from the upper Yalu through the mountains towards the Russian left rear. The Russian line covering Mukden was 47m. long, the armies from right to left being 2nd (Kaulbars), 3rd (Bilderling) and 1st (Linievich); a general reserve was at Mukden. On the other side from left to right, on a line 40m. long, were Oku (2nd Army), Nozu (4th), Kuroki (1st) and Kawamura (5th), the general reserve in rear of the centre at Yental and the 3rd Army in rear of Oku. Each side had about 310,000 men present. The entire front of both armies was heavily entrenched. The Russians had another offensive in contemplation when the Japanese forestalled them by advancing on Feb. 21. The 5th Army gradually drove in Kuropatkin's small detachments in the mountains, and came up in line with Kuroki, threatening to envelop the Russian left. The events on this side and misleading information induced Kuropatkin to pay particular attention to his left. The Japanese 1st and 5th Armies were now engaged (Feb. 25), and elsewhere all was quiet. But on the 27th the fighting spread to the centre, and Nogai (originally behind Oku) was on the march to envelop the Russian right. He was held under observation throughout by Russian cavalry, but it seems that little attention was paid to their reports by Kuropatkin, who was still occupied with Kuroki and Kawamura, and even denuded his right of its reserves to reinforce his left. With a battle-front exceeding two days' marches the wrong distribution of reserves by both sides was a grave misfortune. Kuropatkin was at last convinced, on Feb. 28, of the danger from the west, and did all in his power to form a solid line of defence on the west side of Mukden. Nogai's first attack (March 1-2) had not much success, and a heavy counterstroke was delivered on the 2nd. Fighting for localities and alterations in the interior distribution of the opposing forces occupied much time, and by the 3rd, though the battle had become severe, Kuropatkin had merely drawn in his right and right centre (now facing west and south-west respectively) a little nearer Mukden. His centre on the Sha-ho held firm, Kuroki and Kawamura made but slight progress against his left in the mountains. Nogai and Oyama were equally impressed with the strength of the new (west) Russian front, and, like Grant at Petersburg in 1864,

extended farther and farther to the outer flank, the Russians following suit. The Japanese marshal now sent up his army reserve, which had been kept far to the rear at Ventai, to help Nogi. It was not before the evening of March 6 that it came up with the 3rd Army and was placed in position opposite the centre of the Russian west front. On the rest of the line severe local fighting had continued, but the Russian positions were quite unshaken and Kuropatkin's reserves—which would have been invaluable in backing up the counter-attack of March 2—had belatedly returned to face Nogi. He had organized another counterstroke for the 6th, to be led by Kaulbars, but this collapsed unexpectedly after a brief but severe fight.

Russian Retreat on Tieling.—Kuropatkin now decided to draw in his centre and left towards Mukden. On the 7th, the various columns executed their movement to the Hun-ho with complete success, thanks to good staff work. The Japanese followed up only slowly. Nogi and Kaulbars stood fast, facing each other on the west front; after the arrival of the general reserve, Nogi was able to prolong his line to the north and eventually to bend it inwards towards the Russian line of retreat. On the 8th the fighting between Nogi and Kaulbars was very severe, and Kuropatkin now made up his mind to retreat towards Tieling. On the 9th, by Oyama's orders, Nogi extended northward instead of further swinging in south-eastward, Oku now occupied all the original line of the 3rd Army, Nogi alone was left on the south front, and Kuroki and Kawamura began to engage Linievich seriously. But Nogi had not yet reached the Mukden-Tieling railway when, on the night of the 9th, every preparation having been made, Kuropatkin's retreat began. On the 10th, covered by Kaulbars, who held off Nogi, and by strong rearguards at and east of Mukden, the movement continued, and though confusion was prevalent and the rearguards suffered very heavily, the Russians managed to draw off in safety to the northward. On the evening of the 10th, after all their long and hardly contested enveloping marches, Nogi's left and Kawamura's right met north of Mukden. The circle was complete, but there were no Russians in the centre, and a map of the positions of the Japanese on the evening of the 10th shows the 17 divisions thoroughly mixed up and pointing in every direction but that of the enemy. Thus the further pursuit of the Russians could be undertaken only after an interval of reorganization by the northernmost troops of the 5th and 3rd Armies. But the material loss inflicted on the Russians was far heavier than it had ever been before. It is generally estimated that the Russian losses were no less than 97,000, and the Japanese between 40,000 and 50,000. Japan had had to put forth her supreme effort for the battle, while of Russia's whole strength not one-tenth had been used. But Russia's strength in Europe, with but one line whereby it could be brought to bear in the Far East, was immaterial, and on the theatre of war a quarter of the Russian field forces had been killed, wounded or taken.

Rozhstvenski's Voyage.—It remains to narrate briefly the tragic career of the Russian Baltic fleet. Leaving Libau on Oct. 13-15, 1904, the fleet steamed down the North sea, expecting every night to be attacked by torpedo-boats. On the 21st, in their excitement, they opened fire on a fleet of British trawlers on the Dogger Bank (*q.v.*), and several fishermen were killed. This incident provoked the wildest indignation, and threatened for some days to bring Russia into conflict with England. A British fleet "shadowed" Rozhstvenski for some time, but eventually the Russians were allowed to proceed. On reaching Madagascar, Rozhstvenski heard of the fall of Port Arthur, and the question of returning to Russia arose. But a reinforcement under Rear-Admiral Nebogatov was despatched from the Baltic via Suez early in March 1905, and the armada proceeded by the Straits of Malacca, Nebogatov joining at Kamranh bay in Cochin China. The united fleet was formidable rather in number than in quality; the battleships were of very unequal value, and the faster vessels were tied to the movements of many "lame ducks." Rozhstvenski had, moreover, numerous store-ships, colliers, etc. Nevertheless, the Japanese viewed his approach with considerable anxiety, and braced themselves for a final struggle. Of the vari-

ous courses open to him, Togo prudently chose that of awaiting Rozhstvenski in home waters. The Russians left Kamranh on May 14, and for a time disappeared into the Pacific. It was assumed that they were making for Vladivostok either via Tushima strait or by the Pacific. Rozhstvenski chose the former course, and on May 27 the fleets met near Tushima. By superior speed and handling the Japanese gained an increasing advantage, and by the following day the whole Russian fleet, with few exceptions, had been captured or sunk. (See TSUSHIMA for battle.)

The Peace of Portsmouth.—After the disasters of Mukden and Tushima, and being threatened with internal disorder in European Russia, the tsar, early in June, accepted the mediation of the president of the United States, and *pourparlers* were set on foot. The war, meanwhile, drifted on through May, June and July. Linievich, who succeeded Kuropatkin shortly after the battle of Mukden, retired slowly northward, reorganizing his forces and receiving fresh reinforcements from Europe. A Japanese expedition occupied Sakhalin (July 8-30), and another, under General Hasegawa, advanced through Korea towards Vladivostok. But the fighting was desultory. The peace negotiations were opened at Portsmouth (N.H.), on Aug. 9, and by the end of the month the belligerents had agreed as to the main points at issue—that Russia should cede the half of Sakhalin, annexed in 1875, surrender her lease of the Kwantung peninsula and Port Arthur, evacuate Manchuria, and recognize Japan's sphere of influence in Korea. The treaty of peace was signed on Aug. 23, 1905.

BIBLIOGRAPHY.—Among the first-hand narratives the most important are: Ian Hamilton, *A Staff Officer's Scrap Book*; and the *British Officers' Reports*, War Office, 1908. Also *Reports of Military Observers*, General Staff U.S.A.; Major v. Tettau's *18 Monate beim Heere Russlands*; von Schwarz, *Zehn Monate beim Heere Kuropatkins*, and Kuropatkin's own work (part of which has been translated into English). Of detailed military histories the principal are the semi-official series of narratives and monographs produced by the Austrian military journal "Strenge" (*Einzelhefte über den russ.-japanischen Krieg*); the volumes of lectures delivered at the Russian staff college after translation (*Contes de la guerre russo-japonaise faite à l'Académie Nicolas*); British official *History of the Russo-Japanese War*; German official *Russisch-japanischer Krieg* (Eng. trans. by K. von Donat); Löffler, *Der russisch-japanische Krieg* (Leipzig, 1907; French trans.); L. Gianni Trapani, *La Guerra russo-japonaise* (1908); E. Bujac, *La Guerre russo-japonaise* (1909). Of critical studies one of the most important is Culmann, *Étude sur les caractères généraux de la guerre en extrême-orient* (1903). One naval narrative of absorbing interest has appeared, *Semenov's Rasplata* (Eng. trans.).

RUSSO-POLISH CAMPAIGN. This campaign, of 1920, which resulted in the defeat and rout of the Soviet Army when it was within sight of the Polish capital, is full of dramatic incident. Organization of command, staff and administration was lacking on both sides, but above all it was the want of a proper system of supply which accounted for the sudden collapse of troops engaged in a victorious advance. The thinly populated territory lying between the Niemen in the north and the Dniester in the south was incapable of supporting large bodies of troops, and as both sides attempted to live on the country during their advances the failure of their operations followed quickly each success.

Cause of the War.—During the course of 1919 and early 1920, the Soviet Government had succeeded in clearing their territory of the White Russian armies under Kolchak, Denikin and Yudenich. They were thus at liberty to examine the situation on their frontiers. With such a mixture of races living side by side in the disputed regions no delimitation of frontier would have suited all parties, and in the absence of authority to enforce a decision, trouble quickly arose between the Soviet and the newly formed Polish State. Poland was determined to maintain her new liberty and had called up fresh levies to support the various legions which had been repatriated from the fronts upon which they had been fighting in the World War. The Soviet began to concentrate their troops towards the west. Inflammatory speeches in Moscow and a fierce propaganda amongst the Polish working people brought Polish public opinion to a fever heat. From seven divisions in January the Soviet had, by March, increased the number of their

troops facing the Poles to 20 divisions, with three cavalry divisions. Poland decided that she could not wait quietly for the inevitable Soviet attack by which she would certainly be destroyed, and that she must act at once.

Polish Offensive.—Strategically, the territory in dispute may be divided into two separate areas: White Russia in the north and Volhynia and Podolia in the south. The marshes of the Pripyet divide one area from the other. Acting in collusion with Petlura, the Hetman of the Ukraine, who had promised to raise his country against the Soviet, the Poles advanced in April as far as Kiev. By the beginning of May the Polish-Soviet front ran from Dvinsk in the north along the course of the Dnieper to Kiev and thence to the Dniester near Kamienets. No sooner were the Poles established in Kiev than the Soviet northern army began to advance. The Poles were able to transfer troops from the south and counter-attacked the Soviet forces which had already penetrated as far west as Lida and Baranowicz. By the end of May the line held at the beginning of the month had been restored. Operations had been most ably carried out by the Polish minister of war, Gen. Sosnkowski, but there were indications that the Soviet were transferring more and more troops to the west and that a renewal of their attacks might be expected.

At the beginning of June, in the southern area there appeared a new Soviet cavalry leader, Budenny, who completely altered the situation. Budenny had been a non-commissioned officer in the old Russian Army and soon proved himself a man of action. Within a month he had driven back the Poles a distance of 200m. until their line in the south ran just east of Pinsk and Równe (Rovno) to the junction of the Dniester and Siret (Sereth).

Russian Success.—Fighting in the northern area continued intermittently during the month of June, preventing the Poles from transferring troops to the hard-pressed south. Despite the operations in the south it was clear that the main Soviet attack was coming in the north. On July 4 the blow fell. The whole Polish line gave way. Wilno (Vilna) and Minsk were lost in the first week. Grodno fell on July 20 and Bialystok on July 25. By the end of July the Soviet advance guards had reached the Bug. In 25 days the Poles had lost 300m. of territory. The main cause of the collapse was their failure to constitute reserves. In their desire to protect their new territory they had been led into a linear defence on a front of nearly 800m., where they were strong nowhere.

Disposition of Troops.—The Polish situation was now critical. With the help of the French military mission, under Gen. Weygand, a plan for a great counter-attack was evolved on Aug. 6. The situation of the opposing sides on that date was as follows:—

Soviet: (1) Northern group. Four armies—4th, 15th, 3rd and 16th, with a cavalry corps on the extreme north aiming to outflank the Polish left.

(2) Southern group. Two armies—12th and 14th with Budenny's cavalry, along a line from Kowel through Brody to Tarnopol. The men of the Soviet army were unfed and worn out with a month's marching.

Poles: (1) A Northern group formed of units which had been retreating for over a month, strengthened by reinforcements thrown in hastily as they came up. Much material had been lost and the men were tired and hungry, but the approach to the line of the Vistula was beginning to simplify the supply of food and munitions.

(2) Southern group. Three armies—6th, 3rd and 4th—facing the Soviet southern group. Here pressure from the enemy had been by no means so severe as in the north and many of the divisions still retained their original fighting value.

Polish Plan of Attack.—The Polish plan was to withdraw all but a minimum of force from the southern area and to attack the Soviet northern group with the greatest possible strength. The operation bears a close resemblance to Ludendorff's manoeuvre at Tannenberg. In many respects the situation was similar. The Russians were advancing in two main groups divided by the Pripyet marshes instead of the Masurian lakes. Here the Soviet southern group was advancing slowly like Rennenkampf's army in 1914. The situation would become critical as

soon as the two Soviet groups converged upon the Polish Army. No time was to be lost. Would the commander of the Soviet armies in the south allow himself to be deceived in the same manner as Rennenkampf?

On August 6 orders for the following fresh groupings were issued from Polish headquarters:—

(1) Three armies—2nd, 1st and 5th—under Gen. Joseph Haller, were to withdraw slowly to the line of the Vistula from Dęblin to Modlin, with the 5th Army pushed well forward on the left to prevent any outflanking of the Polish left between Warsaw and the East Prussian frontier.

(2) Two armies, 3rd and 4th—were to concentrate behind the Wieprz between Chełm and Dęblin, ready to strike due north; the advance of these two armies to commence on Aug. 16.

(3) One army, 6th—would withdraw as necessity arose in the direction of Lemberg, tempting the Soviet southern group away from the critical point in the north.

By Aug. 12 all the armies, with the exception of the two on each flank, had reached their assigned positions without incident. In the south the 3rd had found the 12th Soviet army advancing and had been forced to throw out a detachment on its right flank to cover its concentration. It had been delayed in consequence.

In the north, the 5th had been driven back by overwhelming strength and had been unable to prevent the enemy outflanking movement.

Enthusiasm in the Polish army had risen surprisingly in the days since the momentous decision to attack had been taken. The chief of the Polish State, Marshal Piłsudski, had himself taken command of the 3rd and 4th Armies. With the help of Weygand and his staff the service of supply had been restored. New bodies of reinforcements were moved forward from the depôts in Western Poland and the depleted units began to raise their heads again. National optimism returned. The enemy in the south made no determined move and appeared to have no inkling of what was afoot. Every hour that he delayed meant more chance of success for the Polish plan.

Polish Advance.—Gen. Sikorski's 5th Army in the north was the first to move. The Soviet movement round his left had assumed alarming proportions and had to be stopped. On Aug. 14 he pressed forward from his defensive position at Modlin and at once encountered the Soviet 15th Army advancing to the attack. Sikorski persisted in his attacks all through Aug. 15 and 16, his men fighting with determination. Not even the appearance of elements of the Soviet 4th Army in his left rear turned him from his purpose. Throwing out covering detachments to watch his rear, he attacked again on Aug. 17. His determination reaped its reward, for the enemy gave way in front of him, their retreat rapidly developing into a rout.

In the south Piłsudski's armies made good progress. The blow against the left of the Soviet 16th Army came as a complete surprise and they offered little resistance. During Aug. 16 and 17 the Poles covered over 50 miles. By Aug. 18 the 3rd Soviet Army, which lay between the 15th destroyed by Sikorski, and the 16th broken by Piłsudski, turned also in hopeless confusion.

On the extreme Soviet right the 4th Army, containing some of the picked Communist regiments, together with the cavalry corps, had reached the Vistula between Toruń and Płock in their great turning movement when Sikorski suddenly advanced. Had they advanced resolutely even then, all might have been well, but they hesitated and were lost. Their half-hearted attacks against Sikorski's left had little effect. It was not till Aug. 20 that the order for a general retreat reached them. On Aug. 22, at Miawa, and Aug. 23 at Chorzów they were successful in cutting themselves a passage, but on Aug. 24 at Kowno they ran up against Piłsudski's 4th Army blocking the way. Almost without making an effort to attack they passed ignominiously over the East Prussian border to internment.

The pace of the Polish pursuit was remarkable. From Aug. 16 to Aug. 25 the advanced units of the 2nd army had covered 200m. as the crow flies. The 4th Army averaged 25m. a day in their advance. The service of supply was left far behind. The troops existed as they could upon the exhausted country. Luckily

the Soviet resistance was so completely broken that there was no further fear of counter-attack and the Polish units had ample time in which to reorganize.

Conclusion.—The results of the battle of Warsaw, as it has been named, are only exceeded by those of Tannenberg. The Poles captured 70,000 prisoners, 200 guns and 1,000 machine-guns. From 50,000 to 100,000 Soviet troops passed over into East Prussia. The victory of the Poles was due to the adoption of a determined offensive based upon a sound plan. The raising of the morale of the beaten troops by the Polish authorities, roused to enthusiasm themselves by the inspiring presence of Gen. Weygand, is little short of miraculous. The crisis of the battle was undoubtedly Aug. 15-16, when Sikorski's 5th army cleared its front. If it was Pilsudski's force which completed the Soviet defeat, it was undoubtedly the magnificent fighting of Sikorski and his men which made victory possible.

RUSSO-TURKISH WARS. The Greek insurrection in 1824 gave England, France and Russia occasion to press demands upon Turkey, which the Porte refused to accede to, rejecting besides the London Protocol of July 1827. Hostilities broke out in Oct. 1827, when the allied fleet under Admiral Codrington defeated the Turkish fleet off Navarino. This victory greatly facilitated the eventual Russian operations against Turkey as the Russian army supported and provisioned by her own fleet could march along the coast by the shortest road to Adrianople and thence towards the Turkish capital.

Towards the end of April 1828 the Russian army consisting of three army corps stood between the Pruth-Dniester 69,000 strong, war having been formally declared on April 28. Turkey, whose army was being reorganized at the time, decided to resist the enemy in the quadrilateral, Ruschuk, Silistria, Varna and Shumla, for which purpose she assembled about 80,000 men. One corps of the invading army invested Braila, which was captured on June 17; another Russian corps crossed at the mouth of the Danube on June 17, while a third drove back the garrisons of Ruschuk and Widdin into these fortresses from which they had emerged. The first two Russian corps now advanced on Shumen but finding the Turks to be stronger than they supposed, they fell back on Yenibazar. A Russian force was thrown forward towards Varna but only on the arrival of the Russian guard corps could the idea be entertained of investing it. The siege began on Sept. 10 and a month later Varna surrendered. The Russians owing to numerical weakness retired into winter quarters in Moldavia and Wallachia, leaving two corps in the vicinity of Varna, Pravodi and Bazardjik. The fortress of Silistria was still in Turkish hands and it now became on the resumption of hostilities the principal Russian objective. Sizopol at the entrance to the harbour of Burgas was captured providing the Russians with a base for their operations south of the Danube. Silistria being invested fell on June 29. Meanwhile Reschid Pasha advanced from Shumla against Pravodi hoping to recapture Varna but was beaten off. General Diebitch, who had replaced Wittgenstein as Russian commander-in-chief, defeated Reschid Pasha at Tcherkovna on June 11. Diebitch now decided to advance south of the Balkans. Reschid attempted to hinder his march but was vanquished at Sliven on Aug. 12. Adrianople was entered Aug. 20, but as Diebitch had only 15,000 men and pestilence was ravaging his ranks he deemed it wiser to conclude a treaty in September before Turkey became aware of the state of his army. Success crowned the Russian arms in Asia, Paskevitch gaining two important victories on June 1 and 2 at Erivan, his advance coming to a close by terms of the treaty arranged in Europe. A conference held in London proclaimed the independence of Greece, Russia receiving the islands at the mouth of the Danube, while Moldavia and Wallachia were to be no longer provinces of Turkey, but only under her protectorate.

The War of 1877-78.—The oppression of the Christian subjects of the Sultan had made hostilities in 1877 between Turkey and Russia inevitable. After the Crimean War Turkey promised

to grant reforms, thereby bettering the treatment of the Christian population, but the following years brought no material change. In 1875 an insurrection broke out in Hercegovina and Montenegro, to be followed by Serbia openly taking up arms against Turkey. Russia, whose sympathies by reason of race and religion, were wholly on the side of the Slavs, could not remain a silent onlooker of the events in the Balkans. Russian volunteers flocked in great numbers to join the Serbians and General Chernyaff was entrusted with their command. Disparity of numbers however, went against the Serbians, the Turks gaining several successes, which culminated in their victory at Djunis on Oct. 29, 1876. Alexander II. then stepped forward and insisted on hostilities ceasing, to which Turkey hurriedly assented. A conference now assembled at Constantinople, but after months of deliberation, it failed to come to an agreement, Turkey taking advantage of the divergent views of the Great Powers. She became as time progressed less willing to make concessions. To prepare for all eventualities and to bring greater weight to her influence at the conference Russia mobilized six army corps in Nov. They consisted of the VII., VIII., IX., X., XI. and XII., corps and were concentrated on the southern frontier, on the Rumanian borders. Mobilization arrangements were not worked effectively nor the deployment of the forces. It must be borne in mind that conscription had been only enforced in Jan. 1874 and there was consequently a lack of well trained officers and reserves. Another great obstacle that hindered Russia from dealing a quick blow at Turkey was the lack of a fleet in the Black sea, though this restriction was removed in 1871. Knowing the unprepared state of the forces several experts, among them General Todleben, the world famous defender of Sevastopol in the Crimean War (*q.v.*), were opposed to Russia undertaking an active campaign, but the Pan-Slav movement which was general in Russia, forced the Tsar to declare war April 24. Having underrated her foe Russia began hostilities with insufficient forces, sending 257,000 men into Rumania and 70,000 each to the Caucasus and to the Austrian frontier. The Grand Duke Nicholas, the Tsar's brother, was in command of the forces and orders were instantly given to cross the Rumanian frontier; this state having proclaimed her independence of Turkey afforded every facility to the Russians to move their army to the Danube. Early in June the Russian army was assembled around Bucharest; it consisted of the VIII., IX. and XII. corps, with detachments thrown forward to the Danube. The XI. corps was guarding the region from the river Argis to the river Yalomniza, further east towards the Pruth stood the XIV. corps while the XIII. was expected by the middle of June and the IV. a month later. The Russian army was armed indifferently and tactically was ill trained, which was due to the men being unused to handling their new weapons. The Russian forces in the middle of June which intended crossing the Danube numbered 257,000 men, but one must deduct those guarding the railway line through Rumania.

The Turks numbered 135,000 men north of the Balkans who were distributed in the following manner: 80,000 in the quadrilateral, 23,000 around Vidin, 10,000 in Nicopol, 8,000 in Dobrudja, 3,000 in Tirmovo, 4,000 in Sistovo, 2,000 at Lom Palanka and 5,000 at Rahoff. Forty thousand men were grouped around Adrianople and Constantinople and some 80,000 in Bosnia, Montenegro and Epirus. The Turks besides disposed of another 120,000 men in Asia Minor.

Political and military reasons forced Turkey to remain on the defensive while Russia was bent on the swiftest possible offensive—bordering on rashness. Rumania having allowed the Russians to traverse her territory greatly aided their initial concentration towards the Danube. She was even prepared in the middle of June to join the Russians against the Turks with her force of 32,000 infantry and 5,000 cavalry, but the Russians, feeling certain of an easy victory, declined her proffered help. Two months later they were only too glad to avail themselves of this assistance which would have been of inestimable value in their first operations south of the Danube. To cross this river was their primary object, but this was impeded by the Turkish fleet which patrolled the Danube and prevented them bridging

it. The Russians by means of steam launches, batteries, mines and torpedoes drove the Turkish ironclads into Sulina harbour, one being destroyed, while the smaller vessels were obliged to seek refuge in Silistria and Ruschuk. Mines were laid across the Danube, bridging now being made possible. Hearing of the hostile approach, Abdul Kerim, the Turkish leader, decided not to make a resolute defence against the enemy crossing the Danube, but to attack him, when advancing to besiege Ruschuk and Shumla. The distribution of the Turkish troops remained little changed by the middle of June; the detachments guarding the Danube were generally too weak to offer any serious resistance to the invader.

The Russians began crossing the river in boats at Zimniza early on June 23 and the following day the VIII. corps was across, standing on the southern bank of the Danube. The same day a bridge 1,300 yards long was begun to be constructed at Nicopol, which was ready by July 1, a second one being ready by Aug. 1. The other Russian corps, the XII. and XIII., commanded by the Tsarevitch, having crossed the Danube moved to the Lom and Yantra facing Ruschuk with the object of laying siege to it while the IX. corps made for Nicopol. Gourko's advance guard entered Timova July 7, the VIII. corps following it five days later. The Grand Duke Nicholas wished to cross the Balkans with two corps while guarding his right flank with the IX. corps, and watching Ruschuk fortress with the XII. and XIII. corps, but Alexander II. would not sanction this, rightly considering this plan too risky. Gourko left Timova July 12 hearing the Shipka Pass was defended by only 3,000 men. He made for the Hainkiof Pass intending to turn the Shipka Pass (*q.v.*), while a Russian detachment attacked the Pass from the north. Gourko having been delayed 24 hours, was repulsed by the Turks when attacking the Pass; the same fate befell the Russians advancing north of Shipka. Nevertheless next day Gourko again pressed forward, when the Turks offered to negotiate terms of capitulation. While they were being drawn up the Turks evacuated all their positions and retreated to Philippopolis. Gourko's capture of Shipka gave the advantage to the Russians for a short time only, though he hastened to put it in a state of defence and it remained in their hands up to the end of the war. Alarmed by the incursion of the Russians, the Turks recalled Suleiman Pasha from Montenegro with his army 30,000 strong and having transported it by sea to the mouth of Maritza pushed it forward without delay on July 23 between Hermanli and Karabunar. After several engagements against greatly superior forces Gourko received orders Aug. 5 from the Headquarters to return north of the Balkans. The passes being deemed of great importance the Russians decided to defend them with the 9th Division, 4th Rifle Brigade and a Bulgarian contingent.

Meanwhile Nicopol fell July 27, the IX. corps capturing 8,000 men and it now received orders to advance to Plevna. General Krudener, its commander, detached one division under Schilder-Schuldner, which without any preliminary reconnaissance attacked the Turks July 20, only to be thrown back with heavy losses by Osman Pasha's much superior force, which had marched from Vidin unperceived by the Russians. Though the Rumanians had warned them of the hostile approach no serious attention was given by the Russian military authorities, for which they had to pay dearly. But even now the Russians thought this to be a momentary check and gave orders to make a fresh effort to capture Plevna, for which purpose they detailed 40,000 men. Osman Pasha had meanwhile entrenched himself round Plevna and had occupied Lovcha on the 26th, thereby securing the direct road to Sofia. The second attempt to capture the town, July 31, failed as the first and the Russians at last began to realize that their forces were inadequate to vanquish the enemy. The Tsar, by an Imperial Ukase called up the Guard and Grenadier Corps, 24th and 26th Infantry Divisions, also the 2nd and 3rd Infantry Divisions with the 3rd Rifle Brigade which had already left Moscow for Bulgaria. Valuable assistance was also forthcoming from the Rumanian forces, which now joined the Russians. The Russian plan of campaign, which was faulty to a degree, now became absolutely impossible, there being no longer any question

of moving south of the Balkans, whilst Osman from Plevna might threaten not only their right flank, but the bridges across the Danube. Every effort was to be made to vanquish the Turkish force defending Plevna, now greatly strengthened by field works.

At the end of July, Abdul Kerim, the Turkish commander-in-chief was superseded by Mohammed Ali, who decided to attack the Russian forces under the Tsarevitch (XI., XII. and XIII. corps) on the river Lom. Mohammed Ali had two army corps for his offensive, not to mention five divisions at Shumla and two at Ruschuk, but he carried out his movement with little skill, sending his left wing against the Russians standing on the Yantra, which brought about two engagements at Ayazak on Aug. 22 and 23. The Russians retreated slightly, and a week later the XIII. corps was attacked at Karahassankioi, but no serious result was gained by this move. On Sept. 5, another engagement occurred, but though the Russians retired across the Lom the Turks were unable to march further west. The intended plan to unite the forces of Mohammed Ali with those of Suleiman at Trnova failed, his advance producing no effect on the Russian forces assembled around Plevna, which were by that time considerably reinforced (two Russian and three Rumanian infantry divisions, together with a Russian rifle brigade). On the Rumanians joining the Russians, it was agreed that Prince Charles of Rumania should be in nominal command of the forces grouped around Plevna, which were now known as the Western army. But the authority vested in Prince Charles was small, as the Commander-in-Chief, the Grand Duke Nicholas, was living in the vicinity, not to mention the Tsar himself and General Milutin, the War Minister. By this time the Russians had mobilized a huge army.

Meantime Suleiman Pasha was ordered to join Osman, but he was instructed firstly to capture the Shipka Pass which he attempted to do Aug. 21. Severe fighting took place for several days, but Radetsky, being reinforced, maintained his position, beating off every hostile attack. Suleiman in five days having lost 10,000 men, a quarter of his effective strength, decided to fall back on Kazanlik, leaving detachments by the pass. Hearing that Suleiman had been forced to give up momentarily the attempt to capture the Shipka Pass, the Russians began to fear that he might endeavour, by using the Rosalita and Trojan Passes, not only to turn the Shipka Pass, but by moving via Lovcha to get into communication with Osman Pasha, who might at any moment make for Timova. For this purpose Prince Imeretinsky was ordered to drive a Turkish detachment from Lovcha, which he forced to retire into Plevna. Leaving a brigade to guard the town, Imeretinsky fell back on Bogot. The Allies now decided to assault Plevna again, for which purpose they assembled about 200,000 men. Three Rumanian divisions were to advance from Grivitza, four Russian from Radishevo, and a division, having a brigade in reserve under Skobeleff, facing the Green Hills. A long artillery preparation took place Sept. 7-11, but the allies failed to make any proper reconnaissance, for which they had to pay a severe penalty, thousands of lives being sacrificed in vain. They advanced on the 12th, but failed to break the Turkish circle of defence. The Rumanians captured a redoubt at Grivitza, but were held up at Radishevo; Skobeleff on his part established himself on the Green Hills, but was thrown back the next day by Osman Pasha, who used his reserves for the counter attack. A serious crisis now arose among the Allies and a council of war was held. Many of the members, including Milutin, the War minister, urged that the army should recross the Danube and renew the advance the following spring with increased forces. This opinion was over-ruled, the Tsar showing great determination, and it was decided to invest Plevna, entrusting all operations to General Todleben, the heroic defender of Sevastopol during the Crimean War. With his arrival, the Russians gained confidence and renewed energy, one and all feeling they were at last being led by a masterly head, that chaos was replaced by order. The Guard Corps, on arriving from Russia, was sent to cut the Turkish communications and the enemy was driven out of Gorni Dubniak and Telish by General Gourko, Plevna being thus cut off from the outer world. In the middle of Nov. the Russians stood as follows: 12 divisions around Plevna, 6 on the Lom; 3 by the Shipka Pass;

2½ on the Plevna-Orhanie road.

Suleiman, now commanding the main Turkish army, took the offensive, crossed the Lom and attacked the Russians at Mechka and Tristenik Nov. 19 and 26, but both times sustained a repulse. Vessil Pasha, who now in place of Suleiman stood facing the Shipka Pass, had been considerably weakened through sending reinforcements to aid Mohammed Ali near Sofia, and he could only muster 20,000 men. Meanwhile Gourko, hearing of Mohammed's preparations to relieve Plevna, urged that the Russians should advance boldly on Sofia, thereby depriving the enemy of the initiative. This plan being agreed to, Gourko, at the head of 30,000 men, drove the Turks out of Entropol, forcing Mohammed to retreat to Araba Konak Nov. 23. Gourko disposed of too small a force to be able to pursue the enemy, and so took up a position near Orhanie. Meantime in Plevna Osman's provisions were getting shorter every day, and ultimately he attempted a sortie, hoping to cut his way through Berkovitz to Sofia. After several hours severe fighting, however, Osman was convinced of the impossibility of breaking through, and surrendered with his whole army, about 40,000 men, on Dec. 10.

The Russians now decided to move on Sofia, cross the Balkans, relieve Shipka from the south and attack Vessil Pasha, the Tsarevitch with his 70,000 men being left to guard the communications. Gourko on Dec. 25 advanced with 5½ divisions against the Turks but on reaching Tashkesen he found that the Turks had already retreated. The Russians, after occupying Sofia, followed the enemy, who was making for Tatar Bazardjik. There Suleiman assumed command, having collected a force 50,000 strong, including reinforcements from Shumen. Radetsky began his attack on Jan. 5 at Shipka, being aided by two columns coming on his left and right; the western, Skobeleff with 17,000; the eastern, Prince Imbertinsky with 19,000 men. The Prince's advance was held up, while Skobeleff, delayed, came on the scene only the following day, when they together captured the Turkish entrenched camp two miles south of the Pass, forcing Vessil Pasha to capitulate with 36,000 men. Suleiman, on hearing of Vessil Pasha's surrender, made for Philippopolis, Gourko following in direct pursuit, while Radetsky cut off his retreat from Adrianople, entering the town with his advanced guard on Jan. 19. After several minor actions near the town Suleiman retreated to the south over the Rhodope Mountains direct to the coast reaching Enos on Jan. 28. His forces were then shipped to Constantinople. The Russians advanced rapidly towards the Turkish capital, reaching the Chataldja lines on Jan. 30. Next day an armistice was concluded, the terms being greatly modified at the Berlin conference which took place the following July, when Russia was deprived of many important concessions, which greatly irritated both the nation and the army. Bulgaria now became an independent principality, while Eastern Roumelia was to be under the protectorate of Turkey.

While these events were taking place in Europe military operations were simultaneously being carried on in the Caucasus. The Grand Duke Michael, the Tsar's brother, commanded the Russian forces which were 65,000 strong. The Turks numbered 70,000 men under Mukhtar Pasha. The same mistake was committed in the Caucasus as had been done in Europe—the Russian army finding itself too weak was obliged to await reinforcements, which arrived by the end of August when they began their advance. The first serious battle occurred on Oct. 15, at Aldja Dag, when the Turks were defeated, a part of their forces hurriedly making for Kars, which was an important fortress, while the other portion fled to Erzerum. Kars was now invested. A month later on Nov. 18, the Russians stormed and captured it. This was a brilliant feat of arms, perhaps the finest Russian exploit throughout this war. Their communications now being assured, the Russians moved rapidly towards Erzerum, but the severe winter weather and the strength of the fortifications prevented them capturing it as quickly as they had hoped. When the armistice was concluded Erzerum was still holding out, but the Turks were now forced to evacuate it under the terms of the armistice. The Russo-Turkish War amply proved the truth of the military maxim that to wage war with insufficient forces is

highly risky. The Russians were many times on the brink of disaster, which would most certainly have occurred had they been faced by abler Turkish leaders and more efficiently trained troops (A. SMY.)

RUST, RICHARD SUTTON (1815–1906), U.S. clergyman and educator, was born in Ipswich, Mass., on Sept. 12, 1815, the son of a shoemaker. In 1841 he was graduated from Wesleyan university, Middletown, Conn. Ordained an elder in the Methodist Episcopal church in 1846, Rust was president of Wilberforce university, Wilberforce, O., a school for Negroes, 1858–62. For many years he was active in the Freedmen's Aid Society of the Methodist Episcopal church, which he helped to organize in 1866. In 1880 he published *The Freedmen's Aid Society of the Methodist Episcopal Church*. He died June 17, 1906.

RUST, a term usually applied to the reddish deposit formed on iron and having the approximate chemical composition $2\text{Fe}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$. (See also CORROSION AND OXIDATION OF METALS.)

RUSTICATION, in architecture, a form of masonry in which the stones have their edges cut back to a careful plane surface, but with the central portion of the stone face either left rough or projecting markedly. (See DRAFTED MASONRY.) Rusticated masonry is found in the platform of the tomb of Cyrus at Pasargadae in Persia (560 B.C.) and is common in certain types of Greek and Hellenistic work such as retaining walls and the like. It was similarly used for terrace and retaining walls by the Romans, who also realized its decorative value and employed it not only for such utilitarian works as the Pont du Gard at Nîmes, France and the aqueduct at Segovia, Spain (c. 109), but also decoratively as in the Porta Maggiore at Rome (time of Claudius), where the rustication is very rough, and the walls of the temple of Augustus at Vienne, France (c. 47), in which the rustication is carefully finished, the faces of the stone cut to a plane and the edges very delicately sunk.

The early Renaissance architects developed this tradition still further, and in the 15th century palaces in Florence used it with magnificent effect. Thus in the Pitti palace, by Brunelleschi (1458), the Riccardi, by Michelozzo (1444–52), and the Strozzi, by Benedetto da Maiano (1489), the carefully studied rustication forms the chief element in the design, and in the Rococo, from designs by Alberti (1446–51), the wall surfaces between the pilasters are delicately rusticated. During the Baroque period rustication assumed great importance in garden and villa design and all sorts of fantastic surfaces were employed on the projecting portions of the stones, such as vermiculated work, in which the surface is covered with wavy and serpentine sinkings like worm-eaten wood, or treated with vertical dripping forms like lime deposits from dripping water. Sometimes the stones had sides bevelled and brought to a point or ridge in the centre.

The use of rustication was introduced into England by Inigo Jones, as in the gate of the Botanic Gardens at Oxford (1632), and became a dominant feature in much English Renaissance work. In American colonial work this influence is seen in the occasional shaping of outside sheathing boards to imitate rusticated masonry, as in portions of the Morris-Jumel house in New York (1765). Quoins (q.v.), or corner blocks are, in many styles, rusticated, where the face of the wall is left smooth.

RUTABAGA: see TURNIP.

RUTACEAE, a family of dicotyledonous plants, mostly shrubs and trees, comprising about 144 genera and 1,600 species found in temperate and tropical regions, and especially abundant in Australia and South Africa. *Ruta graveolens* is rue (q.v.). *Citrus* includes the grapefruit, orange, lemon (qq.v.), etc. *Chloroxylon swietenia* is satinwood (q.v.). *Ptelea trifoliata* is the shrubby trefoil or wafer ash; *Zanthoxylum americanum* is the prickly ash (q.v.). See A. Engler, "Rutaceae," in Engler and Prantl, *Die natürlichen Pflanzenfamilien* 191:187–357, fig. 89–164 (1931).

RUTBA WELLS, a post and watering place in the Syrian desert, in 33° N. and 40° E. The post, which is the headquarters of part of the desert police is the most westerly occupied place in Iraq. Westward from this point L. H. D. Buxton found considerable traces in the desert of palaeolithic remains.

See L. H. D. Buxton, *Antiquaries Journal* (1926).

RUTEBEUF or **RUSTEBUEF** (fl. 1245-1285), French trouvère, was born in the first half of the 13th century. His name is nowhere mentioned by his contemporaries. He frequently plays in his verse on the word Rutebeuf, which was probably a pseudonym. Some of his poems have autobiographical value. In *Le Mariage de Rutebeuf* he says that on Jan. 2, 1267, he married a woman old and ugly, with neither dowry nor amiability. In the *Complainte de Rutebeuf* he details a series of misfortunes which have reduced him to abject destitution. In these circumstances he addresses himself to Alphonse, comte de Poitiers, brother of Louis IX, for relief. His distress could not be due to lack of patrons, for his metrical life of Saint Elizabeth of Hungary was written by request of Erard de Valéry, who wished to present it to Isabel, queen of Navarre; and he wrote elegies on the deaths of Anceau de l'Isle Adam, the third of the name, who died about 1257, Eude, comte de Nevers (d. 1267), Thibaut V of Navarre (d. 1270) and Alphonse, comte de Poitiers (d. 1271), which were probably paid for by the families of the personages celebrated. In the *Pauvrete de Rutebeuf* he addresses Louis IX himself.

The piece which is most obviously intended for popular recitation is the *Dit de l'Herberie*, a dramatic monologue in prose and verse supposed to be delivered by a quack doctor. Rutebeuf was also a master in the verse *conte*, and the five of his *fabliaux* that have come down to us are gay and amusing. The adventures of *Frère Denyse le cordelier*, and of "*la dame qui alla trois fois autour du moulin*," find a place in the *Cent Nouvelles nouvelles*.

Rutebeuf's serious work as a satirist probably dates from about 1260. His chief topics are the iniquities of the friars, and the defense of the secular clergy of the university of Paris against their encroachments; and he delivered a series of eloquent and insistent poems (1262, 1263, 1268, 1274) exhorting princes and people to take part in the crusades. He was a redoubtable champion of the university of Paris in its quarrel with the religious orders, and he boldly defended Guillaume de Saint-Amour when he was driven into exile. The libels, indecent songs and rhymes condemned by the pope to be burned together with the *Péris des derniers temps* attributed to Saint-Amour, were probably the work of Rutebeuf. The satire of *Renart le Bestourné*, which borrows from the Reynard cycle little but the names under which the characters are disguised, was directed, according to Paulin Paris, against Philip the Bold. To his later years belong his religious poems, and also the *Voie de Paradis*, the description of a dream, in the manner of the *Roman de la Rose*.

The best work of Rutebeuf is to be found in his satires and verse *contes*. A miracle play of his, *Le Miracle de Théoophile*, is one of the earliest dramatic pieces extant in French.

BIBLIOGRAPHY—The *Oeuvres* of Rutebeuf were edited by Achille Jubinal in 1839 (new edition, 1874); a more critical edition is by Dr. Adolf Kressner (*Rutebeuf's Gedichte*; Wolfenbüttel, 1885). See also the article by Paulin Paris in *Hist. lit. de la France* (1842), vol. xx, pp. 719-783, and *Rutebeuf* (1891), by M. Léon Clédard, in the *Grands Écrivains français* Series.

RUTGERS UNIVERSITY, the state university of New Jersey, has its main campuses in New Brunswick, N.J., with major centres in Newark and Camden. It offers undergraduate and graduate instruction for both men and women.

The university dates from Nov. 10, 1766, when Queen's college was chartered as the eighth college in the American Colonies. It owed its founding largely to the zeal for religion and education of Dutch settlers of the reformed Protestant faith who saw the need of an institution of higher learning that might provide training for candidates for the ministry. The New Brunswick Theological seminary was affiliated with the college until 1856. Classes began in 1771 in New Brunswick, but during the American Revolution the small student body was forced to evacuate the city and meet elsewhere. In 1809 Queen's building, a splendid example of Georgian Colonial architecture designed by John McComb, was erected and for several decades housed all the college work. It became the main administration building of the university.

In 1825 the name of the institution was changed to Rutgers college in honour of Col. Henry Rutgers, a leading churchman and philanthropist of New York city. In 1864 the state legislature designated the newly organized Rutgers Scientific school to be

"The State College for the Benefit of Agriculture and the Mechanic Arts," and in 1917 the land-grant units were declared to be the state university of New Jersey. Rutgers is the only land-grant college with a colonial charter. In 1880 the New Jersey Agricultural Experiment station was located at the college farm.

The New Jersey College for Women was created in 1918 by the trustees of Rutgers as an integral part of the university but with a separate campus in New Brunswick. The name "Rutgers University" was adopted in 1924, although the corporate title remained "The Trustees of Rutgers College in New Jersey." Divisions, with the dates of their founding or their association with the university, are: the college of arts and sciences (1766), the college of engineering (1864), the college of agriculture (1864), the school of education (1923), the university extension division (1925), the college of pharmacy (Newark, 1927), the graduate faculty (1932), University college (1934), the Newark Colleges of Arts and Sciences (Newark, 1946), the school of business administration (1946), the school of law (Newark and Camden, 1946, 1949), the institute of microbiology (1949), and the College of South Jersey (Camden, 1950).

Rutgers university was designated by legislation effective July 1, 1945, as the state university of New Jersey "to be utilized as an instrumentality of the State for providing public higher education" on a contractual basis, and the state board of education was given "visitorial general powers of supervision and control" over the university. Management of the institution was vested in a board of trustees of 58 members, 16 of whom would represent the state, seven the alumni and one the State Federation of Women's Clubs. Thirty-four "charter trustees" are elected for life terms by the board.

About 50 courses of study leading to the degrees of bachelor of arts, bachelor of letters, bachelor of science and bachelor of laws were established. Graduate instruction leading to the degrees of master of arts, master of science, master of laws, master of education, doctor of education and doctor of philosophy is also offered.

In 1940-41, prior to the incorporation of the Newark colleges into the university, the enrolment of full-time graduate and undergraduate students was about 3,000. This figure expanded to more than 9,000 in the post-World War II years and then declined slightly to approximately 8,000 by 1950-51. In the latter year there were also about 19,000 part-time students enrolled mainly in the extension divisions.

Rutgers university's physical plant was valued in the early 1950s in excess of \$60,000,000 and it comprised more than 50 major structures and more than 3,000 ac. of land. In 1950-51 its endowment was \$6,754,000 and its total budget was \$14,000,000, 35% of which was met by state appropriations. The Rutgers University libraries contained more than 500,000 catalogued volumes. (R. P. McC.)

RUTH, GEORGE HERMAN (BARE) (1895-1948), U.S. baseball player, was born at Baltimore, Md., on Feb. 6, 1895. He spent a considerable part of his boyhood in the St. Mary's industrial school in Baltimore as (by his own account) an incorrigible.

On Feb. 27, 1914, he joined the Baltimore Orioles of the International baseball league and later that year was sold to the Boston Red Sox, with whom he played through the 1918 season as a pitcher, his record including three world series victories. In the 1919 season, performing mostly as an outfielder, Ruth set a new big-league home-run record by hitting 29.

In 1920 Ruth was sold to the New York Yankees and in that season set a new record by hitting 54 home runs. In the winter of 1920-21 the scandal of the 1919 world series became public with the revelation that certain Chicago White Sox players had colluded with gamblers, agreeing to lose the series. Baseball observers called this the greatest crisis in the U.S. national game and credited Ruth's sensational play in 1921, including a new record of 59 home runs, with reviving interest in the sport. He was voted the most valuable player in the American league in 1923.

During his major league career Ruth broke more than 50 records, setting a new record for home runs in one season by hitting 60 in 1927. He led the American league in home runs for 12

years; he hit at least 50 home runs in four separate seasons and 40 in 11 seasons. He played in ten world series—three with Boston and seven with New York. His high earnings and congenial nature tempted Ruth periodically into waywardness, and he was suspended for 30 days of the 1922 baseball season by Baseball Commissioner K. M. Landis for an unauthorized barnstorming tour. In 1925 he was fined \$5,000 by Yankee Manager Miller Huggins for "misconduct off the ball field."

Ruth quit the Yankees after the 1934 season, played for a part of a season with the Boston Braves in 1935 and became a coach of the Brooklyn Dodgers in 1938, after which his formal baseball career ended. Throughout World War II he lent himself to patriotic promotions, and he appeared in a motion picture on the life of his teammate, Lou Gehrig. He acted as consultant on the motion picture on his own life. Ruth died in New York city on Aug. 16, 1948. (See BASEBALL, Plate I, fig. 3, and Plate II, fig. 1.)

RUTH, BOOK OF, in the Old Testament. The story of Ruth, the Moabitess, great-grandmother of David, is one of the Old Testament Hagiographa (see BIBLE: *Old Testament; Canon*). On the other hand, it follows Judges in the Septuagint, the Vulgate and the English version. But although a late rearrangement might transfer Ruth from the Hagiographa to the historical books, and place it between Judges and Samuel, no motive can be suggested for the opposite change, unless it had been placed in the last part of the Jewish canon after the second (with the historical books) had been definitely closed. Moreover, the book is untouched by the "prophetic" or "Deuteronomistic" editing, which helped to give the "Former Prophets" (Joshua-Kings) their present shape after the fall of the kingdom of Judah. Nor has the narrative any affinity with the view that the history of Israel was a series of examples of divine justice and mercy in the successive rebellions and repentances of the people of God. Finally, if the book had been known when Joshua-Kings was edited it could hardly have been excluded, since David's ancestry (iv, 17, 18-22) was of greater interest than that of Saul (given in i Sam. ix, 1), whereas the old history names no ancestor of David beyond his father Jesse.

Date.—The book of Ruth deals with a distant past (Ruth i, 1), and delights in depicting details of antique life and obsolete usages (iv, 7). It views the stormy period before the kingship through the softening atmosphere of time, in contrast to the harsher colours of the old narratives of the book of Judges. It has been argued that, as the author seems to take no offence at the marriage of Israelites with Moabite women, he must have lived before the time of Ezra and Nehemiah (Ezra ix; Neh. xiii); but the same argument would prove that the book of Esther was written before Ezra. The very designation of a period of Hebrew history as "the days of the judges" is based on the exilic "Deuteronomistic" parts of the book of Judges (ii, 16 sqq.), and although the language sometimes recalls the narratives in Samuel and Kings, it can be assumed, either that the book is the work of a late author acquainted with the earlier literature, or that an old narrative was rewritten. The fact that the language is in contrast to that of Chronicles, Ezra, Nehemiah, etc., has no force since writings evidently more or less contemporary did not necessarily share the same characteristics (observe, for example, the prose parts of Job).

Purpose.—Like the stories appended to Judges, the book of Ruth connects itself with Bethlehem, the birthplace of David. Some connection between Bethlehem and Moab has been found in i Chron. iv, 22 (where the Targum and rabbinical exegesis discover references to the story of Ruth), and is explicitly suggested by the isolated i Sam. xxii, 3 seq., which knows of some relationship between Moab and David. Next, the writer claims the sympathy of his readers for Ruth, upon whose Moabite origin he insists, and this is noteworthy in view of the aversion with which intermarriage was regarded at a certain period (Deut. xxiii, 3; Neh. xiii; Ezra ix seq.). The independent evidence for the present late form of the book has led many scholars to the conclusion that it was directed against the drastic steps associated with the reforms of Ezra and Nehemiah, which, as is known, were not everywhere acceptable. Thus, not only have we a beau-

tiful portrait of a woman of Moabite origin, but she becomes the ancestress of David himself; and in the days of these measures the simple story would raise the question whether the exclusiveness of Judaism was being carried too far.

RUTHENIA or CARPATHIAN RUTHENIA, formerly an autonomous part of Czechoslovakia, and later of Hungary, became, after it was briefly returned to Czechoslovakia, an administrative division (Transcarpathian oblast) of the U.S.S.R. in 1945. Its northern frontier follows the ridge of the Carpathian mountains between Hungary and Poland. Much of Ruthenia is mountainous, deeply dissected by incised valleys which often open into broad, fertile basins in their upper courses. The southern edge of the highland is heavily forested with beech on its lower levels and conifers on the higher. But the plain, largely the drainage basin of the upper Tisa and its tributaries, is the important region. Sheltered from the cold winds of the north and northeast, it receives the moist southwesterly currents and the climate is ideal for cereal and vine cultivation. Agricultural products include maize, oats, wheat, potatoes, rye, tobacco and barley. The lower slopes are devoted to vineyards and orchards of plum and apple trees.

Ruthenia had been a much neglected district of Upper Hungary, inhabited by a backward population, where agricultural methods were most primitive and therefore insufficient to assure a decent standard of living to the population, which in its large majority was Ruthenian, a Slav people closely related to the Ukrainians who lived on the northeastern slopes of the Carpathian mountains. Industrial activity was small, illiteracy widespread, and the Ruthenian peasants were without any initiative as a result of centuries of servitude. The peace treaty of Trianon brought the country under Czechoslovak administration, guaranteeing its autonomous status. This autonomy was during the first years very much restricted. The Czech administration, however, founded a large number of schools with Ruthenian as the language of instruction, combated illiteracy and the low state of public health, and helped to modernize the economic life.

The area of the province was 4,886 sq.mi., the population in 1930, 725,357, of whom 450,925 were Ruthenians, 175,805 Magyars, 95,008 Jews, 34,511 Czechoslovaks, 13,804 Germans, and 12,777 Rumanians. The Ruthenians therefore formed 62.17% of the population. With regard to religion, 49.52% belonged to the Greek Catholic Church, 15.44% to the Greek Orthodox Church, and 14.14% to the Jewish faith. In 1930, 30.88% above the age of ten were illiterate. The 1941 population of towns over 20,000 was: Užhorod 32,250; and Mukačevo 31,602.

As a result of the German-Italian award of Nov. 2, 1938, at Vienna, Czechoslovakia lost the southern and more fertile part of Ruthenia to Hungary. The remaining part was constituted as one of the three autonomous governments within the new Czechoslovakia. Its name was changed to Carpatho-Ukraine and it was regarded as the nucleus of a Pan-Ukrainian national movement the purpose of which was to create a great Ukraine embracing the Ukrainian parts of Poland and of the Soviet Union. The capital is Khust (1941, 21,118); the area of the state was, in 1941, approximately 5,000 sq.mi., with a population (1947 estimate) of 900,000. On March 14, 1939, Hungary, with Germany's action against Czechoslovakia, annexed Ruthenia. Occupied by the Soviet Union in 1944, Ruthenia, after a brief period under Czech control, was incorporated in the U.S.S.R. as the Transcarpathian oblast in 1945. (H. Ko.; X.)

RUTHENIANS, a name also applied to those Ukrainians, or Little Russians, who were formerly Austrian subjects. The name is simply a Latinized form of "Russian," the terms "Red Russian," etc., being due to false derivations. When, however, the early Ruthene states lost their independence, the term "Russia" was monopolized by the Muscovite state which, anxious to deny to the Ruthenes a national individuality, gave them the name of

"Little Russians." The Ruthenes themselves adopted the distinguishing title of "Ukrainians," i.e., inhabitants of the Turk-Tatar frontier in S. Russia. The name Ruthene survived among the subjects of Poland and Lithuania, and later, Austria. The Ruthenians are thus neither more nor less than Ukrainians, and their linguistic and ethnographical features are described under that head. Yet they can be distinguished from the Ukrainians of Russia, both by their separate history (see *POLAND, GALICIA*) and by their religion. After Galicia and Volhynia came under Polish and Lithuanian rule in the 14th century, their upper classes were soon assimilated into the conquering nations, whose language and Catholic faith they adopted. The peasants sank into a state of great degeneracy, which was largely due to the decadence of their own Orthodox priests; recognizing which, they themselves proposed union with Rome. This was proclaimed by the Pope and accepted by the Ruthenes at the Union of Brest-Litovsk, Oct. 6-10, 1596. Under this new "Uniate Church," the Ruthenes retained their Slavonic liturgy and most of the outward forms of the Greek Orthodox Church, while acknowledging the spiritual supremacy of the Pope. Although the two liturgies were nominally entitled to equal treatment in Poland, actually the Uniate was always treated as inferior, and its adherents sank into a lamentable state of ignorance and poverty, due partly to the exactions of their feudal masters, partly to national oppression, partly to their portentous capacity for consuming fiery liquor, their habit of keeping the holidays of both Julian and Gregorian calendars (in 1860 16 districts in Galicia kept 160-200 days annually as holidays) and their superstitions (in 1807 a current method of exorcising cattle plague was to place the carcasses of the stricken animals in the wells, pastures and stables of uninfected districts).

On the partition of Poland, a number of Ruthenes passed back under Russian rule. Many of them were quickly converted to the orthodox faith, and every effort was made to Russify them. The orthodox propaganda was extended to Galicia (see *PAN-SLAVISM*) but the results were more sensational than practical. The Russian Government systematically discouraged Ruthenian nationalism until after the revolution of 1905, when some relaxation was made in the oppressive regulations. Similar efforts were made by the Poles of Galicia, and winked at by the Austrian Government, but here something was done for the Ruthenes. A metropolitan bishopric was founded at Lemberg in 1806, and suffragates added at Przemyśl and Stanisław. In 1877 a Ruthenian chair was established at Lemberg University, but Austria never granted a separate Ruthenian university, in spite of agitation.

After the war the largest body of Ruthenes, those in East Galicia, claimed the right of self-determination, but their short-lived state was soon absorbed in Poland (see *GALICIA*). The Ruthenes in the N.E. Carpathians were attributed to Czechoslovakia, special guarantees being laid down for their national autonomy. They were formed into the province of Sub-Carpathian Russia (see *CZECHOSLOVAKIA*). The Ruthenes of Bessarabia and the Bukovina came under Rumanian rule (where the state religion was orthodox), with the protection of the Rumanian Minorities treaty.

The population of Transcarpathian Oblast, formerly known as Ruthenia (*q.v.*) and bounded on the northwest by Poland, west by Czechoslovakia, south by Rumania and southwest by Hungary, was estimated at 900,000 in 1947. The 5,000-sq. mi. region had been controlled briefly by Czechoslovakia during World War II before it was secured to the Soviet Union in Sept. 1945. It became an administrative unit of the Ukrainian S.S.R. See *UKRAINE, POLAND, RUSSIA*, etc.

See also the publications of the League for Ukrainian National Independence (Geneva 1919-22).

RUTHENIUM, (symbol Ru, atomic number 44, atomic weight 101.7, stable isotopes 102, 104, 101, 99, 100, 96, 98), a metal, member of the platinum group.

Ruthenium, the last member of the platinum family to be discovered, was definitely established as a new element by C. Claus in 1845. A previous announcement by G. Osann in 1828 of a new element of the platinum group, the discovery of which was never

confirmed, had suggested the name ruthenium from Ruthenia, Little Russia. Claus retained the name.

Ruthenium, like osmium, forms a tetroxide RuO_4 , less stable than OsO_4 but which can likewise be distilled from aqueous solution. The tendency to form the tetroxide is far less strong than it is with osmium and the solutions of ruthenium are consequently easier to handle.

In analytical procedures osmium and ruthenium may be distilled together or, by changing the conditions of the solution, the two may be separated. Osmium is best distilled from a solution containing nitric acid, while ruthenium is best distilled from a solution of its sulphate in sulphuric acid to which sodium bromate is added.

Ruthenium and osmium form a natural alloy with iridium and it is from this portion of crude platinum, insoluble in aqua regia, that they are obtained. They are brought into soluble form, Na_2RuO_4 and Na_2OsO_4 , by fusing the crude material with an alkaline oxidizing flux. It is customary to remove osmium first by distilling from the solution acidified with nitric acid, and then to distil the ruthenium tetroxide after making the solution alkaline again and saturating it with chlorine. In preparing pure ruthenium the metal, isolated by distillation as the tetroxide, is absorbed in hydrochloric acid diluted with four volumes of water. After removing excess acid by evaporation on a steam bath, ammonium chloride is added to precipitate a salt, probably $(\text{NH}_4)_2[\text{RuCl}_5\text{OH}]$ or $(\text{NH}_4)_2[\text{RuCl}_6]$. Reduction of the salt in hydrogen gives metallic ruthenium. If the absorbent solution is treated with nitric acid, the salt obtained will be $(\text{NH}_4)_2[\text{RuCl}_5\text{NO}]$.

The behaviour of the nitroschloride on hydrolysis differs markedly from that of $(\text{NH}_4)_2[\text{RuCl}_5\text{OH}]$ or $(\text{NH}_4)_2[\text{RuCl}_6]$. The tightly bound nitroso group prevents the precipitation of a hydrated oxide so that one is able to separate the ruthenium contained in the two types of compounds.

Considerable confusion existed from the time the discoverer C. Claus, in 1845, prepared two chloro salts of ruthenium to which he assigned the formulas K_2RuCl_6 and K_2RuCl_5 . Later it was shown that the supposed K_2RuCl_5 was a nitroso salt, $\text{K}_2\text{RuCl}_5\text{NO}$. The first salt has, since the time of Claus, passed for K_2RuCl_6 , which was considered a pentachlororuthenite. Efforts to oxidize this salt to K_2RuCl_6 have been of no avail. In 1904 James Lewis Howe described a monohydrate of K_2RuCl_5 which differed markedly from the former salt in properties, especially in stability toward hydrolysis and in being converted into K_2RuCl_6 by the action of chlorine. It was formed from the earlier K_2RuCl_5 by boiling with dilute alcohol in acid solution and was called an aquo salt. The corresponding rubidium and cesium salts were also prepared, as well as similar salts with bromine in the place of chlorine. It was thought that there might be an instance of isomerism between these two series of pentachlororuthenites.

The explanation of this anomaly depended upon ascertaining the state of valency of the ruthenium in the two types of compounds and in determining the composition of the salts, particularly with respect to water. Raymond Cheronnet in 1925 suggested that the true formula for the ordinary pentachlororuthenite is $\text{K}_4[\text{RuCl}_5\text{OH}]$, basing his view on the action of this salt on potassium iodide, and on the formation of the aquo salt by the action of hydrochloric acid on the oxalato compound $\text{K}_4[\text{Ru}(\text{C}_2\text{O}_4)_3]$. Howe concluded, in 1927, that no isomerism exists and that the explanation lies in the fact that Claus's K_2RuCl_5 is in reality $\text{K}_4[\text{RuCl}_5\text{OH}]$, in which the ruthenium is quadrivalent and that the aquo salt $\text{K}_2\text{RuCl}_5\text{H}_2\text{O}$ is $\text{K}_4[\text{RuCl}_5\text{H}_2\text{O}]$, in which the ruthenium is tervalent.

In reducing solutions with zinc, hydrogen sulfide and other agents, a conspicuous blue colour is formed. Claus had regarded the colour as that of bivalent ruthenium. In 1927 Heinrich Remy and T. Wagner considered it to be that of univalent ruthenium and based their opinion on its being formed when the valency of the ruthenium in K_2RuCl_5 was reduced two units, as measured by the action of sodium amalgam. E. Zintl and P. Zaimis also assumed the presence of univalent ruthenium in the blue solution, basing their view on the potentiometric titration of RuCl_5 with chromous or titanous sulphate where with one equivalent they obtained a pale yellow solution, while with the next drop the blue colour began to appear.

Ruthenium sulphate, $\text{Ru}(\text{SO}_4)_3$, is formed when ruthenium tetroxide is dissolved in sulphuric acid and the resulting orange-yellow solution is evaporated. Hydrogen sulphide does not produce the blue reaction obtained with a solution of the chloride.

Ruthenium shows its relationship to iron through the cyano and

nitroso complexes, as exemplified by $K_4[Ru(CN)_6]$ and $K_4[Fe(CN)_6]$ and by $K_4[Ru(CN)_5NO]$ and $K_4[Fe(CN)_5NO]$.

Ruthenium is rarely used in the elemental form. As a hardening constituent it is alloyed with platinum and with palladium. Platinum alloyed with 5% of its weight of ruthenium is equivalent in hardness to platinum with 10% of iridium. For this reason ruthenium-platinum alloys became popular as alternatives to iridioplatinum in the manufacture of jewellery. Ruthenium, usually in conjunction with rhodium, is used as a hardener for palladium intended for jewellery. It is also used in making hard alloys for tipping fountain pens and phonograph needles (See PLATINUM; PLATINUM METALS).

(R. G.)

RUTHERFORD, ERNEST, 1st BARON RUTHERFORD OF NELSON (1871-1937), British physicist, was born at Nelson, New Zealand on Aug. 30, 1871. Rutherford received his secondary training at Nelson college and, on graduation in 1889, gained a scholarship at the University of New Zealand. By 1893 he had taken his M.A. degree with a double first in mathematics and physical science.

In 1895 Rutherford won an 1851 exhibition scholarship which took him to Cambridge university. At the Cavendish laboratory his ability was recognized at once by J. J. Thomson. His earliest research there was a detector for electromagnetic waves, its essential feature being a small magnetizing coil containing a tiny bundle of magnetized iron wire. Rutherford's second piece of work, done jointly with Thomson, dealt with the temporary conduction in gases which results from ionization produced by X-rays.

In 1897 Rutherford worked with Thomson upon the mobility of ions and related topics, but especially upon the negative ions emitted when ultra-violet light falls upon a clean metal surface. The discovery of Becquerel rays and radium had aroused his curiosity as to just what kind of ions are emitted by radium. At this juncture, Rutherford accepted a call to McGill university in Canada. On reaching the Macdonald laboratory there, in the autumn of 1898, he at once set to work on the radiation from radium, and discovered in 1899 that it is quite complex, consisting first of all of easily absorbed rays—rays which are stopped by a few centimetres of air. These he called alpha-rays. Besides these, he found uranium giving a far more penetrating radiation, able to pass through a sheet of aluminium several millimetres thick. These he named beta-rays, and they proved to be high-speed electrons.

Rutherford's next work at Montreal was done jointly with R. B. Owens. It was a study of thorium emanation which led to the discovery of a new noble gas, later known as thoron. After Frederick Soddy came to McGill university in 1900, he and Rutherford created the modern theory of radioactivity, excellently set forth in Rutherford's *Radioactive Substances and their Radiations*.

In 1906 he accepted an invitation to succeed Sir Arthur Schuster in the Langworthy professorship at Manchester university. It was about this time that he and J. T. Royds proved that alpha-particles consist of helium atoms. The Nobel prize was presented to Rutherford on Dec. 11, 1908, some two years before he began thinking about the scattering of alpha-rays and the nature of a nucleus which could produce such scattering—his nuclear theory—the greatest of all his contributions to physics. In 1912 Niels Bohr came to work in the Manchester laboratory, and it was here that Bohr adopted the nuclear structure of Rutherford to the quantum theory of Max Planck and thus obtained an atomic structure which satisfied the experimental findings of J. R. Rydberg and other spectroscopists. About this time H. G. Moseley got in touch with Rutherford and worked with him during the year 1913. Moseley bombarded the atoms of various elements with cathode rays and proved that the inner structures of these atoms (with the positive charge on the Rutherford nucleus) respond in a group of lines which characterize the elements much as the natural numbers might do, so that each element can be assigned its atomic number. The importance of this discovery lies in the fact that the properties of an element are defined by its atomic number.

In 1919, Rutherford was invited to succeed J. J. Thomson in the Cavendish chair at Cambridge. Honours now came in rapid succession. Rutherford had been knighted in 1914. The Copley medal of the Royal Society was bestowed on him in 1922; the presidency of the British Association for the Advancement of Science in 1923, to be followed, two years later, by the presidency of the Royal Society. In 1931, he was created 1st Baron Rutherford of Nelson. He died Oct. 19, 1937. **BIOGRAPHY**—E. R. Rutherford, J. Chadwick and C. Ellis, *Radiation from Radioactive Substances* (1930) is a book so thoroughly documented that it serves every need in the way of a chronological list of Rutherford's published papers. (H. Cw.)

RUTHERFORD, MARK, the pen name of William Hale White (1819-1913), English author, born at Bedford, Eng. His

father, William White, a member of the nonconformist community of the Bunyan meeting, moved to London, where he was well known as a doorman of the house of commons; he wrote sketches of parliamentary life for the *Illustrated Times*, papers afterward collected by his son as *The Inner Life of the House of Commons* (1897). The son was educated at Cheshunt and New College for the Congregational ministry, but the development of his views prevented his following that career, and he became a clerk in the admiralty.

He had already served an apprenticeship to journalism before he made his name as a novelist by the three books "edited by Reuben Shapcott," *The Autobiography of Mark Rutherford* (1881), *Mark Rutherford's Deliverance* (1885), and *The Revolution in Tanner's Lane* (1887). Under his own name he translated Spinoza's *Ethics* (1883, new ed. 1894). Later books are *Miriam's Schooling*, and other papers (1890), *Catherine Furze*, 2 vol. (1893), *Clara Hogwood* (1896), *Papers from a Journal*, with other papers (1900), *John Bunyan* (1905), *More Pages from a Journal* (1910) and *Last Pages* (1915) which was edited by his wife. Though for a long time little appreciated by the public, his novels—particularly the earlier ones—have a power and style which must always give his works a place of their own in the literary history of their time. He died at Groombridge, Sussex, on March 14, 1913.

See A. E. Taylor, "The Novels of Mark Rutherford" in *Essays and Studies* by members of the English association (1913-14).

RUTHERFORD, a borough of Bergen county, New Jersey, U.S., on the Erie railroad, midway between Jersey City and Paterson. Pop. (1950) 17,411; in 1940, 15,466 by federal census. The combined population of Rutherford and the adjoining borough of East Rutherford (7,438 in 1950 and 7,268 in 1940) was 24,849 in 1950. Both boroughs are primarily residential communities, with little manufacturing.

RUTHERGLEN (locally pronounced *Rüglén*), royal and large burgh of Lanarkshire, Scotland. Pop. (1951) 24,225. Area 1.6 sq. mi. It is situated on left bank of the Clyde, 2½ mi. by the Scottish region railway S.E. of Glasgow, with the east of which it is connected by a bridge. The parish church stands near the spire of the ancient church where, according to tradition, the treaty was made in 1297 with Edward I, by which Sir John Menteith undertook to betray Wallace to the English. The industries include collieries, chemical works, dye works, paper mills, chair making, tube making, pottery, rope- and twine-works.

Rutherglen was erected into a royal burgh by David I in 1126. It then included a portion of Glasgow, but in 1226 the boundaries were rectified so as to exclude the whole of the city, and Rutherglen has continued to resist incorporation with Glasgow. In early times it had a castle, which was taken by Robert Bruce from the English in 1313. It was kept in good repair until after the battle of Langside (1568), when it was burned by order of the regent Moray. In 1679 the Covenanters published their "Declaration and Testimony" at Rutherglen prior to the battles of Drumclog and Bothwell Brig (1679).

RUTHIN, market town and municipal borough, Denbigh parliamentary division, Denbighshire, Wales, 215 mi. N.W. of London by Western region railway. Pop. (1951) 3,599. Area 3.2 sq. mi. Ruthin (*Rhudd ddim*, red fortress) stands on a hill above the river Clwyd. Apart from legends of Arthur, the first fact of note is its connection with the Grey de Ruthyn family (1282). Owen Glendower attacked the castle in 1400; it was later sold to Henry VII, and Elizabeth gave it to the earl of Warwick. In 1646 it was dismantled by the Parliamentarians but later a new castle was built on the site. The church of St. Peter has nearly 500 panels of carved oak. The incumbent is known as the warden.

RUTHVEN (rú'ven), name of a noble Scottish family tracing descent from a certain Thor, who settled in Scotland during the reign of David I. In 1488 one of its members, Sir William Ruthven (d. 1528), was created a lord of parliament as Lord Ruthven. Patrick, 3rd Lord Ruthven (c. 1520-1566), played an important part in the political intrigues of the 16th century as a strong Protestant and a supporter of the lords of the congregation. He favoured the marriage of Mary with Darnley, and was the leader of the band which murdered Rizzio. This event was followed by his flight into England, where he died. Ruthven wrote for Queen Elizabeth a *Relation of the murder*, which is preserved in manuscripts in the British museum.

A descendant of the 1st Lord Ruthven in a collateral line, also named Patrick Ruthven (c. 1573–1651), distinguished himself in the service of Sweden, which he entered about 1606. After leaving the Swedish service he was employed by Charles I. in Scotland. He defended Edinburgh castle for the king in 1640, and when the Civil War broke out he joined Charles at Shrewsbury. He led the left wing at the battle of Edgehill, and after this engagement was appointed general-in-chief of the Royalist army. For his services he was created Lord Ruthven of Ettrick in 1639, earl of Forth in 1642 and earl of Brentford in 1644. The earl compelled Essex to surrender Lostwithiel, and was wounded at both battles of Newbury. In 1644 he was superseded in his command by Prince Rupert. After visiting Sweden on a mission for Charles II., Brentford died at Dundee on Feb. 2, 1657. He left no sons and his titles became extinct.

Patrick, 3rd Lord Ruthven, was succeeded as 4th lord by his son William (c. 1547–1584), who like his father was prominent in the political intrigues of the period and was also concerned in the Rizzio murder. In 1582 he devised the plot to seize King James VI., known as the raid of Ruthven, and he was the last-known custodian of the famous silver casket containing the letters alleged to have been written by Mary, queen of Scots, to Bothwell. In 1581 he was created earl of Gowrie, but all his honours were forfeited when he was attained and executed in May 1584 (See GOWRIE, 3RD EARL OF.)

In 1853 the barony descended to Mary Elizabeth Thornton (c. 1784–1864), the wife of Walter Hore (d. 1878). She and her husband took the name of Hore-Ruthven, borne by later barons.

See the *Ruthven Correspondence*, edited with introduction by the Rev. W. D. Macray (1868); J. H. Round, "The Barony of Ruthven of Freeland" in *Joseph Foster's Collections Genealogica* (1887–88); and Sir R. Douglas, *The People of Scotland* (new ed. by Sir J. B. Paul).

RUTILE, the most abundant of the three native forms of titanium dioxide, TiO_2 ; the others being anatase and brookite (q.v.). Like anatase, it crystallizes in the tetragonal system, but with different angles and cleavages, it being crystallographically related to cassiterite, with which it is isomorphous. The crystals resemble cassiterite in their prismatic habit and terminal pyramidal planes and also in the twinning; the prism planes are striated vertically. Acicular crystals are sometimes twinned together to form reticulated skeletal plates to which the name "sagenite" (Gr. *σάγινη* a net), is applied. At the same time, the colour is usually reddish-brown, though yellowish in the very fine needles, and black in the ferruginous varieties ("nigrine" and "limonitine"); the streak is pale brown. The name rutile, given by A. G. Werner in 1803, refers to the colour (Lat. *rutillus*, red). Crystals are transparent to opaque, and have a brilliant metallic-adamantine lustre. The hardness is 6–5; specific gravity 4.2, ranging up to 5.2 in varieties containing 10% of ferric oxide.

Rutile occurs as a primary constituent in eruptive rocks, but more frequently in schistose rocks. As delicate acicular crystals it is often enclosed in mica and quartz; in mica (q.v.) it gives rise to the phenomenon of asterism; and clear transparent quartz (rock-crystal) enclosing rutile is often cut as a gem under the name of "Venus' hair stone" (Pliny's *Veneris crinis*). As a secondary mineral rutile in the form of minute needles is of wide distribution in various sedimentary rocks, especially clays and slates. As rounded grains it is often met with in auriferous sands and gravels. The mineral has little economic value; it has been used for imparting a yellow colour to glass and porcelain, and for this purpose is mined at Risør and other places in Norway.

(L. J. S.)

RUTILIUS CLAUDIUS NAMATIUS, Roman poet, flourished at the beginning of the 5th century A.D. He was the author of a Latin poem, *De Reditu Sui*, in elegiac metre, describing a coast voyage from Rome to Gaul in A.D. 476. The literary excellence of the work, and the flashes of light which it throws across a momentous but dark epoch of history, combine to give it exceptional importance among the relics of late Roman literature. The poem was in two books; the exordium of the first and the greater part of the second have been lost. What remains consists of about seven hundred lines.

The author is a native of S. Gaul (Toulouse or perhaps Poitiers), and belonged, like Sidonius, to one of the great governing families of the Gaulish provinces. His father was an imperial official with a distinguished career, and Rutilius himself was secretary of State and *praefectus urbi*. After reaching manhood, he passed through the tempestuous period between the death of Theodosius (395) and the fall of the usurper Attalus, which occurred near the date when his poem was written. Undoubtedly the sympathies of Rutilius were with those who during this period dissented from and, when they could, opposed the general tendencies of the imperial policy. We know from himself that he was the intimate of those who belonged to the circle of the great orator Symmachus—men who scouted Stilicho's compact with the Goths, and led the Roman senate to support the pretenders Eugenius and Attalus in the vain hope of reinstating the gods whom Julian had failed to save.

Perhaps the most interesting lines in the whole poem are those in which Rutilius assails the memory of "dire Stilicho," as he names him. Stilicho, "fearing to suffer all that had caused himself to be feared," planted the cruel Goths, his "skin-clad" minions in the very sanctuary of the empire. May Nero rest from all the torments of the damned, that they may seize on Stilicho; for Nero smote his own mother, but Stilicho the mother of the world!

We shall not err in supposing that we have here (what we find nowhere else) an authentic expression of the feeling entertained by a majority of the Roman senate concerning Stilicho. He had but imitated the policy of Theodosius with regard to the barbarians; but even that great emperor had met with passive opposition from the old Roman families. It is noteworthy that Rutilius speaks of the crime of Stilicho in terms far different from those used by Orosius and the historians of the lower empire. They believed that Stilicho was plotting to make his son emperor, and that he called in the Goths in order to climb higher. Rutilius holds that he used the barbarians merely to save himself from impending ruin. The Christian historians assert that Stilicho designed to restore paganism. To Rutilius he is the most uncompromising foe of paganism.

With regard to the form of the poem, Rutilius handles the elegiac couplet with great metrical purity and freedom, and betrays many signs of long study in the elegiac poetry of the Augustan era. The Latin is unusually clean for the times, and is generally fairly classical both in vocabulary and construction. The taste of Rutilius, too, is comparatively pure. It is common to call Claudian the last of the Roman poets. That title might fairly be claimed for Rutilius, unless it be reserved for Meropaeus. At any rate, in passing from Rutilius to Sidonius no reader can fail to feel that he has left the region of Latin poetry for the region of Latin verse.

BIBLIOGRAPHY.—All existing mss. of Rutilius are later than 1494, and are copies from a lost copy of an ancient ms. once at the monastery of Bobbio, which disappeared about 1700. The *editio princeps* is that by J. B. Pius (Bologna, 1520), and the principal editions since have been those by Barth (1623), P. Burman (1731, in his edition of the minor Latin poets), Wernsdorff (1778, part of a similar collection), Zumpt (1840), and the critical edition by Lucian Müller (Teubner, Leipzig, 1890), and another by Vessereau (1904); also an annotated edition by Keene, with a translation by G. F. Savage-Armstrong (1906). Müller writes the poet's name as Claudius Rutilius Namatianus, instead of the usual Rutilius Claudius Namatianus; but if the identification of the poet's father with the Claudius mentioned in the Theodosian Code (4, 4, 5) be correct, Müller is probably wrong. Rutilius receives more or less attention from all writers on the history or literature of the times, but a lucid chapter in Beugnot, *Histoire de la destruction du Paganisme en Occident* (1835), may be especially mentioned, and one in Pichon's *Derniers écrivains profanes* (1906). See also O. Schissel von Fleckenberg, *Rutilius Namatianus* (Vienna and Leipzig, 1920).

(J. S. R.)

RUTLAND, EARLS AND DUKES OF. The 1st earl of Rutland was Edward Plantagenet (1373–1415), son of Edmund, duke of York, and grandson of King Edward III. In 1390 he was created earl of Rutland, but was to hold the title only during the lifetime of his father, on whose death in 1402 the earldom accordingly became extinct, the earl then becoming duke of York. The title earl of Rutland seems to have been assumed subsequently by different members of the house of York, though it does not appear that any of them had a legal right to it. One of these

was the 1st earl's nephew, Richard Plantagenet, duke of York, father of King Edward IV. Richard's daughter Anne married for her second husband Sir Thomas St. Leger, and their daughter Anne married George Manners, 12th Baron Ros, or Roos (d. 1513). Their son, Thomas Manners (d. 1543), was therefore great-grandson of Richard Plantagenet, who had styled himself earl of Rutland among other titles. In 1525 Thomas Manners was created earl of Rutland, and his descendants have held this title to the present day.

Thomas was a favourite of Henry VIII, who conferred on him many offices and extensive grants of land, including Belvoir Castle, in Leicestershire, which became henceforth the chief residence of his family. He was succeeded in the earldom by his son Henry (c. 1516-1563); and his second son, Sir John Manners, acquired Haddon Hall, Derbyshire, by his marriage with Dorothy, daughter of Sir George Vernon, called "the king of the Peak." Henry, the 2nd earl, was an admiral of the fleet in the reign of Queen Mary, and later enjoyed the favour of Queen Elizabeth.

John, 9th earl (1638-1711), a partisan of the Revolution of 1688, received the Princess Anne at Belvoir Castle on her flight from London; after the accession of Anne to the throne she created him marquess of Granby and duke of Rutland in 1703. The 1st duke was three times married; the divorce in 1670, while he was still known as Lord Ros, of his first wife, Anne, daughter of the marquess of Dorchester, was a very celebrated legal case, being the first instance of divorce *a vinculo* by act of parliament, a divorce *a mensa et thoro* having previously been granted by the ecclesiastical courts. His grandson John, the 3rd duke (1696-1779), was the father of John Manners, marquess of Granby (q.v.), a distinguished soldier, whose son Charles, 4th duke of Rutland (1754-1787), succeeded his grandfather. When marquess of Granby he represented Cambridge university in the House of Commons, and hotly opposed the policy that led to war with the American colonies. He helped to procure the entrance of the younger Pitt to the House of Commons, and remained through life Pitt's intimate friend. After succeeding to the dukedom in 1779, he sat in the cabinets of Shelburne and of Pitt, and became lord lieutenant of Ireland in 1784.

He was one of the earliest to advocate a legislative union between Ireland and Great Britain, which he recommended in a letter to Pitt in June 1784. The poet Crabbe was for some time private chaplain to the duke at Belvoir. His wife, Mary Isabella (1756-1831), "the beautiful duchess," whose portrait was four times painted by Sir Joshua Reynolds, was a daughter of the 4th duke of Beaufort. His eldest son, John Henry, 5th duke (1778-1857), was "the duke" in Disraeli's *Coningsby*; the latter's two sons, who succeeded in turn to the dukedom, the marquess of Granby and Lord John Manners, figuring in the same novel as "the marquis of Beaumanoir" and "Lord Henry Sidney" respectively. The 7th duke is noticed separately.

RUTLAND, JOHN JAMES ROBERT MANNERS, 7TH DUKE OF (1818-1906), English statesman, was born at Belvoir Castle on Dec. 13, 1818, the younger son of the 5th duke of Rutland by Lady Elizabeth Howard, daughter of the 5th earl of Carlisle. Lord John Manners, as he then was, was educated at Eton and Trinity College, Cambridge. In 1841 he was returned for Newark in the Tory interest, along with W. E. Gladstone, and sat for that borough until 1847. Subsequently he sat for Colchester, 1850-57; for North Leicestershire, 1857-85; and for East Leicestershire from 1885 until in 1888 he took his seat in the House of Lords upon succeeding to the dukedom.

In 1841 Manners definitely associated himself with the "Young England" party, under the leadership of Disraeli. This party sought to extinguish the predominance of the middle-class bourgeoisie, and to re-create the political prestige of the aristocracy by resolutely proving its capacity to ameliorate the social, intellectual, and material condition of the peasantry and the labouring classes. Manners made an extensive tour of inspection in the industrial parts of N. England, in the course of which he and his friend Smythe expounded their views with a brilliancy which frequently extorted compliments from the leaders of the Manchester school. In 1843 he supported Lord Grey's motion for an

inquiry into the condition of England, the serious disaffection of the working classes of the north being a subject to which he was constantly drawing the attention of parliament. Among other measures that he urged were the disestablishment of the Irish Church, the modification of the Mortmain Acts, and the resumption of regular diplomatic relations with the Vatican. In the same year he issued in pamphlet form a strong *Plea for National Holydays*. In 1844 Lord John vigorously supported the Ten-hours Bill, which, though strongly opposed by Bright, Cobden, and other members of the Manchester school, was passed in May 1847.

Manners figured as "Lord Henry Sidney" in Disraeli's *Coningsby*, and not a few of his ideas are represented as those of Egremont in *Sybil* and Walsingham in *Endymion*. But the disruption of the Young England party was already impending. Lord John's support to Peel's decision to increase the Maynooth grant in 1845 led to a difference with Disraeli. Divergences of opinion with regard to Newman's secession from the English Church produced further defections in the ranks, and the rupture was completed by Smythe acquiescing in Peel's conversion to Free Trade. Lord John produced another volume of verse, known as *English Ballads*, chiefly patriotic and historical, in 1850. During the three short administrations of Lord Derby (1851, 1858 and 1866) he sat in the cabinet as first commissioner of the office of works. On the return of the Conservatives to power in 1874 he became postmaster-general in Disraeli's administration, and was made G.C.B. on his retirement in 1880. He was again postmaster-general in Lord Salisbury's administration, 1885-86, and was head of the department when sixteen telegrams were introduced. Finally, in the Conservative government of 1886-92 he was chancellor of the duchy of Lancaster. He had succeeded to the dukedom of Rutland in March 1888, upon the death of his elder brother. He died on Aug. 4, 1906 at Belvoir Castle.

RUTLAND, a midland county of England, bounded north and east by Lincolnshire, north and west by Leicestershire, and south-east by Northamptonshire. It is the smallest county in England, having an area of 152 sq. miles. The western portion is formed of the Jurassic beds, including Lias, inferior Oolites and great Oolites, which form the high ground. They dip gently to the east and are interrupted in places by faults, as in the Welland valley between Ketterton and Duddington. The lower Lias occupies but a very small part in the extreme north-west. The middle Lias includes marlstone and ferruginous limestone yielding iron in workable quantities and forming the productive soil of the Catmose valley. The upper Lias forms the steep slopes below the Oolitic scarp, and furnishes materials for bricks and tiles. The inferior Oolite limestones and sands form the highland of the west and the dip slope to the east, where, in the north-east, they are overlain by great Oolite. All these deposits are covered with glacial deposits.

Rutland is drained by the tributaries of the Welland, which flows along its eastern boundary.

HISTORY.—Ancient stone implements have been found in the Oakham district and along the river Wash, and small late Bronze age hoards. At the time of the Roman invasion, this region was inhabited by a scanty population of the Coritani tribe. This is inferred by the absence of finds, although Ermine street passes through its eastern portion. Rutland was forested in pre-Norman days and only a few early settlements occurred, which were found on the belt of Northampton sands at its junction with the Lias clays, where dry sites could be found near springs, with pastures on the clay beds. These sites were occupied by a tribe of the Middle Angles in the 6th and 7th centuries, and the whole region was absorbed subsequently in the kingdom of Mercia.

Although mentioned by name in the will of Edward the Confessor, who bequeathed it to his queen Edith for life, with remainder to Westminster abbey, Rutland did not rank as a county at the time of the Domesday survey in which the term Rutland is applied only to that portion assessed under Nottinghamshire, while the south-east portion of the modern county is surveyed under Northamptonshire, where it appears as the wapentake of Wiclessa. Rutland is first mentioned as a distinct county under the administration of a separate sheriff in the pipe roll

of 1150, but as late as the 14th century it is designated "Rutland Soke," and the connection with Nottinghamshire, a county which does not adjoin it at any point, was maintained up to the reign of Henry III., when the sheriff of Nottingham was by statute appointed also escheator in Rutland.

Rutland was included in the diocese of Lincoln, and in 1291 it became a new rural deanery, within the archdeaconry of Northampton; but on the elevation of Peterborough to an episcopal see by Henry VIII., in 1541, the archdeaconry of Northampton, with the deanery of Rutland, was transferred to that diocese. In 1876 the deanery of Rutland was placed within the newly-founded archdeaconry of Oakham.

The Norman Walkelin de Ferrers was connected with this county, and founded Oakham castle in the 12th century. The castle was subsequently bestowed by Richard II., together with the earldom of Rutland, on Edward, son of Edmond, duke of York. Essendine (Essenden, or Essingdon) was purchased in 1545 by Richard Cecil of Burleigh, and the title of baron of Essenden bestowed on his grandson is retained by the earls of Salisbury. Burley-on-the-hill was held by Henry Despenser, the warlike bishop of Norwich, in the reign of Richard II., and was purchased by George Villiers, duke of Buckingham, who there entertained James I. During the Civil War, Rutland was on the side of the parliament.

The county returned two members to parliament from 1295 until 1885, when the number was reduced to one. It is joined with part of the Kesteven division of Lincolnshire.

Agriculture and Trade.—Rutland has always been mainly an agricultural county. The Domesday survey mentions numerous mills in Rutland, and a fishery at Ayston rendered 325 eels. In the 14th century the county exported wool. Stilton cheese has long been made in Leyfield forest and the vale of Catmose, and limestone is dug in many parts of the county. The development of the economic resources of Rutland was helped in 1793 by the extension of the Melton Mowray canal to Oakham.

In the east and south-east districts of Rutland the soil is light and shallow, whilst in other districts it is a fertile loam, and in the vale of Catmose the soil is either clay or loam or a mixture of the two. The east part of the county is chiefly under tillage and the west in grass. Over 88% of the whole area, or 85,590 ac., was under cultivation in 1939; of this 26,425 ac. was arable land. Clover and rotation grasses for hay occupied 3,486 acres. The chief crops in 1939 were, in order of acreage occupied: barley, wheat, oats, turnips and swedes, sugar beets and mangolds. Many sheep (Leicesters and Southdowns) and cattle, mainly Shorthorns, were reared. Large quantities of cheese are manufactured and sold as Stilton. Agriculture is practically the only industry of importance, but there is some quarrying and bootmaking. The region producing iron is continued from Northampton into Rutland, and the working of the iron ore forms one of the industries of the county. The main line of the L.N.E. ry. intersects the northeastern corner of the county, and branches of that system, and of the L.M.S., serve the remainder. There were 300 miles of highways in 1941.

Population and Administration.—The area of the ancient and administrative county is 152 sq.mi., with a population of 17,860 (est. 1938). Between Sept. 1939 and Feb. 1940, however, wartime population movements, caused by evacuation and intensified industrial effort, caused an increase of 7%. The county contains five hundreds. Oakham (*q.v.*) is the county town and the only urban district. There are three rural districts. The county is in the Midland circuit, and assizes are held at Oakham. It has one court of quarter sessions, but is not divided for petty sessional purposes. The county is in the diocese of Peterborough.

See *Victoria County History, Rutland*; James Wright, *History and Antiquities of the County of Rutland* (London, 1684); T. Blore, *History and Antiquities of the County of Rutland*, vol. I. pt. 2 (containing the East hundred and including the hundred of Casterton Parva; Stamford, 1811); C. G. Smith, *A Translation of that portion of Domesday Book which relates to Lincolnshire and Rutland* (London, 1870).

RUTLAND, a city of Vermont, U.S., the county seat of Rutland county; on Otter creek, 95 mi. N.E. of Albany (New York). It is on federal highways 4 and 7 and is served by the

Delaware and Hudson and the Rutland railways. Pop. (1950) 17,659; 1940 federal census 17,082. Rutland has a beautiful site, 561 ft. above sea level, encircled by the Green mountains. Twenty peaks can be seen from the city hall, and there are 20 lakes within 20 mi. It is a summer resort and touring center. The famous Rutland marble (used for the memorial in Arlington National cemetery and for many public buildings throughout the country) is quarried in West Rutland and in Proctor (6 mi. N.W.) where there is a large marble display. Some of the underground quarries are 300 ft. below the surface. The manufacturing industries of the city include marble and monument works, and factories making stoneworking machinery, maple-sugar products and utensils and scales. Its morning newspaper, the *Herald*, was established in 1794. Rutland was settled in 1770, and from 1784 to 1804 it was one of the capitals of Vermont. The capitol (1784) is the second oldest building in the state.

The village was incorporated in 1847, and in 1892 a part of the town (including the village) was chartered as a city. Plymouth, a village 30 mi. S.E. of Rutland, was the birthplace of Calvin Coolidge.

RUTLEDGE, JOHN (1739–1800), American jurist and politician, was born in Charleston (S.C.) in 1739. He studied law in London, and began to practise in Charleston in 1761. He was a delegate to the stamp act Congress in 1765 and to the Continental Congress in 1774–77 and 1782–83; he was chairman of the committee which framed the State Constitution of 1776, and the first "president" (governor) of South Carolina in 1776–78. He resigned in 1778, but was elected governor in the following year, and served until 1782. In the Constitutional Convention of 1787 he urged that the president and the Federal judges be chosen by the national legislature. He was associate justice of the U.S. Supreme Court in 1789–91, and chief justice of the supreme court of South Carolina in 1791–95. Nominated chief justice of the Supreme Court of the U.S. in 1795, he presided during the August term, but the Senate refused to confirm the nomination, apparently because of his opposition to the Jay treaty. He died in Charleston July 23, 1800.

His brother, **EDWARD RUTLEDGE** (1749–1800), a signatory of the Declaration of Independence, was born in Charleston on Nov. 23, 1749. He studied law in his brother's office, and in London in 1769–73, and practised in Charleston. He served in the Continental Congress in 1774–77, and was sent with John Adams and Benjamin Franklin to confer on terms of peace with Lord Howe on Staten Island in Sept. 1776. As captain of artillery and as lieutenant colonel he served against the British in South Carolina. He was a member of the State legislature from 1782 to 1798, and in 1791 drafted the act which abolished primogeniture in South Carolina. From 1798 until his death Jan. 23, 1800, he was governor of South Carolina.

RUTULI, a people of ancient Italy inhabiting Ardea and the district round it on the coast of Latium, at no very great distance from Aricia, and just west of the territory of the Volsci. They are ranked by the form of their name with the Siculi and Apuli (Apuli), probably also with the Itali, whose real Italic name would probably have been Vituli (*see ITALY*). This suggests that they belong to a fairly early stratum of the Indo-European population of Italy.

RUVIGNY, HENRI DE MASSUE, MARQUIS DE, afterwards EARL OF GALWAY (1648–1730), was born in Paris on April 9, 1648, the son of the 1st Marquis de Ruvigny. He saw service under Turenne, who thought very highly of him. He had English connections, and was selected in 1678 by Louis XIV. to carry out the secret negotiations for a compact with Charles II., a mission which he executed with great skill. Succeeding his father as "general of the Huguenots" he refused Louis's offer, at the revocation of the Edict of Nantes, to retain him in that office, and in 1690, having gone into exile with his fellow Huguenots, he entered the service of William III. of England as a major-general, forfeiting thereby his French estates. In July 1691 he distinguished himself at the battle of Aughrim, and in 1692 he was for a time commander-in-chief in Ireland. He was created Viscount Galway and Baron Portlaurington, and received a large grant of forfeited

estates in Ireland

In 1693 Ruivigny fought at Neerwinden and was wounded, and in 1694, with the rank of lieutenant-general, he was sent to command a force in English pay which was to assist the duke of Savoy against the French, and at the same time to relieve the distressed Vaudois. But in 1695 the duke changed sides, the Italian peninsula was neutralized, and Galway's force was withdrawn to the Netherlands. From 1697 to 1701, a critical period of Irish history, the Earl of Galway (he was advanced to that rank in 1697) was practically in control of Irish affairs as lord justice of Ireland. After some years spent in retirement, he was appointed in 1704 to command the allied forces in Portugal, a post which he sustained with honour and success until the battle of Almanza in 1707, in which Galway, in spite of care and skill on his own part, was decisively defeated. But he scraped together a fresh army, and, although infirm, served in one more campaign. His last service was rendered in 1715, when he was sent as one of the lords justices to Ireland during the Jacobite insurrection. He died on Sept. 3, 1720.

RUVO DI PUGLIA, a town and episcopal see of Bari, Apulia, Italy, 21 mi. W. of the city of Bari by tramway, 853 ft. above sea-level. Pop. (1936) 24,748 (town), 25,452 (commune). The cathedral, a splendid basilica with a very lofty nave and two aisles, has three apses, a square campanile and a rich façade with three portals. It belongs to the early 13th century. The interior has a fine triforium. Ruvo occupies the site of the ancient Rubi.

RUWENZORI, also known as Runsoro or Kokora, a mountain range of Central Africa, 65 m. long and with a maximum breadth of 30 m., trending a little east of north, lying just north of the equator between lakes Edward and Albert. The range falls steeply on the west to the central African rift-valley traversed by the Semliki, the western head-stream of the Nile, while on the east the fall is somewhat more gradual towards the western Uganda uplands. The upper parts are separated by fairly low passes into six groups of snowy summits, lying a little west of the central line, rising in each case above 15,000 ft. and reaching, in the culminating point of the western group (Mount Stanley), about 16,800 ft.

The origin of the range seems connected with that of the rift-valley on the west. Ruwenzori is a fault block of the Archaean floor of the continent, bounded east and west by lines of fracture, and having a general dip from west to east. A further upheaval produced an ellipsoidal anticline, causing the strata to dip outwards at a high angle. Traces of volcanic action are almost non-existent. Composed in its outer parts of Archaean gneisses and mica-schists offering no great resistance to denudation, in its centre the range consists of much more refractory rocks (amphibolites, diorites, diabases, etc.), to which fact, coupled with the existence of vertical fractures, the persistence and separation of the higher summits is probably due. The snow-clad area does not now extend more than ten miles in any direction; the snow-line is 13,450 ft. but there is evidence of a former extension to as low as 4,600 ft.

The upper region is almost entirely enveloped by day in thick cloud, which descends on the east to about 9,000 ft., and lower still on the west. As a result, the climate is excessively humid, the northern slopes having a rainfall of 200 inches a year giving extremely damp conditions on the mountain. The rivers are raging torrents and have cut deep valleys between the outer spurs. From the innermost recesses between Mounts Stanley, Speke and Baker, the main branches of the Mobuku descend to the east, while the four principal streams on the west unite to form the Butagu, the drainage on both sides ultimately finding its way to the Semliki, either directly or through lakes George and Edward.

The vegetation displays well-marked zones, varying with the altitude; but owing to the lower level to which the cloud descends on the west the limits of the several zones reach a lower level on the west than on the east. They have been defined as follows by Mr. R. B. Woosnam (1907), as follows, the figures in brackets being the upper limit on the east side:—grass (6,500 ft.), forest (8,500), bamboos (10,000), tree heaths (12,500) and lobellias and senecios (14,500), above which is the summit region of snow and

bare rock. The boundaries between the zones merely indicate the levels between which the respective forms are specially characteristic. The forest zone is the best marked, but on the west it merges in part with the low-lying forest of the Semliki valley. Mosses, hepaticae and lichens are prevalent in several of the zones, while bogs, vaccinium and other low-growing plants, are common above the forest zone. Helichrysoms are abundant in the zone immediately below the snow. The larger mammals are found chiefly on the lower slopes, but bushbuck, pigs, leopards, monkeys, a hyrax and a serval cat occur at higher altitudes. The birds include ticks, buzzards, ravens, sun-birds, touraques, a large swift, and various warblers and other small kinds. The upper limit of human settlement, with cultivation of colocasia and beans, has been placed at 6,700 ft.

In modern times the existence of a snowy range in this part of Africa was first made known by Sir Henry Stanley during the Emin Pasha relief expedition of 1887-89. Stanley named the main mass Ruwenzori, and outlying eastern peaks he called Mt. Gordon Bennett, Mt. Lawson, Mt. Edwin Arnold, etc.—the last named lying north-east of Lake George. Subsequently Stanley's own name was given to the chief summit. One of Stanley's officers, Lieut. Stairs, ascended the western slopes to over 10,000 ft. in 1889, and partial ascents were afterwards made by Dr. Stuhlmann, Mr. Scott-Elliott, Mr. J. E. S. Moore, Sir Harry Johnston, Mr. Douglas Freshfield, and others. Early in 1906 some of the secondary ridges above the snow-line were scaled by Messrs. Grauer, Tegtart and Maddox, and by Dr. Wollaston and other members of the British Museum expedition, while later in the year the duke of Abruzzi led a well-equipped expedition to the upper parts of the range and ascended all the principal snow-clad peaks. The expedition produced for the first time a detailed map of the upper region, and threw much light on the geology and natural history of the range.

RUYSBROEK or RUYSBROECK, JAN VAN (1203?-1381), Dutch mystic, was born at Ruysbroek, near Brussels, in 1293. In 1317 he was ordained priest and became vicar of St. Gudule, Brussels. When 60 years of age he withdrew with a few companions to the monastery of Groenendaal, near Waterloo, giving himself to meditation and mystical writing, and to a full share of the practical tasks of the society. He was known as the "Ecstatic Teacher," and formed a link between the Friends of God and the Brothers of the Common Life, sects which helped to bring about the Reformation. Ruysbroek insisted that "the soul finds God in its own depths," and noted three stages of progress in what he called "the spiritual ladder" of Christian attainment: (1) the active life, (2) the inward life, (3) the contemplative life. He did not teach the fusion of the self in God, but held that at the summit of the ascent the soul still preserves its identity. His works, of which the most important were *De vera contemplatione* and *De septem gradibus amoris*, were published in 1848 at Hanover; also *Reflections from the Mirror of a Mystic* (1906) and *Die Zierde der geistlichen Hochzeit* (1901).

BIBLIOGRAPHY.—A new edition of his works, *Alle de werken van J. van Ruysbroec de Wonderbare, etc.*, was published at Bussum in 1912 seq. A translation of his works into French was begun by the Benedictines of St. Paul de Wisques in 1920 seq. The following single works have been translated: *The Book of the Twelve Egéries* (1913); *The Adornment of the Spiritual Marriage*, etc., trans. by C. A. Wynschenck, ed. with introd. and notes by E. Underhill (1916). See also R. M. Jones, *Studies in Mystical Religion*, pp. 308-14 (1909); M. Maeterlinck, *Ruysbroek and the Mystics*, with selections from *The Adornment of the Spiritual Marriage* (trans. by J. T. Stoddart, 1894); V. Scully, *A Medieval Mystic* (1910); E. Underhill, *Ruys-*

broeck (1915); Wautier d'Assalliers, *Ruyssbroeck l'admirable* (1923, Eng. trans. 1925).

RUYSDAEL (or **RUISDAEL**), **JACOB VAN** (c. 1628–1682), the most celebrated of the Dutch landscapists, was born at Haarlem. It is not known where he studied. His father, Isaack, was a framemaker, who also painted and it is suggested that Jacob studied first under him and that he was then under his uncle Solomon Ruysdael (c. 1600–1670) an able landscapist. The influence of Cornelius Vroom, another Haarlem landscapist, has also been traced in his early work; other authorities make him the pupil of Albert van Everdingen. The earliest date that appears on his paintings and etchings is 1646. Two years later he was admitted a member of the gild of St Luke in Haarlem; in 1659 he obtained the freedom of the city of Amsterdam, and in 1668 his name appears there as a witness to the marriage of Hobbema. During his lifetime his works were little appreciated, and he seems to have suffered from poverty. In 1681 the sect of the Mennonites obtained his admission into the almshouse of the town, where he died on March 14, 1682.

The works of Ruysdael may be studied in the Louvre and the National Gallery, London, and in the collections at The Hague, Amsterdam, Berlin, and Dresden and Leningrad. His favourite subjects are simple woodland scenes, similar to those of Van Everdingen and Hobbema. He is especially noted as a painter of trees, and his rendering of foliage is characterized by the greatest spirit and precision. His views of distant cities, such as that of Haarlem in the possession of the marquess of Bute, and that of Katwijk in the Glasgow Corporation galleries, clearly indicate the influence of Rembrandt. He frequently paints coast-scenes and sea-pieces, but it is in his rendering of lonely forest glades (such as "The Pool in the Wood" at Leningrad) that we find him at his best. The subjects of certain of his mountain scenes seem to be taken from Norway, and have led to the supposition that he had travelled in that country. We have, however, no record of such a journey, and the works in question are probably merely adaptations from the landscapes of Van Everdingen, whose manner he copied at one period. Otto Beit owns a magnificent view of the "Castle of Benheim" (1653) from which it may be concluded that his wanderings extended to Germany, where he may have made studies for the waterfalls and torrents which appear in many of his pictures. Only a single architectural subject from his brush is known—an admirable interior of the New Church, Amsterdam, in the possession of the marquess of Bute. The prevailing hue of his landscapes is a full rich green, which, however, has darkened with time, while a clear grey tone is characteristic of his sea-pieces. The art of Ruysdael, while it shows little of the scientific knowledge of later landscapists, is sensitive and poetic in sentiment, and direct and skilful in technique. Figures are sparingly introduced into his compositions, and are believed to be from the brush of Adrian Vandevelde, Philip Wouerman, Nikolaas Berchem, Eglog van der Neer, Ostade and Jan Lingelbach.

Unlike the other great Dutch landscape painters, Ruysdael did not aim at a pictorial record of particular scenes, but he carefully thought out and arranged his compositions. He particularly excels in the painting of cloudy skies which are spanned dome-like over the landscape. A romantic and sometimes deeply poetic sentiment is expressed in his work, as in "The Jewish Burial Ground" at Dresden which is regarded as one of the greatest landscapes ever painted. The "Cornfield" and the "Travellers," etchings, are also significant expressions of landscape art.

See Hofstede de Groot, *Catalogue of Dutch Painters* (1912).

RYAN, JOHN DENIS (1864–1933), American capitalist, was born at Hancock, Mich., on Oct. 10, 1864. In 1889 he went to Denver, where he was employed as a salesman of lubricating oils. In 1901 he secured an interest in a bank at Butte. In 1904 he was made manager of the Amalgamated Copper Company in Montana, becoming president in 1908. He had been elected president of the Anaconda Copper Mining Company in 1905, and after the merging of the Amalgamated interests in the Anaconda in 1910 he continued as president of the latter until 1918. He developed large water powers in Montana, and in 1913 electrified the rail-

way between Butte and Anaconda (room.), the success of which led to a wide expansion of railway electrification. During 1917–18 Ryan was an executive of the American Red Cross. He was appointed, in April 1918, head of the aircraft board of the committee of national defence, and in August was appointed second assistant secretary of war and director of air service of the U.S. Army, which position he resigned in November. In 1919 he was elected chairman of the Anaconda Copper Mining Company.

RYAZAN, a region of the Russian S.F.S.R., surrounded by those of Moscow, Ivanovo, Gorky, Penza, Tambov and Tula, and not coinciding with the pre-1917 province of the same name. Area 19,613 sq. mi. Pop. (1939) 2,265,873, mainly Great Russians, with some Tatars, Poles and Jews in the towns. The province is drained by the Oka and its tributaries, the Pronya and Pra, and small lakes are numerous in the wide depression of the Oka. Forests cover about one-fifth of the area, conifers, especially pines, prevailing in the more forested north, and deciduous forest with birch, ash and oak appearing in scattered patches in the south. North of the Oka is gray forest soil of little value for agriculture, but south of that river the fertile black earth of the steppe begins. The climate is extreme, average February temperature 3.2° F., July 67° F., rainfall 16 to 18 in. per annum.

Industries.—The region is essentially agricultural, except for a coal mining belt extending along the railway west from Ryazhsk. Dairying is not much developed, as the land is not suitable for pasture, but grain growing gives a good guarantee for the peasant and the villages are large, averaging 534 inhabitants. There are some collective agricultural artels. The chief crops are rye (50%), oats (19%), millet (11.2%) and potatoes (10%). Buckwheat, grass, hemp and sunflower seed are sown. Orchard fruits, especially apples, and cucumbers, cabbages, onions and other vegetables are cultivated in the valley of the Oka. Sheep, working and milch cattle, horses, pigs and a few goats are bred.

Koustar (peasant) textile industries are widespread, as is the making of leather and felt footwear, and the district was once famous for its lacemaking and leather embroidery. The northern region has small industries of this type, including the making of wooden vessels, sledges and boats, the preparation of pitch and tar and basketwork from the reeds in the marshy northern areas which occupy 6% of the region. The electric plant of Ryazan works on peat fuel from these bog areas, and also on the local coal. Marshy areas near the Oka river have been successfully drained and are now pasture lands.

There is a comparatively good railway net and 57% of the rivers are available for steam navigation; a good deal of transit trade goes on throughout the region.

RYAZAN, chief town of the above region, situated on the elevated right bank of the Trubezh, a mile above its confluence with the Oka in 54° 40' N., 39° 43' E. Pop. (1939) 95,358. A wide prairie dotted with large villages, the bottom of a former lake, spreads out from the base of the crag on which Ryazan stands, and actually has the aspect of an immense lake when it is inundated in the spring. The town manufactures agricultural machinery, boots, shoes and leather goods, and bricks, and has a distilling industry. It is an important trading centre, on a navigable river, with four railways radiating from it and a good main road linking it with Moscow. The Krestovozdvizhensk church contains tombs of the princes of the 15th and 16th centuries.

The capital of Ryazan principality was Ryazan—now Old Ryazan, a village close to Spassk, also on the Oka. It is mentioned in annals as early as 1097, but continued to be the chief town of the principality only until the 14th century. In the 11th century one of the Kiev princes founded, on the banks of a small lake, a fort which received the name of Pereyaslav-Ryazanskiy. In 1294 (or in 1335) the bishop of Murom, compelled to leave his own town, settled in Pereyaslav-Ryazanskiy. The princes of Ryazan followed his example, and by and by completely abandoned the old republican town of Ryazan. In 1300 a congress of Russian princes was held there, and in the following year the town was taken by the Moscow prince. It continued, however, to be the residence of the Ryazan princes until 1517.

RYAZHSK, a town and railway junction in Ryazan region, Russian S.F.S.R., S. of Ryazan, in $53^{\circ} 43' N$, $40^{\circ} 3' E$, on the Krupta river. Pop. 16,164. It is a grain collecting centre with an elevator, and manufactures *makhorka* tobacco and spirits.

RYBINSK, a town in Yaroslavl region, Russian S.F.S.R., in $58^{\circ} 3' N$, $38^{\circ} 47' E$, on the navigable Volga, opposite the mouth of the Sheksna, which connects the Volga system with Lake Ladoga. Pop. (1939) 139,011. There goods are transhipped from the large Volga boats to the smaller ones of the Mari system linking with Leningrad. There are ship yards, wireworking mills, nail, metal and match factories, flourmills, leather works and a brewery.

(2) A small settlement of Asiatic Russia on a left bank tributary of the Irtysh in $56^{\circ} 5' N$, $72^{\circ} 30' E$.

(3) A small town of Asiatic Russia south of the trans-Siberian railway, lying between Krasnoyarsk and Kansk, in $55^{\circ} 55' N$, $94^{\circ} 55' E$.

RYDBERG, ABRAHAM VIKTOR (1828–1895), Swedish author and publicist, was born in Jönköping on Dec. 18, 1828. In 1855 he joined the staff of the *Göteborgs Handels-och sjöfartstidning*, in which his romances successively appeared; he was editorially connected with it until 1876. The *Freebooter on the Baltic* (1857) and *The Last of the Athenians* (1859) gave Rydberg a place in the front rank of contemporary novelists. It was a surprise to his admirers to see him presently turn to theology, but with *The Bible's Teaching about Christ* (1862), in which the aspects of modern Biblical criticism were first placed before Swedish readers, he enjoyed a vast success. He was not elected to the Swedish Academy until 1877, when he had long been the first living author of Sweden. *Roman Days* is a series of archaeological essays on Italy (1876). He collected his poems in 1882; his version of *Faust* dates from 1876. In 1884 he was appointed professor of ecclesiastical history at Stockholm. He died, after a short illness, on Sept. 22, 1895. Rydberg was an idealist of the Romantic type which Sweden had known for three-quarters of a century; he was the last of that race, and, as a writer, perhaps the greatest.

See C. Warburg, *Victor Rydberg, hans levnad och diktning* (1923); L. Lundh, *Victor Rydberg* (Stockholm, 1928); V. Svanberg, *Rydbergs Singskola* (Uppsala, 1923).

RYDBERG, PER AXEL (1860–1931), American botanist, was born at Odh, Sweden, on July 6, 1860. He graduated at the gymnasium in Skara, in 1881, and soon after went to the United States, where he continued further study at the University of Nebraska (B.S., 1891; M.S., 1895) and at Columbia (Ph.D., 1898). In the period 1884–98 he also taught natural sciences in several Swedish-American institutions, and during summers in 1891–96 he was field agent for the divisions of botany and agrostology of the U.S. Department of Agriculture. In 1899 he was made curator at the New York Botanical Garden. He made extensive taxonomic studies of the seed-plants of the Great Plains and the Rocky Mountain region.

He published *Catalogue of the Flora of Montana and the Yellowstone National Park* (1900), *Flora of Colorado* (1906), *Flora of the Rocky Mountains and Adjacent Plains* (1917; 2nd ed., 1922). He also wrote monographs on Saxifragaceae, Rosaceae, Carduaceae and other plant groups, and various contributions to botanical journals.

RYDE, a municipal borough and watering place in the Isle of Wight, England, 5 mi. S.W. of Portsmouth. Pop. (1951) 20,084. Beautifully situated on rising ground on the northeast coast, overlooking Spithead, it is on the site of a village called La Rye or La Riche, which was destroyed by the French in the reign of Edward II. At the close of the 18th century it was a small fishing hamlet, but it rapidly grew as a watering-place. Ryde is connected by rail with the other towns in the island, and also by boat with Portsmouth, Southampton, Southsea, Portsea and Stoke's bay. The pier is half a mile in length. The principal buildings are All Saints church, the market house and town hall, the Royal Victoria Yacht club-house, the pavilion and the Royal Isle of Wight Infirmary. There are golf links near the town. The town was incorporated in 1868. Area, 12.3 sq. mi.

RYDER, ALBERT PINKHAM (1847–1917), American artist, was born at New Bedford, Mass., on March 19, 1847. He

was a pupil of William E. Marshall and of the schools of the National Academy of Design. Among his better known paintings are: "Temple of the Mind," "Jonah and the Whale," "Christ appearing unto Mary," "The Flying Dutchman," "Charity" and "The Little Maid of Arcadia." He became a member of the Society of American Artists in 1878, and a National Academician in 1906. He died at Elmhurst, Long Island, N.Y., on March 28, 1917. In 1918 the Metropolitan Museum held a memorial exhibit of his work.

RYE, a market town and municipal borough in the Rye parliamentary division of Sussex, England, 11 mi. E.N.E. from Hastings, on the S.R. Pop. (1951) 4,511. Area, 1.6 sq. mi. In early times Rye (La Rye, Ric) was a fishing village and, as part of the manor of "Rameslie" was granted by Cnut to the abbot and convent of Fécamp, by whom it was retained until Henry III resumed it in 1247, when that part outside the liberty of the town, and therefore known as Rye Foreign, was probably joined to the abbey's manor of Brede. The town had become attached to the Cinque Port of Hastings by the time of Henry II, but the fluctuations of the sea and attacks of the French caused its decline in the 13th and 14th centuries, and the walls were built during the reign of Edward III. The decay of Winchelsea contributed to the partial revival of Rye in the 15th and 16th centuries, when it was a chief port of passage. Towards the end of the 16th century the decay of the port began, and notwithstanding frequent attempts to improve the harbour it never recovered its ancient prosperity. By the end of the 13th century Rye seems to have become a borough, with mayor, barons and bailiffs but it possesses no charter distinct from the Cinque Ports. As a member of the Cinque Ports it sent representatives to the parliament of 1265, and two members were returned from 1366 until 1832, when, jointly with Winchelsea, it returned one member until 1885. In 1290 Rye was granted a three days' fair in September, altered in 1305 to March. Weekly markets on Wednesday and Friday were evidently held before 1405, as in that year the Friday market was changed to Saturday. Shipbuilding began here as early as the 13th century and is still carried on. The town is situated above the south of Romney marsh, which within historic times was an inlet of the English Channel. The sea began to recede in the 16th century, and now the river Rother forms a small estuary with its mouth 2 mi. from the town; this serves as a small harbour with a depth of 10 ft. at high tide. Fishing is the principal trade and there is a market for sheep, wool, grain and hops.

RYE, a city of Westchester county, New York, U.S., on Long Island sound, 24 mi. N.E. of New York city; served by the New York, New Haven and Hartford and electric railways. Pop. 11,721, 1950 federal census. It is a residential city with several yacht and country clubs and a number of 18th century houses. The municipal hall is an old inn (Haviland) where Washington and Lafayette were entertained. "Kirby's tide-mill," built before the Revolution, still stands. Rye was the home of John Jay, and his grave is there in the family burying ground. At Rye beach there is a seaside playground of 214 ac. owned and operated by the county. The village was incorporated in 1904, the city in 1942.

RYE. This cereal, known botanically as *Secale cereale*, is of less importance than any of the grain crops. While generally distributed over the world, rye is of major importance only on the poorer soils of the northern hemisphere.

The spike of the rye plant consists of alternately ranked spikelets attached to a rachis forming a fairly dense head or "ear." The spikelets are composed of two thin and narrow glumes that enclose two or more florets. Each of the florets consists of a lemma and palea which enclose a pistil and three stamens. The number of fertile florets depends a great deal upon the soil fertility and growth conditions. The lemmas taper into awns of about two to four centimetres in length. The ovary develops after pollination into a long one-seeded fruit known botanically as a caryopsis. The outer colour of the caryopsis varies, but grayish-green and light brown grains predominate. Some of the grains are almost white. Upon threshing, kernels are freed from the enclos-

ing lemma and palea. Sterile florets occur to the extent of 25% to 30% in field grown rye and this is enough to reduce yields. Cross-pollination occurs nearly 100% because the flowers are largely self-sterile. The leaves are long, narrow and thin. The first foliage is reddish or purplish brown. The ligule is short and the auricles are only moderate in size. The growing culms have a bluish-green bloom, and the height and number of culms depend upon growth conditions. Rye has the tallest and strongest straw of all of the small grain crops. Because the straw may attain a height of 7 to 8 ft. on fertile soils, harvesting is accomplished with difficulty. There are numerous fibrous roots, and they penetrate downward more deeply than in other small grains.

Rye probably originated in southwestern Asia, like several other important genera such as *Triticum*, *Avena* and *Hordeum*. The exact progenitor is not known, though some think that the brittle rachis type, *Secale fragile*, may be the correct ancestor. Early cultivation was likely in western Asia.

Volunteer *Secale montanum*, a plant some authors think is the progenitor of common rye, has been seen growing thickly near Tashkent in Turkestan. No traces of cultivated rye have been found in early Egyptian monuments, and likewise ancient writings contain no reference to this crop. However, the name occurs in northern European languages and this suggests early cultivation in this area.

Only one species of cultivated rye is recognized, *Secale cereale*, although several other species have been found growing wild. This plant has seven chromosomes in the haploid state, and there is no evidence of a polyploid series which is characteristic of wheat and other small-grained cereals. Most rye is grown as a fall-sown annual, though a small amount is spring-sown with spring instead of winter varieties.

Rye grows primarily in the temperate and cool regions of the world and up to altitudes of 14,000 ft. Possessing the greatest winterhardiness of all small grains, rye culture extends to the more northerly parts of North America, Europe and Asia as far north as the Arctic circle. This crop ripens earliest of all the small grains, usually about a week earlier than winter wheat. Even though it is grown in warmer parts of the United States and southern Europe the cooler areas have much greater production. The type of soil has an important influence on geographic distribution. Usually rye is grown on the poorer non-chernozem soils of Europe and Russia. Sandier and poorer soils are used in the United States.

Rye culture follows the conventional methods used for other small grains. The crop may be drilled or sown broadcast at the rate of about six pecks per acre.

Rye is not used to any great extent as a nurse crop in establishing forage crops. Soil requirements are modest—even more so than for oats. Rye will produce well on fertile soils, but these types of soils are reserved for growing other crops. In certain areas where other crops fail to produce satisfactory yields because of low soil fertility, rye is often grown. It is frequently rotated with other crops, although it is grown continuously in certain areas. Seeding time is usually in the early fall and harvesting is done mostly in June and July in the northern hemisphere.

As a grain crop rye has two main uses, for breadmaking and for livestock feed. In making rye bread, various proportions of wheat flour may be used because the gluten of rye is less elastic than that of wheat. Rye stands next to wheat in use for milling and baking loaf bread. This type of bread is darker in colour and usually heavier than wheat bread. It is frequently referred to as black bread in Russian and central European areas, where considerable quantities are consumed. In the United States it is of minor importance except where there are concentrations of racial stocks that consume large quantities of rye flour.

Livestock feed is one of the main uses of the rye crop. For most classes of livestock it is usually fed in mixtures of other feeds. It has less fats than wheat, about the same protein content, and is about the highest in carbohydrates of all the cereal crops. Vitamin B₁ content is slightly lower than in barley and wheat, and much lower than in oats. Rye is used also in the making of alcoholic beverages.

Rye straw is fibrous and tough and, therefore, is of less use as a feed than as litter or bedding. The straw is used for thatching in certain areas of the world, and also in the manufacture of hats, paper, saddles and horse collars.

Rye has considerable use for fall and spring cattle grazing. As a spring pasture it is available before permanent pastures have made sufficient growth for grazing livestock. The leaves are high in vitamin A content. In warmer areas rye is used for fall grazing and cover cropping. It is also used as a green manure crop, being plowed under in the spring and followed by a crop of greater economic value.

Ergot is one of the by-products of rye used in medicinal preparations. Ergot is caused from ovary infection by the fungus *Claviceps purpurea*. The developing young kernel is penetrated by the fungus and produces a large bluish-brown body called a sclerotium. Ergot sclerotia contain pharmaceutical compounds such as ergosterol, ergotoxin, ergotamin, ergosterrine, ergoclarin, etc. Ergot fed in large quantities may cause abortion.

Other diseases attack rye; but most of them cause only minor yield reduction. There are many leaf and stem diseases, such as leaf and stem rust, stalk and head smut, scald and blotch, and some root rots. On the whole, if ergot is omitted, disease losses in rye are less than in other small grains.

Improvement of the rye plant by breeding is difficult because of the high degree of self-sterility. Most improvement can be attributed to the mass selection method of breeding rather than the pure line method. Because of the necessity of cross-pollination, varieties are genetically impure. Inbred lines have been produced and their fertility raised to a point where they can be perpetuated without difficulty. Certain crosses between selected inbred lines are known to exhibit hybrid vigour and greater productivity than open-pollinated varieties. No method has been found to utilize this biologic principle. Since rye is thrifty and winter-hardy it has been hybridized with wheat; in some cases the more winter-hardy types of selections having wheat quality have been developed. However, the amount of wheat-rye hybrids in commercial production is rather small.

In the United States the following varieties of rye have been grown to a considerable extent: Schlanstedt, Petkus, Swedish, Dakold, Imperial, Raritan, Rosen and Abruzzese. Some exceptional characteristics are the winter-hardiness of Dakold, and the white kernels of Imperial. Most of these varieties have come from stocks of European and Russian origin.

In other countries some important varieties not already mentioned are Aland, Azov, Abyssinian, Erzerum, Hanna, Ivanov, Probsteler and Russian Giant.

Production and Trade.—World production of rye averages about 1,500,000,000 to 1,800,000,000 bushels. Of the total, Russian and European production ordinarily account for perhaps more than 90%. Russian production alone is about half that of the world. Other important growers are Germany and Poland. The United States grew about 57,000,000 bushels in 1942. Countries of still lesser importance in planting rye are Hungary and France. The frequent low yield—about 12 bushels per acre—is partly due to the fact that rye is grown on poorer soils. The leading states for production in the United States are North Dakota, Minnesota, South Dakota and Nebraska.

Trade in rye has always been rather limited when compared with other grains.

International Trade in Rye, 1938

Country	Exports 1,000 bu.	Imports 1,000 bu.
Poland	17,603	3
Canada	1,121	14
Argentina	2,983	0
Germany	6	5,712
Denmark	463	3,760
Norway	0	4,057
Czechoslovakia	237	2,173
Netherlands	2,093	2,982
Belgium	455	12,282

From 1925 to 1930 the United States, U.S.S.R., Germany, Poland, Hungary and Argentina were the major exporters of rye, with German imports almost as much as exports.

From 1930 to 1935 the United States, Germany, Denmark and the Netherlands were the largest importers.

Belgium was the leading importer of rye in 1938

(H. L. Ss.)

RYKOV, ALEXEI IVANOVICH (1881-1938), Russian politician, was born in Saratov, the son of a peasant. Saratov was a place of banishment for revolutionaries, and Rykov came under their influence. When he went to Kazan he was already taking part in social democratic organizations. He was imprisoned and sent back to Saratov to remain under police supervision. Continuing his revolutionary work, he was rearrested, but escaped abroad before his trial. He visited Lenin at Geneva, and returned to Russia as a propagandist in various industrial districts. In 1904 he was in Moscow, and in 1905 attended a congress of the Communist party which elected him a member of the party's central committee. On returning from the congress he was arrested in St. Petersburg (Leningrad). He was freed by the revolution of 1905, was a representative of the Bolsheviks in the St. Petersburg workmen's soviet and escaped from the capital when the soviet was arrested. He took part in the December revolt and the fighting on the barricades in Moscow, escaped to Odessa after the failure of that revolt, but presently was again working in Moscow, where he was arrested, but once more succeeded in escaping.

In 1907 he was arrested and banished to Samara, but went abroad to visit Lenin. He was arrested on returning and exiled to the province of Archangel for three years. He escaped shortly before the end of his term of exile, and went to Paris. He returned to Russia to organize a congress, was arrested in 1911 and remained in prison till 1913, when in October he was sentenced to exile to the Naryn district for four years. In 1915 he escaped, went to Samara, was recaptured and sent back to the Naryn district, where he remained until the revolution of 1917, after which he worked in the Moscow Bolshevik organization. He was active in the November revolution, became president of the supreme economic council, and succeeded Lenin as president of the council of people's commissars. After 1929 his influence waned. Expelled in March 1937, he was shot following a trial in March 1938.

RYLANDS, JOHN (1801-1888), English manufacturer and merchant, was born at St. Helens, Lancashire, on Feb. 7, 1801, and was educated at the grammar school in that town. In 1819 he, his elder brothers and his father, a manufacturer of cotton goods, founded the firm of Rylands and Sons, cotton goods and linen manufacturers, at Wigan. The business rapidly increased, dye-works and bleach-works were added, and the discovery of coal under some of the firm's property added materially to its wealth. In 1825 the partners became merchants as well as manufacturers, and subsequently acquired spinning mills at Bolton and elsewhere. In 1847, his father being dead and his brothers having retired, John Rylands assumed entire control of the business, which in 1873 was turned into a limited liability company. John Rylands was a benefactor to various charities, and was one of the original financiers of the Manchester Ship canal. He died at Streteford on Dec. 11, 1888. A permanent memorial, the John Rylands Library, was erected by his widow in Manchester in 1899.

RYLANDS, SIR (WILLIAM) PETER (1868-1948), English industrialist, was born on Oct. 23, 1868, and educated at Charterhouse and at Trinity College, Cambridge. He studied law and was called to the bar in 1894, but four years later became managing director of Rylands Brothers. In 1900 he was made president of the Iron and Steel Wire Manufacturers association, retaining this post for almost a half century. After World War I he became president of the Federation of British Industries (1919-21), the Iron and Steel Institute (1926-27) and the National Federation of Iron and Steel Manufacturers (1930). In 1935-36 he was high sheriff of Cheshire.

He was knighted in 1921, created baronet in 1939 and was a commander of the Royal Order of Vasa. He died at Thelwall, Cheshire, England on Oct. 22, 1948.

RYMER, THOMAS (1641-1713), English historiographer royal, was the younger son of Ralph Rymer, lord of the manor of Brafferton in Yorkshire, executed for his share in the "Presbyterian rising" of 1663. Thomas was probably born at Vafforth Hall early in 1641, and was educated at a private school kept at Danby-Wiske by Thomas Smelt, a noted Royalist, and at Sidney Sussex college, Cambridge. He left the university without taking a degree. On May 2, 1666, he became a member of Gray's Inn, and was called to the bar on June 16, 1673. Rymer executed translations, wrote plays, prefaces and complimentary pieces. In 1692 Rymer became historiographer royal.

Within eight months of his official appointment Rymer was directed (Aug. 26, 1693) to carry out that great national undertaking with which his name will always be honourably connected, and of which there is reason to believe that Lords Somers and Halifax were the original promoters. The *Codex Juris Gentium Diplomaticus* (1693) of Leibniz was taken by the editor as the model of the *Foedera*. The plan was to publish all records of alliances and other transactions in which England was concerned with foreign powers from 1101 to the time of publication, limiting the collection to original documents in the royal archives and the great national libraries. Unfortunately, this was not uniformly carried out, and the work contains some extracts from printed chronicles. From 1694 Rymer corresponded with Leibniz, by whom he was greatly influenced with respect to the plan and formation of the *Foedera*. While collecting materials, Rymer unwisely engraved a spurious charter of King Malcolm, acknowledging that Scotland was held in homage from Edward the Confessor. When this came to be known the Scottish antiquaries were extremely indignant, and a controversy arose, the documents in which are now rare and valuable.

At last, on Nov. 20, 1704, was issued the first folio volume of the *Foedera, Conventiones, Litterae et consensuum generis Acta Publica inter reges Angliae et alios quorvis imperatores, reges, etc., ab A.D. 1101 ad nostra usque tempora habita aut tractata*. The publication proceeded with rapidity, and 15 volumes were brought out in nine years. Rymer died after the appearance of the last volume, but he had prepared materials for carrying the work down to the end of the reign of James I. These were placed in the hands of Robert Sanderson, his assistant, who produced the remaining five volumes (1715-17 and 1726-35).

Rymer died at Aiundel Street, Strand, on Dec. 14, 1713, and was buried in the church of St. Clement Danes. His will was dated July 10, 1713.

In 1810 the Record Commissioners authorized Dr. Adam Clarke to prepare a new and improved edition of the *Foedera*. Six parts, large folio, edited by Clarke, Caley and Holbrooke, were published between 1816 and 1830. Considerable additions were made, but the editing was performed in so unsatisfactory a manner that the publication was suspended in the middle of printing a seventh part. The latter portion, bringing the work down to 1383, was ultimately issued in 1869. A general introduction to the *Foedera* was issued by the Record Commission in 1871, 4to.

The best account of Rymer is to be found in the prefaces to Sir T. D. Hardy's *Syllabus* (1869-85, 3 vols. 8vo).

RYNCHOPIDAE: see SKIMMER.

RYOT or RAYAT, properly a subject, then a tenant of the soil (from the Arabic *ra'a*, "to pasture"). The word is used throughout India for the general body of cultivators; but it has a special meaning in different provinces. The *ryotwari* tenure is one of the two main revenue systems in India. Where the land revenue is imposed on an individual or community owning an estate, and occupying a position analogous to that of a landlord, the assessment is known as *zamindari*; and where the land revenue is imposed on individuals who are the actual occupants, the assessment is known as *ryotwari*. (See ZAMINDAR.)

RYSWICK, TREATY OF, the treaty of peace which in 1697 ended the war which had begun in 1689 between France on the one side and the Empire, England, Spain and Holland on the other (see GRAND ALLIANCE, WAR OF THE). The treaty was signed by all the Powers concerned except the Empire on Sept. 20, 1697, a treaty being concluded between France and the Emperor on Oct. 30.

The basis of the peace was that all towns and districts seized

since the treaty of Nijmegen in 1679 should be restored. Thus France surrendered Freiburg, Breisach and Philippsburg to Germany, although she kept Strasbourg. On the other hand, she regained Pondicherry and Nova Scotia, while Spain recovered Catalonia, and the barrier fortresses of Mons, Luxemburg and Courtrai. The duchy of Lorraine, which for many years had been in the possession of France, was restored to Leopold Joseph, a son of duke Charles V., and the Dutch were to be allowed to garrison some of the chief fortresses in the Netherlands, including Namur and Ypres. Louis undertook to recognize William as king of England, and promised to give no further assistance to James II.; he abandoned his interference in the electorate of Cologne and also the claim which he had put forward to some of the lands of the Rhenish palatinate.

See C. W. von Koch and P. Scholt, Histoire abrégée des traités de paix (1817-18); A. Moëtjens, Actes et mémoires de la paix de Ryswick (The Hague, 1725); A. Legrelle, Notes et documents sur la paix de Ryswick (Lille, 1804); H. Vast, Les Grands Traités du règne de Louis XIV. (1803-09).

RYÜKYŪ ARCHIPELAGO (called also **LUCHU**), a long chain of islands forming Okinawa prefecture of Japan, stretching from a point 80 mi. S. of Kyushu to a point 73 mi. from the N.E. coast of Formosa, and lying between 24° and 30° N. and 123° and 130° E. Japanese cartographers reckon the Luchu islands as 55, having a total coastline of 768 mi., an area of 935 sq.mi., and a population (1940) of 574,579. They divide them into three main groups, of which the northern is called Oshima-shoto; the central, Okinawa-gunto; and the southern, Sakishima-shoto. The terms *shoto*, *gunto* and *retto* signify "archipelago," "cluster of islands," and "string of islands," respectively. The last-named group is subdivided into Miyako-gunto and Yagayama-gunto.

Almost at the extreme north of the chain are two islands with active volcanoes; Nakano-shima (3,485 ft.) and Suwanose-shima (2,697 ft.), but the remaining members of the group give no volcanic indications, and the only other mountain of any size is Yuwan-dake (2,399 ft.) in Amami-Oshima. The capital is Shuri in Okinawa, with a picturesque castle. The more modern town of Naha, on the same island, possesses the principal harbour and has considerable trade.

Though so close to the tropics, the islands cannot be said to present tropical features: the bamboo is rare; there is no high grass or tangled undergrowth; open plains are numerous; the trees are not crowded together; lakes are wanting; the rivers are insignificant; and an unusual aspect is imparted to the scenery by numerous coral crags. The temperature in Naha ranges from a mean of 82° F. in July to 50° in January.

The fauna includes wild boars and deer, rats and bats. Excellent small ponies are kept, together with cattle, pigs and goats. The majority of the islands are infested with venomous snakes called *habu* (*Trimeresurus*), which attain a length of 6 to 7 ft. and a diameter of from 2½ to 3 in. Their bite generally causes speedy death, and in the island of Amami-Oshima they claim many victims every year. The most important cultivated plant is the sugar-cane, which provides the principal staple of trade.

Luchu is noted for the production of particularly durable vermilion-coloured lacquer, which is much esteemed for table utensils in Japan. The islands also manufacture fabrics.

People.—Although the upper classes in Luchu and Japan closely resemble each other, there are palpable differences between the lower classes, the Luchuan being shorter and better proportioned than the Japanese; having higher foreheads, eyes not so deeply set, faces less flattened, arched and thicker eyebrows, better noses, less marked cheek-bones and much greater hairiness. The last characteristic has been attributed to the presence of Ainu blood, and has suggested a theory that when the Japanese race entered south-western Japan from Korea, they drove the Ainu northwards and southwards, one portion of the latter finding their way to Luchu, the other to Yezo. Women of the upper class never appear in public in Luchu, and are not even alluded to in conversation,

but women of the lower orders go about freely with uncovered faces. The Luchu costume resembles that of Japan. The chief staple of the people's diet is the sweet potato, and pork is the principal luxury. An ancient law, still in force, requires each family to keep four pigs. In times of scarcity a species of sago (obtained from the *Cycas revoluta*) is eaten.

History.—Tsinshun, "Grandson of Heaven," is the mythical founder of the Luchu monarchy. Towards the close of the 12th century his descendants were driven from the throne, but the old national party soon found a victorious leader in Shunten, son of Tametomo, a member of the famous Minamoto family, who, having been expelled from Japan, had come to Luchu and married there. The introduction of the arts of reading and writing are assigned to Shunten's reign. Chinese invasions of Luchu may be traced back to A.D. 605, but they did not result in annexation; and it was in 1372 that China first obtained from the Luchuan recognition of supremacy. Luchuan relations with Japan had long been friendly, but at the end of the 16th century the king refused Japan assistance against Korea, and in 1609 the prince of Satsuma invaded the islands with 3,000 men, took the capital by storm, captured the king and carried him off to Kagoshima. A few years later he was restored to his throne on condition of acknowledging Japanese suzerainty and paying tribute. The Luchuan nevertheless continued to pay tribute to China also.

The Chinese government, however, though taking a benevolent interest in the welfare of the islanders, never attempted to bring them under military sway. The incongruity of this state of affairs did not force itself upon Japan's attention so long as her own empire was divided into a number of semi-independent principalities. But in 1879 the Japanese government, treating Luchu as an integral part of the mikado's dominions, dethroned its prince, pensioned him as the other feudal chiefs had been pensioned, and converted Luchu into a prefecture under the name of Okinawa. China remonstrating, a conference was held in Peking, when plenipotentiaries of the two empires signed an agreement to the effect that the archipelago should be divided equally between the claimants. The Chinese government, however, refused to ratify this compromise, and the Japanese continued their measures for the effective administration of all the islands. Ultimately (1895) Formosa also came into Japan's possession, and her title to the whole chain of islands ceased to be disputed.

RZESZÓW, a town of Poland, in the province of Lwow, situated on the river Wislok, half-way between Lwow and Cracow. Pop. (1931), 27,499. It was founded by Casimir the Great and became the seat of a great family, taking their name from the town and dying out in 1583. The old church shows traces of the original structure built by King Casimir in the 14th century. Ordinarily it is a prosperous town in an agricultural and pastoral district. It was captured by Germany in Sept. 1939.

RZHEV or RZHOV, a town in the Kalinin region of the Russian S.F.S.R., in 56° 20' N., 34° 19' E., lying on both sides of the Volga river, here 350 ft. wide, and navigable for steamers. It is a centre for four branch railway lines and a telegraph line, and has a radio station. Pop. (1939) 54,087, mainly employed in saw-milling, leather work, oil pressing, silk spinning, distilling, brewing and the making of machinery. In the 12th century it was part of the principality of Smolensk, which from 1225 was a dependency of Novgorod. In the 15th century the parts of the town on the left and right banks of the river were governed separately under the rule of independent princes.

S THIS letter corresponds to the Semitic **W** (*sin*). The Greek treatment of the sibilants that occur in the Semitic alphabet is somewhat complicated. Semitic **𐤎** (*samech*) appears in Greek as **Ξ** (*ksi*) with the value in early times of *ss*, later and more generally of *x* or *ks*. The name *samech*, however, which through its Aramaean form became in Greek *sigma*, was applied to the letter **Σ** which corresponded to Semitic **W** (*sin*) and stood for *s*. In certain Greek alphabets the letter was called by the name *san*. Semitic *ssade* appears in the early alphabets of Thera and Corinth in the form **Μ** representing *s*. These alphabets have no *sigma*, while those that have *sigma* do not have **Μ**.

Greek forms of the letter were **Σ**, **Ϻ**, **ϣ**, **ϛ**. The rounded form appears in the Chalcidic alphabet and from this it was taken

occurs, the left hand oblique stroke being really part of a ligature with a preceding letter.

The letter represents an unvoiced fricative. This has become voiced in English when intervocalic (e.g., *houses, nose*). In most other positions it remains unvoiced (e.g., *sing, save, stamp, speak, aspect*). When doubled the letter represents the unvoiced sound in all positions (e.g., *grasses, miss, assess*). (B. F. C. A.)

SAADIA, BEN JOSEPH (892-942): see **SEADIAH**.

SAALE, a river of Germany, a tributary of the Elbe, 226 m. long, rises between Bayreuth and Hof in the Fichtelgebirge. It joins the Elbe just above Barby. It is navigable from Naumburg, 100 m., with the help of sluices, and is connected with the Elster near Leipzig by a canal. Its chief affluents are the Elster, Regnitz and Orla (right), and the Ilm, Unstrut, Saale, Wipper and Bode (left). Its upper course is rapid. It is sometimes called the Thuringian or Saxon Saale, to distinguish it from another Saale (70 m. long), a right-bank tributary of the Main.

SAALFELD, a town of Germany, in the *Land* of Thuringia, situated on the left bank of the Saale, 24 m. S. of Weimar and 77 S.W. of Leipzig by rail. Pop. (1939) 23,325. Saalfeld grew up around the abbey founded in 1075 by Anno, archbishop of Cologne, and the palace built up by the emperor Frederick I. In 1389 it was purchased by the landgrave of Thuringia, and with this district it formed part of Saxony. In 1680 it became the capital of a separate duchy, but in 1699 it was united with Saxe-Coburg, passing to Saxe-Meiningen in 1826. One of the most ancient towns in Thuringia, Saalfeld is still partly surrounded by old walls and bastions, and contains some interesting mediaeval buildings, among them a palace, built in 1679 on the site of the Benedictine abbey of St. Peter, which was destroyed during the Peasants' War; the Gothic church of St. John, dating from the beginning of the 13th century; the Gothic town hall, completed in 1537; the Kitzerstein, a palace standing on an eminence above the river, probably first erected by the German king Henry I., although the present building is not older than the 16th century; and the ruin of the Hoher Schwarm, called later the Sorbenburg, said to have been erected in the 7th century. Saalfeld has a number of prosperous industries, and there are ochre and iron mines in the neighbourhood.

SAAR, a right-bank tributary of the Moselle. It rises in the Donon, an eminence of the Vosges, and flows generally northward through the Saar coalfield to its junction with the Moselle at Konz. The principal towns on the Saar are Saarguemines, Saarbrücken and St. Johann, Saarlouis and Saarburg. The river is navigable up to Saarguemines, a distance of 75 m., where there is connection with the Rhine-Marne canal.

SAARBRÜCKEN, a town in the Saarland (q.v.), on the Saar, 49 mi. by rail N.E. of Metz. Pop. (1950) 105,391. Saarbrücken owes its name to a bridge which existed in Roman times. Its early lords were the bishops of Metz, the counts of

THE DEVELOPMENT OF THE LETTER "S" FROM THE PHOENICIAN, THROUGH THE CLASSICAL, DOWN TO MODERN TIMES

into Latin. Etruscan had no rounded form, but it appears in Umbrian and Faliscan. In Latin cursive writing of the 6th century the form was **Ϻ**, and from this descended the Irish and Saxon forms **ſ**. The Carolingian form on the other hand was extended above the line instead of below, e.g., **ſ**. In England in the 17th century the form was **ſ** and this is occasionally still seen in handwriting when followed by another *s*. The form **ſ** also

the lower Saargau, and the counts of the Ardennes. From 1381 to 1793 it belonged to the counts of Nassau-Saarbrücken, and then, after having been in the possession of France from 1801 to 1815, it passed to Prussia. St. Johann, Malstatt-Burbach and Saarbrücken were united in 1909. The trade of Saarbrücken is chiefly connected with coal, iron and glass. The coal fields extend more than 70 sq. mi. Saarbrücken was heavily bombed during World War II.

SAARBURG, in Alsace-Lorraine: see **SARREBOURG**.

SAAREMAA (formerly **ÖSEL**), an island of Estonia, lying in the Baltic sea across the mouth of the Gulf of Riga. Pop. (1934) 55,851. It has a length of 45 mi., and an area of 1,010 sq. mi. The chief town, Arensburg, on the south coast, is a place of 4,339 inhabitants (1938), with summer sea bathing and mud baths. In 1227 Ösel was conquered by the Knights of the Sword, and was governed by its own bishops till 1561 when it passed into the hands of the Danes. By them it was surrendered to the Swedes in 1645. Along with Livonia, it was united to Russia in 1721, passing to Estonia in 1918. In 1940 soviet Russia took possession, and Germany conquered it in 1941.

SAARGEMUND: see **SARREQUEMINES**.

SAARLAND, an industrial and mining region on the Franco-German frontier, north of Lorraine, near the iron ore of Briey. Area 991 sq. mi.; pop. (1939) 863,726 (est. pop. 1949, 926,000). Chief town, Saarbrücken, pop. (1939) 135,080 (est. pop. 1950, 105,391). The basic industry is coal, good for industrial purposes and gas production and moderate for coke.

The Saar is largely dependent on imports for certain commodities (including food supplies). Bombing during World War II destroyed 76,000 buildings.

History.—For more than a millennium the inhabitants of France and Germany struggled for the zone to which the Saar belongs. The treaty of Versailles (*q.v.*) stipulated that as compensation for the destruction of the coal mines in northern France, and as part payment toward the reparation due from Germany, the latter had to cede to France the Saar coal mines. Germany had to renounce the government of the Saar territory in favour of the League of Nations, in the capacity as trustee. At the end of 15 yr. a plebiscite was to be held and the inhabitants were to indicate the sovereignty under which they desired to be placed. In the event of a union of the territory with Germany, France's rights of ownership in the mines were to be repurchased by Germany at a price payable in gold, to be fixed by three experts. Some stipulations of the treaty were designed to guarantee France complete freedom in working the mines, while others attempted to assure the rights and welfare of the population. The Saarlanders retained, for example, their local assemblies, religious liberties, schools, language and nationality. A local *gendarmérie* was to maintain order. The territory was to be subjected to the French customs regime; but certain receipts from customs duties were to be included in the local budget. A governing commission was to consist of five members chosen by the council of the League and was to include one citizen of France, one native of the Saar (non-French) and three members belonging to three countries other than France and Germany. Though in some respects an executive body, this commission had broad legislative powers. It had merely to hear an electoral assembly before introducing a new tax measure; the opinion of the representatives was not binding. In making the Saar government an object of international responsibility annexationist tendencies had been checked.

From 1918–23 the Saar, nevertheless, was an object of French expansionism. French troops occupied the territory even until 1927; and this meant at times the existence of French courts-martial besides the neutral court that the treaty established. On June 1, 1923, French money was declared sole legal tender and 60% of the heavy industry of the country passed into the hands of French capitalists. In the spring of 1923, all Saar miners downed tools for 100 days and the French chairman of the governing commission, Victor Rault, issued a decree which considered any socialism of the Versailles treaty as a misdemeanor.

Between 1923 and 1933 the Saarlanders enjoyed peace, because after the occupation of the Ruhr French imperialism retreated.

Rault's administration was gradually replaced by that of more impartial officials who adopted a conciliatory policy. The naturally somewhat unsympathetic attitude of the Saarlanders toward the inhabitants' welfare.

In the years 1933–35 the plebiscite dominated the life of the Saarland. The liberty front—German exiles, Saar socialists, Communists, unionists, Catholics, Jews and Francophiles—defended the Saar against annexation by imperialistic Germany, which was favoured by the German front led by the National Socialists. Hitlerite methods influenced the vote which was held on Jan. 13, 1935, and it does not seem impossible that the ballot itself was manipulated. Nearly 98% of all qualified voters appeared at the polls, an unprecedented showing, although the weather was bad and about 155,000 voters cast their ballots in a location other than the one in which they were living. During the 18 hours in which the ballots were stored, National Socialists had access to them. This fact was concealed by the official reports, which also overlooked discrepancies in the returns. Ninety and three-tenths per cent declared for union with Germany, 8.8% for continued autonomy under the League and 0.4% for French annexation. On March 7, 1935, the Saar territory was handed over to the third reich.

In 1945 the Saar was occupied by Allied troops. In 1947 the representative Saar assembly, against the pro-German Communists, adopted a constitution which made the (somewhat enlarged) Saarland an autonomous state under French protection and within the French economy. In 1950 France was given a lease on the mines by a Franco-Saar convention.

SAARLOUIS, a town in the Saarland (*q.v.*), situated on the left bank of the Saar and on the railway from Saarbrücken to Trier, 40 mi. south of the latter. Pop. (1939) 33,356. Saarlouis was founded in 1681 by Louis XIV of France, and was fortified by Vauban in 1680–85. By the peace of Paris, in 1815, it was ceded to the Allies and by them was made over to Prussia. Marshal Ney was born there. It contains a town hall in which are hung Gobelin's, the gift of Louis XIV. There are coal mines in the vicinity, and the town has foundries and large manufactures. During the national socialist regime the city was named Saarlautern.

SAAVEDRA FAJARDO, DIEGO DE (1584–1648), Spanish diplomatist and man of letters, showed himself master of an excellent prose style in his *Idea de un principio político cristiano* (1640), of which there is an English translation by Asty (1700). His most interesting work is the *República literaria*, published in 1655 as the *Juicio de Artes y Ciencias* under the name of Claudio Antonio de Cabrera.

SABAC, a town in Serbia, Yugoslavia. Pop. (1931) 12,563, many of whom are Jews. It is a busy river port on the Sava, exporting cereals, prunes, cattle and pigs, with a large weekly market for livestock, cheeses and grain. It is the seat of a bishop, a prefecture and a tribunal. The fortress was built by Mohammed II in 1470 to facilitate incursions into Slavonia. In the Austro-Turkish wars of 1788–91 the Serbs captured the town, and in the first Serbo-Turkish rising, Kara George, in 1806, defeated the Turks at Mishar, near Sabac. In World War I the Serbs took the town and drove the Austrians back across the Sava. Germans occupied the town in World War II.

SABADELL, a town of northeastern Spain, in the province of Barcelona, on the river Ripoll and on the Barcelona-Saragossa railway. Pop. (1940) 45,931 (mun., 47,831). Cloth, linen, paper, flour and brandy are manufactured, and there are iron foundries and sawmills. About half the inhabitants are employed in the textile factories. Sabadell is said to be the Roman *Sabandunum*, and in Spanish annals it is not noticed until the 13th century.

SABAEANS. This name is used loosely for the ancient dwellers in southwest Arabia, in the parts now called Yemen, Hadhramaut and Asir. Strictly it belongs to one tribe and one state only. The chief source of information about these peoples is their inscriptions, found in their own land and elsewhere; other sources are the Greek geographers, Babylonian and Ethiopic inscriptions, the Bible and the record of Aelius Gallus' expedition. The Arab tradition is not of much value and only for the latest period of the history.

History.—The land produced spices and incense and was a stage on the trade road from India, the Malay archipelago and Africa. At an early date men from Arabia migrated to Abyssinia. The oldest State in Yemen of which anything is known was Ma'in or Ma'n, the Minaeans of the Greeks. Its chief towns, Karnawu, Kaminahu and Yathil (the modern Barāḡish) lay in the southern Jōf, about 120 km. N.N.E. of Sanaa. Though the names of 20 kings are known the history of Ma'in cannot be written. Relations with Hadramaut were friendly, indeed they "almost suggest a personal union," and there was a colony or outpost at Ma'in Mus-rān (now El 'Ola) to guard the trade road to Egypt and Palestine. Later the State of Katabān began to encroach on Minaean territory, and after fighting with and becoming a vassal or ally of Saba, it joined with that State in destroying Ma'in about 700 B.C. Taking all things into account, the extent of the State, the number of kings, the highly developed script and language, the beginning of the Minaean kingdom cannot be put later than about 1500 B.C. The Sabaeans are mentioned in a Minaean inscription as nomads who raided the caravan road to El 'Ola. This suggests that they may have migrated south to Yemen and founded the kingdom of Saba which bears their name. Perhaps the queen of Sheba lived in the north of Arabia though she has been decorated with the wealth of the kingdom in Yemen. Marib, 100 km. east of Sanaa was its capital. An inscription of Sargon (c. 715 B.C.) refers to Il'i-amara the Sabaean, and one of Sennacherib (c. 685 B.C.) to Ka-ri-bi-lu, king of Saba'. More than once the second successor of a Yt' Mr was a Krb'l. Most probably the pair referred to by the Assyrian kings was Yt' mr'Byn, who completed the Marib dam, so famous in Arab story, and defeated Ma'in, killing 45,000 of its inhabitants, and his grandson Krb'l Wtr, who finished the overthrow of Ma'in and pacified the country. Sennacherib speaks of receiving a present from Saba; even court flattery did not dare to call it tribute. About the same time Ausan, which had been a vassal of Katabān, was crushed along with its ally and neighbour Datinat.

Krb'l Wtr was one of the last of a line of rulers who bore the title Mkrb. It was used also by the earlier lords of Katabān. Not long after, the title of king was adopted by the ruler of Saba and used till 115 B.C. This period is marked by the rise of noble clans and ended with the incorporation of Katabān after war both civil and foreign. At home the Hamdān clan tried for the throne and Himyar appears for the first time among the external enemies with Gedarot which had taken the place of the older Ausan. This year 115 is the first of an era by which some of the later monuments are dated. Now began a serious attack on the trade supremacy of the Sabaeans. The Nabataeans fixed themselves across the trade road to Syria and from Egypt as a base Rome tried to control the sea traffic, besides sending Gallus to attack by land. The royal title now became king of Saba and Du Raidān. About A.D. 300 Hadramaut was conquered and the style became king of Saba, Du Raidān, Hadramaut and Yamnat. This change coincided with a slackening of the Roman effort to control the eastern trade. In the middle of the century Abyssinia conquered the land but already in A.D. 375 there was a native king again. His immediate successor adopted the Jewish religion, a mark of an anti-Roman policy, and in A.D. 525 Du Nuwās, the last Jewish king, was killed and an Abyssinian governor ruled the land. The failure of the dam at Marib was at once an effect and a cause of the national decay. In A.D. 579 Persia conquered the country and in A.D. 628 the governor turned Muslim and submitted to the prophet. Katabān was ruled at first by Mkrb and then by kings who may have been foreigners. The capital Tmna lay some 110 km. S.E. of Marib. The capital of Hadramaut was Sabwat, the Sabota of the ancients.

Government and Social Conditions.—The States were built up of tribes mostly held together by local ties not by blood bonds. A tribe contained an aristocracy, tenant vassals, resident aliens and serfs. The name Katabān stood for the kingdom and for the tribes composing it; all were children of the god 'Amm. In Saba the tribe of that name stood apart from the others and held a commanding position in the kingdom. The common phrase is "Saba and the tribes." Saba alone is the child of 'Imkh. Later it was put on a level with the other tribes, and was merged in the

militia. The king, tribal aristocrats and the temples were the great landholders. Under the form of government in Katabān (probably much the same in the other States) the king was helped and to some extent controlled by a council of elders, though general policy was decided by the assembly of the tribes. In this the serfs had of course no place. At a later time in Saba the government became feudal, no longer did the tribal assembly decide the allocation of the land, the king granted fiefs. The change may have been helped by the example of the temples, where the retainers had to obey the orders of the god whose land they tilled. The offices of Mkrb and king were hereditary and the latter seems often to have associated his son with himself. The land paid three taxes which are never mentioned separately. The amount paid is not known but it was assessed while the crops were standing. Taxes were paid to the temples also; the tithe is named. Public works were done by forced labour. No list of customs, duties or tolls has been found. In early times the title Kbr is given to the chief of a tribe or clan, the governor of a town or district, the chief of the king's serfs and the head of a college of officials; thus there were many offices with one name. Down to the latest times a Kbr was the eponym after whom the year was named. Kyl is first heard of as the name of a leading section of a tribe in the territory of the god Ta'lab Riyam. The ancestors of a petty king are also called Kyl. So it is probable that he was part of the tribal organisation and took the place of the Kbr. The Kyn was an administrative officer to serve princes, temples or cities. One was a priest. The name suggests that he was not a part of the tribal organisation.

Trade and the Arts.—Monuments of the south Arabians have been found in Kuwait and Mesopotamia; a coffin of a dealer in spices was found in Egypt and an altar with a bi-lingual dedication to Wadd in Delos. Spices and incense were the chief exports and re-exports. The road from Hadramaut ran through the capitals of the other three States, so it is not surprising that one tried to make itself supreme. The returning caravans certainly brought back female slaves for the temple service; women from Gaza and Yathrib (Medina) are mentioned. The production of incense was in the hands of the nobles, 3,000 families Pliny says, and was surrounded with various tabus, besides a tithe paid to the temple at Sabwat. Great care was given to irrigation and the terracing of the hills into fields. The people were fine masons and stonecutters. The dam at Marib is now in much the same condition as when Hamdān (A.D. 848) saw it. The buildings were made of stone so carefully dressed that often the joints are scarcely visible; the stones are held together by leaden dowels and pillars are strengthened by morise and tenon joints. Big buildings were often elaborately decorated and several forms of pillars and capitals were in use. The Arab tales of lofty houses with windows of translucent stone are not much exaggerated. The pointed arch was known. Many of the old cisterns are still in use. Many of the inscriptions are beautiful and testify to the skill of the stone-cutters, who were successful with the figures of animals and conventional foliage in low relief. Figures in the round were less good and in statues of men the body is usually a mere block while the face is wooden and expressionless and often out of proportion. Stone pots and jars for household use are simple but neat and well shaped. Most of the metal work that survives is figures of animals and tablets with inscriptions. The figures are generally crude. One can never be sure that the jewellery, pottery and similar small articles really belong to the land and the period. The best things suggest foreign influence or even origin. At first the coins followed Athenian models and the workmanship is very good in some. Later they degenerated till the owl looks like a jar with two round handles. Curiously the standard is Babylonian. The latest coins are weak imitations of Roman coins.

Inscriptions and Language.—The inscriptions are all on stone or metal. Words are separated by a divider and the letters are never joined. In early times the characters are angular but later the corners are rounded and curves appear. The alphabet is connected with the Phoenician; some of the letters are exactly alike, some look as if they had been purposely altered by

those who understood the art of carving in stone, and some not found in Phœnician are formed by differentiation from those that are. Short inscriptions have been found in Mesopotamia in which Sabæan letters are combined with others resembling the Phœnician and Greek forms. It is not certain whether this is an early form of the alphabet or merely a freak. There are 29 letters, the 28 of Arabic and the second form of *š* which is found in Hebrew. The language is classified with Abyssinian as south Semitic and is split into several dialects which differ in grammatical forms and vocabulary. In Ma'in and Kāṭābān *s* is used in the pronoun of the third person and in the causative form of the verb where Sabæan has *k*. Hadramaut has forms which are phonetically later than the other dialects. The vowels are not indicated so the pronunciation of all words is a matter of guesswork. The writing is usually from right to left but some of the oldest inscriptions read alternately from right to left and from left to right. This is occasionally found in later ones but then for special reasons. Presumably there was a literature but it has disappeared. Sabæan inscriptions have been found in Abyssinia and the Ethiopic alphabet is derived from the south Arabian. Inscriptions in various alphabets derived from the Sabæan are found in different parts of Arabia as far north as Damascus and testify to the widespread influence of the south Arabian kingdoms. Many of the south Arabian inscriptions are hard to interpret and the sense highly problematical.

Religion.—Over 100 gods and many temples are named but next to nothing is known about them. Certain deities are common to the whole land. Sams, the sun, is feminine and perhaps all goddesses are forms of it. 'Aṭtar, the star Venus, is masculine but corresponds phonologically with the Babylonian Ishtar and the Canaanite Ashtoreth. The moon, Waraḥ, Sahr or Sin, occurs occasionally and Il or Ilan is the name of a god as well as a common noun. Each country had its own god; Ma'in had Wadd, Kāṭābān had 'Amm, Saba had Imukkah and the clan of Hamdān had Ta'lab Riyam. Perhaps these tribal gods are all forms of the moon. There are indications that the moon, sun and Venus formed a divine family. Others are Anbal, Du Samawi, the enigmatic Nakrah and Aṭīrat (the Hebrew Ashera). Other divine names are clearly descriptive; Hawhas "the drier" is the moon according to Hamdān, Kahlil "the old," Sa'd "luck" the giver of good fortune and Fuḳm "judgment" the judge. At times kings seem to have been worshipped (after death?). Springs and water courses were inhabited by spirits. The bull, the bull's horns and the crescent were symbols of the moon and a disc stood for both the sun and Venus. Often one cannot decide which of the two is meant. The people were the offspring and the king the first-born of the god, so the formula runs "god, king and people." There were no images of the gods. To obtain success in one's undertakings it was the custom to dedicate to the god a statue of oneself in stone or figures of men or animals in gold (? gilt). Sacrifices and incense were offered to them. The names for altar and sacrifice are the common Semitic terms, and the altar of incense has among other names that of *miklār* as in Hebrew. A variety of spices (the wealth of the land) are named on these altars, as rind, ladanum, costus, tarum, frankincense and others not yet interpreted. Pilgrimages were made at certain seasons and the pilgrim month was named Du Hījjat or Du Mahajjat. There are many names for the months, some of which refer to agriculture. The name for priest is *š-š-w* (which may mean giver) and in the El 'Ola texts comes the word *l-w-*, both masculine and feminine, which looks very like Levite. In later times the name Rahmān for God suggests Jewish influence. Christianity was introduced into South Arabia but it was not favoured because of its association with Abyssinia and the famous church in Sanaa was looked on as a sign of foreign domination. The massacre of Christians in Nejran had political causes as well as religious.

The ruins of the temple at Marib are an open space surrounded by an elliptical wall with the main door at one end of the shorter axis and a smaller at one end of the longer axis. Columns flanked the main door. Outside are several groups of pillars and a set of four may have held a canopy over a throne. The temple at

Sirwah is an oblong building with two sets of pillars inside it. One set held up the roof of the sanctuary and the other surrounded a light well. Another at Ycha in Abyssinia is an oblong building with the door at one end. It seems to have been of three stories (A. S. T.).

SABAKI, a river, 400 mi. long, in Kenya Colony, Africa, which enters the Indian ocean north of Malinda. As the Athi, it rises north of Nairobi, flows across the Kapote and Athi plains, and turns south under the Yatta ridge. Navigation is interrupted by the Lugard falls, 100 mi. from its mouth.

SABANG, a free port situated on the island of Pulu Weh, about 20 mi. N. of Kota Raja, the capital of Achin (Atjeh), in north Sumatra, Netherlands Indies, 308 mi. from Penang (from which it lies due west), 608 mi. from Singapore and 1,100 mi. from Batavia. Pop. 8,706.

Sabang is the first port of call in the Malay archipelago for vessels proceeding from Europe eastward, being the westernmost point at the entrance to the Straits of Malacca. The harbour, built in 1887, principally as a coaling station, is sheltered from the heavy swell of the Indian ocean and strong winds by mountains and high stretches of coast line. Coal wharves extend 1,700 ft, the coal being conveyed to vessels by electric transporters, and vessels drawing 30 ft. can moor alongside; coal is also conveyed to vessels at anchor in Sabang bay (which is extensive) by lighters. There is a dry dock of 5,000 tons' capacity and slipways for the construction of small ships and lighters up to 1,000 tons.

On the eastern side of the bay there is a petroleum wharf and two tanks, with a capacity of 4,000 tons. Goods destined for northern Sumatra are landed at Sabang, a ferry service being maintained with Oleh Leh, the harbour for Kota Raja.

There is a Dutch settlement at the head of the bay, with a post, telegraph and harbourmaster's office, and there is a cable to Oleh Leh and a wireless station. In 1939 the port was visited by 918 ships, measuring 9,393,697 cu.yd. net. Sabang was occupied by the Japanese in 1942.

SABAR KANTHA, a political agency in India, in the Western India States Agency, with headquarters at Sadra. It comprises 64 petty jurisdictional states, 13 non-jurisdictional talukas, and a number of estates grouped in 9 thanas. The thakors, or chiefs, are for the most part Rajputs or Kolis and were formerly feudatory to Baroda. Many of the inhabitants belong to Bhil tribes and other aboriginal stock. Area 5,408 sq.mi. Pop. (1941) 457,813.

SABATIER, LOUIS AUGUSTE (1839-1901), French Protestant theologian, was born at Vallon (Ardèche), in the Cévennes, on Oct. 22, 1839, and was educated at the Protestant theological faculty of Montauban and the universities of Tübingen and Heidelberg. After four years' work as a pastor he became professor of reformed dogmatics at Strasbourg. His markedly French sympathies during the war of 1870 led to his expulsion from Strasbourg in 1871. After five years' effort he established a Protestant theological faculty in Paris, and became professor and then dean. In 1886 he became a teacher in the newly founded religious science department of the École des Hautes Études of the Sorbonne. He died on April 12, 1901.

Among his chief works were *The Apostle Paul* (3rd ed., 1895); *Mémoires sur la notion hébraïque de l'Esprit* (1879); *Les Origines littéraires de l'Apocalypse* (1888); *The Validity of Christian Dogmas and their Power of Evolution* (1890); *Religion and Modern Culture* (1897); *Historical Evolution of the Doctrine of the Atonement* (1903); *Outlines of a Philosophy of Religion* (1897); and his posthumous *Religions of Authority and the Religion of the Spirit* (1904), to which his colleague Jean Réville prefixed a short memoir. On his theology see E. Ménégoz in *Expository Times*, xv, 30, and G. B. Stevens in *Hibbert Journal* (April 1903).

SABATIER, PAUL (1858-1928), French historian, the younger brother of Louis Auguste Sabatier (q.v.), was born at Chabrillanoux, in the Cévennes, on Aug. 3, 1858. He studied at the Faculty of Theology in Paris, and in 1885 became vicar of St. Nicholas, Strasbourg, from which he was expelled on declining the German government's offer of preferment which was conditional on his becoming a German subject. He was then appointed

pastor of St. Cierge, but being compelled by ill-health to give up his cure, he devoted himself to historical research. The appearance of his *Life of St. Francis*, in 1893, made his name, and his reputation was enhanced by the publication of *Collection d'études et de documents*, in 1898. In this work were incorporated the texts of the *Speculum Perfectionis seu Sancti Francisci Assisiensis legenda antiquissima*, an early life of St. Francis written by his disciple, Brother Leo, in 1227, the *Tractatus de Indulgencia Portuiculae*, and the *Actus B. Francisci et sociorum eius*; but Sabatier's criticism and interpretation of the documents were widely challenged. In 1902 Sabatier founded the International Society of Franciscan Studies, and soon after he organized at Assisi *La Riforma Scolastica* for feeding necessitous children, in support of which he delivered a brilliant lecture on Modernism in France at London (1905). In 1914 he sent a striking letter to the president of the International Society of Franciscan Studies in reply to a resolution in favour of peace which had been passed by the council, in which he eloquently set forward the ideals of France in the World War. This was published in *The Times*, Jan. 22, 1915, and was later reprinted as a pamphlet. In 1919 Sabatier became professor of Protestant theology at Strasbourg, which post he held until his death in March 1928.

SABAZIUS, a Phrygian or Thracian deity, frequently identified with Dionysus, sometimes (but less frequently) with Zeus. His worship was closely connected with that of Cybele and Attis and was chthonian and mystic in character. It reached Greece in the 5th century B.C. A few passages state that the Jews worshipped him (confusion with Heb. *sabaoth*?) see Val. Max. I, 3, 2. The true etymology of the name is unknown. Whether he was the same as Sozon, a marine deity of Southern Asia Minor, is doubtful. His image and name are often found on "votive bands," a kind of talisman adorned with emblems, the nature of which is obscure. His ritual and mysteries (*Sacra Savadia*) gained a firm footing in Rome during the 2nd century A.D.

See Eisele in Roscher's *Lexikon*, s.v. (ibid.).

SABBATAI SEBI (1626-1676), Jewish mystic, who claimed to be the Messiah, was born in Smyrna, of Spanish descent. As a lad he was attracted by the mysticism of Luria (*q.v.*), which impelled him to adopt the ascetic life. He passed his days and nights in a condition of ecstasy. He began to dream of the fulfilment of Messianic hopes, being supported in his vision by the outbreak of English Millenarianism. Christian visionaries fixed the year 1666 for the millennium. Sabbatai's father (Mordecai) was the Smyrna agent for an English house, and often heard of the expectations of the English Fifth Monarchy men. In 1648 (the year which Kabbalists had calculated as the year of salvation) Sabbatai proclaimed himself Messiah, and in Constantinople came across a man, who pretended that he had been warned by a prophetic voice that Sabbatai was indeed the long-awaited Redeemer. At first his adherents were a small circle of devotees who kept their faith a secret. He charmed men by his sweet singing of Psalms, and children were always fascinated by him. He journeyed to Jerusalem, where a local pasha was opposing the Jews, and Sabbatai secured help for them from Cairo. At Cairo Sabbatai married, and secured the support of Raphael Halebi. With a retinue of believers, a charming wife and considerable funds, Sabbatai returned in triumph to the Holy Land. Nathan of Gaza assumed the rôle of Elijah, the Messiah's forerunner, proclaimed the coming restoration of Israel and the salvation of the world through the bloodless victory of Sabbatai "riding on a lion with a seven-headed dragon in his jaws" (Graetz). Again 1666 was given as the apocalyptic year.

Threatened with excommunication by the Rabbis of Jerusalem, Sabbatai returned to Smyrna (autumn of 1665). Here he was received with wild enthusiasm. From the Levant the Sabbataean movement spread to Venice, Amsterdam, Hamburg and London. Sabbatai no longer doubted the reality of his mission. Day by day he was hailed from all the world as king of the Jews. At the beginning of the fateful year 1666 Sabbatai went (or was summoned) to Constantinople. Here he was arrested, but reports of miracles continued, and many of the Turks were inclined to become converts. Soon he was transferred to Abydos. In September

Sabbatai was brought before the Sultan, and he had not the courage to refuse to accept Islam. The Messianic imposture ended in the apostasy of Sabbatai. In 1676 he died in obscurity in Albania. A sect of Sabbataeans—the Dornheim of Salonica—survived him and for many years the controversy for and against his claims left an echo in Jewish life.

See Graetz, *History of the Jews*, vol. v. ch. iv. r. Zangwill has a brilliant sketch of Sabbatai's career in his *Dreamers of the Ghetto*.

SABBATH, the seventh and especially sacred day of the week among the Jews.

Observance.—How tenaciously the Jews held to the observance of the Sabbath may be seen from the fact that on this account the Romans found themselves compelled to exempt them from military service. The rules of the Scribes enumerated thirty-nine main kinds of work forbidden on the Sabbath, and each of these prohibitions gave rise to new subtleties. When the disciples of Jesus plucked ears of corn on the Sabbath they had, according to the Rabbinical views, violated the third of the thirty-nine rules, which forbade harvesting; and in healing the sick Jesus himself broke the rule that a sick man should not receive medical aid unless his life was in danger. In fact, as Jesus put it, the Rabbinical theory seemed to be that the Sabbath was not made for man but man for the Sabbath, the observance of which was so much an end in itself that the rules prescribed for it did not require to be justified by appeal to any larger principle of religion or humanity. The precepts of the law were valuable in the eyes of the Scribes because they were the seal of Jewish particularism, the barrier erected between the world at large and the exclusive community of Yahweh's grace. The ideal at which these rules aimed was absolute rest on the Sabbath from everything that could be called work; and even the exercise of those offices of humanity which the strictest Christian Sabbatarian regarded as service to God, and therefore as specially appropriate to his day, was looked on as work. To save life was allowed; danger to life "superseded the Sabbath." The positive duties of its observance were to wear one's best clothes, eat, drink and be glad (justified from Isaiah lviii. 13). A more directly religious element, it is true, was introduced by the practice of attending the synagogue service, but even this service was regarded as a meeting for instruction in the law rather than as an act of worship.

Attitude of Jesus and Early Christian Church.—The general position which Jesus takes up, that "the Sabbath is made for man and not man for the Sabbath," is only a special application of the wider principle that the law is not an end in itself but a help towards the realization in life of the great ideal of love to God and man, which is the sum of all true religion. But Jesus further maintains that this view of the law as a whole, and the interpretation of the Sabbath law which it involves, can be historically justified from the Old Testament. In this connection He introduces two of the main methods to which historical criticism of the Old Testament has resorted in modern times: He appeals to the oldest history rather than to the Pentateuchal code as proving that the later conception of the law was unknown in ancient times (Matthew xii. 3 *seq.*), and to the exceptions to the Sabbath law which the Scribes themselves allowed in the interests of worship (v. 5) or humanity (v. 11), as showing that the Sabbath must originally have been devoted to purposes of worship and humanity, and was not always the purposeless arbitrary thing which the Scribes made it to be. Modern criticism of the history of Sabbath observance among the Hebrews has done little more than follow out these arguments in detail, and show that the result is in agreement with what is known as to the dates of the several component parts of the Pentateuch.

In the early Christian church Jewish Christians continued to keep the Sabbath, like other points of the old law. Eusebius records that the Ebionites observed both the Sabbath and the Lord's day, the weekly celebration of the resurrection. This practice obtained to some extent in wider circles, for the *Apostolic Constitutions* recommend that the Sabbath shall be kept as a memorial feast of the creation, as well as the Lord's day as a memorial of the resurrection. The festival character of the Sabbath was long recognized in a modified form in the Eastern

church by a prohibition of fasting on that day, which was also a point in the Jewish Sabbath law. On the other hand Paul from the first days of Gentile Christianity, laid it down definitely that the Jewish Sabbath was not binding on Christians. Controversy with Judaizers led in process of time to direct condemnation of those who still kept the Jewish day (e.g., Co. of Laodicea, A.D. 363). For discussion of the difficult problem when and how the Christian Sunday superseded and took on some characteristics of the Jewish Sabbath see SUNDAY.

(W. R. S.; S. A. C.)

Origin.—What was the origin of the Sabbath? What part did it play in the life of the Israelite nation before the exile? To these questions confident answers have been given, but the material upon which we can base our conclusions is not sufficiently extensive or clear to warrant dogmatism. It is a noteworthy fact that there is no evidence of Sabbath observance in the patriarchal period: there is, indeed, very little material that can be reckoned as pre-exilic.

There are four passages which seem to point to the conclusion that in the earlier times a close connection existed between the Sabbath and the new-moon festival. In 2 Kings iv. 23 the Shunammite's husband asks, when she proposes to visit the prophet, "Wherefore wilt thou go to him to-day? it is neither new moon nor sabbath." Among the religious observances which Isaiah names as offensive to Yahweh he links together (i. 13) "new moon and sabbath." In Hosea ii. 11 Yahweh says of Israel "I will cause all her mirth to cease, her feasts, her new moons, her sabbaths, and all her solemn assemblies." Amos (viii 5) denounces the traders who say "When will the new moon be gone, that we may sell corn? and the sabbath, that we may set forth wheat?" The reference in Hosea would make it probable that the Sabbath was a season of festal joy, and that in Amos makes it clear that there was at any rate some cessation of ordinary business activities on that day. By inference this latter conclusion may be deduced from the passage in Kings. The question of the Shunammite's husband suggests that the ass for which she had asked in order to make her journey would have been available, even in harvest time, had the day been a new moon or a Sabbath: the inference surely is that on those days the work of harvesting stood still, so that the beasts would not be required for labour on the farm. This combination of new moon and Sabbath suggested to Meinhold (*Sabbat und Woche im Alten Testament*, 1905) that originally the Sabbath must have been the day of the full moon. This theory is very plausible, though Meinhold's endeavour to explain how the full moon feast came to be transformed into the regular seventh day Sabbath of abstinence is not convincing. Kittel has attacked the fundamental hypothesis on which the theory rests. He contends that the existence of a full moon feast in ancient Israel is nowhere demonstrable, and points out that while the new moon festival has maintained itself in later Judaism there is no survival of a full moon festival. This last argument, however, might easily be countered, for if it be a fact that the full moon festival was converted into the weekly Sabbath the disappearance of the former would be amply accounted for.

Meinhold regards the Decalogue as dating, at the earliest, from the exile, and rejects decidedly the idea that before the exile the Hebrews had a seven day week running throughout the year. Many critics, however, tend distinctly towards the belief that the Decalogue in some simple form may very well go back to the time of Moses. The story of the manna in Exodus xvi. in its original form may represent Moses as the discoverer of the Sabbath; and if so, this would be evidence that in certain streams of tradition Moses was regarded as the sponsor in Israel of the Sabbath. If the kernel of the commandments be accepted as Mosaic the institution of the Sabbath goes back to the very beginnings of the history of Israel. In the decalogue of Exodus xx. 3-7 the command "remember the sabbath day" follows immediately upon the commandments which are concerned with Yahweh and Yahweh's name. This shows how great must have been the importance of the Sabbath, and suggests that it was regarded as in an especial sense Yahweh's day, a fact for which the Old Testament offers abundant confirmation. The emphasis on the Sabbath in this form of the Decalogue is the more noteworthy

in view of the fact that it ignores all the other feasts and rites. It is highly probable, considering the close association between Yahweh and the Sabbath, that the celebration of the latter as a festival goes back to the time when Yahweh first became the national deity. This does not, of course, conflict with the theory that it was connected also with the changes of the moon, which, indeed, seems to be the most probable hypothesis. Whether originally it was the day of the full moon only, or whether the half-moon days were also Sabbaths, it is difficult to say.

It has been objected that a regular rest day like the Sabbath could be celebrated only by a settled agricultural people. Apart from the fact that the ancestors of the Israelite nation were not all nomads it may be urged that even the life of the desert was much more artificial than we have been accustomed to suppose. The wandering herdsmen have many trades. Some of them breed cattle. Slaves and artisans have always been known in the desert. At the oases corn and fruit are cultivated. And peoples in a comparatively primitive state of culture observe rest-days, though these are not as a rule periodic, and are not necessarily consecrated to a particular deity or employed for religious purposes. Hutton Webster (*Rest Days*, 1911), regards the restrictions which characterize them as being in the nature of tabus. Such days are observed at critical seasons, among which are the changes of the moon. He instances in particular the custom of Hawaii, according to which on a strict tabu day there must be no fire or light, and general gloom and silence prevail. No canoes may be launched, no one may bathe, or even be seen out of doors unless his presence is required at the temple. The old Hawaiian system included a remarkable approximation to the institution of a weekly Sabbath. In each lunar month four periods were tabu, the 3rd to the 6th nights, the time of the full moon, including the 14th and 15th nights, the 24th and 25th nights, and the 27th and 28th nights. On the other hand among some peoples such seasons of abstinence developed into joyous festivals and holidays. "Among many peoples in the lower culture," says Hutton Webster, "the time of the new moon and full moon, much less commonly each half moon, is a season of restriction and abstinence." Such days may be dedicated to a god, or may simply be regarded as unlucky days.

A theory that the Jewish Sabbath, name and institution, alike, is derived from Babylonian sources was propounded by Friedrich Delitzsch (*Babel and Bible*) and has been widely accepted. To quote Delitzsch, "Since the Babylonians also had a Sabbath (*shabattu*) on which, for the purpose of conciliating the gods, there was a festival—that is to say, no work was to be done—and since the 7th, 14th, 21st and 28th days of the month are marked on a calendar of sacrifices and festivals dug up in Babylonia as days on which 'the shepherd of the great nations' (i.e., the king) shall eat no roast flesh, shall not change his dress, shall not offer sacrifice, as days on which the king shall not mount the chariot, or pronounce judgment, the magus shall not prophesy, even the physician shall not lay his hand upon the sick, in short, as days which are not suitable for any affair, it is scarcely possible for us to doubt that we owe the blessings decreed in the Sabbath or Sunday day of rest in the last resort to that ancient and civilized race on the Euphrates and Tigris."

The evidence adduced by Delitzsch, plausible as it seems, is not however, conclusive. The inscription he quotes—which, though it comes from the "library" of Assurbanipal, is evidently of Babylonian origin—refers only to a particular month, the intercalary Elul, and it is not shown that these special days occurred in the other months. Further, the prohibitions apply only to particular persons such as the king and the physician. It should be noted, too, that the calendar specifies in addition to the 7th, 14th, 21st and 28th days also the 19th as an "evil day" on which the restrictions apply. It is explained that the 19th is the 49th day from the beginning of the preceding month, that is, the end of the seventh week from that starting-point. But even if this explanation is correct the fact would remain that the day of restriction occurs oftener than at the end of each week. In order to discover whether there is evidence of a general restriction of business in Babylonia on particular days C. H. W. Johns (*Ency. Brit.* 11th ed. vol. xxiii. 961 seq.) analyzed a great many business

contracts, classifying them according to the day of the week on which they were dated. The result showed that on all these "evil days" business was carried on, though, if the documents may be taken as fairly representative, there was a marked diminution of business on the 19th day of the month. During the First Dynasty of Babylon, and in the seventh century B.C., all these days show a falling off in the number of trading transactions. But, on the other hand, during the Kassite period trade went on much as usual on all days, including even the 19th day of the month. In any case these "evil days" seem different from the early Hebrew Sabbath; the latter was just the day when the Shunammite woman might actually have been expected to go on a journey, whereas the former were just the days when the king might not ride in his chariot.

It is true that the Babylonians had a day called *shabattum* or *shapattum*. This seems, however, to be distinct from the days of restriction dealt with in the calendar tablet. In a syllabary *shapattum* is equated to *um nuh libbi*, that is, "day of the rest of the heart." It has been urged that here is a proof that the Babylonians had a Sabbath which, like that of the Hebrews, was a rest day. But it is clear from the Babylonian penitential psalms that the real meaning of the words is "day when the heart (of the gods) is propitiated." A tablet discovered by Pinches shows that the *shapattum* was the 15th day of the month. A passage in the astronomical poem of the Babylonian epic *Enuma elish* quite clearly shows that the *shapattum* is the day of the full moon. The verb *shapatu* is elsewhere explained as equivalent to the verb *gamaru*, meaning "to be complete, full." None of the attempted etymologies for Sabbath from the Hebrew is successful, probably for the reason that the word is older than the Hebrew language. It is not unreasonable to suppose that both *shapattum* and *sabbath* are descended from a word belonging to the older tongue from which both the Babylonian language and the Hebrew developed, and that its prime meaning is "full moon day." This would confirm Meinhold's theory that among the Hebrews the Sabbath was originally the full moon day. But the fact that the name is derived from a common source, and that the day itself among both peoples is originally the day of the full moon, must not blind us to the truth that the Babylonians had no real equivalent to the Jewish Sabbath at regular seven-day intervals. Had there been any great likeness between the ways in which the *shapattum* and the Sabbath were celebrated the latter could hardly have been insisted on as a distinctive mark of the Jews.

Sabbatical Year.—An ancient Hebrew law enjoined that in every seventh year the land should lie fallow (Exodus xxiii. 11); vineyard and olive garden, too, are to remain uncultivated. Whatever may be produced under these conditions is to be for the poor and the wild beasts. It is extremely unlikely that this was meant to apply to all cultivated land in the same year. If any attempt were made to carry out this injunction the Sabbatical year must have varied from plot to plot. The later Law of Holiness does, however prescribe one definite year for all land. According to Josephus the Sabbatical year was a close time for warlike operations. From the same authority we learn that the Jews requested Alexander to remit tribute during the Sabbatical year, and that Tacitus complained that the Jews devoted every seventh year to idleness. Similar is the rule that there should be release of debtors from their debts in each seventh year.

The term has been adopted in universities for a period of freedom from academic duties every seventh year.

BIBLIOGRAPHY.—See, besides the literature already cited, Hehn, *Stebenzeit u. Sabbat bei den Babyloniern u. im Alten Testament* (1907); "Sabbath" in E.R.E. and Wardle, *Israel and Babylon*, pp. 236-239.

SABBATION or **SAMBATYON**, a river (1) natural and (2) supernatural. (1) The Targum pseudo-Jonathan to Exod. xxiv. 10 states that the Ten Tribes were exiled beyond the Sambatyon: this is repeated in Gen. Rabba lxiii.; Num. Rab. xvi. and Yalqut Genesis 94. This is therefore a river in Media, identified by Ramban (Deut. xxxiii., 26) with the Gozan (II Kings xvii, 6) and a natural stream. Fuenn (*Pirkei Chofin* ii., 133) identifies this with the Zab in Adiabene which Xenophon calls Sabatos and which

became corrupted to Sabbath. This river must be sharply distinguished from that mentioned by Josephus (*War.* vii., v., 1) who makes Titus on his return from the destruction of Jerusalem pass, near Beirut, a river which, flowing only on one day in seven, is called after the Sabbath. It will be noted that this river is in Palestine, not in Media and that it is periodic.

(2) With Pliny (*Hist. Nat.* xxxi., 2) two supernatural elements enter the story. First the river rests one day in seven instead of flowing on that day and secondly that day is the Sabbath. A variant of the miracle occurs in Gen. Rabba xi. In the 9th century the mysterious Eldad the Danite carried the wonder still further. In his chronicle the river is waterless but full of sand and stones which roll with a great noise during the week-days but rest on the Sabbath. Th. Noelcke (*Beiträge zur Gesch. d. Alexanderromans*, 48) traces the Sambatyon in the Alexander legend. The river of sand (*Wadi ar-Raml*) is mentioned by Kazwini (*Cosmography* ed. Wüstenfeld, ii., 17) and by Mas'udi, Benjamin of Tudela mentions the ten tribes and the Gozan river but he ascribes no miraculous properties to it, save that David Alroy crossed it on his mantle. In the 17th century the miracles have increased. Travellers from India relate that the sand or water is curative of leprosy. Menasseh ben Israel states that the sand, if kept in a bottle moves about during the week but rests on Sabbath. It has been suggested that the sand element in the story is to be explained by a confusion of a Hebrew name *ne'ar* (*Ne'ar Höl*) which could mean either "weekday river" or "river of sand."

See *Jew. Enc.* x.v. and A. Neubauer, *Jew. Quart. Rev.* i., "Where are the Ten Tribes?"

SABELLIC (from Latin *Sabellus*, Samnite) has often been used of a minor group of the Italic dialects, namely the pre-Latin dialects of the Paeligni, Marrucini and Vesini (better called North Oscan), of the Volsci, and of the Marsi, Aequi, Sabini and other central Italian tribes (conveniently called Latinian); these dialects are all closely related to Oscan (*q.v.*). The same name, or sometimes Old Sabellic, is also used, but inaccurately, to describe two small but distinct groups of inscriptions from various sites near the east coast of central Italy (1) from Novilara and Fano (near Pesaro); (2) from Belmonte Piceno, Cupra Marittima, Castignano, Bellante, Greccio and Supercure. These may be better designated, by "East Italic."

The second group, not more recent in date than the 6th century B.C., are doubtless the oldest written documents known from Italian soil. The lines of writing run alternately left to right and right to left, the positions of the letters being both reversed and inverted in the lines written right to left. Their alphabet is clearly of the same Chalcid-Etruscan origin as that of all the other alphabets of ancient Italy (except the Greek and Phoenician), but shows some peculiarities which suggest direct Greek influence; the language, still untranslated, will probably prove to be an Indo-European (two I.-E. stems, *pater* father, *mater* mother have been identified) and ancient Illyrian dialect (*meitine* is an Illyrian name). For it is known from the elder Pliny (*N.H.* 3.110, *cf.* 113), from the Iguvine tables (*Iguvina Tabulae* Iapydian, i.e. belonging to the Illyrian Iapydes), and from archaeological evidence, that there were Illyrian settlers in or near that district, the ancient Picenum, where these inscriptions were discovered.

But the documents of the Novilara group are later in date, distinct in alphabet—this is perhaps of Etruscan origin, but shows certain resemblances both to the Umbrian and to the Oscan alphabets—and probably also in dialect. The suggestion that the dialect, however, is allied to Etruscan itself, is quite unsupported by the evidence; the decorative motifs, for example the spiral, which appear on all three of the inscriptions of this group, point rather to the opposite coast of the Adriatic, where similar motifs occur, especially round Nesusio, on contemporary monuments; and there is nothing in the word-forms of these documents which may not be Indo-European, while the characteristic Etruscan syncope and elision (at least in the writing) are entirely lacking.

BIBLIOGRAPHY.—R. von Planta, *Grammatik der oskisch-umbrischen Dialekte*, vol. II, pp. 551-594, 654-699, (1897); two new inscriptions discovered since 1897 were reported in *Rendiconti d. R. Acc. dei*

was probably not very closely determined. The traditions connect them closely with the beginning of Rome, and with a large number of its early institutions, such as the worship of Jupiter, Mars, and Quirinus, and the patrician form of marriage (*confarreatio*).

Of their language as distinct from that of the Latins no articulate memorial has survived, but we have a large number of single words attributed to them by Latin writers, among which such forms as (1) *frons*, Lat. *hircus*; (2) *ausum*, Lat. *aureum*; (3) *novensiles*, Lat. *novensides* ("gods of the nine seats"); (4) the river name *Farfarus*, beside pure Lat. *Faboris* (Servius, ad *Aen.* vii. 715); and (5) the traditional name of the Sabine king, *Numa Pompilius* (contrasted with Lat. *Quinctilius*), indicate clearly certain peculiarities in Sabine phonology: namely, (1) the representation of the Indo-European palatal aspirate *gh* by *f* instead of Lat. *h*; (2) the retention of *s* between vowels; (3) the change of medial and initial *d* to *l*; (4) the retention of medial *f* which became in Latin *b* or *d*; and (5) the change of Ind.-Eur. *q* to *p*. The tradition (e.g., *Paul. ex Fest.* 327 M.) that the Sabines were the parent stock of the Samnites is directly confirmed by the name which the Samnites apparently used for themselves, which, with a Latinized ending, would be *Safini* (see *SAMNITES* and the other articles there cited, dealing with the minor Samnite tribes).

To determine the ethnological relation of these tribes, whom we may call "Safine," to the people of Rome on the one hand, and the earlier stratum or strata of population in Italy on the other, linguistic and archaeological material must be examined. Archaeological evidence connects the Sabines with the patricians of Rome, (see *ROME, Ancient History*). What language did the Sabines speak? Was it most nearly akin to Latin or to Oscan or again to Umbrian and Volscian? Festus, though he continually cites the *Lingua Oscan*, never spoke of *Lingua Sabina*, but simply of Sabini, and the same is practically true of Varro, who never refers to the language of the Sabines as a living speech, though he does imply (v. 66 and 74) that the dialect used in the district differed somewhat from urban Latin. The speech therefore of the Sabines by Varro's time had become too Latinized to give us more than scanty indications of what it had once been. The language of the Samnites was that which is now known by the name of Oscan.

It appears that in, say, the 7th century, B.C., the Safines spoke a language not differing in any important particulars from that of the Samnites, generally known as Oscan; and that when this warlike tribe combined with the people of the Latian plain to found or fortify or enlarge the city of Rome, and at the end of the 6th century to drive out from it the Etruscans, who had in that century become its masters, they imposed upon the new community many of their own usages, especially within the sphere of politics, but in the end adopted the language of Latium henceforth known as *lingua Latina*.

See R. S. Conway, *Italic Dialects* p. 351 (Cambridge, 1897). For the history of the Sabine district see Mommsen, *C.I.L.* ix. p. 396; and Beloch, "Der italische Bund unter römischer Hegemonie" (Leipzig, 1880) and "La Conquista Romana della regione Sabina," in the *Rivista di storia antica* ix. p. 269 (1905).

SABINIANUS, pope from 604 to 606, the successor of St. Gregory the Great.

SABLE, the name of a small quadruped, closely akin to the martens, and known by the zoological name of *Martes sabelina*. It is a native of Siberia and famous for its fur. The name appears to be Slavonic in origin, whence it has been adapted into various languages. The Eng. and Med. Lat. *sabellum* are from the O.Fr. *sable* or *saible* (see *MARTEN* and *FUR*). "Sable" in English is a rhetorical or poetical synonym for "black." This comes from its usage in heraldry (first in French) for the colour equivalent to black.

SABLE ANTELOPE, a large and handsome South African antelope (*Hippotragus niger*), exhibiting the rare feature of blackness or dark colour in both sexes. The sable and the roan antelope (*H. equinus*) belong to a genus nearly related to the oryxes (*g.v.*), but distinguished by the stout, thickly ringed horns (present in both sexes) rising vertically from a ridge over the eyes at an obtuse angle to the plane of the lower part of the face, and then

sweeping backwards in a bold curve. The muzzle is hairy; there is no gland below the eye; the tail is long and tufted. Sable antelopes are among the handsomest of South African antelopes, and are endowed with great speed and staying power. They are commonly met with in herds including from 10 to 20 individuals. Forest-clad highlands are their favourite resorts. The roan antelope is a larger animal, with shorter horns, strawberry-roan in colour in both sexes.

SABLE ISLAND, an island of Nova Scotia, Canada, 110 m S.E. of Cape Canso, in 43° 56' N. and 60° W. It is composed of shifting sand, and is about 20 m. in length by 1 m. in breadth, rising in places to a height of 85 feet. In the interior is a lake about 10 m. in length. At either end dangerous sandbars run out about 17 m. into the ocean. It has long been known as "the graveyard of the Atlantic"; over 200 known wrecks have been catalogued, and those unrecorded are believed greatly to exceed this number. The coast is without a harbour and liable to fogs and storms; irregular ocean currents of great strength sweep round it, and its colour makes it indistinguishable until close at hand. Since 1873 an efficient lighthouse system and life-saving station has been maintained by the Canadian Government, and the danger has been much lessened. Since 1904 it has been connected with the mainland by wireless telegraphy. Sable Island is the home of the Ipswich sparrow (*Passerculus princeps*).

Sable Island was known to the early navigators as *Santa Cruz*. See G. A. England, *Isles of Romance* (1929); Harold St. John, "Sable Island," with history, zoology and botany, *Boston Soc. Nat. Hist.*, vol. 36, no. 1 (1917).

SABORAIM; see *GAON*.

SABOTAGE, systematic working in such a manner as to delay production, or to injure the quality of the product, a policy sometimes advocated, especially by syndicalists, either to remedy a particular grievance or as part of a general revolutionary program. Sabotage of this kind may conveniently be discussed under two headings:

(1) Exceedingly slow work. This may be either *ca' canny* (*g.v.*), deliberately slow work, whose extreme form is the "stay-in strike" when the workers enter the factory but do no work at all, or it may take the form of elaborately careful work. Apart from the "stay-in strike" or "sit-down" in the U.S., the only generally effective use of this kind of sabotage has been "working to rule" by railwaymen. The procedure consists in following exactly the rule books, which, if rigorously applied, forthwith disorganize the service, as they generally contain items either obsolete or merely entered for formal purposes of record. An example of the former is the British regulation that every ticket must always be examined on both sides, the latter the Italian regulation that a driver must satisfy himself that he crosses all bridges at or about a certain speed, both of which items have been used for "working to rule" strikes. The first disorganizes the "City rush," the second the long-distance expresses.

(2) Injury to product or other obstruction. The anarchist "propaganda by deed" (i.e. assassination of oppressors; see *ANARCHISM*) is not strictly included in this, though in polemical writers the two types of action are often confused. The commonest form is destruction of machinery, but the doing of very bad work, deliberately designed to break down, is also frequent. Destruction of the tools of blacklegs is an allied form of sabotage (it was common in Sheffield in the '60s under the name of "ratting"); and, like sabotage in general, is only common when peaceful picketing is forbidden.

Sabotage as a policy has been advocated by the French trade unions and the (mainly American) Industrial Workers of the World. In both cases the reason given is that the workers are engaged in a class struggle in which the capitalist class shrinks from no methods however brutal, and that the workers cannot afford to abstain from any weapon for sentimental reasons. Its chief advocates, the French *syndicats* and the I.W.W., emerged from the war of 1914-18 and the ensuing crisis much weakened, and the Russian Revolution of Nov. 1917 had injured the general case for sabotage.

Sabotage is also, of course, a weapon commonly employed in

war time, or even in peace, against the essential industries of a hostile power. It may be the results of spy action (probably uncommon) or due to the action of nationally oppressed workers. It is commonly supposed that the Czech workers employed in the armaments took effective and extensive sabotage action after the invasion by Germany in March 1939. But facts about such sabotage are naturally unobtainable, it being to the interest of both sides to conceal them.

See Georges Sorel, *Reflexions sur la violence* (1910); E. Pataud and E. Pouget, *Comment nous ferons la Revolution* (Eng. tr. 1913); E. Pouget, *Le sabotage* (1910); and DIRECT ACTION and INDUSTRIAL WORKERS OF THE WORLD; SYNDICALISM, TRADE UNIONS.

(R. W. F.)

SABRATHA, an ancient city of Africa Proconsularis (Tripoli), founded in the 7th-6th century B.C. by Tyrian settlers as a factory on the shore of a flat and inhospitable coast, mod. Sabratha Vulpia, 48 mi. W. of Tripoli by rail. Towards the end of the 2nd century A.D. its prosperity began to increase: Antoninus Pius built two temples, the tribunal before which Apuleius (q.v.) was tried met here, and under Commodus the Sabratenses had a *statio* (or office) at Ostia (q.v.). Towards the end of the 4th century there occurred fiscal exactions, religious disputes and attempts at invasion by the tribes of the interior (the most destructive being that of the Austuriani in A.D. 363), after which, as inscriptions show, the building of Sabratha, and notably the baths, were rebuilt. The Vandals themselves, who only occupied Tripolitania in A.D. 455, were defeated by a native rebellion, and after the destruction of their power by the Byzantines the very natives who had invited the aid of the latter rose against them also. During the years of peace following 548 new fortifications were made. Justinian's death, in 565, brought a renewal of the native risings. The Arabs took Tripoli in 643, and Sabratha was surprised in the night and sacked. Excavations have revealed the east gate of the Roman walls, while Byzantine fortifications surround the western portion of the city, where are situated the forum, the *curia* or council hall, a temple of Jupiter (of whom a fine bust was found), and another temple (perhaps the Capitulum), both of the time of Antoninus Pius, two Christian basilicas (one, erected by Justinian, with fine mosaics), a baptistery. The theatre and the amphitheatre, fairly well preserved and recently carefully restored, lie farther away, near the quarries. The streets are wide and well laid, and the houses are numerous and closely built, without courtyards. There were no less than 15 fountains, supplied by an aqueduct. The Roman harbour was constructed by joining the rocks with masses of concrete, so as to form two moles with a narrow entrance between them; while along the shore were cisterns and storehouses.

SABRE FENCING. Toward the end of the 19th century, prior to the founding of the Scuola Magistrale di Roma, which was to modernize Italian fencing, the Italian government sent out experts, who later became the leaders of the school, to various parts of the world to study the different styles and methods of swordplay. At this time sabre fencing was done with heavy cavalry sabres almost exclusively by the military, mainly cavalry men. In Europe in this game the French style was generally predominant. The main characteristics of this style were the handling of the sword from the wrist, making great "moulinets" (Fr.), while slashing at the opponent, and parries were executed by countercuts.

From the observation of these experts a new style of sabre fencing was evolved whose basic principle was the cutting from the elbow instead of from the wrist and parrying by interposing the sabre at right angles to the plane of the cut. In sabre fencing the majority of touches are made with the cutting edges in preference to the point. This is due to the fact that the sabre lends itself better to cutting. The cut is executed with weapon and forearm moving as one from the elbow to give complete control, speed and precision to the movement. Gradually fencing sabres were made lighter in order to be more easily and skilfully used in making feints and parries.

The maximum allowed weight of the modern sabre, everything included, is 500 grams (18 oz.); the total length of the sabre must be less than 1,050 mm. (41½ in.) and the blade shall have a maximum length of 880 mm. (34½ in.). The guard must be able to pass through a rectangular gauge 150 mm. (5½ in.) by 140 mm. (5½ in.), the flat of the blade being parallel to the 150-mm. side. The modern fencing sabre blade is straight and flexible. The regu-

lations as to ground dimensions are the same as for duelling sword (see *EPEE FENCING*). The target for sabre is the entire body with the exception of the legs, the limits of the target being the groin line in front and a horizontal line passing across the top of the hip bones in back. A touch on the legs does not count but annuls any subsequent touch on the valid target.

The sabre is held with the thumb resting on the back edge of the handle about one-half inch from the guard, while the other

ADAPTED FROM J. MARTINES CASTELLO'S "THEORY AND PRACTICE OF FENCING"
FIG. 1.—HOW TO HOLD THE SABRE

Short attacks in general prevent too great vulnerability in case the attacks fail. The stance of the sabreman is somewhat higher than the fencer; in other words, the legs are bent less. The opponents fence at a greater distance from each other than in foil

ADAPTED FROM J. MARTINES CASTELLO'S "THEORY AND PRACTICE OF FENCING"
FIG. 2.—FRONT AND PROFILE VIEWS OF THE PARRY OF HIGH FIRST

Therefore, direct lunges are seldom used, lunges having to be preceded usually by advances, beats and binds. The combinations of attacks are innumerable and greater training is necessary for

ADAPTED FROM J. MARTINES CASTELLO'S "THEORY AND PRACTICE OF FENCING"
FIG. 3.—PARRY OF LOW FIRST

sabre than for other weapons.

Parries of cuts are made not by beating the attacker's blade aside but by interposing the blade at right angles to the direction of the cut. The force of the blow is taken by the strong part of the blade. Once the defender so meets the blade he gains an opportunity to return or riposte the blow.

The lines of foil fencing (see *FOIL FENCING*) are called planes in sabre fencing and are the same as in foil. There are six parries in sabre. First to fifth parries are generally used; sixth is used only occasionally.

The parries in sabre are slightly different from the corresponding guards. In the guard position the point is more in line and the arm straighter so as to be able to make a quick counter-

attack and to engage the opponent's blade if desired. In the parries the point must be a little out of plane, with arm slightly bent so that the opponent's cut cannot be forced through the weak part of the blade to the target as would be the case if the point were more in line.

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"

FIG. 4.—POSITION OF ARM AND WEAPON AT THE COMPLETION OF THE PARRY OF SECOND

In the first (prime) parry the sword arm is held out at shoulder level with the hand to the left of the body and the blade pointing diagonally downward; it is used to protect the chest. The second parry is made with hand at waist height to the right of the body and with weapon pointing downward. This parry pro-

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"

FIG. 5.—PARRY OF THIRD

TECTS the flank. The third parry (tierce) is made with hand at hip height or slightly higher, to the right of the body with the weapon pointing upward. It protects the right cheek, wrist, sword arm and flank. The fourth parry is made with hand in plane with the extreme left side of the chest, close to the body.

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"

FIG. 6.—POSITION OF ARM AND WEAPON IN THE PARRY OF HIGH FOURTH

The weapon points upward and slightly outward. This parry is used to protect the chest and sword arm.

The first and fourth parries are used to cover the whole inside plane; the second and third parries protect the entire outside plane.

In the fifth parry the hand is to the right of the head and slightly above the eyes and the weapon is almost horizontal, pointing slightly upward. It is used against cuts to the head. In the little-used sixth parry the hand is to the left of the head in line with the eyes, and the weapon is almost horizontal pointing slightly upward. Like the fifth parry, it protects the head.

The second, fifth and first parries are enough to protect the

ADAPTED FROM J. MARTINEZ CASTELLO'S "THEORY AND PRACTICE OF FENCING"

FIG. 7.—PARRY OF LOW FOURTH

whole target, just as are the third, fourth and fifth. Some fencers are inclined to favour one or the other of these groups of parries but one should make use of all of them.

In close quarters third and fourth are preferable to second and first, while at regular distance second and first are better.

A sabre bout is a matter of speed, timing and judgment of distance. False attacks to fool the opponent and force him out of position so that he is less able to defend himself are basic. Flèche attacks (running attacks) are characteristic of the weapon.

The functions of the director and judges are the same for

FIG. 8.—POSITION OF ARM AND WEAPON AT THE COMPLETION OF THE PARRY OF FIFTH

sabre as for foil.

The Italian sabre school became so superior to others that many countries adopted it. To do so they invited Italian fencing masters, the foremost of which was Italo Santelli, who in the 1860s was called to Hungary. Mainly through his efforts the Hungarians became supreme in international competitions and frequently excelled the Italians.

The Italian school places emphasis on classicism and form. Foremost among the sabre teachers of the 20th century in Italy was Beppe Nadi of Leghorn, whose pupils established amazing records in national and international competitions.

The Hungarian school is an elaboration of the Italian school and discards all academic flourishes to bring the game more in line with the exigencies of modern competitiveness.

The Magyar temperament, the specialization in one weapon only and the popularity of the game, which is of national importance, account for the extraordinary development of sabre fencing in Hungary. The rivalry between Hungary and Italy pro-

vided exciting fencing competition particularly at the Olympic games.

(L. G. N.; X.)

SACAGAWEA or **SACAJAWEA** (1790–1884?), the "Bird Woman," a Shoshone Indian girl who, in 1805–06, accompanied the Lewis and Clark expedition. She has been widely but erroneously credited with having guided the expedition across the Rocky and Cascade mountains to the Pacific coast. Actually her geographical knowledge and usefulness as a guide were limited to her native region of western Montana. Nevertheless, with her French-Sioux mate, Toussaint Charbonneau, Sacagawea did accompany the expedition all the way from Fort Mandan, N.D., to the Pacific coast and back. First-hand accounts of the expedition, by McIwether Lewis, William Clark, Patrick Gass and others, praise her courage, resourcefulness and good humour, while indicating that Charbonneau mistreated her and was not worthy of his hire. Charbonneau was engaged as a guide in the autumn of 1804 and insisted upon bringing along Sacagawea, one of two wives he had purchased from Indian slave traders. A son, Jean-Baptiste Charbonneau, was born to Sacagawea Feb. 11, 1805, at Fort Mandan, and the baby, too, made the entire journey. Toussaint Charbonneau was paid \$500.33 for his services to the expedition, but Sacagawea received no remuneration. Their son was later taken to St. Louis, where Clark sponsored his education. The later history of the "Bird Woman" is obscure. An old Indian woman, who called herself Sacagawea and displayed a remarkably intimate and accurate knowledge of the Lewis and Clark expedition, died in Dakota territory in 1884.

See John Bakeless, *Lewis and Clark, Partners in Discovery* (1947); Charles Morrow Wilson, *Meriwether Lewis of Lewis and Clark* (1934).

SACCHARIN is a name applied to several organic substances. These comprise (1) derivatives of toluene and (2) derivatives of certain naturally occurring sugars, including milk sugar.

The commonly known saccharin of commerce is derived from toluene. Commercial saccharin is marketed as insoluble saccharin—the imide of ortho-sulphobenzoic acid—and as soluble saccharin—the sodium salt of the acid. Pharmaceutical manufacturers who compound saccharin for consumer use commonly tablet saccharin into tiny pellets containing $\frac{1}{4}$, $\frac{1}{2}$ or 1 gr. of U.S.P. saccharin. The pellets may contain the saccharin as the soluble sodium salt or in the acid form combined with sodium bicarbonate which converts the acid to the sodium salt upon dissolving.

Commercial saccharin is a sweetening agent; it possesses no food value at all. The sweetening power of the commercial powder is estimated at 425 times the sweetening power of ordinary sugar; the commercial crystals, which contain some water of crystallization, are estimated to have a sweetening power 375 times that of sugar. A $\frac{1}{4}$ gr. pellet has roughly the same sweetening power as a level teaspoon of sugar.

Saccharin, scientifically referred to as ortho-benzoisulphimide, was discovered by Ira Remsen and C. Fahlberg in 1879 in the course of investigations at The Johns Hopkins university on the oxidation o-toluenesulphonamide. Fahlberg noticed an unac-

countable sweet taste to his food and found that this sweetness was present on his hands and arms, despite his having washed thoroughly after leaving the laboratory. Checking over his laboratory apparatus by taste tests, Fahlberg was led to the discovery of the source of this sweetness—saccharin.

Saccharin (1) is a white powder, mildly acidic, and forms neutral salts. It is relatively insoluble in water, chloroform and ether. The melting point of the commercial product is approximately 226° C.

Much of the saccharin in commercial use is the white crystalline sodium salt (II). The sodium salt or soluble saccharin normally contains two molecules of water, and the crystals are readily soluble in water. The crystals may be of very small particle size or they may be of a size resembling granulated sugar. Crystalline sodium saccharin is efflorescent, so for easier handling, commercial sodium saccharin may be partially dehydrated, leaving less than one molecule of water in the compound. The partially dried sodium saccharin does not change weight so easily on exposure to the air. In this form it is termed powdered soluble saccharin.

Saccharin is made by treating toluene with chlorosulphonic acid. The reaction produces ortho- and para-toluene sulphonylchlorides. The two products are separated and the ortho-toluene sulphonylchloride is treated with ammonia to form the amide. The amide is then oxidized to saccharin.

Saccharin is used all over the world as a sweetener. It cannot be considered as a substitute for sugar, since it offers no nourishment. However, saccharin is used as part of the diets of people who must avoid excessive sugar intake, such as diabetics. It is also used in the preparation of dietetic foods, dentifrices, mouthwashes, cosmetics and for sweetening tobacco and medicinal preparations, particularly where the presence of sugar might lead to spoilage by fermentation or mould growth. Saccharin is not metabolized; it is excreted unchanged from the body in the urine.

In a number of countries the use of saccharin in food products is discouraged or even prohibited. Prohibition of the use of saccharin is not based on any harmfulness in the substance, but rather because of its lack of food value, persons using saccharin-sweetened foods might be unaware that they were depriving themselves of sugar which might be needed for its high food value.

An authoritative report by C. A. Herter and O. Folin entitled *Influence of Saccharin on the Nutrition and Health of Man*, published by the U.S. department of agriculture in 1911, was studied and reported on in 1912 by a referee board of consulting scientific experts: Ira Remsen, Russell H. Chittenden, John H. Long and A. E. Taylor. After thorough consideration of facts contained in the report, the board concluded that ingestion of saccharin in quantities up to .3 g. per day is without deleterious or poisonous action and is not injurious to health.

Saccharins derived from sugars are lactones of saccharinic acids. When either dextrin or lactulose is boiled with lime, a lactone of the formula $\text{CH}_2\text{OH}.\text{CH}.\text{CH}(\text{OH}).\text{C}(\text{OH}).\text{CH}_2$ is obtained. It

crystallizes in prisms soluble in hot water and possesses a bitter taste.

Isosaccharin and metasaccharin, melting points 95° C. and 142° C. respectively, are formed by the action of lime on milk sugar. The sugar derived saccharins are of little commercial importance.

Frawley, "A Comparison of the Chronic Toxicities of Synthetic Sweetening Agents," *Journal of the American Pharmaceutical Association*, scientific edition, vol. xl, no. 11 (Nov. 1951).

(F. D. Su.)

SACCHETTI, FRANCO (c. 1330–c. 1400). Italian poet and novelist, was a member of the noble and ancient Florentine family of the Sacchetti (comp. Dante, *Par.*, c. xvi).

While still a young man he achieved repute as a poet, and he appears to have travelled on affairs of more or less importance as far as Genoa, Milan and "Ischiavonia." When a sentence of banishment was passed upon the rest of the house of Sacchetti by the Florentine authorities in 1380, it appears that Franco was expressly exempted, *per esser tanto uomo buono*, and in 1383 he was one of the "eight," discharging the office of prior for the months of March and April.

In 1385 he was chosen ambassador to Genoa, but he preferred to go as podestà to Bibbiena in Casentino. In 1392 he was podestà at San Miniato, and in 1396 he held a similar office at Faenza. In 1398 he received from his fellow citizens the post of captain of their then province of Romagna, having his residence at Portico.

Sacchetti left a considerable number of *sonetti*, *canzoni*, *ballate*, *madrigali*, etc. His *Novelle*, based on real incidents of Tuscan life, are valuable for the light they throw on the manners of that age.

See N. Sapegno, *Il Trecento* (Milan, 1934).

SACCHI, ANDREA (c. 1600–1661), Italian painter of the later Roman school, was born at Nettuno near Rome in 1600, or perhaps as early as 1598. His father, Benedetto, a painter, gave him his earliest instruction in the art; Andrea then passed into the studio of Albani, of whom he was the last and the most eminent pupil. Sacchi was one of the most learned designers and one of the soundest colourists of the Roman school. He went to Venice and to Parma to study Venetian colour and the style of Correggio. His principal painting—in the Vatican gallery—is "St. Romuald Relating his Vision to Five Monks of his Order." The Vatican gallery contains also an early painting of the master—the "Miracle of St. Gregory," executed in 1624; a mosaic of it was made in 1771 and placed in St. Peter's. Other leading examples are the "Death of St. Anna," in S. Carlo di Catina; also frescoes in the Palazzo Barberini—"Divine Wisdom." There are pictures by the master in the galleries of Perugia, Madrid and Dresden. He had a flourishing school: Nicholas Poussin and Carlo Maratta were his scholars.

See Hans Posse, *Der Römische Maler Andrea Sacchi* (Leipzig, 1925).

SACCHINI, ANTONIO MARIA GASPARE (1734–1786), Italian composer, was born at Pozzuoli, It., on July 23, 1734. He was the son of a poor fisherman and was heard singing on the sands by Francesco Durante, who undertook his education at the Conservatorio di Sant' Onofrio at Naples. Durante and Nicola Piccinni taught him composition and Nicola Fiorenza, the violin. The intermezzo *Fra Donato* was written for the theatre of the conservatorio in 1756, but his first serious opera was produced at Rome in 1762, and was followed by many others.

In 1769 he went to Venice, and as a result of the great success achieved there by the production of his opera *Alessandro nell' Indie* he was appointed director of the Conservatorio dell' Ospedale, where he trained singers and wrote church music.

In 1772 he visited London, where he was also successful, especially with his four new operas, *Tamerlano*, *Lucio Vero*, *Niteti e Persoo* and *Il Gran Cid*. His *Rinaldo* was produced in 1783 in Paris under the patronage of France Marie Antoinette, to whom he had been recommended by Emperor Joseph II. But neither in England nor in France did his reputation continue to the end of his visit. Even Marie Antoinette was not able to support his cause in the face of the general outcry against the favour shown to foreigners; by her command his last opera, *Edipe à Colone*, was set aside in 1786 to make room for Jean Baptiste Lemoigne's *Phédre*. After Sacchini died on Oct. 7 (or 8), 1786, *Edipe* became popular.

SACCO-VANZETTI CASE, THE, a murder trial in Massachusetts, extending over seven years, 1920–27, and resulting in the execution of the defendants, Nicola Sacco and Bartolomeo Vanzetti. The trial resulted from the murder in South Braintree, Mass., on April 15, 1920, of F. A. Parmenter, paymaster of a shoe factory, and Alessandro Berardelli, the guard accompanying him, in order to secure the pay roll they were carrying. On May 5

Sacco and Vanzetti, two Italians who had immigrated to the United States in 1908, one a shoe worker and the other a fish pedlar, were arrested for the crime. On May 31, 1921, they were brought to trial before Judge Webster Thayer of the Massachusetts superior court and, on July 14, were both found guilty by verdict of the jury. The verdict was disputed by Socialists and other radicals on the ground that the men had not received a fair trial because of their radical affiliations. Motion for a new trial, on grounds that the identification was not complete, failed. Further motions for a new trial were made from time to time but also failed on grounds that the evidence submitted did not justify it. On Nov. 18, 1925, the confession of Celestino Madeiros that he had participated in the crime, and that neither Sacco nor Vanzetti was present, added a new complication. Motion for a retrial on the basis of this confession was also denied by Judge Thayer who claimed that Madeiros, already sentenced to execution for another crime, was motivated in assuming the guilt in the hope that the giving of testimony would delay his own death. A motion of appeal to the state supreme court failed, the court taking the position that the trial judge had the final power to determine the matter of retrial on grounds of additional evidence. On April 9, 1927, Judge Thayer sentenced the two defendants to the electric chair.

It was at this point that the storm of protest broke loose. Newspapers in both Europe and America gave large amounts of space to the proceedings, mass meetings were held, and the officials connected with the case were flooded with petitions mingled with threats. The defense carried the case to Governor Fuller, holder of the power of clemency, who in addition to a personal investigation appointed President Lowell of Harvard university, President Stratton of the Massachusetts Institute of Technology and Robert Grant, a former judge, to investigate the case independently. On Aug. 3, Governor Fuller announced that he had found against the plea, and that his advisory committee had also come to the conclusion that a new trial was not warranted. Successive stays postponed the execution while further vain appeals were made to Judge Thayer, to the supreme judicial court, and finally to members of the U.S. supreme court, the attorney-general and the president. During the days following Governor Fuller's denial of clemency, demonstrations were made in many cities in America and abroad, bombs were set off in New York city and Philadelphia and guards were set up against other threats of violence. The two men were executed on Aug. 23, 1927, both maintaining their innocence.

SACHAU, CARL EDUARD (1845–1930), German scholar, was born on July 20, 1845 at Neumünster in Holstein. In 1869 he was appointed professor of Semitic languages at the University of Vienna, and in 1876 professor of oriental languages at Berlin, where he became director of the school of oriental languages. In 1879–80 he travelled extensively in Syria and Mesopotamia, and in 1897–98 in Babylonia and Assyria. He wrote *Syrisch-römisches Rechtsbuch aus dem 5. Jahrhundert* (1890); *Reise in Syrien und Mesopotamien* (1883); *Neuarabische Volkslieder aus Mesopotamien* (1889); *Katalog persischer Handschriften* (1889); *Muhammedanisches Erbrecht von Zansibar und Ost-Afrika* (1894); *Am Euphrat und Tigris* (1900); *Syrische Rechtsbücher* (1907–14).

For a complete bibliography of the works of Sachau, see S. Well, *Die Festschrift zu Ehren Ed. Sachaus* (1915).

SACHEVERELL, HENRY (1674–1724), English ecclesiastic and politician, was the son of Joshua Sacheverell, rector of St. Peter's, Marlborough. He was adopted by his godfather, Edward Hearst, and his wife, and was sent to Magdalen college, Oxford, in 1689, was demy of his college from 1689 to 1701 and fellow from 1701 to 1713. Sacheverell took his degree of B.A. in 1693, and became M.A. in 1695 and D.D. in 1708. His first preferment was the small vicarage of Cannock in Staffordshire; and in 1705 he was elected to the chaplaincy of St. Saviour's, Southwark. In 1709 he leapt into notoriety by his famous sermons attacking the Whig ministry on the charge of

neglecting to watch over the interests of the church. These sermons were delivered, one in Derby on Aug. 15, the other in St. Paul's cathedral; and both, especially the latter, were delivered in excessively violent language. They were immediately printed, and made the preacher the idol of the Tory party.

The attention of the House of Commons was drawn to the two sermons by John Dolben in Dec. 1709, and were denounced as "malicious, scandalous and seditious libels." The Whig ministry, then slowly but surely losing the support of the country, were divided in opinion as to the propriety of prosecuting Sacheverell. Somers was against such a measure; but Godolphin urged the necessity of a prosecution, and gained the day. The trial lasted from Feb. 27 to March 23, 1710, and the verdict was that Sacheverell should be suspended for three years and that the two sermons should be burnt at the Royal Exchange. Popular resentment over the trial resulted in the downfall of the ministry, Godolphin being dismissed in August and the other ministers in November. Immediately on the expiration of his sentence (April 13, 1713) Sacheverell was instituted to the valuable rectory of St. Andrew's, Holborn, by the new Tory ministry. He died at the Grove, Highgate, on June 5, 1744 (See also ENGLISH HISTORY).

See Hearne's *Diaries*, Bloxam's *Register of Magdalen* and Hill Burton's *Queen Anne*, vol. ii. There is an excellent bibliography by Falconer Madan (1887).

SACHEVERELL, WILLIAM (1638-1691), English statesman, son of Henry Sacheverell, a country gentleman, entered parliament in 1670 for Derbyshire. He was an opponent of the court policy, especially of the secret treaty with France. In 1678 he was one of the most active investigators of the "Popish Plot," and one of the managers of the impeachment of the five Catholic peers. He also served as a manager in the impeachment of Danby. He made the first suggestion of the Exclusion Bill on Nov. 4, 1678, in a debate raised by Lord Russell with the object of removing the duke from the King's Council. He vigorously promoted the bill in the House of Commons and opposed granting supplies till it should pass.

At the general election following the death of Charles II. in 1685 Sacheverell lost his seat, but he was an active member of the convention parliament. He died on Oct. 9, 1691. In the judgment of Speaker Onslow, Sacheverell was the "ablest parliament man" of the reign of Charles II. He was one of the earliest of English parliamentary orators; his speeches greatly impressed his contemporaries, and in a later generation, as Macaulay observes, they were "a favourite theme of old men who lived to see the conflicts of Walpole and Pulteney."

BIBLIOGRAPHY.—Many of Sacheverell's speeches are reported in Archibell Grey's *Debates of the House of Commons, 1667-1694* (10 vols., London, 1760). See also Sir George Sitwell, *The First Whig* (Scarborough, 1894).

SACHS, HANS (1494-1576), German poet and dramatist, was born at Nuremberg on Nov. 5, 1494. His father was a tailor, and he himself was trained to the calling of a shoemaker. Before this, however, he received a good education at the Latin school of Nuremberg. In 1509 he began his apprenticeship, and was initiated into the art of the Meistersingers by a weaver, Leonhard Nunnenpeck. In 1511 he set out on his *Wanderjahre*, and worked at his craft in many towns, including Regensburg, Passau, Salzburg, Munich, Osnabrück, Lübeck and Leipzig. In 1516 he returned to Nuremberg, where he remained during the rest of his life, working steadily at his handicraft and devoting his leisure time to literature. In 1517 he became master of his guild and in 1519 married. Sachs became an ardent adherent of Luther, and in 1523 wrote in Luther's honour the poem beginning *Die wittenbergisch Nachtigall*. *Die man jetzt höret überall*, and four dialogues in prose, in which his warm sympathy with the reformer is tempered by counsels of moderation. The town council of Nuremberg then forbade him to publish any more *Büchlein oder Reimen*. Before long, however, the council itself declared for the Reformation. Sachs died on Jan. 19, 1576.

By the year 1567 Sachs had composed, according to his own account, 4,275 *Meisterlieder*, 1,700 tales and fables in verse, and

208 dramas, which filled no fewer than 34 large manuscript volumes; and this was not all, for he continued writing until 1573. The *Meisterlieder* were not printed, being intended solely for the use of the Nuremberg Meistersinger school, of which Sachs was the leading spirit. His fame rests mainly on the *Spruchgedichte*, which include his dramatic writings. His "tragedies" and "comedies" are, however, little more than stories told in dialogue, and divided at convenient pauses into a variety of acts. The subjects are drawn from the Bible, the classics, the Italian novelists and elsewhere. He succeeds best in the short anecdotal *Fastnachtspiel* or Shroveide play, where characterization and humorous situation are of more importance than dramatic form or construction. Farces like *Der fahrende Schüler im Paradies* (1550), *Das Wildbad* (1550), *Das heisse Eisen* (1551), *Der Bauer im Fegfeuer* (1552), are inimitable in their way, and have even been played with success on the modern stage.

Hans Sachs himself made a beginning to an edition of his collected writings by publishing three large folio volumes (1558-61); after his death two other volumes appeared (1578, 1579). A critical edition has been published by the Stuttgart *Litterarischer Verein*, edited by A. von Keller and E. Goetze (23 vols., 1870-96); *Sämtliche Fastnachtspiele*, ed. by E. Goetze (7 vols., 1880-87); *Sämtliche Fabeln und Schwänke*, by the same (3 vols., 1893). There are also editions of selected writings by J. Titmann (3 vols., 1870-71; new ed., 1883-85) and B. Arnold (2 vols., 1885). See E. K. J. Lützeler, *Hans Sachs* (1870); C. Schweitzer, *Etude sur la vie et les oeuvres de Hans Sachs* (1887); K. Drescher, *Hans Sachs Studien* (1890, 1891); E. Goetze, *Hans Sachs* (1891); A. L. Stiefel, *Hans Sachs-Forschungen* (1894); R. Genée, *Hans Sachs und seine Zeit* (1894; 2nd ed., 1902); E. Geiger, *Hans Sachs als Dichter in seinen Fastnachtspielen* (1904).

SACHS, JULIUS VON (1832-1897), German botanist, was born at Breslau on Oct. 2, 1832. On leaving school in 1851 he became assistant to the physiologist J. E. Purkinje at Prague. In 1856 he graduated as doctor of philosophy, and established himself as *Privatdozent* for plant physiology in the university of Prague. In 1859 he was appointed physiological assistant to the Agricultural Academy of Tharandt in Saxony; and in 1861 he went to the Agricultural Academy at Poppelsdorf, near Bonn, where he remained until 1867, when he was nominated professor of botany in the university of Freiburg-im-Breisgau. In 1868 he accepted the chair of botany in the university of Würzburg, which he continued to occupy until his death on May 29, 1897.

Sachs was especially associated with the development of plant physiology which marked the latter half of the 19th century, though he contributed to every branch of botany. His earlier papers, in botanical journals and publications of learned societies, are of interest. Prominent among them is the series of "Kleimgeschichten," which laid the foundation of our knowledge of microchemical methods, and the morphological and physiological details of germination. Then there is his resuscitation of the method of "water-culture," and its application to problems of nutrition; and further, his discovery that the starch-grains to be found in chloroplasts are the first visible product of their assimilatory activity. His later papers were published in the three volumes of the *Arbeiten des botanischen Instituts in Würzburg* (1871-88). Among these are his investigation of the periodicity of growth in length; his researches on heliotropism and geotropism, in which he introduced the "clinostat"; his work on the structure and arrangement of cells in growing-points; the evidence upon which he based his "imbibition-theory" of the transpiration-current; his studies of the assimilatory activity of the green leaf; and other papers.

Sachs' works are: *Handbuch der Experimentalphysiologie der Pflanzen* (1865; French edition, 1868); *Lehrbuch der Botanik* (1868, Eng. ed. 1875 and 1882); a comprehensive work giving a summary of the botanical sciences of the period, including the results of original investigations; *Vorlesungen über Pflanzenphysiologie* (1st ed., 1882; 2nd ed., 1887; Eng. ed., Oxford, 1887); *Geschichte der Botanik* (1875, Eng. ed. 1890).

A full account of Sachs' life and work was given by E. C. Pringsheim, *Julius Sachs* (1912); see also *Flora*, lxxvii (1897); *Allg. Deutsch. Biogr.*, lvi (1907); *Proc. Roy. Soc.*, lxi (1897); *Naturwiss. Rundschau* (Braunschweig, 1898).

SACHS, MICHAEL (1808-1864), German Rabbi, one of the first of Jewish graduates of the modern universities, was appointed Rabbi in Prague in 1836, and in Berlin in 1844. He took

the conservative side against the Reform agitation, and retired from the Rabbinate rather than acquiesce in the use of the organ in the synagogue. Sachs co-operated with Zunz in a new translation of the Bible. He is best remembered for his work on Hebrew poetry, *Religiöse Poesie der Juden in Spanien* (1845).

SACKBUT, *SHAKBUSHE*, *SAGBUT*, *DRAW* or *DRAWING TRUMPET*, the earliest form of slide trumpet, derived from the Roman *buccina*, which afterwards developed into the trombone. As soon as the effect of the slide in lengthening the main tube and therefore proportionally deepening the pitch of the instrument was understood, and its capabilities had been realized, the development of a family of powerful tenor and bass instruments followed as a matter of course. The transformation of the *buccina* (into the sackbut involved two or three processes, the addition of the slide being accomplished in at least two stages, the extending portion of the tube being at first straight and later bent or folded to make the instrument less unwieldy. (See also *TROMBONE*, *TRUMPET* and *BUCCINA*.)

SACKETS HARBOR, a village in Jefferson county, New York, U.S.A., at the eastern end of Lake Ontario, on the south shore of Black River bay, about 1 mi. from its mouth, and about 10 mi. W. by S. of Watertown. Pop. (1940) 1,962; (1950) 2,247. Sackets Harbor is served by the New York Central railway. It is built on low land, around a small, nearly enclosed harbour, the northern shore of which is formed by Navy Point, a narrow tongue of land extending about ½ mi. nearly due eastward from the mainland. In the military cemetery is the grave of Gen. Zebulon M. Pike (q.v.), killed at York (Toronto) on April 27, 1813.

The first settlement was made in 1801 by Augustus Sacket and the village was incorporated in 1814. In the war of 1812 Sackets Harbor, important strategic point for the Americans, was the base for naval operations on the Great Lakes. In July 1812 it was attacked by a Canadian provincial squadron and again in May 1813, by a British squadron under Commander Yeo and troops under General Sir George Prevost, on both occasions unsuccessfully. For many years it boasted the world's smallest navy yard, under four acres. It continues to be occupied by Naval Reserves. For several years the property was in charge of the shipkeeper's widow and thus was commanded by a woman. The first steamship on the Great Lakes was launched at Sackets Harbor in 1817. Von Schultz and 700 men sailed from the port in Nov. 1838, to invade Canada, were captured near Prescott and Von Schultz was executed at Kingston after the trial.

See A. T. Mahan, *Sea-Power in its Relation to the War of 1812* (Boston, 1905); and W. Kingsford, *The History of Canada*, vol. viii. (Toronto, 1895).

SACKING AND SACK MANUFACTURE

Sacking is a heavy closely-woven fabric, originally made of flax, but now almost exclusively made of jute or of hemp. The more expensive kinds, such as are used for coal sacks for government and other vessels, are made of hemp, but the jute fibre is extensively used for the same purpose, and almost entirely for coal-sacks for local house supplies. The same type of fabric is used for wool sacks, cement bags, ore bags, pea sacks and for any heavy substance; it is also made up into a special form of bag for packing cops and rolls of jute and flax yarns for delivery from spinners to manufacturers. Proper sacking is essentially a twilled fabric, in which the number of warp threads per inch greatly exceeds the number per inch of weft. The illustration shows a typical kind of three-leaf twill, double warp sacking. All three-leaf twill sack-

ings are double in the warp, but four-leaf sackings are usually single; special kinds may be double in the warp. In all cases the warp is comparatively thin, say 6lb. to 8lb. per spynkle, whereas the weft is thick and single from 16lb. to 48lb. per spynkle. Cloths are usually 27 in. wide, but other widths are made.

The lower part of the illustration shows four repeats of the three-leaf twill, while the lines drawn to the plan of the fabric show that each line of the design is reproduced in the cloth by two warp threads. Large quantities of cotton sacks are made for flour, sugar and similar produce; these sacks are usually plain cloth, some woven circular in the loom, others made from the piece.

Large quantities of seamless bags or sacks for light substances are woven in the loom, but these are almost invariably made with what is termed the double plain weave; i.e., the cloth, although circular except at the end, is perfectly plain on both sides, and similar in structure to, but wider than hose-pipe (q.v.). Circular bags have been made both with three-leaf and four-leaf twills, but it is found much more convenient and economical to make the piece, and then to make it up into sacks by one or other of the many types of sewing machines. The pieces are first cut up into definite lengths by special machinery, which may be perfectly automatic or semi-automatic—usually the latter, as many thicknesses may be cut at the same time, each of the exact length. The lengths of cloth are then separately doubled up, the sides sewn by special sewing machines.

The chief centres for jute bags are Dundee and Calcutta, all varieties of sacks and bags being made in and around the former city. For paper sacks see *PAPER* and *PAPER MANUFACTURE*.

See T. Woodhouse, *The Finishing of Jute and Linen Fabrics* (1928).

SACKVILLE, GEORGE, 1st Viscount (1716–1785), generally remembered as Lord George Sackville or Lord George Germain, third son of Lionel Cranfield Sackville, 1st duke of Dorset, was born on Jan. 26, 1716. Educated at Westminster School and Trinity College, Dublin, he was gazetted captain in 1737, and saw active service in the German campaign. Wounded in the charge of Cumberland's infantry column at Fontenoy, he was taken to the tent of King Louis XV. to have his wound dressed, and was soon released. He received rapid military promotion, and was gazetted major-general in 1755 and lieutenant-general in 1757. Meanwhile he filled the offices of first secretary to his father, the lord-lieutenant of Ireland, and Irish secretary of war, and sat in each of the two Houses of Commons at Westminster and Dublin. In 1758, under the duke of Marlborough, he shared in the ineffective raid on Cancale Bay, and the troops, after a short sojourn in the Isle of Wight, were sent to join the allied army of Duke Ferdinand of Brunswick in Germany. Marlborough died shortly after they landed, and Sackville succeeded him as commander-in-chief of the British contingent. His haughty and domineering temper estranged him both from his second-in-command, Lord Granby, and the commander-in-chief, Prince Ferdinand. This culminated on the day of Minden (August 1, 1758). The British infantry, aided by some of the Hanoverians, had won a brilliant success, and every man in the army looked to the British cavalry to charge and to make it a decisive victory. But Sackville, in spite of repeated orders from Prince Ferdinand, sullenly refused to allow Granby's squadrons to advance. The crisis passed, and the victory remained an indecisive success. A court-martial in 1760 pronounced him guilty of disobedience, and adjudged him "unfit to serve his Majesty in any military capacity whatsoever." In 1763 his name was restored to the list of the Privy Council. In 1769 he allied himself with Lord North. To this period belong the famous Junius Letters, with the authorship of which Sackville was erroneously credited. In 1770, under the terms of a will, he assumed the name of Germain. In 1775, having meantime taken an active part in politics, he became secretary of state for the colonies in the North cabinet, and he was practically the director of the war for the suppression of the revolt in the American colonies. Germain and the North cabinet misunderstood the situation and there was constant friction with the generals and the army in the theatre of war. Nevertheless he received a peerage. He died at Stoneland Lodge (Buckhurst Park) Sussex, on Aug. 26, 1785.

SACKVILLE, THOMAS 1st EARL OF DORSET (c. 1530-1608), English statesman and poet, son of Sir Richard Sackville, was born at Buckhurst, Sussex, took his M.A. at Cambridge and was called to the bar at the Inner Temple. He married Cicely, daughter of Sir John Baker of Sissinghurst, Kent; in 1558 he entered parliament as member for Westminster, in 1559 he sat for East Grinstead, Sussex, and in 1563 for Aylesbury, Buckinghamshire. During a visit to the continent in 1565 he was imprisoned for a rash declaration of Protestant opinions. The news of his father's death on April 21, 1566, recalled him to England. On his return he was knighted in the queen's presence, receiving at the same time the title of baron of Buckhurst. In 1571 he was sent to France to congratulate Charles IX on his marriage with Elizabeth of Austria, and he took part in the negotiations for the projected marriage of Elizabeth to the duke of Anjou. In 1572 he was one of the peers who tried Thomas Howard, duke of Norfolk, and in 1586 he was selected to convey the sentence of death to Mary queen of Scots. He was sent in 1587 as ambassador to The Hague and carried out under protest the foolish and often contradictory orders he received. His plain speaking on Leicester's action in the Netherlands displeased the queen. His return was followed by a short period of disgrace, but he was sent again to the Netherlands in 1589 and 1598. He was elected chancellor of the University of Oxford in 1591, and in 1599 succeeded Lord Burghley as lord high treasurer. In 1601 as high steward he pronounced sentence on Essex, his rival for the chancellorship and his opponent in politics. James I confirmed him in the office of lord treasurer. He was created earl of Dorset in 1604, and died suddenly at the council table on April 19, 1608. His eldest son, Robert, the 2nd earl (1561-1609), was a member of parliament and a man of great learning. Two other sons were William (c. 1568-91), a soldier killed in the service of Henry IV of France, and Thomas (1571-1646), also a soldier. Sackville is remembered, not by his distinguished political career, but by his share in two works, each of which was, in its way, a new departure in English literature. To the second edition (1563) of the *Myrroure for Magistrates*, edited by William Baldwin, Sackville contributed the *Complaint of Henry Stafford*, duke of Buckingham, to which he prefixed an *Induction*. This induction was arbitrarily transposed (1610) to the beginning of the collection by a later editor, Richard Nicolls, a proceeding which led to the attribution of the general design to Sackville, an error repeated by Thomas Warton. The originators were certainly Baldwin and his "printer" who designed the *Myrroure* as a continuation of John Lydgate's *Falls of Princes* in the form of laments of the ghosts of great men written by various hands. Fragments of the earliest edition entitled *A Memoriall of such princes as . . . have been unfortunate . . .* are sometimes found bound up with Lydgate's book.

Sackville's *Induction* opens with a description of the oncoming of winter. The poet meets Sorrow, who offers to lead him to the infernal regions that he may see the sad estate of those ruined by their ambition, and thus learn the transient character of earthly joy. At the approaches of Hell he sees a group of terrible abstractions, Remorse of Conscience, Dread, Misery, Revenge, Care, etc., each vividly described. The last of these was War, on whose shield he saw depicted the great battles of antiquity. Finally, penetrating to the realm of Pluto, he is surrounded by the shades, of whom the duke of Buckingham is the first to advance, thus introducing the *Complaint*. Sackville's models were Gavin Douglas and Virgil. The dignity and artistic quality of the narrative of the fall of Buckingham make the work one of the most important between the *Canterbury Tales* and the *Faerie Queene*.

Sackville has also the credit of being part author with Thomas Norton of the first legitimate tragedy in English. This was *Gorboduc* or *Perrex* and *Porrex*, performed at Christmas 1560 by the society of the Inner Temple, and on Jan. 18, 1561, before Elizabeth at Whitehall. The argument is as follows:

"Gorboduc, king of Brittain, devided his Realme in his lyfe time to his Sones, Ferrex and Porrex. The Sones fell to dyvisyon and disencion. The yonger kyllled the elder. The Mother, that more dearly loved theilder, fr revenge kyllled the yonger. The people, mooved with the Crueltie of the kyll, rose in Rebellion and

Slewe both father and mother. The Nobilitie assembled, and most terribly destroyed the Rebelles. And afterwards for want of Issue of the Prince, wherby the Succession of the Crowne became uncertayne, they fell to Cuill warre, in which both they and many of their Issues were slayne, and the Lande for a longe tyme almoste desolate, and miserablye wasted."

The story is taken from book ii, chap. xvi, of Geoffrey of Monmouth's history. It was first printed (1563) in an unauthorized edition as *The Tragedie of Gorboduc* "whereof three Actes were written by Thomas Nortone, and the two laste by Thomas Sackvyle." In 1570 appeared an authentic edition, *The Tragedie of Perrex and Porrex*. The tragedies of Seneca were now being translated, and the play is conceived on Senecan lines. The paucity of action is eked out by a dumb show to precede each act, and the place of the chorus is supplied by four "ancient and sage men of Brittain." In the variety of incident, however, the authors departed from the classical model. The play is in blank verse, and is the first example of the application of Henry Howard, earl of Surrey's innovation to drama. Jasper Heywood in the poetical address prefixed to his translation of the *Thyestes* alludes to "Sackvilde's Sonnets sweetly saute" but only one, prefixed to Sir T. Hoby's translation of Castiglione's *Courtier*, has survived.

The best edition of *A Mirror for Magistrates* is that of Joseph Haslewood (1815). *Gorboduc* was edited for the Shakespeare society by W. D. Cooper in 1847; in 1883 by L. Toulmin Smith for C. Vollmüller's *Englische Sprach und Literaturdenkmale* (Heidelberg, 1883); and by J. Q. Adams, *Chief Pre-Shakespearean Dramas* (1924). The *Works of Sackville* were edited by C. Chapple (1830) and by R. Sackville-West (1899). See also *A Mirror for Magistrates* (1898) by W. F. Trench; and accounts in W. J. Courthope's *History of English Poetry*, vol. i, and in the *Cambridge History of English Literature*, vol. iii.

SACO, a city of York county, Me., U.S., on the Saco river and the Atlantic ocean, opposite Biddeford and 14 mi. S.W. of Portland. It is on federal highway 1 and is served by the Boston and Maine railroad. Pop. (1930) 10,324; (1940) 8,631. There is abundant water power, and the city has cotton mills and various other factories. The adjoining town of Old Orchard Beach, with one of the finest beaches on the coast (a wide crescent 10 mi. long), has long been a popular summer resort and was a starting point for several early transatlantic flights. Saco was founded by settlers from Plymouth colony in 1629 through a grant of land which included the present site of the city. The first permanent settlement, however, is recorded as 1623, when Thomas Lewis and Richard Bonnython arrived. It was made a part of Massachusetts in 1653 and became represented in the general court in 1659. It was incorporated as Biddeford in 1718. Later it was divided, and that part north of the Saco river was incorporated as Pepperell-boro in 1763 in memory of Gen. Sir William Pepperell. In 1805 the name was changed to Saco. It was incorporated as a city and a charter was adopted in 1867.

SACRAMENT, the title given by Christians to an external rite or ceremony regarded as the instrument, or at least a symbol, of the reception by those who participate in it of a spiritual benefit whereof Christ is the author. As the conception of a spiritual benefit received through participation in an external rite is by no means peculiar to Christianity, the expression is often applied also to rites in other religions more or less analogous to those designated sacraments by Christians, and sometimes to any instance of the use of material objects as instruments whereby spiritual benefits may be conveyed or appropriated, even although no religious doctrine or ritual be associated with such conveyance or appropriation. The present article, however, will be mainly concerned with the Christian conception of a sacrament, and rather with the content and significance of that conception than with its history.

In the *Sentences* of Peter Lombard, bishop of Paris 1159-60, which served for centuries as the theological textbook of western Christendom, *sacramentum* in the most general use of the word is defined (5 *Sent.*, dist. 1 B. following Augustine *Ep.* 138 § 8, *signa quae, cum ad res divinas pertinent, sacramenta appellantur*) as *sacrae rei signum*; and, more precisely, as *invisibilibus gratiae visibilibus forma*; but in its strictest acceptance, wherein it is applicable only to certain Christian rites, we need the *sacramentum* and

gratiae Dei et invisibilis gratiae forma ut ipsius imaginem gerat et causa existat—an outward and visible sign of an inward divine grace, which it both aptly represents (as immersion in baptismal water represents cleansing from sin, or eating and drinking eucharistic bread and wine the maintenance and strengthening of spiritual life) and also actually imparts to the recipient.

The word *sacramentum* is used in classical Latin literature of the pledge deposited in a temple by the parties to a lawsuit, and also of the soldier's oath of allegiance to his commander; and neither of the senses has been without influence on its employment by Christian theologians. But the far less restricted sense given to it by the Latin-speaking Fathers and their choice of it to render the Greek *μυστήριον* point to its having had a more general signification, corresponding to its etymology, such as is suggested by St. Thomas Aquinas when he says that that may be called *sacramentum* whereby anything is made sacred (*sacratum*) as that whereby anything is adorned (*ornatur*) is called *ornamentum* (in 4 Sent. i. 1; cf. *Summ. Theol.* q. u. ix. art. 1: *Sacramentum dicitur a sacando, sicut medicamentum a medicando*). Thus, behind the conception of a sacrament lies the notion, common to all peoples, of a "sacred" sphere or world, distinct from, but in close contact with, that of everyday life, so that particular persons, things, places and times can, by recognized methods of "consecration" or "desecration," be removed from one to the other.

The word *μυστήριον*, employed by the Greek-speaking Church, was associated with the same notion, being the regular designation of religious ceremonies of initiation. These ceremonies distinguished the initiated from those not counted worthy of such translation from the sphere of ordinary life to communion with denizens of a higher world, and suggested the *secrecy* with which "sacred" rites were invested, in order to secure their performance from the intrusion of profane or unconsecrated persons or things. In the New Testament *μυστήριον* is almost exclusively used of the divine secrets (e.g., of God's purpose to include all nations in the covenant made by him at first with Israel alone) which are described as now at length divulged to the world by the preaching of Christ's apostles. It is not applied to the solemn rites of initiation and communion which were nevertheless already regarded as "means of grace," and came, with the spread of Christianity in the Graeco-Roman world, to be treated as corresponding in the new faith to the ceremonies there denoted by the name, in which Christians from Justin onwards, were accustomed to see a diabolical travesty of the Christian "sacraments." Nor for a long time was the word *sacramentum*, by which the earliest Latin translators of the Scriptures rendered *μυστήριον* limited to those outward "means of grace" to which it came eventually to be appropriated; and, even after it had been thus appropriated, it was only gradually that among a host of ceremonies and things used in ceremonies, all supposed to convey divine grace in some manner or degree, a certain number were definitely acknowledged as properly entitled to the name of sacraments.

THE SEVEN SACRAMENTS

Seven rites were recognized in the west, from Peter Lombard onwards, as sacraments in the strict sense: Baptism, Confirmation, the Eucharist, Penance, Extreme Unction, Orders and Marriage; the Councils of Trent and of the Vatican endorsed this list which has also been adopted by the orthodox Church of the east. The Churches of the Reformation, on the other hand, acknowledged only baptism and the eucharist, to which indeed a certain pre-eminence was universally allowed, as entitled to be called sacraments in the proper sense; mainly on the ground that these alone could be proved from Scripture to have been instituted by Christ himself as external ceremonies effecting, or at least attesting and sealing, the conveyance of an inward spiritual grace to worshippers qualified to receive it by faith in the promise expressly associated with its performance by its divine Founder. In demanding that a sacrament in the proper sense must be able to claim institution by Christ the Reformers did not differ from the Roman Church. But they refused to accept inferences from the words of Scripture, though supported by ecclesiastical tra-

dition, as evidence of such institution equivalent to the direct commands to be found for baptism in Matt. xxviii. and for the eucharist especially in 1 Cor. xi.

The Scriptural texts alleged to suggest a like institution for the other rites recognized by the Roman Church as sacraments seemed to them either to be inapplicable to them or else to make no such provision for a particular outward symbol of the promised grace as was necessary to constitute a "sacrament," while the traditional rendering of *μυστήριον* by *sacramentum* in the application of the word to marriage in Eph. v. 32 could hardly be said to warrant the interpretation of the word there, as intended in a very specialized sense otherwise unknown to the New Testament. Where, however, there was, as with baptism and the eucharist, express scriptural authority for the institution by Christ of an outward and visible sign of an inward spiritual grace, of the bestowal whereof it was to be, to a believer in his promise, at least the assurance, if not the instrument, there the Protestant as well as the Catholic, recognized a genuine sacrament.

There was, however, an important point of difference between them, in respect of such ceremonies as they agreed in regarding as "sacraments." The former denied, and the latter affirmed that they confer grace *ex opere operato*. This phrase seems to have been originally intended to express the belief that sacraments do not depend for their efficacy on the moral character or even on the private beliefs of the individual minister; that where an otherwise qualified person, though wicked or unbelieving, yet intending "to do what the Church does," observes the appointed forms, the recipient need not be afraid that the promised grace is not received; the human minister being no more than an instrument in the hand of the true Giver, Christ Himself. This the Churches of the Reformation for the most part did not deny; the view of Wyclif that only one himself in a state of grace could administer a valid sacrament obtained little acceptance. But the Reformers objected to the phrase *ex opere operato*, which was solemnly reaffirmed against their objections by the Council of Trent. It seemed to them inconsistent with the supreme place assigned in their theology to faith as the sole means of justification. Catholics did not indeed deny that the absence of personal faith in a recipient in whom it could be present (as it could not be, for example, in infants brought to baptism) would present an impediment to this profiting by the grace offered in a sacrament, and on their side, Protestants, in allowing infant baptism, were constrained to admit that the requisite faith was not necessarily that of the individual recipient, but might be that of his parents or of the Church.

Nevertheless, the difference between Catholic and Protestant in that the one laid stress upon the necessity to salvation of sacraments where they could be had, and the other on the indispensableness of faith, which could justify without sacraments, while without it sacraments could not justify, profoundly affected their respective attitudes towards an institution which the Protestant as little intended to disparage as the Catholic. In respect of the eucharist, whereas Luther, Calvin, and the Reformers generally had hoped, by abolishing celebrations at which the priest alone communicated, to restore the primitive frequency of communions, the actual result of the changes introduced by them was to deprive that service in any form of the central place in the public worship of the Church which it had held from the very beginnings of Christianity. Catholics on the other hand were driven by the necessity of maintaining the efficacy of sacraments *ex opere operato* into placing and encouraging a reliance on sacraments which exposed them to the charge of allowing their religion to degenerate in practice into magic.

SYMBOLISM

It cannot be denied that the use of sacraments presents a certain resemblance to some kinds of magic. There is in both the employment of material objects and of bodily gestures in conjunction with a particular form of words to produce effects which, apart from such conjunction, they could not have accomplished. But sacraments resemble far more closely facts of human life which no one would think of describing as magical in any disparaging

ing sense; such as the operation of words, spoken or written, in creating states of feeling, inspiring action, or revealing personality. Here the necessity of intelligent acceptance by those affected of the conventional meaning of the sounds or words employed, the limitation of the effect produced to a certain social context, and the quality (not merely physical, but intellectual or spiritual) of the result obtained distinguish verbal communication (though, as certainly not fully explicable on the principles recognized in the natural sciences, it may fairly be called *mysterious*) from what is usually meant by *magic*. And in these respects, sacraments must be classed with verbal communication. No Christian theologian would allow that these are effective altogether outside of the context of that agreement as to the meaning of the signs and formulas used which exists among Christians, or for the production of merely physical effects according to any law which, like those called "natural," operates irrespectively of the consciousness of those in whose bodies they are produced.

Attempts to treat sacraments as thus effective for "magical" purposes have not been unknown; but they have always been denounced by ecclesiastical authority and regarded as wrong and profane. Without entering into details as to charges of the magical use of sacraments made by theological opponents against particular groups of Christians, it may be observed, in reference to one of special historical importance that, while it is quite arguable that to use the eucharist as a focus of adoring devotion apart from communion is an unwarrantable departure from its original intention, both parties to the controversy here indicated would agree in disapproving as illegitimate any use of it for purposes really other than that or those (whatever it or they may be) for the sake of which it was originally instituted.

Wherever sacraments are used at all (and few Christian denominations have, like the Society of Friends, abandoned the use even of the two which undoubtedly date back to New Testament times), although there may be no crude abuse of them for confessedly magical purposes, quite other than those which the Church holds them to be intended to secure, it is possible to assimilate them to magical performances, by losing sight of their function as vehicles for communicating to individuals a life essentially social and, like all social life, requiring a conventional or ceremonial mode of expression, and of the essentially ethical character of the life which they are thus designed to communicate. The use of material objects or of bodily gestures in the communication of spiritual grace is not alien to the religion of the New Testament, but it is never there taken out of the context of a moral and social life in the imparting and maintaining of which the whole purpose of such use of objects and gestures consists. It is in a firm grasp of the *social* character of sacraments and of the *moral* quality of the life which they are designed to serve as instruments in communicating that the true safeguard against the very real danger of a degeneration of sacramentalism into magic-mongering should be sought rather than in the elimination of sacramentalism from religion, with the whole history of which it is intimately bound up, and by which, as has been well said, "the higher gifts are made accessible to persons of all stages of culture."

"The principle that spiritual values and forces are mediated through material processes," the same writer observes, "runs through nature as a whole." The very production of a new personality is only possible through "a material process the most liable . . . to carnal misuse." "Truth, beauty, goodness . . . become effective only through material forms." There are "natural sacraments"—the kiss, the handshake, the flag—outside of religion. The admittedly important part which these and their like play in our common social life the sacraments play in religion; and in Christianity in particular, "we are bidden to act as sons of God and sharers in Christ, knowing by an outward sign that we are so. Our reliance is to be on the word and act of God, while the joy of responsive emotion comes and goes." (Gore, *The Holy Spirit and the Church*, pp. 24, 146, 148.)

To the value of sacramentalism to human life Goethe (*Wahrheit u. Dichtung*, Th. II., B. 7) and Comte, who devised an elaborate system of symbolic rites for his new Religion of Humanity, may

be cited as witnesses. That in the early stages of civilization the magical and the sacramental are not easily discriminated is no more than may be said of the magical and the religious in general, or indeed of the magical and the scientific. Primitive magic owes its disappearance at a higher level of culture to its confusion (arising at first from lack of experience, afterwards from the persistence of uncriticized tradition) of different kinds of causation; the supposition, for instance, that the utterance of a name may affect an animal, thing, or unconscious person as it may a person who hears himself called; or that the moral healing of a soul may be effected by external actions without a change in the direction of the will. We still know too little about the interaction of mind and body to despise our ancestors or undeveloped contemporaries for making mistakes in this department, which it has taken centuries of progress, religious and scientific, to render us inexcusable in making. But neither need these ancient errors, even though they may, here as elsewhere, have left traces of themselves, interesting to the archaeologist in conventions and customs which have survived the false beliefs in which they originated, be supposed to render trivial or illusory the higher activities and experiences in connection with which these traces are retained.

THE ARGUMENT OF CONTINUITY

But while we may speak of "natural sacraments" the word is strictly appropriate only where a distinction is drawn between the everyday world and a "sacred" world transcending this, although not necessarily separated from it in space or time. Where the use of the term is extended to the communication of spiritual illumination or power through material symbols apart from religion, we have to do either with a metaphor or, more usually, with a conviction that what is experienced in religion may be employed as a key to the true or ultimate nature of the world as a whole, including those features of it which are revealed to us in that part of our experience which is not in itself specifically religious. For Christians the "sacred" sphere is that which is directly related to Christ, and accordingly nothing can be properly called a "sacrament" which cannot claim authorization by Christ as a vehicle of Divine grace. While a statement in the Bible was taken as, by its presence there, guaranteed to be, when rightly understood, free from error, the undoubted occurrence in Scripture of direct statements that Christ instituted baptism and the eucharist was sufficient to establish their claim. Critical study of the Bible has here, however, altered the situation. Few scholars would now be prepared to regard Matt. xxviii. 19, and 1 Cor. x. 23 *sqq.* as putting it beyond doubt that the historical Jesus actually prescribed the permanent observance of these rites by his followers. Thus the old question as to the number of sacraments cannot be argued on the old grounds, but rather on that of the continuity between any rite now in use and a rite observed in the primitive Christian community from which the New Testament proceeded; and of the degree in which that community regarded it as intimately bound up with that fellowship with the crucified and risen Saviour which this community existed to offer to all who would join themselves with it.

That baptism and the eucharist were regarded as very intimately bound up with it is certain. Converts were always initiated by a ceremonial washing in Christ's name; such a washing, symbolical of cleansing from sin, being (whether or no actually practised or enjoined by Jesus) familiar to Jews as used in the admission of proselytes and specially associated with Christ's own baptism by John the Baptist, whose mission Christians believed to have been preparatory to their Master's. From the first the followers of Jesus continued the custom, which had plainly been characteristic of his daily intercourse with his disciples, of the solemn blessing and breaking of bread at their social meals; a custom invested with specially solemn associations by the circumstances of His last supper whereat he was believed to have used words identifying the bread and cup shared among his companions with his own blood and blood, which were so soon after to be broken and shed upon the cross.

The credentials of the other rites acknowledged by many Christians as sacraments were more doubtful. A laying on of hands

symbolical of the gift of the Spirit seems usually from the beginning to have formed part of the initiatory rite, though sometimes detached from the baptism proper; but no tradition connected it with any injunction of Jesus; the gift imparted was associated in the New Testament with extraordinary manifestations not destined to be permanent; of the anointing which later became the chief feature of "confirmation" Scripture says nothing. Jesus had been wont to forgive sins, and sins were believed to be washed away in baptism; but no ceremony or fixed formula is recorded to have been used by Jesus in this connection; only gradually was it realized that sin after baptism would be a normal feature of the Christian's life; nor can scriptural authority be claimed for the system of penitential discipline which was gradually developed in the Church. The unction of the sick mentioned in James was not, like the later rite which appealed to its precedent, intended to be "extreme"; its primary purpose was not the imparting of a spiritual gift, but bodily healing, which alone is mentioned as the object of unction in the only scriptural passage (Mark vi, 13) which appears to represent it as performed by Christ's direction. The setting apart of office-bearers in the Christian community by laying on of hands is certainly apostolical; but this symbolic mode of appointment is nowhere stated in Scripture to have been used or enjoined by Jesus himself. Lastly, the only claim of the immemorial and universal institution of marriage to be a "sacrament of the new law" appears, as said above, to be the incidental observation of St. Paul (doubtless suggested by the prophetic use of it as a symbol of the bond between Yahweh and Israel) that it is a "great mystery" or "sacrament" as representing the union of Christ with his Church. But though only certain rites may be reckoned as sacraments in a prerogative sense, the whole system through which individual members of a religious group are placed, through symbols, conventionally recognized therein as instruments of its communication, in contact with the spiritual life which gives unity to the group may be regarded as sacramental. In Christianity—and the associations of the word "sacrament" are Christian—this is the divine life historically manifested in the person and work of Jesus Christ and believed to be continued in the community which, as inspired by His Spirit, may be called His "mystical body." Here those rites, the continuous experience of grace received through which throughout the history of the community attest the unbroken presence therein of the same source of spiritual life are entitled to the name of sacraments. It is clear that only where there exists faith in the reality of this divine life and in the organic relation of the community thereto, can any significance or efficacy be attributed to these; but also that such faith can only be other than an illusion if this life and this relation are in fact real. (See also BAPTISM, EUCHARIST.)

SACRAMENTALS, in the Roman Catholic Church, signs of ecclesiastical institution which differ from sacraments in that they do not give grace of themselves, but only prepare men to receive more worthily the grace of the sacraments. Typical sacramentals are the sign of the cross, holy water, blessed candles, ashes, palms, crucifixes and rosaries. Their special effect derives from the power of the church's prayer. It is conditioned in the concrete by the dispositions of the user. (Cf. *Codex Iuris Canonici*, cc. 1144 ff.)

SACRAMENTARIANS, the name given to those who during the Reformation controversies not only denied the Roman Catholic doctrine of "transubstantiation," but also the Lutheran "consubstantiation." They admitted a spiritual presence of Christ which the devout soul can receive and enjoy, but denied any physical or corporeal presence. Finally accepting the Confession of Augsburg, they were merged in the general body of Lutherans; with the exception of the Swiss followers of Huldreich Zwingli, whose position was incorporated in the Helvetic Confession. It is a curious inversion of terms that in recent years has led to the name Sacramentarians being applied to those who hold a high or

extreme view of the efficacy of the sacraments.

SACRAMENTO, the capital city of California, U.S., and the county seat of Sacramento county, is located at the confluence of the American and Sacramento rivers midway between the Sierra Nevada range and the Pacific ocean. It is on the hub of federal highways 40, 50 and 99, and major routes of the state highway system. It has a municipal airport and several private airports and is served by transcontinental and other air lines serving the Pacific coast area. Railroads serving Sacramento are the Southern Pacific, Western Pacific, Sacramento Northern and Central California Traction company. Facilities are available for the handling of freight traffic from the San Francisco bay area via the Sacramento river to Sacramento. Under construction at mid-20th century was the port of Sacramento, to provide a deep-water port for ocean-going vessels.

The population of Sacramento was 135,761 in 1950, 105,958 in 1940 and 93,750 in 1930. The city occupies 16.7 sq. mi. and is about 30 ft. above sea level. The mean annual temperature is 60° F., and the mean annual rainfall is 18.02 in. The state capitol (built 1860-69 with later addition) stands in a park of 40 ac (owned by the state) in the heart of the city. A mile east of the capitol (in another state-owned park) is old Fort Sutter, restored and maintained by the state as a historic museum. Within the city limits are the state fairgrounds of 210 ac. The city park system covers 1,337 ac.; a municipal vacation camp is maintained in the mountains; the municipal auditorium (completed 1927) seats 5,000, and the athletic stadium (1928) 25,000. Zoning ordinances are in effect, and a city-planning board was created in 1926. The public-school system provides instruction from the kindergarten through the ninth grade. The Sacramento Junior college and the Sacramento State college provide instruction at the college level. At Davis, 14 mi. W. of Sacramento, is the college of agriculture of the University of California. The State library (427,197 vol.) has a fine law department and the most complete collection in existence on the history of California, and the Crocker art gallery houses one of the largest and most valuable collections in the west. In 1921 the city adopted a council-manager form of government. The assessed valuation of property in 1950 was \$90,859,400.

Industries and Commerce.—Sacramento is an important distributing centre and the trading area of 17 counties, a highly productive agricultural, mining and lumbering region. The immediate vicinity produces pears, peaches, plums, apricots, oranges, olives, cherries, strawberries, asparagus, celery, spinach, almonds and Tokay grapes, and harvests some fruit or vegetable every month in the year. Canning and preserving is the city's chief industry. The railroad shops employ more than 6,000 men.

Among the other major industries are can-manufacturing plants, meat-packing plants, rice and flour mills, olive-pickling plants, bean and rice cleaners and polishers, brick and pottery works, box factories and an almond-shelling plant.

History.—On Aug. 12, 1839, Capt. John Augustus Sutter (1803-80), a Swiss army officer, with three companions, landed at the confluence of the American and the Sacramento rivers, coming by rowboat from the port of San Francisco, then known as Yerba Buena. With the help of a few Indians they built an adobe house, roofed with tules, fortified it and surrounded it with a protecting adobe wall. Sutter had obtained from Gov. Juan Alvarado a grant of 11 square leagues of land. Settlers came, whom he welcomed, and his hospitality and prosperity made "Fort Sutter" famous. Situated as it was on the main line of overland travel, it soon became the greatest trading post in the west. Captain Sutter employed several hundred men, had 13,000 head of stock on his ranges, a vast acreage of wheat and a large mercantile business. In 1847 he sent James W. Marshall to find a good site for a new sawmill. A spot was selected on the south fork of the American river, 35 mi. N.E. of the fort at Coloma, and work had begun on the mill when, on Jan. 24, 1848, Marshall picked up in the millrace the first gold nugget found in California. The discovery of gold on his own land by his own man was, ironically, the cause of Sutter's ruin, for his men deserted him, the newcomers pillaged his property and he died in the east a poor man; but it

was the foundation of the city's development and of the rapid settlement of the whole state. The site of the present city was surveyed in 1848 and the name Sacramento (already in common use) was adopted. The first sale of town lots was held in Jan. 1849. The federal census reported a population of 6,820 in 1850, and the city was incorporated in that year. For some time conditions were chaotic, as in most new mining towns. Trouble with "squatters" almost led to local war in 1850. In 1849 the city offered \$1,000,000 for the honour of being the state capital. The legislature met there in 1852, and in 1854 it was chosen as the permanent seat of government. Three times between 1849 and 1853, and again in 1862, the city suffered from devastating floods, and in 1852 two-thirds of it was destroyed by fire. Further danger from flood has been averted by strong levees and by filling in the low land along the river. By 1856 the Sacramento Valley railroad (the first steam railway in California, built to accommodate the business developed in the gold mines) was completed to Folsom, 23 mi. N.E. of Sacramento. Its chief engineer, Theodore D. Judah, took plans for a feasible route across the mountains to the capitalists in San Francisco and was laughed at as a dreamer. In Sacramento, however, he found four merchants (Leland Stanford, Mark Hopkins, Charles Crocker and Collis P. Huntington) who pledged their personal fortunes to secure the undertaking of the enterprise, and on Feb. 22, 1863, in Sacramento, the construction of the Central Pacific railroad across the Sierras was begun. On May 10, 1869, at Promontory Point, Utah, Stanford drove the golden spike that united the section of road built from the west with the section built from the east, and later in the month the first through train from the Atlantic coast reached the city. Through the rest of the 19th century the growth of Sacramento was steady and gradual, and in 1900 the population was 29,282.

Subsequently, accompanying the increasing productivity of its tributary territory (largely because of irrigation and completion of the great levee system), there was a rapid commercial and industrial expansion.

Between 1900 and 1920 the population considerably more than doubled.

Between 1939 and 1949 postal receipts increased 211%; bank debits 361%; and building permits 261%.

SACRARIUM, a term used in classical Latin for the place where sacred things were kept in a temple or private house. In mediaeval ecclesiology the term is used in various senses; e.g., choir or chancel of a church (usually called sanctuary or presbytery), tabernacle, sacristy, etc.

SACRED HEART. Devotion to the Sacred Heart of Jesus is a cult peculiar to the modern Roman Catholic Church. The principal object of this devotion is the Saviour Himself. Saint Marguerite Marie Alacoque (q.v.), assisted by her director, the Venerable Claude de la Colombière, S.J. (1641-82), spread the devotion. This devotion was strongly opposed by the Jansenists, who claimed that the Heart of Christ was being adored as separate from the rest of His Being. Some of those within the church, led by the Jansenists, also opposed the devotion. The Jansenist synod of Pistoia, assembled by Scipio de Ricci, bishop of Pistoia (1780-91), which formulated this objection against the devotion, was condemned by Pope Pius VII in the Bull *Auctorem Fidei*, Aug. 28, 1794. In May 1805, De Ricci submitted to the papal condemnation of the synod. In 1856 Pius IX introduced the feast into the general calendar of the Roman Catholic Church, fixing the Friday after the Octave of Corpus Christi for its celebration. The Beatification of Blessed M.M. Alacoque in 1864 gave a new impetus to the devotion.

III, col. 271-351.

SACRIFICE, the ritual destruction of an object, or more commonly, the slaughter of a victim by effusion of blood, suffo-

cation, fire or other means (from Lat. *sacrificium*; *sacer*, holy, and *facere*, to make). While the Hebrew for sacrifice, *qan*, makes the killing of the victim the central feature, the Latin word brings out sacralization (see TABU) as an essential element in many cases. The sacrifice of desacralization is also found; hence MM. Hubert and Mauss describe a sacrifice as "a religious act, which, by the consecration of a victim, modifies the moral state of the sacrificer or of certain material objects which he has in view"; i.e., it either confers sanctity or removes it and its analogue, impurity. It is, in fact, "a procedure whereby communication is established between the sacred and profane spheres by a victim, that is to say by an object destroyed in the course of the ceremony."

Principles of Classification.—It is possible to classify sacrifices according to (1) the occasion of the rite, (2) the end to be achieved, (3) the material object to be effected or (4) the form of the rite. (1) The division into periodical and occasional is important in Hindu and other higher religions; the former class is obligatory, the latter facultative. In less developed creeds the difference tends to remain in the background; but where sacrifices are found, solemn annual rites, communal, purificatory or expiatory, are celebrated, and are obligatory. (2) The end to be achieved is sometimes sacralization, sometimes desacralization. In the former case the sacrificer is raised to a higher level; he enters into closer communion with the gods. In the latter either some material object, not necessarily animate, is deprived of a portion of its sanctity and made fit for human use, or the sacrificer himself loses a portion of his sanctity or impurity. In the sacrifice of sacralization the sanctity passes from the victim to the object; in that of desacralization, from the object to the victim. (3) Sacrifices may be classified into (a) subjective or personal, where the sacrificer himself gains or loses sanctity or impurity; (b) objective, where the current of *mana* (see TABU) is directed upon some other person or object, and only a secondary effect is produced on the sacrificer himself.

Ritual.—The necessary elements of a Hindu sacrifice are: (1) the *sacrificer*, who provides the victim, and is affected, directly or indirectly, by the sacrifice, he may or may not be identical with (2) the *officiant*, who performs the rite; we have further (3) the *place*, (4) the *instruments* of sacrifice and (5) the *victim*; where the sacrificer enjoys only the secondary results, the direct influence of the sacrifice is directed toward (6) the *object*; finally, we may distinguish (7) *three moments of the rite*—(a) the *entry*, (b) the *slaughter*, (c) the *exit*.

Sacralization and desacralization, sometimes performed by means of subsidiary sacrifices, were the essential elements of the preparation for sacrifice and the subsequent lustration. In developed forms, such as the offering of *soma*, they assumed a great importance; (1) the sacrificer had to pass from the world of man into a world of the gods; consequently he was separated from the common herd of mankind and purified; he underwent ceremonies emblematic of rebirth and was then subject to numberless taboos imposed for the purpose of maintaining his ceremonial purity. In like manner (2) the officiant prepared himself for his task; but in his case the natural sanctity of the priest relieved him of the necessity of undergoing all that the common man had to pass through; in fact, this was one of the causes which brought him into existence, the other being the need of a functionary familiar with the ritual, who would avoid disastrous errors of procedure, destructive of the efficacy of the sacrifice. (3) Where there was an appointed place of sacrifice there was no need of preparation of a place of sacrifice. (4) The necessary rites included (a) the establishment of the fires, friction being the only permitted method of kindling, (b) the tracing on the ground of the *vedi*, or magical circle, to destroy impurities, (c) the digging of the hole which constituted the real altar, (d) the preparation of the post which represented the sacrificer and to which the victim was tied, and other minor details. (5) The victim might be naturally sacred or might have to undergo sanctification. In the former case (a) individual animals might be distinguished by certain marks, or, (b) the whole species might be allied to the god. In the latter case the victim had to be with-

out blemish; (c) the age, colour or sex of the victim might differ according to the purpose of the sacrifice. It reached a degree of sanctity when only the priest might touch it. Finally, the priest made three turns round it with a lighted torch in his hand, which finally separated it from the world and fitted it for its high purpose. The sacrificer had to remain in contact with the victim, either personally, or, to avoid ritual perils, by the intermediary of the priest. After excuses made to the animal or to the species in general, the victim was placed in position, and silence observed by all who were present. The cord was drawn tight and the victim ceased to breathe; its spirit passed into the world of the gods. It remained to dispose of the corpse. After a rite intended to secure its perfect ceremonial purity, a part of the victim was removed, held over the fire and finally cast into it. The remainder, divided into portions, was cooked; a certain number of these portions fell to the sacrificer, after an invocation, which made them sacred by calling the deity to descend into the offering and thus sanctify the sacrificer. (6) Then followed the rites of desecration. Finally the priest, the sacrificer, and his wife performed a lustration and the ceremonies were at an end.

With present knowledge the problem of the original form of sacrifice, if there be a single primary form, is insoluble. It is impossible to give a general survey of the purposes of sacrifice; they are too numerous, and it is rare to find any but mixed forms.

Cathartic Sacrifice.—In primitive cults the distinction between sacred and unclean is not well defined (see TABU); consequently we find two types of cathartic sacrifice—(i.) one to cleanse of impurity and make fit for common use, (ii.) the other to rid of sanctity and in like manner render suitable for human use or intercourse.

(i.) The best example of the first class is the scapegoat, where a more concrete idea of expulsion of evil (see DEMONOLOGY, EXORCISM) is present among primitive peoples, such as the Australians.

(ii.) As an example of the second class may be taken the sacrifice of the bull to Rudra, which exemplifies the concentration of holiness in a single animal as representative of its species (see ANIMAL WORSHIP).

Communal Sacrifice.—The common meal is not a primitive rite of adoption. The custom of eating the body of the victim does not necessarily spring from any idea of communion with the god; it may also arise from a desire to incorporate the sanctity which has been imparted to it—an idea on a level with many other food customs (see COUVADE), and based on the idea that eating anything causes its qualities to pass into the eater. Where the victim is an animal specially associated with a god (the most conspicuous case is perhaps that of the corn spirit), it may be granted that the god is eaten; but precisely in these cases there is no custom of giving a portion of the victim to the god.

Deificatory Sacrifice.—The object of certain sacrifices is to provide a tutelary deity of a house, town or frontier. (a) In many countries, those who die a violent death are held to haunt the place where they met their fate; consequently, when a town is built living men are interred beneath the ramparts and the pillars of the gates. (b) In parts of North America the *nagual* or *manitu* animal, of which the Indian dreams during the initiation stage and which is to be his tutelary spirit, is killed with certain rites. (c) Human representatives of the corn or vegetation spirits are killed; in these, as in other cases of the sacrifice of the man-god, the killing of the old god is at the same time the making of a new god. (d) Suicide is treated as a means of raising a human being to the rank of a god. (e) Gods may be sacrificed (in theriomorphic form) to themselves as a means of renewing the life of the god. (f) The method of creating a fetish (see FETTERISM) on the Congo resembles deificatory sacrifice: but here there is no actual slaughter of a human being; magical means are alone relied upon.

Honorific Sacrifices.—Sacrifices tend to be interpreted as gifts to the god. Man seeks to influence his fellow men in various ways, and it is quite natural to find the same ideas in the sphere of religion. Food is often given to a god because he is be-

lieved to take pleasure in eating; the germ of this idea may have been to nourish the divine life. With the spiritualization of the god, comes a refinement of the tastes attributed to him, and the finer parts of the sacrifice, finally it may be only its savour, are alone regarded as acceptable offerings. Just as attendants are provided for the dead, so the god receives sacrifices intended to put slaves at his disposal. The gift theory of sacrifice is closely associated with that of the god as the ruler or king to whom man brings a tribute, just as he had to appear before his earthly king bearing gifts in his hands. The honorific sacrifice is essentially a propitiation but must be distinguished from the *piaculum* (see (below)).

Mortuary Sacrifice.—Sacrifices, especially of human beings, are offered immediately after a death or at a longer interval. Their object may be (a) to provide a guide to the other world; (b) to provide the dead with servants or a retinue suitable to his rank; (c) to send messengers to keep the dead informed of the things of this world; (d) to strengthen the dead by the blood or life of a living being, in the same way that food is offered to them or blood rituals enjoined on mourners.

Piacular Sacrifice.—Whereas the god receives a gift in the honorific sacrifice, he demands a life in the piacular. The essential feature of the *piaculum* is that it is an expiation for wrong-doing, and the victim is often human.

Human Sacrifice.—If tradition is any guide, human sacrifice seems in many important areas to be of secondary character; in spite of the great development of the rite among the Aztecs, tradition says that it was unknown till 200 years before the conquest; in Polynesia human sacrifices seem to be comparatively modern; and in India they appear to have been rare among the Vedic peoples. On the whole, human sacrifice is far commoner among the semi-civilized and barbarous races than in still lower stages of culture. In Australia, however, where sacrifice of the ordinary type is unknown, the ritual killing of a child is practised in connection with the initiation of a magician.

Among the forms of human sacrifice must be reckoned religious suicide, mainly found in India but not unknown in Africa and other parts of the world.

Sacrifice in Greece and Rome.—Both on the mainland of Greece and in the Greek colonies human sacrifice was practised, usually as a means towards expulsion of evil. (See GREEK RELIGION.)

At Rome the scapegoat did not suffer death; but in the Saturnalia a human victim seems to have been slain till the 4th century A.D. Many forms of animal sacrifice were found. (See ROMAN RELIGION.)

Sacrifice in Egypt.—Of Egyptian ritual little is known. (See EGYPT: Religion.)

Sacrifice in India.—Among human sacrifices may be mentioned the *suttee*, or custom of immolating a widow on the funeral pyre of the husband, and the Khond sacrifice of the Meriah, who was either purchased or the son of a victim father. Some days before the sacrifice, the victim, who was often kept in captivity for long periods, was devoted and his sanctity was increased; finally he was put to death by strangulation or pressure. The remains were dismembered and distributed among the fields, excepting the portion offered to the earth goddess, which was buried.

Sacrifice in Africa.—Especially in West Africa, many forms of sacrifice are found. Three main forms of human sacrifice existed: (1) the scapegoat; (2) the messenger; and (3) the expiation; but combinations were not infrequent. On the Congo, if a man committed a murder, the community voted whether he should die or be expelled; if the latter, a victim was killed, of which all partook; this is not a *piaculum* for re-establishment of the tribal bond, for the criminal is driven out of the community.

Sacrifice in America.—The Pawnees had an elaborate ritual, in which a human victim was sacrificed to the Morning Star; the blood of the victims was sprinkled on the fields, and the details of the rite are not unlike those of the Khond custom. The Iroquois sacrifice of the white dog bore in later times the character of a scapegoat festival. In Mexico human sacrifices were very

common, the number being estimated at 20,000 a year.

THE IDEA OF SACRIFICE IN THE CHRISTIAN CHURCH

There can be no doubt that the idea of sacrifice occupied an important place in early Christianity. It had been a fundamental element of both Jewish and Gentile religions, and Christianity tended rather to absorb and modify such elements than to abolish them. To a great extent the idea had been modified already. Among the Jews the preaching of the prophets had been a constant protest against the grosser forms of sacrifice, and there are indications that when Christianity arose bloody sacrifices were already beginning to fall into disuse; a saying which was attributed by the Ebionites to Christ repeats this protest in a strong form, "I have come to abolish the sacrifices; and if ye do not cease from sacrificing the wrath of God will not cease from you" (Epiph. xxx. 16). Among the Greeks the philosophers had come to use both argument and ridicule against the idea that the offering of material things could be needed by or acceptable to the Maker of them all. Among both Jews and Greeks the earlier forms of the idea had been rationalized into the belief that the most appropriate offering to God is that of a pure and penitent heart, and that the vocal expression of contrition in prayer or of gratitude in praise is also acceptable.

The best instances of these ideas in the Old Testament are in Psalms i. and li., and in Greek literature the striking words which Porphyry quotes from an earlier writer, "We ought, then, having been united and made like to God, to offer our own conduct as a holy sacrifice to Him, the same being also a hymn and our salvation in passionless excellence of soul" (Euseb. *Dom. Ev.*, 1). The ideas are also found both in the New Testament and in early Christian literature: "Let us offer up a sacrifice of praise to God continually, that is, the fruit of lips which make confession to His name" (Heb. xiii. 15); "That prayers and thanksgivings, made by worthy persons, are the only perfect and acceptable sacrifices I also admit" (Just. Mart. *Trypho*, c. 117); "We honour God in prayer, and offer this as the best and holiest sacrifice with righteousness to the righteous Word" (Clem. Alex. *Strom.*, vii. 6).

But among the Jews two other forms of the idea expressed themselves in usages which have been perpetuated in Christianity, and one of which has had a singular importance for the Christian world. The one form, which probably arose from the conception of Yahweh as in an especial sense the protector of the poor, was that gifts to God may properly be bestowed on the needy, and that consequently alms have the virtue of a sacrifice. Biblical instances of this idea are—"He who doeth alms is offering a sacrifice of praise" (Ecclus. xxxii. 2); "To do good and to communicate forget not, for with such sacrifices God is well pleased" (Heb. xiii. 16); so the offerings sent by the Philippians to Paul when a prisoner at Rome are "an odour of a sweet smell, a sacrifice acceptable, well pleasing to God" (Phil. iv. 18). The other form, which was probably a relic of the conception of Yahweh as the author of natural fertility, was that part of the fruits of the earth should be offered to God in acknowledgment of His bounty, and that what was so offered was especially blessed and brought a blessing upon both those who offered it and those who afterwards partook of it. The persistence of this form of the idea of sacrifice constitutes so marked a feature of the history of Christianity as to require a detailed account of it.

Meals as Thank-offerings.—In the first instance it is probable that among Christians, as among Jews, every meal, and especially every social meal, was regarded as being in some sense a thank-offering. Thanksgiving, blessing and offering were co-ordinate terms. Hence the Talmudic rule, "A man shall not taste anything before blessing it" (*Tosephta Berachoth*, c. 4), and hence St.

Paul's words, "He that eateth, eateth unto the Lord, for he giveth God thanks" (Rom. xiv. 6; cf. 1 Tim. iv. 4). But the most important offering was the solemn oblation in the assembly on the Lord's day.

The points in relation to this offering which are clearly demonstrable from the Christian writers of the first two centuries, but which subsequent theories have tended to confuse, are these (1) It was regarded as a true offering or sacrifice; for in the *Teaching of the Twelve Apostles*, in Justin Martyr and in Irenaeus it is designated by each of the terms which are used to designate sacrifices in the Old Testament. (2) It was primarily an offering of the fruits of the earth to the Creator; this is clear from both Justin Martyr and Irenaeus, the latter of whom not only explicitly states that such oblations are continued among Christians, but also meets the current objection to them by arguing that they are offered to God not as though He needed anything but to show the gratitude of the offerer (Iren. iv. 17, 18). (3) It was offered as a thanksgiving partly for creation and preservation and partly for redemption: the latter is the special purpose mentioned (e.g.) in the *Teaching of the Twelve Apostles*; the former is that upon which Irenaeus chiefly dwells; both are mentioned together in Justin Martyr (*Trypho*, c. 41). (4) Those who offered it were required to be not only baptized Christians but also "in love and charity one with another"; there is an indication of this latter requirement in the Sermon on the Mount (Matt. v. 23, 24, where the word translated "gift" is the usual *lxx.* word for a sacrificial offering, and is so used elsewhere in the same Gospel, viz. Matt. viii. 4, xxiii. 19), and still more explicitly in the *Teaching*, c. 14, "Let not any one who has a dispute with his fellow come together with you (i.e. on the Lord's day) until they have been reconciled, that your sacrifice be not defiled." This brotherly unity was symbolized by the kiss of peace. (5) It was offered in the assembly by the hands of the president; this is stated by Justin Martyr (*Apol.* i. 65, 67), and implied by Clement of Rome (*Ep.* i. 44, 4).

Sacred Meals.—Combined with this sacrifice of the fruits of the earth to the Creator in memory of creation and redemption, and probably always immediately following it, was the sacred meal at which part of the offerings was eaten. Such a sacred meal had always, or almost always, formed part of the rites of sacrifice. There was the idea that what had been solemnly offered to God was especially hallowed by Him, and that the partaking of it united the partakers in a special bond both to Him, and to one another. In the case of the bread and wine of the Christian sacrifice, it was believed that, after having been offered and blessed, they became to those who partook of them the body and blood of Christ. This "communion of the body and blood of Christ," which in early writings is clearly distinguished from the thank-offering which preceded it, and which furnished the materials for it, gradually came to supersede the thank-offering in importance, and to exercise a reflex influence upon it. In the time of Cyprian, though not before, we begin to find the idea that the body and blood of Christ were not merely partaken of by the worshippers but also offered in sacrifice, and that the Eucharist was not so much a thank-offering for creation and redemption as a repetition or a showing forth anew of the self-sacrifice of Christ.

This idea is repeated in Ambrose and Augustine, and has since been a dominant idea of both Eastern and Western Christendom. But, though dominant, it has not been universal, nor did it become dominant until several centuries after its first promulgation. The history of it has yet to be written. For, in spite of the important controversies to which it has given birth, no one has taken the pains to distinguish between (i.) the theories which have been from time to time put forth by eminent writers, and which, though they have in some cases ultimately won a general acceptance, have for a long period remained as merely individual opinions, and (ii.) the current beliefs of the great body of Christians which are expressed in recognized formularies. A catena of opinions may be produced in favour of almost any theory; but formularies express the collective or average belief of any given period, and changes in them are a sure indication that there has

been a general change in ideas.

It is clear from the evidence of the early Western liturgies that, for at least six centuries, the primitive conception of the nature of the Christian sacrifice remained. There is a clear distinction between the sacrifice and the communion which followed it, and that which is offered consists of the fruits of the earth and not of the body and blood of Christ. Other ideas no doubt attached themselves to the primitive conception, of which there is no certain evidence in primitive times, e.g. the idea of the propitiatory character of the offering, but these ideas rather confirm than disprove the persistence of those primitive conceptions themselves. All Eastern liturgies, in their present form, are of later date than the surviving fragments of the earlier Western liturgies, and cannot form the basis of so sure an induction; but they entirely confirm the conclusions to which the Western liturgies lead.

In the course of the 8th and 9th centuries, by the operation of causes which have not yet been fully investigated, the theory which is first found in Cyprian became the dominant belief of Western Christendom. The central point of the sacrificial idea was shifted from the offering of the fruits of the earth to the offering of the body and blood of Christ. The change is marked in the rituals by the duplication of the liturgical forms. The prayers of intercession and oblation, which in earlier times are found only in connection with the former offering, are repeated in the course of the same service in connection with the latter. The designations and epithets which are in earlier times applied to the fruits of the earth are applied to the body and blood. From that time until the Reformation the Christian sacrifice was all but universally regarded as the offering of the body and blood of Christ. The innumerable theories which were framed as to the precise nature of the offering and as to the precise change in the elements all implied that conception of it. It still remains as the accepted doctrine of the Church of Rome. For, although the council of Trent recognized fully the distinction which has been mentioned above between the Eucharist and the sacrifice of the mass, and treated of them in separate sessions (the former in Session xiii., the latter in Session xxii.), it continued the mediaeval theory of the nature of the latter.

The reaction against the mediaeval theory at the time of the Reformation took the form of a return to what had no doubt been an early belief,—the idea that the Christian sacrifice consists in the offering of a pure heart and of vocal thanksgiving. Luther at one period (in his treatise *De captivitate Babylonica*) maintained, though not on historical grounds, that the offering of the oblations of the people was the real origin of the conception of the sacrifice of the Mass; but he directed all the force of his vehement polemic against the idea that any other sacrifice could be efficacious besides the sacrifice of Christ. In the majority of Protestant communities the idea of a sacrifice has almost lapsed. That which among Catholics is most commonly regarded in its aspect as an offering and spoken of as the "mass" is usually regarded in its aspect as a participation in the symbols of Christ's death and spoken of as the "communion." But it may be inferred from the considerable progress of the Anglo-Catholic revival in most English-speaking countries that the idea of sacrifice has not yet ceased to be an important element in the general conception of religion.

See J. H. Srawley and H. Watt, art. "Eucharist" in Hastings, *Encyclopaedia of Religion and Ethics*, vol. v.; R. A. S. Macalister, art. "Sacrifice (Semitic)," *ibid.* vol. ix, p. 31; M. Gaster, art. "Sacrifice, Jewish," *ibid.* p. 24; G. F. Moore, art. "Sacrifice" in the *Encyclopaedia Biblica*; W. R. Smith, *Religion of the Semites* (1889; reprint of 2nd ed., 1907); J. G. Frazer, *The Golden Bough*, pt. vi., "The Scapegoat," and *Folklore in the Old Testament*.

SACRILEGE, the violation or profanation of sacred things. The word comes from the Lat. *sacrilegium*, which originally meant merely the theft of sacred things, although already in Cicero's time it had grown to include in popular speech any insult or injury to them.

In primitive religions inclusive of almost every serious offence even in fields now regarded as merely social or political, its scope is gradually lessened to a single part of one section of ecclesiastical

criminology, following inversely the development of the idea of holiness from the concrete to the abstract, from fetishism to mysticism. The primitive defence against sacrilege lay directly in the nature of sacred things, those that held a curse for any violation or profanation (see TABU). Early criminal law brought a measure of physical sanction into consideration. The Levitical code exacted of the offender reparation for the damage with the addition of one-fifth of the amount, and an expiatory sacrifice (Lev. v. 15, 16). The tragic story of the stoning of Achan, who stole some of the spoils of Jericho which Joshua had consecrated to the treasury of Yahweh, is one of the most graphic details of Old Testament history (cf. Joshua vii. 20-25).

No religion was more prodigal in rules to safeguard that which was holy or consecrated than the Jewish, especially in its temple laws; violation of them often led to mob violence as well as divine chastisement. The temple rules do not apply to synagogues, however, and unseemly conduct in them is liable only to civil action.

While the Roman cults were amply protected by tabus, there was no comprehensive term in Roman law for religious violations and profanations in general. *Sacrilegium* was narrowly construed as the theft of sacred things from a sacred place. According to Ulpian the punishment for *sacrilegium* varied according to the position and standing of the culprit and the circumstances under which the crime was committed. For the lower classes it was crucifixion, burning or the wild beasts. The latter penalty was also attached to theft of sacred things by night, but stealing by day from a temple objects of little value brought only sentence to the mines. People of higher rank were deported. During classical times the law kept to the narrow meaning of *sacrilegium*, but in popular usage it had grown to mean about the same as the English word. Traces of this usage are frequent in Augustan writers. The early church Fathers use the word most frequently in the restricted sense, although an effort has been made to read the wider meaning in Tertullian. But by the middle of the 4th century the narrower meaning had disappeared. In Ambrose, Augustine and Leo I., *sacrilegium* means sacrilege. The wider meaning had invaded the law as well. Mommsen was of the opinion that *sacrilegium* had no settled meaning in the laws of the 4th century. But it was rather that an enlarged application of the idea of sacredness made the crime of sacrilege in the sense of *violatio sacri* a more general one. This was partly due to the influence of Christianity, which sought to include as objects of sacrilege all forms of church property, rather than merely those things consecrated in pagan cults, partly to the efforts of the later emperors to surround themselves and everything emanating from them with highest sanctions. In the Theodosian Code the various crimes which are accounted sacrilege include—apostasy, heresy, schism, Judaism, paganism, attempts against the immunity of churches and clergy or privileges of church courts, the desecration of sacraments, etc., and even Sunday. Along with these crimes against religion went treason to the emperor, offences against the laws, especially counterfeiting, fraudation in taxes, seizure of confiscated property, evil conduct of imperial officers, etc. There is no formal definition of sacrilege in the code of Justinian but the conception remains as wide.

The penitentials (q.v.), or early collections of disciplinary canons, gave much attention to sacrilege. The Frankish synods emphasize the crime of seizing church property of every kind, including the vast estates so envied by the lay nobility. The worst sacrilege of all, defiling the Host, is mentioned frequently, and generally brought the death penalty accompanied by the cruellest and most ignominious tortures. The period of the Reformation naturally increased the commonness of the crime. Under the emperor Charles V. the penalty for stealing the Host was the stake; that for other crimes was graded accordingly. In France, in 1561, under Charles IX., it was forbidden under penalty of death to demolish crosses and images and to commit other acts of scandal and impious sedition. In the declaration of 1682, Louis XIV. decreed the same penalty for sacrilege joined to superstition and impiety, and in the somewhat belated religious persecution of the duke of Bourbon in 1724 those convicted of larceny in churches, together with their accomplices, were condemned, the men to the galleys for life or for a term of years, the

women to be branded with the letter V and imprisoned for life, or for a term. The trial of La Barre in 1766 at Abbeville is the most famous sacrilege case in modern times. Convicted of wearing his hat while a religious procession was passing—as well as of blasphemy—he was accused as well of having mutilated a crucifix standing on the town bridge. Declared guilty, after torture, he was sentenced to have his tongue cut out, to be beheaded and the body to be burned, a sentence which was confirmed by the parlement of Paris and the bigoted king Louis XV. In the midst of the French Revolution respect for *civic* festivals was sternly enacted, but sacrilege was an almost daily matter of state policy. In 1825 the reactionary parlement once more brought back the middle ages, by decreeing the death penalty for public profanation, the execution to be preceded by the *amende honorable* before the church doors. "Theft sacrilege" was treated in a separate series of equally savage clauses. This ferocious legislation was expressly and summarily abrogated in 1830.

English Law.—In English law, sacrilege is the breaking into a place of worship and stealing therefrom. At common law benefit of clergy was denied to robbers of churches. A statute of 1553 made the breaking or defacing of an altar, crucifix or cross in any church, chapel or churchyard punishable with three months' imprisonment on conviction before two justices, the imprisonment to be continued unless the offender entered into surety for good behaviour at quarter sessions. The tendency of the later law has been to put the offence of sacrilege in the same position as if the offence had not been committed in a sacred building.

Thus breaking into a place of worship at night, says Coke, is burglary. The Larceny Act of 1861 punishes the breaking into, or out of, a place of divine worship in the same way as burglary, and the theft of things sacred in the same way as larceny. Now by the Malicious Damage Act 1861 the unlawful and malicious destroying or damaging any picture, statue, monument or other memorial of the dead, painted glass or other monument or work of art, in any church, chapel, meeting-place or other place of divine worship, is a misdemeanour punishable by imprisonment.

SACRISTY, in ecclesiastical architecture, the room or hall in a church wherein are kept the vestments and utensils (*sacra*) used in the services and celebrations.

SADDLE, a seat, usually of leather, fixed by girths to the back of a horse for riding; also a padded cushion for the back of a draught horse, fastened by girths and crupper; to it are attached the supports for the shafts, and rings for the reins. (See **SADDLERY AND HARNESS**.) The word is also applied to many objects resembling a saddle in shape or function, such as a block to support a spar in a ship, or in machinery to support a rod.

In architecture, a saddle is a piece of wood, metal, marble, etc., at the bottom of a door opening. It is usually raised slightly above the floor on either side, and is used not only to cover the space or joint between the flooring of two adjacent rooms or spaces, but also to raise the bottom of the door sufficiently to clear carpets, rugs, etc. The word saddle is usually restricted to such a member in interior doorways; sill (*g.v.*) is used similarly in the case of exterior doorways. The term is also applied to a saddle-shaped stone used as a coping.

Saddle bars are small, horizontal bars of iron or bronze running across a stained glass window, and fastened to the stone or frame on each side, not only bracing the window structure, but forming a rigid basis to which the leading of the stained glass can be attached.

SADDLERY AND HARNESS. These two terms embrace the equipment for the horse when used for riding or driving. "Harness" was originally a general term for equipment, e.g., the body armour of a soldier. It is now usually confined to the work and driving horse's equipment, "saddle and bridle" being applied to that of the riding horse.

Saddlery is principally a leather trade, and the craft has been

established in England as a separate trade since the 13th century, when the London Saddlers' Company received its charter from Edward I. There is evidence also of its early prosperity at Birmingham; the principal seat of the British harness and saddlery trade is now at Walsall. Saddlers' ironmongery embraces the making of buckles, rings, chains, stirrups, spurs, bits, hames.

The "bridle" is the combination of straps, bits, rings, chains and buckles which fits on the horse's head. The headstall consists of the headpiece passing behind the ears and joining the head-band over the forehead; the cheek-straps run down the sides of the head to the bit to which they are fastened; in the "blind" type of driving bridle the "blinkers," rectangular or round leather flaps which prevent the horse from seeing anything except what lies in front, are attached to the cheek-straps; the nose-band passes round the front of the nose just above the nostrils; and the throat-latch extends from the top of the cheek-straps underneath the head. The "martingale," an attachment sometimes used on riding horses, passes between the horse's forelegs, with one end fastened to the saddle girth and the other to the bridle. It keeps the horse from throwing up his head. The bit is the metal contrivance inserted in the mouth to which the reins are attached. There are innumerable patterns of bits, but they may be roughly divided into the straight bar, "snaffle" and "curb." The "snaffle" for the riding horse generally has a smooth, jointed steel mouthpiece, with straight cheek-bars, the rings for the reins and cheek-pieces of the headstall being fixed in the bars at the junction with the mouthpiece. A severer snaffle has the mouthpiece twisted and fluted. The bars prevent the horse's pulling the bit through its mouth. The snaffle without bars is generally termed a "bridoon." The commonest form of bit used in driving is the double-ring snaffle, in which the rings work one within the other, the headstall straps fastening to one and the reins to the other, or, if the horse is driven on the double ring, the reins are buckled to both rings. The curb-bit (*Fr. courbe*, *Lat. curvus*, bent, crooked) is one to which a curb-chain or strap is generally attached, fastened to hooks on the upper ends of the cheek-bars of the bit and passing under the horse's lower jaw in the chin groove. The reins are attached to rings at the lower ends of the cheek-bars, the leverage thus pressing the curb-chain against the jaw. The mouthpiece of the curb-bit is unjointed and commonly has in the centre a "port," i.e., a raised curve allowing liberty for the tongue and bringing the pressure on the base of the horse's jaw. The curb-bit and the bridoon can be used together with separate headstalls and reins, and there are many combination bits.

Saddles.—The riding saddle is composed of the "tree," the framework, the parts of which are the pommel or head, the projection which fits over the withers, and the side bars which curve round into the cantle or hind-bow. The tree in the best saddles is made of beechwood split with the grain; thin canvas is glued over the wood to prevent splitting, and iron or steel plates then riveted on the head and on the cantle. Linen webs are fastened lengthwise and across, over which is nailed canvas and serge between which the padding is stuffed. To the tree are fastened the stirrup-bars. The leather covering of the tree should be of pig-skin; cheap saddles are made of sheep-skin stamped to imitate pig-skin. The various parts of the man's saddle are the seat, the skirt, i.e., the fold or pad of leather on either side of the head, and the hanging flaps; knee-rolls are not used as much as they were, except where roughly broken-in horses are ridden. The saddle is cut straight over the withers with a square-ended cantle, as in the hunting saddle, or cut back over the withers with a round-ended cantle, as in the polo saddle. The saddles in use on the continent of Europe still retain the high pommel and cantle and heavy knee-rolls discarded by riders trained in the British school and the hunting-field. The saddles of the East and of the Arabs keep their primitive shape, and they are really seats in which rather than on which the rider sits. The Mexican saddle, with its silver adornments and embossed leather, is a characteristic type. It has a very high padded pommel and a round-headed projecting cantle.

Harness.—Space forbids the discussion of the varieties of harness for the pair-horse carriage, the four-horse coach, the farm wagon, etc., or the different kinds of ornamentation that are or

SADDLE IN ARCHITECTURE: (LEFT) IN DOOR OPENING, (RIGHT) STONE COPING

have been lavished upon it. The leather collar, heavily padded, passes over the head and rests firmly on the shoulders; the hames, linked pieces of metal, fit tightly round it and are fastened at the top and bottom by the hame-straps; they bear the traces, or straps which pass along the horse's sides and the shafts, and are attached to the whiffletree. Where the collar is dispensed with, the traces are attached to a breast-strap against which the horse works. This breast harness is much used for the lightly harnessed American trotting horses, and for military draught horses. The saddle pad is a narrow leather cushion resting on the back and girthed under the belly and held in position by the back-band and crupper, a loop strap passing under the tail. The saddle supports the shafts by straps fitted with shaft loop-holes. The reins pass from the bit through "terrets" or rings on the hames and pad. The harness on the horse's hind-quarters consists of the breeching, passing round behind the horse and helping in backing and stopping the vehicle and the hip-strap fastened to the breeching and passing over the hind-quarters. The bearing rein, or check-rein, when used as a support to the head, or as help to the paces, consists of a separate bridle-bit with the reins passing through rings on the throat-band and thence slipped over a hook on the pad.

Historical Sketch.—Questions as to the epoch in the history of mankind when the horse was first trained for draught and riding are for archaeologists and anthropologists to discuss (see *Horse: Origin and History*). With the domestication of the horse came the development of the bit; first a halter of hide bound the muzzle, then a thong slipped into the mouth, finally replaced by wood or bone. Stone age objects have been found in lake-dwellings, such as that at Robenhausen, near Zürich, which may have been bits; one is slightly curved, with two knobs grooved at either end for the reins. Bits from the bronze age and the iron age can be seen in most museums showing that the forms have changed little. In the late iron age burial of a Gaulish chief with his chariot at Somme-Bionne were two horses' bits of the jointed snaffle type.

In ancient Greece and Rome the bit and bridle were used during historic times, and allusions to riding without them refer to exhibitions of horsemanship. On Trajan's column the Numidians ride without bridles or bits, and various North African tribes trained their horses to obey their voice alone (cf. Claudian, *Epig.* i. 10, and the Gaulish *essedarii*, driving without bridle and reins). The *locus classicus* for the bridling and saddling of the Greek horse is Xenophon, *Περὶ ἵππων*. The Greek name for the bridle bit and reins collectively is *χαλῶς* (Lat. *frenum*), the bit proper *στίλβον*, in Lat. *frenum* is also used of the bit itself. The headstall (*κορυφαία*) and cheek-straps (*παραίτια*) were richly decorated. In Homer (*Il.* iv. 142) the latter are ornamented with ivory plates stained with purple, and such have been found on the site of Troy (Schliemann, *Ilios*, 476, 631). The head-band also bore a crest (*νοφός, crista*), and in front the *ἀμρυξ* (*frontale*) might be extended down the face to serve as a defence, as in the mediaeval *chaufrein*. This frontal was a special subject of decoration. Of the two principal types of ancient bits, the unjointed and the jointed mouthpiece, the latter is the most common form. There are also other forms of bits; those with sharp points were called *lupata* (Virg. *Georg.* iii. 208). There is a Greek bit in the British Museum with revolving disks, a device which occurs in mediaeval bits, to give the horse something to keep turning in his mouth. The curb was also used: Xenophon distinguishes between the snaffle (*λεῖος χαλῶς*) and the curb. The curb-strap or chain was termed *τροχαλῶν* or *ψάλλων*, which, however, may mean a muzzle. A bronze bit found at Pompeii has a twisted and jointed metal mouthpiece and a plain curved bar acting as a curb-strap. The cheek-bars of the bit take a variety of forms: straight bars, circles with rays, square or oblong plaques, triangles and the swan-necked or S-shaped type are all found. In medieval times complicated and severe bits were used, and heavy bits with cruel mouthpieces and long elaborately curved cheek-bars are still used by Arabs and the riders of Central and South America.

The saddle was not used in Egypt; the Assyrian monuments show decorated saddle-cloths rather than the saddle. The harness of the chariots of Egypt and Assyria are also illustrated on the

monuments (see especially Sir J. G. Wilkinson, *Manners and Customs of the Ancient Egyptians* revised ed. 1878). The ancient Greeks rode bare-backed as in the Panathenaic frieze of the Parthenon or used a saddle-cloth (*ἐπιπριον*, Lat. *ephippium*; *sella* as applied to a saddle is quite late). Even the saddle-cloth does not appear to have been in use till the 5th century. A 6th-century vase, found at Daphnae, Lower Egypt (Flinders-Petrie and Murray, *Tanis*, 1888, ii. Pl. xxix.), shows a woman riding astride on a cloth, with fully developed headstall and powerful bit. A black-figured sarcophagus, now in the British Museum, from Clazomenae, shows a long pointed *ephippium* with a chest-strap. These indicate Asiatic influence, for Daphnae was an Ionian and Carian settlement of the 7th century B.C. In Xenophon (*l.c.*) we find that the saddle-cloth had been adopted by the Athenian cavalry, and from his advice as to the seat to be adopted pads or rolls seem to have been added. There were no stirrups (till the time of the emperor Maurice, A.D. 602), and the rider mounted at a vault or by blocks; mounting by the spear used as a vaulting pole was also practised as an athletic feat. On a funeral monument of the time of Nero in the museum at Mainz is the figure of a horseman on a saddle-cloth with something resembling the pommel and cantle of a saddle, but the first saddle proper is found in the so-called column of Theodosius at Constantinople (usually ascribed to the end of the 4th century A.D., though it may be more than 100 years earlier), where two figures are riding on high-peaked saddles resting on embroidered saddle-cloths. In mediaeval times the saddle was much like that of the Oriental saddle of to-day with high peaks before and behind. In the military saddle of the 14th and 15th century the high front parts of the saddle were armoured and extended to protect the legs of the rider. The jousting saddle (cf. the example in the Tower of London) becomes almost a box into which the rider is fixed; the high cantle fits round the rider's loins and when charging he lifted himself into practically a standing position in the stirrups. The saddle for use on the road or hunting was much like the Arab saddle of to-day, and similar forms are in use in Europe and elsewhere where the British saddle has not been adopted. Women rode astride or on a pillion behind a male rider. The side-saddle is said to date from the end of the 12th century. For the harness of the ancient draught horse see *CHARIOT*. (C. Wz.)

SADDUCEES, the name of a party which was opposed to the Pharisees down to the destruction of Jerusalem in A.D. 70. The Sadducees have been represented, not so much an organized party, as the lax and worldly-minded aristocrats, who were primarily interested in maintaining their own privileged position; who favoured Greco-Roman culture. Their attitude towards religious questions was purely negative; indeed, they were not a religious party at all. This view, championed by G. Hölscher, is not supported by the early sources. Both in Josephus and the N.T. Sadduceism is represented as associated with certain definite religious positions; they represented the conservative tendency in matters of religion.

The most probable explanation of the name Sadducees is that proposed by A. Geiger, viz., that it is equivalent to "Zadokites," i.e., "the adherents of the Sons of Zadok." The latter were a priestly family who claimed descent from Zadok, who was head of the priesthood in the days of Solomon (cf. 1 Kings i. 34; and ii. 35); Ezekiel (xlv. 10-15) selected this family as worthy of being invested with the control of the Temple; and in fact members of this family formed the Temple hierarchy down to the time of Ben Sira (cf. Sirach. ii. 12, Hebrew text). Later this priestly line became tainted with Hellenism, and ultimately the high priesthood was usurped by others. After the disappearance of the legitimate high priest of the house of Zadok the title "Zadokites" may well have been assumed by conservative elements in the priesthood, to preserve the earlier traditions of their order.

Unfortunately, we possess no statement from the Sadducean side of their beliefs and principles, unless the "Zadokite" work

discovered by Schechter represents, as is possible, the views of a section of the party. There are many controversial references in the Rabbinical literature to the Sadducees on points connected with the interpretation of the law. The main principle that divided the two parties was concerned with the written Torah (the Pentateuch). The supremacy of the law was common ground to both parties, but whereas the Pharisees assigned to the oral tradition a place of authority side by side with the written law, and determining its interpretation, the Sadducees refused to accept any ordinance as binding, unless it was based directly on the written word. The rest of Scripture (the Prophets and the Hagiographa) they regarded as mere Kabbalah "tradition." The Pharisaic device of harmonizing apparent contradictions between the Law and the Prophets by exegetical expedients was not accepted by the Sadducees, who refused to sanction doctrines and practices which could not be based on the written law. Thus the doctrine of a Davidic Messiah was rejected because it was considered that the prophetic teaching on this subject was in conflict with the Torah.

R. Leszynsky suggests that the Sadducees, or a section of them, accepted the hope of a priestly Messiah (cf. Ex. xix. 6), from which passage it might be inferred that a priestly line was destined to possess the Kingdom. There was also the example of the Priest King Melchizedek, which might easily suggest "Zadok King," or "Sadducean King." According to Acts xxiii. 8, the Sadducees denied the existence of angels and spirits, as well as the doctrine of the resurrection. This probably means that they did not accept the fully developed angelology of later times, while in the latter case the point of controversy was not whether the resurrection was true, but whether it could be proved from the Pentateuch. Another interesting point of difference is concerned with the date of Pentecost. The Sadducean hierarchy had its stronghold in the Temple, and it was only during the last 10 or 20 years of the Temple's existence that the Pharisees finally got control. With the destruction of the Temple in A.D. 70 their power as an organized party disappeared.

See R. Leszynsky, *Die Sadduceer*, (1912); Art. "Sadducees" E.R.E. where further literature is cited. Cf. also Burkhitt "Jesus and the Pharisees" in *J. Th. S.* xxviii, 392-397. (G. H. B.)

SADE, DONATIEU ALPHONSE FRANÇOIS, COUNT [usually called the MARQUIS DE SADE] (1740-1814), French writer, was born in Paris on June 2, 1740. He entered the light horse at fourteen and saw considerable military service before returning to Paris in 1766. Here his vicious practices became notorious, and in 1772 he was condemned to death at Aix for an unnatural offence, and for poisoning. He fled to Italy, but in 1777 he was arrested in Paris, removed to Aix for trial, and there found guilty. In 1778 he escaped from prison, but was soon re-arrested and finally committed to the Bastille. Here he began to write plays and obscene novels. In 1789 he was removed to the Charenton Lunatic Asylum, but was discharged in 1790, only to be recommitted as incurable in 1803. He died there on Dec. 2, 1814. Among his works, all of the type indicated, were *Justine* (1791), *Juliette* (1792), *Philosophie dans le boudoir* (1793) and *Les Crimes de l'amour* (1800). The word Sadism is derived from his name.

See C. R. Dawes, *The Marquis de Sade: his Life and Works* (1927).

SÁ DE MIRANDA, FRANCISCO DE (1487?-1558), Portuguese poet, was the son of a canon of Coimbra belonging to the ancient and noble family of Sá. He probably made his first studies of Greek, Latin and philosophy in one of the colleges of the Old City, and in 1505 went to Lisbon university. He seems to have resided for the most part in the capital down to 1531, dividing his time between the palace and the university, in the latter of which he had taken the degree of doctor of law by 1516.

In the middle of July 1520 he set out across Spain for Italy, and spent the years 1521 to 1525 abroad, visiting Milan, Venice, Florence, Rome, Naples and Sicily "with leisure and curiosity." He enjoyed intimacy with Giovanni Rucellai, Lattanzio Tolomei and Sannazaro; he saluted the illustrious Vittoria Colonna, a distant connection of his family, and in her house he probably talked with Bembo and Ariosto, and perhaps met Machiavelli and Guicciardini. He brought home with him (ca. 1525) the

sonnet and canzone of Petrarch, the tercet of Dante, the *ottava rima* of Ariosto, the eclogue in the manner of Sannazaro and Italian hendecasyllabic verse. He did not, however, abandon the short national meter, but carried it to perfection in his *Cartas*.

His *Os Estrangeiros*, produced in 1527-28, was the first Portuguese prose comedy, as his *Cleopatra* (c. 1530) is recognised to be the first Portuguese classical tragedy. In 1528 Miranda made his first real attempt to introduce the new forms of verse by writing in Spanish a canzone entitled *Fábula do Mondego*, and in 1530-32 he followed it up with the eclogue *Aleixo*.

The year 1532 had marked his passage from the active to the contemplative life, and the eclogue *Basto*, in the form of a pastoral dialogue written in *redondilhas*, opened his new manner. It has a pronounced personal note, and its episodes are described in a genuinely popular tone. The same epoch saw the composition of his *Cartas* or sententious letters in *quintilhas* which, with *Basto* and his satires, make up the most original, if not the most valuable, portion of his legacy. A more lyrical vein is apparent in the *quintilhas* of *A. Egípiaca Santa Maria*.

In 1538 he wrote his second classical prose comedy *Os Vilhãndos*, which was played before the Cardinal Infant Henry. He died on March 15, 1558.

Sá de Miranda led the way in a revolution in literature, and especially in poetry, which under his influence became higher in aim, purer in tone and broader in sympathy. He introduced the Renaissance into Portugal and at the same time made an austere stand against materialism. Some of his sonnets are admirable, and display a grave tenderness of feeling, a refinement of thought and a simplicity of expression which give them a high value. He wrote much and successfully in Castilian, several of his best eclogues being in that language.

Sá de Miranda's works were first published in 1595, but the admirable critical edition of Madame Michéls de Vasconcelos (Haile, 1886) contains his life, notes and glosses, supercedes all others. His plays can best be read in the 1784 edition of the collected works, *A. Egípiaca Santa Maria* was edited by T. Braga (Oporto, 1913). See Sousa Viterbo, *Estudos sobre Sá de Miranda* (3 parts, Coimbra, 1895-96); Decio Carneiro, *Sá de Miranda e a sua obra* (Lisbon, 1895); Theophilus Braga, *Sá de Miranda* (Oporto, 1896); C. Michéls de Vasconcelos, *Novos estudos sobre Sá de Miranda* in vol. v. (1912) of the *Boletim da Segunda Classe* of the Lisbon Academy of Sciences.

SA'DI (c. 1184-1201), MUŠLIH-UD-DĪN, or more correctly MUŠHARRĪF-UD-DĪN. A MUŠLIH-UD-DĪN, the greatest didactic poet and the most popular writer of Persia, was born about 1184 (A.H. 580) in Shiraz. His early youth was spent in study at the Nizāmiyya in Baghdad and he returned to Isfahan just at the time of the inroads of the Mongols, when the aiatbeg Sa'd (in whose honour Sa'di took his pen name) had been deposed by the victorious Khwarizm ruler of Ghiyāss-ud-din (1226). Distressed by the misfortune of his patron and disgusted with the miserable condition of Persia, Sa'di quitted Shiraz and entered upon the second period of his life—that of his wanderings (1226-1256).

He proceeded via Balkh, Ghazni and the Punjab to Gujrat, on the western coast of which he visited the famous shrine of Siva in Somnath. After a prolonged stay in Delhi, where he learned Hindūstani, he sailed for Yemen. Overcome with grief at the loss of a beloved child (when he had married is not known), he undertook an expedition into Abyssinia and a pilgrimage to Mecca and Medina. From there he directed his steps toward Syria and lived as a renowned sheikh for a considerable time in Damascus, which he had once already visited. There and in Baalbek he added to his literary renown that of a first-rate pulpit orator. Wary of Damascus, he withdrew into the desert near Jerusalem and led a solitary wandering life, till one day he was taken captive by a troop of Frankish soldiers, brought to Tripoli, and condemned to forced labour in the trenches of the fortress. After enduring countless hardships, he was eventually rescued by a rich friend in Aleppo, who paid his ransom, and gave him his daughter in marriage. But Sa'di, unable to live with his quarrelsome wife, set out on fresh travels, first to North Africa and then through the length and breadth of Asia Minor and the adjoining countries. Not until he had passed his 70th year did he return to Shiraz (about 1256; A.H. 653). Finding the place of his birth tranquil and prosperous under the wise rule of Abūbakr b. Sa'd, the son of his old patron (1226-1260; A.H. 623-658), the aged poet took up his permanent abode, interrupted only by repeated pilgrimages to Mecca, and devoted the remainder of his life to Sūfī contemplation and poetical composition. He died at Shiraz in 1202 (A.H. 691) according to Hamdallāh Mustaufi (who wrote only 40 years later), or in Dec. 1291 (A.H. 690), at the age of 110 lunar years.

His *Bāstān* or "Fruit garden" (1257) and *Gulistān* or "Rose garden" (1258), both dedicated to the reigning atabeg Abū Bekr, acquired great popularity in both the east and the west, owing to their easy, varied style and their happy *bons mots*. But Sadī's *Dīwān*, or collection of lyrical poetry, far surpasses the *Bāstān* and *Gulistān*, at any rate in quantity, and perhaps in quality. Minor works are the Arabic *qasidas*, the first of which laments the destruction of the Arabian caliphate by the Mongols in 1258 (A.H. 656); the Persian *qasidas*, partly panegyric, partly didactic; the *marāṭī*, or elegies, beginning with one on the death of Abū Bekr and ending with one on the defeat and demise of the last caliph, Mosta'isim; the *muḥammadī*, or poems with allusion to Persian and Arabic verses of a rather artificial character; the *tar'īḍī*, or refrain-poems; the *ghazals*, or odes; the *shāhībiyyah* and *muḥammadī*, or moral aphorisms and epigrams; the *rubā'iyāt*, or quatrains; and the *muḥaddar*, or distichs. Sadī's lyrical poems possess neither the easy grace and melodious charm of Hāfiz's songs nor the overpowering grandeur of Jelāl al-Dīn Rūmī's divine hymns, but they are nevertheless full of deep pathos and show a fearless love of truth.

The first who collected and arranged his works was 'Alī b. Ahmad b. Bīstūn (1326-1334; A.H. 726-734). The most exact information about Sadī's life and works is found in the introduction to W. Bacher's *Sa'di's Aphorismen und Sinngedichte (Shāhībiyyah)* (Strassburg, 1879; a complete metrical translation of the epigrammatic poems), and in the same author's "Sa'di Studien," in *Zeitschrift der morgenländischen Gesellschaft*, xxx, pp. 81-105; see also H. Ebbé in W. Geiger's *Grundriss der iranischen Philologie*, II, pp. 202-206, with full bibliography; and E. G. Bionne, *Literary History of Persia*, pp. 525-530. Sadī's *Kulīyyāt* or complete works have been edited by Harrington (Calcutta, 1791-1795) with an English translation of some of the prose treatises

and by Platts (London, 1874), the best translations into English by Eastwick (1852) and by Platts (1873), the first four *bābs* in prose and verse by Sir Edwin Arnold (1899); into French by Deffrémery (1858); into German by Graf (1846); see also S. Robinson's *Persian Poetry for English Readers* (1883), pp. 245-366.

SADIYA, the extreme northern frontier station of British India, headquarters of the Sadiya Frontier Tract of Assam. Pop. (1941) 2,056. It stands high on a grassy plain, nearly surrounded by forest-clad mountains, on the right bank of what is locally (but erroneously) considered the main stream of the Brahmaputra. A railway on the opposite bank connects with the Assam-Bengal line. There is a bazaar, to which the hillmen beyond the frontier—Mishmis, Abors and Khamtis—bring down rubber, wax, ivory and musk, to barter for cotton cloth and salt.

The Sadiya Frontier Tract covers an area of 35,307 sq.mi. extending to Tibet on the north and east and to Burma on the south and southeast, but only 3,309 sq.mi. are under regular administration.

SADLER, MICHAEL THOMAS (1780-1835). English social reformer and economist was born at Snelston, Derbyshire, on Jan. 3, 1780. Entering business in Leeds in 1800, he took an active part in politics, devoting himself particularly to the administration of the poor law. In 1829 he was elected M.P. for Newark and thenceforward, until he was deprived of his seat, he was the leader of factory reform in parliament. He died in Belfast July 29, 1835.

SADLER (OF SADLER), SIR RALPH (1507-1587), English statesman, the son of Henry Sadler, steward of the manor of Cilney, near Great Hadham, Hertfordshire, was born at Hackney, Middlesex, in 1507. While a child he was placed in the family of Thomas Cromwell, afterward earl of Essex, whose secretary he eventually became. Sadler held many positions under Henry VIII, but he is best known for his employment under Elizabeth I in connection with the affair of Mary, Queen of Scots. Elizabeth sent him (1559) to Scotland, ostensibly to settle the border disputes, but in reality to secure a union with the Protestant party there, and he helped to arrange the treaty of Leith, July 6, 1560.

In 1568 Sadler was appointed chancellor of the duchy of Lancaster, and in the same year was one of the English commis-

sioners employed in treating on the matters arising from the flight of the Queen of Scots. From this time he seems to have been continually engaged as a discreet and trusty servant in connection with Mary's captivity, and was frequently sent with messages to her. On Aug. 25, 1584, when, owing to the imputations made by his countess, George 6th earl of Shrewsbury resigned his guardianship of the queen, Sadler succeeded him. In September Mary was removed from Sheffield to Wingfield and early in 1585 to Tutbury.

In April, Sadler, after numerous petitions on his part, was permitted to resign his distasteful charge. On March 30, 1587, Sadler died at Standon, and was buried there. His letters on Scottish affairs are most interesting.

SAĐOWA.—*Letters and Negotiations of Sir Ralph Sadler* (Edinburgh, 1720); *The State Papers and Letters of Sir R. Sadler*, ed. by Arthur Chiford, with a memoir by Sir Walter Scott, 3 vol. (Edinburgh, 1809).

SADO, a Japanese island in the Niigata prefecture, lying 32 mi. W. of Niigata (9° 11', in 38° N. 138° 30' E. It has a circumference of 130 mi., an area of 331 sq.mi. and a population (1950) of 125,597. The port is Ebisu, on the east coast; and at a distance of 161 mi., near the west coast, is the town of Aikawa, having in its vicinity gold and silver mines, for which Sado is famous.

SADOWA, a village of Bobemia, 4 mi. N.W. of Königgrätz. Sadowa, with the small adjoining wood, was one of the principal Prussian positions in the decisive battle of July 3, 1866, now usually called Königgrätz (see SEVEN WEEKS' WAR).

SAFED KOH, in many respects the most remarkable range of mountains on the northwest frontier of India, extending like a 14,000 ft. wall, straight and rigid, towering above all surrounding hills, from the mass of mountains which overlook Kabul on the southeast to the frontiers of India, and preserving a strike which—being more or less perpendicular to the border line—is in strange contrast to the usual frontier conformation. The highest peak, Sikaram, is 15,600 ft. above sea level, and yet it is not a conspicuous point on this unusually straight-backed range. Geographically the Safed Koh is not an isolated range, for there is no break in the continuity of water divide which connects it with the great Shandur offshoot of the Hindu Kush except the narrow trough of the Kabul river, which cuts a deep waterway across where it makes its way from Dikka into the Peshawar plains.

The same name is often used for the mountain range north of the Hari Rud river in its upper course.

SAFES, STRONG ROOMS AND VAULTS. Although boxes provided with locks or coffers must have followed closely on the development of locks (*q.v.*) and been in use in ancient Egypt, no examples remain of earlier date than the middle ages. The earliest examples extant were constructed of hard wood banded with hammered iron, and subsequent development took place rather on artistic than on practical lines up to the time of the introduction of boxes entirely of iron. On the continent of Europe the iron box was developed to a very high standard of artistic beauty and craftsmanship, but with no real increase of security. Several specimens of these coffers supposed to be of 17th-century workmanship are preserved in the museum at Marlborough house.

Milner's Work.—Up to that time no attempt had been made to make coffers fireproof, for though a patent for fireproofing had been taken out in 1801 by Richard Scott, it does not appear to have been used. In 1834, however, a patent was obtained by William Marr for the application of nonconducting linings, followed about four years later by a similar patent in the name of Charles Chubb. The foundation, however, of the modern safe industry was laid by Thomas Milner, originally a tinsmith of Sheffield, who after a few years' business in Manchester established, in 1830, works at Liverpool for the manufacture of tinplate and sheet iron boxes and who later made plate iron chests or coffers and, probably the earliest, safes about the year 1846.

Chatwood's Patent, 1860.—Concurrently with the increase of strength in safes and probably with the increased value of articles preserved in safes, the skill of the professional thief had also increased, and this went on for some years until the Cornhill burglary of 1865 called general attention to the question. In 1860

a patent was taken out by Samuel Chatwood for a safe constructed of an outer and inner body with the intervening space filled with ferro-manganese or spiegeleisen in a molten state, the total thickness being 2 in.

It is about this period (1860-1870), perhaps the most important in the history of safes, that the opening of safes by wedges seems to have become prominent. The effect of wedges was to bend out the side of the safe sufficiently to allow of the insertion of a crowbar between the body and the edge of the door, and various devices were adopted by different makers with the object of resisting this mode of attack.

To prevent safes from being opened by the drilling of one or two small holes in such positions as to destroy the security of the lock itself, advantage was taken of the improvements in the manufacture of high carbon steel, and even in what is to-day called the "fire-proof" safe a plate of steel which offers considerable resistance to drilling is placed between the outer door plate and the lock.

About 1888 the "solid" safe was introduced. In this the top, bottom and two sides of the safe, together with the flanges at the back only or at both back and front, are bent from a single steel plate. This construction, with solid corners, only became practicable in consequence of the great improvements which had been made in the quality of steel plates.

The Modern Safe.—The requirements of a modern safe may be briefly summarized as follows:

For fire resisting safes, the safe body must be constructed of steel plate of sufficient thickness, this varying with the dimensions of the safe, to withstand the effect of a fall from an upper floor in the event of a fire and to resist the crushing effect of falling masonry, displaced girders, etc., as safes are frequently buried by falling debris in the ruins of office buildings. The crucial test of the fire resisting capacity of a safe is fully applied under these conditions, *i.e.*, when buried under a red hot mass of ruins, often for a period of several days, before it can be dug out and removed from the collapsed building. The "proofing" of the safe must be of sufficient quantity, packed around the whole area of the body and door to preserve the heat resistance over a long period, otherwise when this reserve is exhausted the safe would become a slow oven and its contents charred and completely destroyed.

Safes which are intended to resist burglars, as well as fire, must be made with greater constructional strength successfully to resist brute force and destructive violence. In addition, they need to be formed from such a combination of metals and alloys as will withstand all forms of cutting and piercing tools and appliances, in addition to the oxy-acetylene cutting blow-pipe. This appliance, which is now in wide industrial use, will cut through practically all known steels, so that modern safe makers have had to resort to the metallurgist for the production of ferrous alloys which possess the power to resist the cutting effect of the gas flame, and are impervious to all drilling methods. The more successful of these alloys, although they can be heated by the gas flame to their melting point, cannot be cut, like steel, by the application of a stream of pure oxygen when their melting temperature has been reached.

It is essential that the walls and doors of such safes should be of considerable thickness, as mass is of great importance in providing resistance to the blow-pipe method of attack. The doors of such safes must be closely and accurately fitted to the opening in the safe body and secured in the closed position by a number of suitable moving bolts operated by an external handle. The actual shape of the bolts is not of vital importance, provided they are of sufficient strength and rigidity to resist all forces that can be brought to bear against them in an effort to force the door away from the safe body. The majority of safe manufacturers use bolts formed from either round or flat section steel bars, but others are of special shape and design.

In America, fire-resisting safes usually are not made burglar-proof; the highest standard of requirement being 20 minutes' protection against amateur attack through the door. Burglar-proof alloy steel chests are however frequently fitted into fire-

resisting safes. Most important are the locks used to control its operation. To provide the maximum amount of security and lengthen the period of resistance that a safe will offer to forcible entry, more than one lock should be employed and the locks need to be made as large as possible to increase the amount of material which has to be removed to expose the lock. It is also advisable to provide the lock with more than one moving bolt to engage with the bolting mechanism, as it is this moving lock bolt which prevents the bolt action being operated and the bolts retracted into the door.

When gunpowder was the only explosive available, it was possible to construct safe locks to resist its use, but with present day high power explosives other methods must be employed. In good quality safes these take the form of independent bolting actions which are brought into active operation only by the actual force of an explosive, when used to destroy the working lock; the effect of such an explosion being to substitute the dogging action of the special device for that of the lock which it was sought to destroy. To prevent the insertion of explosives in the keyholes it is the practice with work intended for bankers' use to provide a shutter, either in the form of a rotating disc or a sliding bar built into the door, to close the entrance to the locks after the keys have been used, the shutter action being in turn locked by a dial on the face of the door. In some instances, keyless combination locks only are used to control the bolting mechanism, but these locks are not in general use or favour in Great Britain, although their use is practically universal in the United States.

Time locks with two, three or four chronometer movements are frequently employed to control the hours for opening safes and vault doors. These locks are fitted in addition to either the key or dial operated locks, and are intended to prevent the door being opened at any other than the official times.

Strong-rooms and Vaults.—For the purpose of providing security for deeds, papers and books against the risk of fire, rooms are built either of brick or concrete, according to the conditions existing on the site and the amount to be expended on the construction, the thickness of the walls varying from 14 inches to 18 inches if built in brick, and from 8 to 14 inches in concrete. Bank vaults and strong-rooms for the custody of securities, cash, etc., are now mainly constructed of reinforced concrete or with a combination of brick and concrete, the thickness of the walls varying with their importance and the ground space available. Generally speaking, reinforced concrete walls can be built of less thickness than brickwork to provide equivalent security against penetration, but in all important vaults and strong-rooms it is advisable to reinforce the walls, roof and floor with linings of steel and flame resisting alloy, forming a self-contained safe inside the concrete shell.

The most effective method of employing steel to reinforce the concrete construction is to use it in the form of plates attached to the inner face of the walls by rag bolts or other suitable connections. The steel then has the protection of the full thickness of the concrete and itself prevents the breaking away of the inner face of the concrete in large sections into the void forming the strong-room, whereas if the steel reinforcement is distributed throughout the concrete walling in the form of bars or mesh work, it can be quickly and easily cut through with the blow-pipe.

In the design of strong-rooms and vaults, the formation of the roof and floor is frequently of more importance than that of the walls, the latter are usually subject to inspection (unless the room is built against an exterior or party wall, which should be avoided if possible), whereas the floor is liable to attack by means of tunnelling which can be carried out without any indication being given until the actual breaking through of the floor of the room. The highest degree of security is obtained when the vault is built as an island with an inspection or patrol passage entirely surrounding it, the floor of the vault being laid on sleeper lamps providing for full visibility below the floor level, with suitable lamps and switches for illumination.

Electrical devices are frequently installed to give an alarm in the event of a burglarious attempt upon strong-rooms, either

BY COURTESY OF (1, 2, 3, 4) HOBBS, MART AND COMPANY, LTD.; (5, 6, 7, 8) THE MOELLER SAFE COMPANY; (9, 10) THE NATIONAL CITY BANK OF NEW YORK

VARIOUS TYPES OF SAFES, STRONG ROOMS AND VAULTS

1. Closed vault door, English type. Only one combination lock used in this type of door
2. A strong room with the vault or security vault door open, showing complicated mechanism that operates bolts
3. English type of strong room door standing open. Seven large bolts seen in front
4. A circular vault door used almost exclusively for safety deposit vaults. It has two combination locks and one four-movement time lock
5. English type door to vault or strong room. Equipped with four separate combination locks (each combination is known to but one man, thus four men are needed to open this type of door)
6. Safety deposit vault of a large bank, showing thousands of small safe deposit boxes that are rented by the year
7. Barred entrance to a safety deposit vault. Customer must first gain entrance through outer gate before entering vault
8. Steel filing safe equipped with safe-deposit boxes, an armoured steel sheet with steel circular door, and filing units. Designed especially for hotels, clubs, lodges, etc.
9. A complete burglar's outfit for opening safes and strong rooms from a photograph taken by the British police after the set had been abandoned by the foiled owners. Acetylene gas containers, hose, torch, bits, drills, levers, chisels and other instruments are shown
10. Safe deposit boxes of the larger types in a vault. Such types are used largely by bond, brokerage and insurance companies

upon the main structure or the door. In no case should they be regarded as a primary means of defense, for they may be put out of action through failure of an essential feature or neglect of maintenance and inspection duties.

A new type of bank vault that is said to be virtually immune to burglar attack through the use of copper in construction has been recently announced by the Copper and Brass Research association in the U.S. It is said that a burglar would require about six hours of uninterrupted effort with the oxy-acetylene torch to penetrate a modern vault door 20 in. thick, containing a 12 in. plate of pure copper. The high resistance of copper to torch attack is explained by the fact that this metal is a rapid conductor of heat, in contrast with other metals of low heat conductivity heretofore used in vault construction. A torch capable of developing a heat between 5,000° F. and 6,000° F. will penetrate the first few inches of a copper plate in a comparatively short time. However, the flame loses its efficiency as the copper conducts the heat rapidly away before the entire body of the metal can be raised to a fusing point, and the torch becomes ineffective.

The ductility of the metal makes it unsuited for successful attack with explosives.

SAFETY GLASS: *see* GLASS, SAFETY.

SAFETY LAMP. Toward the end of the 18th century mine explosions became increasingly common, and efforts were made to devise means of lighting which would be safe in the presence of gas. The explosive nature of a cloud of fine coal dust was not then recognized, and explosions were attributed wholly to gas. The explosions usually originated at the flame of a tallow candle. W. Reid Clanny invented a form of lamp in 1813 in which the external air was blown-by bellows through a small cistern of water and the products of combustion forced through a similar water seal. George Stephenson, who was experimenting with lamps for underground use in 1815, concluded that "if a lamp could be made to contain the burnt air above the flame, and permit the firedamp to come in below in small quantity to be burnt as it came in, the burnt air would prevent the passing of the explosion-upwards and the velocity of the current from below would also prevent its passing downwards." Though neither type of lamp was satisfactory, some of Clanny and Stephenson's ideas were incorporated in the Davy lamp as the latter was developed and improved. In Aug. 1815, the Sunderland Society of the Prevention of Accidents in Mines interested Sir Humphry Davy in the problem of mine explosion, and by the end of that year the first Davy lamp (q.v.) was ready for testing. It had a qualified success, but improvements were rapidly made to the original design and the type was accepted in all coal fields.

Great Britain.—In any mine comprised within the Coal Mines act of 1911, no lamp or light other than a locked safety lamp may be used in any seam in which the air current in the return airway from any ventilating district is normally found to contain more than 0.5% of inflammable gas; and wherever safety lamps are required by the act or by regulations under that act the type must be approved by the secretary of state. The safety lamps in use in the coal mines of Great Britain can be divided into two broad classes; viz., flame safety lamps and electric safety lamps. Flame safety lamps must be provided with double gauzes of some arrangement serving the same purpose.

Gauzes must be rigid in construction and made from suitable material. In lamps fitted with a metal chimney and only one gauze protecting the air outlets, the gauze must be made of wire of not less than 28 gauge and must be secured by screws to the frame. In lamps fitted with a metal chimney and two gauzes, the inner gauze must be made of wire of not less than 28 gauge and must be secured by screws to the frame. The outer gauze must be made of wire of not less than 26 gauge and must be secured by screws to the frame. The gauzes must be so constructed that they will not be displaced by the action of the flame or by the action of the air current. The gauzes must be so constructed that they will not be displaced by the action of the flame or by the action of the air current. The gauzes must be so constructed that they will not be displaced by the action of the flame or by the action of the air current.

quantity the lamp is filled with blue flame. For testing the presence of gas the flame of the lamp is lowered until the yellow part is at a minimum, when the gas will be discernible as a small blue cap to the flame. The size of cap and the percentage of gas present in the air have been correlated, and as little as 1.5% of firedamp in the air current can be detected.

The detector used with an electrical motor must be of the automatic type which gives visible warning of the presence of a gas-air mixture without manual manipulation. In other places the ordinary flame safety lamp suffices.

In addition to portable lamps, fixed lighting can be used on main roads or defined traffic centres. (J. A. S. R.)

United States.—The flame safety lamp, except for a few cases, had become by mid-20th century primarily a gas testing instrument and was not depended upon for illumination. U.S. usage, based on federal and state laws, recommended that a minimum of two flame safety lamps in good operating condition be available at all mines for testing the presence of methane or oxygen deficiency. U.S. specifications required that each lamp be equipped with double steel or brass gauzes constructed of wire between 20 and 27 American wire gauge (0.0113 to 0.014 in. in diameter), with mesh openings from 28 to 30 per lineal inch. There should be a shield or bonnet so constructed as to prevent injury to the gauzes and shield the gauzes from strong air currents. Lamp locks should be of the magnetic type and the relighting device simple and safe to use in the presence of explosive gas.

Portable electric lamps in the U.S. are chiefly the cap variety using either a caustic or acid electrolyte solution. In addition, the permissible flashlight, a hand-held dry cell battery type, was tested and found safe to use under specified conditions.

Methane detectors, electrically operated, are used for special surveys or checks of return air courses, and methane alarms may be used under dangerous fluctuating conditions.

SAFETY RAZOR: *see* RAZOR.

SAFETY VALVE is a valve which lifts at a predetermined pressure and prevents the accumulation of a dangerous pressure in a steam boiler. The resistance to pressure is provided by a weight or by springs, the use of the latter being obligatory if the boiler is not a stationary one. The lever valve (*see* drawing) is loaded with a weight at the end, to keep the valve shut. A casing with lock may be fitted over to prevent tampering by an unauthorized person. Many boilers carry two safety valves as a precaution, one being locked up. Marine boiler valves are of the direct spring-loaded type, the spring encircling the valve spindle. The pop valve blows off sharply with a pop, and is used for yacht and launch boilers. The valve closes again quickly when the pressure has been slightly reduced.

DIAGRAM SHOWING WORKING OF SAFETY VALVE ON STEAM BOILER

SAFFARIDS, a Persian dynasty of the 9th century, founded about 866 by Yakub ibn Laith al-Saffar ("the coppersmith"), who gained the command of a body of local troops and took control of his native province of Seistan. He soon added Herat, Fars, Balkh and Tabaristan to his possessions, overthrew the Tahirid governors of Khurasan, and, though still nominally dependent on the caliphs of Baghdad, established a dynasty in Seistan (*see* CALIPHATE; *The Abbasid Caliphs*; and *PERSIA: History*).

In 900 Yakub's successor was defeated by the Samanids (q.v.), and few of the later Saffarids had any wide authority.

See T. Nöldeke, *Sketches from Eastern History*, tr. by J. S. Black (London, 1892).

SAFFI: *see* SARA.

SAFFLOWER or **BASTARD SAFFRON** (*Carthamus tinctorius*), a plant of the family Compositae; its flowers form the basis of the safflower dye of commerce. The plant is a native of the East Indies, but is cultivated in Egypt and to some extent in southern Europe. To obtain the dyeing principle (carthamin, $C_{42}H_{64}O_{10}$) the flowers are first washed to free them from a soluble yellow colouring matter they contain; they are then dried and powdered, and digested in an alkaline solution in which pieces of clean white cotton are immersed. The alkaline solution having been neutralized with weak acetic acid, the cotton is removed and washed in another alkaline solution. When this second solution is neutralized with acid, carthamin in a pure condition is precipitated as a dark red powder. It forms a brilliant but fugitive scarlet dye for silk, but its principal use is in the preparation of toilet

rouge, for which it is mixed with powdered talc.

SAFFRON, a product manufactured from the dried stigmas and part of the style of the saffron crocus, a cultivated form of *Crocus sativus*; some of the wild forms are also employed. The purple flower, which blooms late in autumn, is very similar to that of the common spring crocus, and the stigmas, which protrude from the perianth, are of a characteristic orange-red colour; the fruit is rarely formed. The Egyptians, though acquainted with the bastard safflower (*Carthamus tinctorius*), often used to adulterate saffron, do not seem to have possessed the true saffron; but it is named in Canticles iv, 14 among other sweet-smelling herbs. It is also mentioned by Homer and Hippocrates.

Saffron has long been cultivated in Iran and Kashmir, and is supposed to have been introduced into China by the Mongol invasion. It is mentioned in the Chinese materia medica (*Pun tsaon*, 1552-78). The chief seat of cultivation in early times, however, was the town of Corycus (modern Korghoz) in Cilicia. According to Hehn, the town derived its name from the crocus; Raymond, on the other hand, with more probability, held that the name of the drug arose from that of the town. It was cultivated by the Arabs in Spain about 662, and is mentioned in an English leechbook of the 10th century, but seems to have disappeared from western Europe until reintroduced by the crusaders. According to Hakluyt, it was brought into England from Tripoli by a pilgrim, who had a stolen corn in the hollow of his staff. It was especially cultivated near Histon in Cambridgeshire and in Essex at Saffron Walden, its cultivators being called "crokers."

Saffron was used as an ingredient in many of the complicated medicines of early times; that it was very largely used in cookery is evidenced by many writers; the Chinese used to employ it largely, and the Iranians and Spaniards still mix it with their rice. As a perfume it was strewn in Greek halls, courts and theatres, and in the Roman baths. The streets of Rome were sprinkled with saffron when Nero made his entry into the city.

It was, however, mainly used as a dye. It was a royal colour in early Greek times, though afterward, perhaps from its abundant use in the baths and as a scented salve, it was especially appropriated by the hetairae. Saffron is chiefly cultivated in Spain, France, Sicily, on the lower spurs of the Apennines and in Iran and Kashmir. It occurs in the form of *cake saffron*, which consists of the stigmas and part of the style which have been "sweetened" and pressed together into a cake, and also as *hay saffron*, which consists of the dried stigmas alone.

SAFFRON WALDEN, a market town and municipal borough in the Saffron Walden parliamentary division of Essex, Eng., 43½ mi. N.N.E. from London by the Eastern Region railway. Pop. (1951) 6,825. Area, 11.7 sq. mi. Of the old castle, dating probably from the 12th century, the keep and a few other portions still remain. Near it is a series of curious circular excavations in the chalk, called the Maze, of unknown date or purpose. The earthworks west and south of the town are of great extent; a large Saxon burial ground was there. The church of St. Mary the Virgin contains the tomb of Lord Audley, chancellor to Henry VIII. The town has a museum with good archaeological and natural history collections. In the neighbourhood is the fine mansion of Audley End, built by Thomas, 1st earl of Suffolk, in 1603 on the ruins of the abbey, converted in 1700 from a Benedictine priory founded by Geoffrey de Mandeville in 1136.

Saffron Walden (*Waldana*) was almost certainly fortified by the Britons, and probably by some earlier people. The town corporation grew out of the Guild of the Holy Trinity, which was incorporated under Henry VIII, the lord of the town, in 1514. It was dissolved under Edward VI, and a charter was obtained appointing a treasurer and chamberlain and 24 assistants, who, with the commonalty, formed the corporation. In 1694 William and Mary made Walden a free borough. The culture of saffron was the most characteristic industry at Walden from the reign of Edward III until its gradual extinction about 1768. Carnation growing is now important.

SAFFRON WOOD or **SAFFRONHOUT** (*Elaeodendron croceum*), a South African tree belonging to the staff-tree family (Celastraceae) and yielding valuable timber. The genus *Elaeo-*

dendron contains about 30 species, confined to the tropics and subtropics.

SAFI or **ASFI**, a seaport on the west coast of Morocco, in 32° 20' N, 9° 12' W., 106 mi. W.N.W. of Marrakesh. The old town, built on the rapid slope of a plateau toward the sea, is surrounded by crenellated ramparts dominated by an old Portuguese citadel, the Kechla. Safi is the chief town of the *contrôle civil* of Adha-Ahmar and the nearest port to Marrakesh. Trade reached 102,000,000 fr. in 1938 (imports 25,000,000, exports 77,000,000).

The population was (1936) 25,159, including 23,328 natives and 1,831 Europeans; (1944) 35,574, including 32,710 natives and 2,864 Europeans; (1947) 50,800.

In the early 1940s Safi became the second port of Morocco. The port was deepened, permitting eight ocean steamers to dock at one time. A rail line was built to the port from the Kowibgha phosphate deposits, which became the most important item of export.

The town was the site of one of the U.S. landings on Nov. 8, 1942, and for many months of the North African campaign was an important port for the landing of war supplies.

SAGA. The word saga is used in Icelandic for any kind of narrative, written or oral, whether anecdote, story or history. But in English, as in other languages in which it has been borrowed, this word has a narrower sense and is applied to biographies written in Iceland, or occasionally in Norway, during the middle ages. The sagas are thus a branch of literature distinct from annals and summaries of history, many of which were also written in Iceland during the 12th and 13th centuries. Several classes of sagas are distinguished.

Kings' sagas are the oldest class. The heroes described in them were rulers of Norway and of dependencies of Norway who lived between the 9th and 13th centuries. The oldest of the kings' sagas now known is the so-called *First Saga of St. Olaf*, which is a life of St. Olaf, king of Norway (d. 1030), and was written about 1180. It survives only in fragments, but these are sufficient to show its form and style. In form it closely resembled the popular lives of European saints, many of which had been translated into Icelandic in the 12th century. The style was halting and unpractised. The sources were, for the most part, oral. They consisted partly of popular tales about miracles worked through Olaf's agency and partly of verses composed in honour of Olaf during his lifetime and handed down orally. In these verses the battles and great achievements of Olaf were commemorated and they provided an outline of his career, giving the saga its chief value as history. This *First Saga* was used as a source, directly or indirectly, by authors who wrote later lives of Olaf. The most important of these later lives was written by Snorri Sturluson (1179-1241), who incorporated it in his *Heimskringla* (Orb of the World), which is a collection of biographies of rulers of Norway from the 9th century to the 12th.

Sagas of several other Norse rulers were written late in the 12th century and early in the 13th. They included sagas about Olaf Trygvasson (d. 1000), about Haakon the Good (d. c. 963), and about the earls of the Orkney Islands. The *Morkinskinna* (Rotten Skin) was written about 1220 and contains detailed sagas about kings who ruled Norway after the death of St. Olaf.

During the 13th and 14th centuries these early kings' sagas were often revised and combined with other works. The greatest of these compilations is the *Book of Flatey*, a magnificent manuscript written about 1390, which contains lives of the Norse kings combined with those of Icelandic heroes.

Icelanders' Sagas.—The terms "Icelanders' sagas" (Icelandic: *Íslendinga sögur*) and "family sagas" are applied to biographies of heroes who are supposed to have lived in Iceland in the 10th and 11th centuries. Many of these heroes had visited the British Isles and lands as distant as Greece and Russia; some had emigrated to Greenland and others were said to have landed on Wine-land the Good, as the Icelanders called the American continent.

The oldest of the Icelanders' sagas were written in the first years of the 13th century and were strongly influenced by the kings' sagas in structure, style and material. The sources were many

and varied, and included summaries of history and genealogies written in Iceland early in the 12th century, popular tales and poems preserved orally.

The value of Icelanders' sagas as history is difficult to assess. For a time they were accepted as trustworthy records, but it became widely agreed that they are, in the first place, works of art based upon historical and pseudohistorical sources. Such questions cannot, however, be discussed in general terms, for the aims and sources of the author of every saga must be considered separately.

Among the oldest of the Icelanders' sagas may be mentioned the *Fóstbrædra Saga* (Saga of the Foster-brothers), a great part of which is placed in the wastes of Greenland. *Hallfreðar Saga* (Saga of Hallfred) is the tale of the favourite poet of King Olaf Trygvason. The *Kormáks Saga* (Saga of Kormákr) and the *Bjarnar Saga Hítalækappa* (Saga of Björn) are early love stories.

These early Icelanders' sagas are somewhat primitive, but the art of saga writing developed rapidly during the 13th century, reaching its zenith soon after the middle of that century. The most perfect saga of this class in structure is the *Laxdæla Saga* (Saga of the Men of Laxárdal), a story in which women, love and romance play an unusually great part. The *Gísla Saga* (Saga of Gísli) belongs to the same period and is the story of an upright man, outlawed and unjustly persecuted. The *Grettis Saga* (Saga of Grettir the Strong), written rather later, is also an adventurous story of outlawry. Undoubtedly, the greatest of all sagas is the *Njáls Saga* (Saga of Burnt Njáll), written toward the end of the 13th century. There is no more moving tragedy in early Germanic literature and it is among the greatest prose narratives of the world.

Few of the Icelanders' sagas can be assigned to authors whose names are known. An exception is the *Egils Saga* (Saga of Egill), the story of the viking poet of the 10th century. It has lately been shown that this saga was probably written by Snorri Sturluson.

Bishops' Sagas.—At the beginning of the 13th century several sagas were written about bishops of the two Icelandic sees, Skálholt and Hólar. These included sagas about Þorlák (d. 1193) and Páll (d. 1211), bishops of Skálholt, and about Jón, bishop of Hólar (d. 1212). Later bishops' sagas were those about Bishop Árni of Skálholt (d. 1298) and Bishop Laurentius of Hólar (d. 1331).

Sagas of Later Times.—Numerous sagas were written about lay chieftains who lived in Iceland during the 12th and 13th centuries. Most of these were combined at the end of the 13th century in the *Sturlunga Saga* (Saga of the Sturlungar). The largest section of this compilation is the *Íslendinga Saga* (Saga of the Icelanders), a history of the Icelanders beginning with the year 1183 and covering a great part of the 13th century. The author of the *Íslendinga Saga* was Sturla Þórðarson (1214–84), nephew of Snorri Sturluson.

Heroic Sagas.—The term "heroic sagas" (Icelandic: *Fornaldar sögur*) is applied to sagas about heroes of Scandinavia and continental Germania who lived before Iceland was peopled. The *Ynglinga Saga* (Saga of the Ynglingar) contains legends of the early kings of the Swedes and was written by Snorri Sturluson as an introduction to the *Heimskringla*. The *Skjöldunga Saga* (Saga of the Skjöldungar) was also written early in the 13th century and contained legendary tales about kings of the Danes.

Most sagas of this class date from the late 13th and 14th centuries. Their sources were often ancient heroic poems, such as those preserved in the *Poetic Edda* (see *EDDA*). One of the best known is the *Völsunga Saga* (Saga of the Völsungs), which contains a prose version of the legends of Sigurd and Brunhild. The *Hrólfs Saga* (Saga of Hrólf Kraka) is also based partly on heroic poetry, and contains interesting legends about the Danes. The *Heiðreks Saga* (Saga of Heiðrek) consists of numerous stories of devious origin, some of them about battles between Goths and Huns in the dark ages. Fantastic as they are, some of these heroic sagas preserve memories of historical events which would otherwise have been forgotten.

Romantic Sagas.—These are prose narratives based upon foreign

romances. Many of them were written in Norway under the patronage of King Haakon Haakonson (1217–63). They were later transcribed in Iceland and revised. They gained wide popularity and gave rise to original compositions in similar style. One of the best known, and perhaps the oldest, of the romantic sagas is the *Tristrams Saga* (Saga of Tristram), written in Norway in 1226, and based upon a French poem of the 12th century.

The *Karlamagnús Saga* (Saga of Charles the Great) contains prose versions of a number of French poems about Charles and his champions, including the *Chanson de Roland* (Song of Roland). Most of the romantic sagas are post-classical, dating from the 14th and later centuries.

(See ICELANDIC LITERATURE.)

SAGAING, a district and division of Burma, lying to the west of Mandalay on both sides of the Irrawaddy. The district has an area of 1,878 sq. mi.; pop. (1941) 387,270, showing an increase of 51,305 in the decade. The chief crops are sesame, millet, rice, peas, wheat and cotton. It lies in the heart of the dry belt, and the rainfall ranges from about 25 to 35 in. In the hot season the maximum shade temperature rises to a little more than 100° F. The lowest readings in the cold season average about 56° F.

Sagaing, the headquarters town, is opposite Ava, a few miles below Mandalay; pop. (1931) 14,127. It was formerly a capital of Burma. The Ava bridge (3,940 ft.), completed in 1934, with its western end at Sagaing, carries the Mandalay-Mytikya railway and also road traffic. The steamers of the Irrawaddy Flotilla company call daily.

The Sagaing division includes the districts of Upper and Lower Chindwin, Shwebo, Sagaing, Katha, Bhamo, Myitkyina and Naga Hills.

SAGALLO, a small settlement on the north shore of the Gulf of Tajura, French Somaliland. In Jan. 1889 Sagallo was occupied by a Cossack chief named Achinov, who was accompanied by about 200 people, and the archimandrite Païsi, who had been entrusted by the metropolitan of Novgorod with an evangelistic mission to the Abyssinian church; while Achinov stated that he had a commission from the Negus for the purchase of arms and ammunition.

The presence of Achinov at Sagallo was regarded by the French government as an invasion of French territorial rights. The Russian foreign office having disavowed (Feb. 7) any connection with Achinov, instructions were sent from Paris to secure the removal of the Cossacks. On Feb. 17 French warships appeared off the port, and after an ultimatum which had no effect the fort was bombarded, and seven persons killed. The Cossacks then surrendered and were deported to Suez, whence they returned to Russia. Achinov was interned by the Russian government until Oct. 1889. In 1891 he returned to Abyssinia. Païsi was promoted by his ecclesiastical superiors. In Paris the incident caused great excitement among the Russophiles, and the consequent demonstrations led to the suppression of the League of Patriots and the prosecution of Paul Déroulède.

See *Vicomte de Constantin*, *L'Archimandrite Païsi et Pataman Achinov* (1891).

SAGAN (ZAGAN), formerly a town in Lower Silesia, Ger., and after 1945 in Zielona Gora province, western Poland, on the Bobr, or Bobrawa, river, a tributary of the Oder, 60 mi. S.S.E. of Frankfurt-on-Oder and 102 mi. S.E. of Berlin by the direct main line of railway to Breslau. The population was 4,359 in 1946 and 23,341 in 1939.

The mediate principality of Sagan, forming a portion of the Prussian governmental district of Liegnitz, was formed in 1397 out of a portion of the duchy of Glogau. One of its most famous possessors was Wallenstein.

In modern times the town was still partly surrounded by its old fortifications and numerous mediaeval houses survived. The palace of the dukes of Sagan was built there. During World War II Sagan suffered extensive damage. Industries include cloth weaving and wool spinning.

SAGASTA, PRÁXEDES MATEO (1827-1903), Spanish statesman, born July 21, 1827, at Torredella de Cameros, in the province of Logroño. From the first he displayed Liberal inclinations. He entered the Cortes in 1854 as a Progressist deputy for Zamora. Exiled after O'Donnell's *coup d'état* (1856), he returned to sit in the Cortes 1859-63. Exiled again after conspiring with Prim and the Progressists against Isabella, he took part in the rising at Cadiz which culminated in the revolution of Sept. 1868, was minister several times under Serrano and then under King Amadeo, 1868-72. Sagasta headed the most conservative groups of the revolutionary politicians against Ruiz Zorrilla and against the Federal republic in 1873; and in 1874 he vainly attempted to crush the Carlists and to check the Alphonist military conspiracy that overthrew Serrano (Dec. 1874). After the restoration of the Bourbons, Sagasta was premier in 1885-90 and again in 1892-95.

His attempt to conciliate both the Cubans and the United States by a tardy offer of colonial home rule, the recall of Weyler, and other concessions, did not avert the disastrous war with the United States, and his party was defeated (March, 1899). A trimmer *par excellence*, shier in opposition than in office, Sagasta returned with the Liberals to power in March 1901; in Dec. 1902 he was defeated on a vote of censure and resigned office, dying at Madrid on Jan. 15, 1903.

SAGE, MARGARET OLIVIA SLOCUM (1828-1918), American philanthropist, was born at Syracuse, N.Y., Sept. 8, 1828. She was educated at the Troy, N.Y., Female Seminary, afterwards known as the Emma Willard School. She married Russell Sage in 1869. Knowing her business ability and her interest in charity, her husband left her at his death over \$64,000,000 without restriction. In 1907 the Russell Sage Foundation was incorporated for the "improvement of social and living conditions of the United States of America." To it Mrs. Sage gave \$10,000,000. In 1912 Mrs. Sage bought Marsh Island, off the coast of Louisiana, and later turned it over to the State as a permanent refuge for birds. She died in New York city Nov. 4, 1918. By her will she left \$36,000,000 to be divided into 52 parts and distributed to various public institutions. It is estimated that during her life she made public gifts to the amount of \$40,000,000.

SAGE, RUSSELL (1816-1906), American financier, was born in Oneida county (N.Y.), on Aug. 4, 1816. He had a part interest in 1837-39 in a retail grocery in Troy, and in a wholesale store there in 1839-57. He was an alderman of Troy in 1841-48 and treasurer of Rensselaer county in 1845-49. In 1853-57 he was a Whig representative in Congress. He became an associate of Jay Gould in the development and sale of railways; and in 1863 removed to New York city, where, besides speculating in railway stocks, he became a money-lender and a dealer in "puts" and "calls" and "privileges," and in 1874 bought a seat in the New York Stock Exchange. Sage died in New York on July 22, 1906. His wife, Margaret Olivia Slocum, inherited his fortune, and gave liberal benefactions to different institutions. See RUSSELL SAGE FOUNDATION; SAGE, MARGARET OLIVIA SLOCUM.

SAGE-BRUSH, the name given to various shrubby species of *Artemisia* (*g.v.*) native to plains and mountain slopes of western North America. The common sage-brush (*A. tridentata*) is a much-branched shrub, usually 3 ft. to 6 ft., but sometimes 12 ft. high, with silvery-grey, bitter-aromatic foliage, the small, wedge-shaped leaves mostly with three teeth at the outer end. This shrub is very abundant on semi-arid plains, mainly between 1,500 ft. and 6,000 ft. altitude, where it is often a conspicuous and characteristic feature of the vegetation. It occurs from Montana and western Nebraska to British Columbia and California, growing usually on fertile soil.

SAGE HEN or **SAGE-GROUSE** (*Centrocercus urophasianus*), a long-tailed North American grouse. The male is 26 to 30 in. long; breeds in the sage-brush plains from Saskatchewan to Utah and California, feeding on grasshoppers and the leaves and buds of the sage-brush.

SAGINAW, a city of Michigan, U.S., 85 mi. N.W. of Detroit, on the Saginaw river, 15 mi. from its entrance into Saginaw bay (Lake Huron); a port of entry and the county seat of Saginaw

county. It is on federal highways 10 and 23, and is served by the Grand Trunk, the New York Central and the Chesapeake and Ohio railways and by Capital Airlines. Pop. (1950) 92,918. The city lies on both banks of the river, on level ground at an altitude of 581 ft. The area is 17 sq.mi. A council-manager form of government was adopted in 1936. There are 200 oil wells in the near vicinity, and the region raises large crops of sugar beets, grain, beans and other vegetables. Saginaw is the metropolis of a wide area, and has a large wholesale and distributing trade. Its manufacturing industries ordinarily employ 25,000 workers. Among the more important are foundries, machine shops and plants making auto parts, rules, sugar, furniture, baking equipment, seed cleaners, caskets, farm and dairy equipment, paper products, truck bodies, graphite products and boilers. Of interest to visitors are the federal building with its French Renaissance type of architecture and the Romanesque Hoyt library; the Schuch hotel with its collections of Indian relics and early Americana; Ojibway Island and Hoyt park. A Veterans Administration hospital was completed in 1950. In 1822 Saginaw City was founded on the west bank of the river, and in 1849 East Saginaw was laid out and financed by eastern capitalists. The two cities were chartered separately in 1859, and were consolidated in 1890. The lumber industry was at its height about 1880-90.

SAGITTARIUS ("the Archer"), in astronomy, the 9th sign of the zodiac denoted by the symbol \nearrow an arrow or dart. The Greeks represented this constellation as a centaur in the act of shooting an arrow, and professed it to be Crotus, son of Eupheme, the nurse of the Muses. On account of its southern declination the constellation is not well seen in the latitude of Great Britain; but it is one of the most interesting regions of the sky. A very bright arm of the Milky Way passes through it, and another part of the constellation is occupied by remarkable dark obscuring patches of nebulae. It contains the Trifid nebula and the Omega nebula, both fine examples of bright diffuse nebulae. Cepheid variables and globular clusters seem to congregate in this region, and it is now known that the centre of our galactic system lies in this direction, at a distance of the order of 30,000 light-years from the sun.

SAGO, a food-starch prepared from a deposit in the trunk of several palms, the principal source being the sago palms (*Metroxylon rumplii* and *M. sagu*), a native of the East Indian archipelago, the sago forests being especially extensive in the island of Ceram. The trees flourish only in low marshy situations, seldom attaining a height of 30 ft., with a thick-set trunk. They attain maturity and produce an inflorescence (flower spike) at the age of 15 years, when the enormous pith of the stem is gorged with starch. If the fruit is allowed to form and ripen, the whole of this starchy core material passes into the developing fruits, leaving the stem a mere hollow shell; and the tree after ripening its fruit dies. Accordingly the palms are cut down directly the inflorescence appears, the stems divided into sections and split up, and the starchy pith extracted and grated to a powder. The powder is then kneaded with water over a strainer, through which the starch passes, leaving the woody fibre behind. The starch settles in the bottom of a trough, in which it is floated, and after one or two washings is fit for use by the natives for cakes and soups. That intended for exportation is mixed into a paste with water and rubbed through sieves into small grains, from the size of a coriander seed and larger, whence it is known according to size as pearl sago, bullet sago, etc. A large proportion of the sago imported into Europe comes from Borneo, and the increasing demand has led to a large extension of sago-palm planting. Sago is also obtained from various other East Indian palms such as the Gomuti palm (*Arenga pinnata*), the Kitul palm (*Caryota urens*), the cabbage palm (*Corypha umbraculifera*), besides *Corypha uxor*, *Raphia flabelliformis* and *Phoenix farinifera*, also from *Martelia flexuosa* and *Guilielma gasipaes*, two South American species. It is also obtained from the pith of species of *Cycas*.

SAGUARO: see SUWARRO.

SAGUENAY, a river of Quebec province, Canada, flowing into the St. Lawrence 120 m. north-east of Quebec. It drains Lake St. John, from which it issues by two channels, La Grande

and La Petite Décharge. It is a source of hydro-electric power, owing to its fall of 314 feet in its descent to sea-level, and the reduction of aluminium from its ores is carried on at the town of Arvida. From Chicoutimi the river is navigable by small steamers, and from Ha Ha Bay to the mouth by vessels of the largest size. It is indeed rather a fjord than a river, containing neither rock nor shoal, and having at its mouth a depth of some 600 ft. greater than that of the St. Lawrence. Its width varies from three-quarters of a mile to two miles, and the waters are blackened by the shadow of treeless cliffs, over 1,000 ft. in height, separated here and there by narrow wooded valleys, and culminating in Capes Trinity and Eternity, 1,600 and 1,800 ft. in height. Tadoussac, at its mouth, is the oldest European trading post in Canada.

Lake St. John is a shallow basin, 26 m. by 20, with an area of 365 sq.m. It receives the waters of the Ashuapmucuan, often spoken of as the upper course of the Saguenay, the Mistassini, the Peribonka and various other important streams. In it is found the *ouananiche*, or land-locked salmon, which attains a weight of about 6 lb.

SAGUNTO, formerly Murviedro, a Spanish town 18 mi. north of Valencia on the Valencia-Barcelona coast railway. Pop. (1940) 10,352 (mun., 20,253). The well-preserved Roman theatre looks across the Huerta de Valencia to the Mediterranean. Sagunto is the ancient Saguntum, an ancient Greek or Greek-Iberian town, founded by colonists from Zacynthus (whence its name). About the year 228 B.C. the Romans, disquieted by the enormous growth of Carthaginian power in Spain, concluded an alliance with Saguntum and further required the Carthaginian general, Hasdrubal, not to pass the Ebro. These conditions were observed until 219 when Hannibal judged it safe to begin the war by attacking Saguntum. Confident in Roman protection, the town made a desperate resistance for eight months, at the end of which it was taken by storm. Rome complained to Carthage, requiring the surrender of Hannibal and the members of the Council present with him; the Council, though doubtful of the wisdom of Hannibal's action, naturally refused, and the second Punic War began. Saguntum never recovered its old importance, and in 138 B.C. was definitely eclipsed by the foundation of Valentia by D. Iunius Brutus, and its population by Lusitanian war-captives who were given the Latin franchise.

SAHAPTIN or **SHAHAPTIN**, originally the name of a tribe also called Nez Percé, has become the usual designation of a family of Indians on middle Columbia and lower Snake river, in Idaho, Oregon and Washington. The principal tribes are the Nez Percé, Palos, Wallawalla, Umatilla, Tenino, Yakima, Klikitat. Subsistence was primarily on salmon and roots, residence likely to be shifting. The Sahaptin are now on Lapwai, Umatilla, Warm Springs and Yakima reservations, with remnants of other groups; the tribal lines are much blurred.

SAHARA, the great desert of North Africa. It forms the western part of a wide desert tract which extends from the Atlantic ocean through Egypt, across the Red sea and through Arabia to Mesopotamia. Its physical boundaries are in some directions clearly defined but in others vague, conventional and disputed. On the west the desert extends in many places to the Atlantic coast; on the north to the foot of the Atlas mountains and to the Mediterranean sea east of these ranges. The eastern part, the Libyan desert, is flanked by the Nile, but the Nubian desert beyond differs very little from it; whilst on the south the Sahara merges into the Sudan and the basin of the Niger and only in a few places does a natural boundary exist between them. The area of the desert is estimated at 3½ million square miles, about the area of Europe minus Scandinavia. Its greatest length along lat. 20° N. is 3,200 m. and its breadth from north to south varies from 800 to 1,400 miles.

In such a vast region as the Sahara desert a wide range of topographical forms must occur. Some small tracts lie below sea-level, but, on the other hand, approximately half the area stands above the 1,000 ft. contour line, the highest altitude (8,800 ft.) being reached in the volcanic cone of Tisidde (Tibesti massif). The horizontally bedded Cretaceous rocks form characteristic

plateaux and escarpments which are dissected by an ancient river system and form a sharp contrast with the volcanic cones.

The Sahara Proper.—This is the region which extends southward from the Atlas mountains as far as the highland tract of the central massif and down the western side of the latter to the basin of the Niger. For the most part it is a succession of low plateaux of Cretaceous rocks covered largely by dunes, locally called *erg* or *igidi*, although, in many parts of the west and south, Palaeozoic and Archaean rocks crop out. Along the Atlantic coast, in Mauritania, is a wide belt of dune country with recent deposits of salt and gypsum; inland the dunes give place to tracts of pebbles, the eastern continuation of which is the low plateau country of Adrar and El Juf again covered with dunes, which extend as far as the central massif. To the north are the districts of Rio de Oro, with a penneplained mass of Archaean and metamorphic rocks in the Wessat region; the plateaux of Dra'a and Tafellit of Cretaceous and newer rocks, at the foot of the Anti Atlas and drained by the Wad Dra'a; the desert of Igidi, a large part of which is covered by dunes; and the plateau of Tademaït formed of flat Cretaceous rocks and formerly the watershed of this region. This plateau is continued eastward into the Hammada el Homra whilst to the north is the Great Erg, into which a spur of the hammada extends northward dividing it into the western and the eastern Erg.

The Central Tuareg Massif.—This comprises the Ahaggar plateau of Archaean and Palaeozoic rocks which occupies a central position in the desert and on which are several peaks of volcanic origin which do not rise above 8,000 ft. but are periodically snow-capped. The mass is flanked on the west, north-west and north-east by the lower plateaux of Ahnet, Moudir and the Tassili of the Asjer (5,000 ft.) respectively. The latter is continued south-eastward by a low range, the Tummo, into the Tibesti mass of Archaean rocks in which occurs the highest peak in the desert, Mt. Tisidde (8,800 ft.), an extinct volcano, and still farther south-eastward into the lower range of Ennedi.

The Libyan Desert.—This is triangular in shape, extending from the Mediterranean sea to the Sudan. In the north-west is the hammada country of the Fezzan (*q.v.*) in which are the mountains of Jebel es Soda (Black mts.) which are continued south-eastward towards Kufara by the Huruj es Soda. On the coast in the extreme north are the Jebel el Akhdar ranges, but the rest of the desert is a wide expanse of almost level country, over 500,000 sq.m. in extent, which consists of dunes and sandy wastes of unascertained limits, and across which there is only one known route, running from north to south through the oases of Kufara.

Geology and Structure.—Exact geological information about many parts of the Sahara is not known, but the main structure is now fairly well understood. In the central Tuareg massif we find Archaean gneisses, mica schists, granites, etc., which are flanked by folded Silurian rocks upon which rest Devonian and, in some places, Carboniferous strata. Permian, Trias, Jurassic and Lower Cretaceous rocks are apparently missing in the central Sahara, although the Jurassic crops out in south-west Algeria and along the Atlas borders, but a large area is covered by horizontally bedded Middle and Upper Cretaceous rocks, at the base of which is a variegated clay with gypsum. This latter, a typical lagoon formation, indicates the incoming of changed conditions which caused a widespread transgression in the Cenomanian epoch (lower chalk of Britain) and established an epi-continental sea on the stable mass of northern Africa. Miocene, Pliocene and Quaternary deposits occur locally, the Nummulitic limestone being important in the Libyan desert and Egypt. The Sahara is quite distinct from the folded Atlas mountains (*q.v.*), which tectonically belong to Europe and to which North Africa acted as hinterland during the period of Tertiary folding.

Water Supply.—The winds of the Sahara are very dry, and in consequence there is little or no precipitation, except in the highland region of the central massif, where there is a fall of a few inches per annum, and also along the coastal fringes. Nevertheless, the desert as a whole is not entirely without water, but possesses a skeleton of a regular river system. Inadequate streams radiate from the central massif, but they are soon lost in the sand

of the surrounding country. Similar streams flow down from the Atlas mountains, the Wād Dra' finally reaching the ocean, whilst in the Atlantic and Mediterranean coastal regions similar streams occur, some reaching the sea, others losing themselves in the desert. Irrigation has been attempted in various parts, and it has been found that in many places, especially south of the Atlas and in Algeria, the geological structure is such that artesian water has been obtained. The water so obtained is remarkably fresh, and by means of it agriculture has been made possible in several districts, but the arid hamada country must be abandoned as hopeless. How far such irrigation works can be extended is very uncertain for the detailed geological structure of the area is not yet sufficiently known.

Origin of the Sand.—Several theories have been put forward to explain the enormous quantity of sand in the Sahara. The theory of marine origin is now no longer tenable, for the sand is Quaternary, or at the oldest Pleistocene, in age, and there is no evidence of a marine transgression since pre-Tertiary times. During the great Ice age, when the southern limit of the ice-sheet extended across Central Europe, meteorological conditions were such that much, if not all, of the desert belt lay in a warm, moist, temperate or sub-tropical zone. Under such conditions rock disintegration and soil formation would proceed in the way normal to such regions, the soil being held in position by vegetation, as is still the case in parts of Mauritania, the regions of north of Timbuktu and round Lake Chad and the several oases. A mature river system also assisted in the disintegration and transportation of sediments. Later the soil lost its moisture and the winds became dry, consequent upon the changed meteorological conditions brought about by the retreat of the ice, and vegetation disappeared, leaving the dry soil at the mercy of the wind.

Climate.—The summer heat (June, July and August) is very great and is measured by Augeras in terms of the number of days on which a thermometer not directly exposed to the sun's rays reached 50°C (122°F). In 1913 the number was 33, in 1914 it was 37, in 1915 it was 11 and in 1916 it was 42. During the hottest night in 1916 the temperature did not go below 104° , but the average summer night temperature is about 77° . These figures are for the western Sahara; the central highlands are cooler. The highest recorded temperature for the western Sahara is 56°C (132.8°F). In the cool season the monthly average maxima are about 68° – 78° , the minima about 41° – 50° . On one or two nights of the year the ground in the west may freeze; there is more frost in the central highlands. In summer the soil-temperature may occasionally reach 175° , the relative humidity may be as low as 5% even in the oases; in the cooler season the relative humidity may increase to 48%. The winds in many parts are chiefly the north-east trades, but there may be summer centres of low pressure, and in the western Sahara the wind often blows from the west.

Flora.—The three chief trees are the date palm, *Acacia tortilis* (on the rocky areas), and *Tamarix articulata* (in beds of wadis). The small plants belong mostly to the Compositae, Cruciferae, Leguminosae and Gramineae, usually with small, often hard, leaves, and sometimes fleshy stems. Some desert plants have leaves grey with hairs, which immediately suck in any drop of dew, while others have salt incrustation that attracts any moisture, some plants (colocynths) have very deep roots. Many desert plants retain vitality in spite of years of "resting" while they wait for water; the rose of Jericho is famous in this connection.

Fauna.—The antelope and gazelle occur in the Sahara, and were formerly hunted by the lion, which is now nearly extinct in the desert. Jackal, fox, fennec, badger, jerboa, rat, isabelline hare and, near water, bats also occur. The hyena wanders near the desert border, and the mouflon is found here and there on the higher land. Ostriches survive in the Mauretanian Ergs, but must once have been abundant and widespread. Eagles are fairly numerous, and there are quails, with some ducks, flamingoes and herons near the wadis, where there is water occasionally. Horned vipers, several large lizards, scorpions, tarantulas, beetles, myriads of locusts and flies and many ticks are other members of the

fauna. A few crocodiles survive in some dwindling swamps of the west.

Peoples and Settlement.—It has been indicated above that what is now the desert of Sahara seems to have been open grass land or steppe land in the days of early man. Consequently, it is not surprising to find evidences of a more extensive human occupation of the region than its present climatic and physical conditions will allow.

Barth, in 1850, described drawings as representing a dense crowd of cattle all moving in one direction. Incised drawings are known in Tibesti, and in the region of North Tuareg (Adgor), and north of this, through Algeria to Morocco from Constantine by Ain Sefra to Figie. The animals represented on these drawings no longer inhabit these regions. Neolithic implements have been found at the base of the rocks. Rock drawings are rarer in the western Sahara; some occur at Mecherrah 60 km. W. of Menakeb.

Attempts have been made to trace in certain of the existing inhabitants the remnants of an early race of negro affinities, which inhabited the Sahara before the arrival of the Berbers and Arabs. Gauthier thought that at a period as recent as the Roman conquest of North Africa the Sahara had still a Neolithic culture and people of negro affinities. Negro influence is undoubtedly seen in various parts of the Sahara, but it may date from a much more recent period than has been supposed. For example, the connection between many of the place-names in Fezzan and the language of Bornu is attributable to the northward extension of the influence of the Bornu-Kanem empire between the 11th and 14th centuries A.D. The allusions by classical writers to Ethiopians as inhabitants of the Sahara prove little, in view of the very vague and general meaning attached to the word. Caravans of negro slaves from time immemorial passed northwards along the main desert routes, and it is just in the oases on these routes that the dark element in the population is chiefly found. The oases are naturally the chief centres of population in the Sahara. They occupy positions where the underground water makes its way to the surface or is readily reached by boring; other centres of population are certain mountainous districts where the atmospheric moisture is condensed, and a moderate rainfall results.

The northern oases, such as Dra'a and Tafilalet, are poor. In the east is the Zuzana group, near Tarhit. The Gurara oasis is probably an old lake floor watered by subterranean galleries made by man, and called *goggaras*, and is a rather rich settlement. Tuat is of the same type, but on a cliff top. Tinerkuk and Tarhuz are Erg oases. Tidikelt is the only artesian oasis. Ugarta, Zerhama and Bon Mahud are small "spring" oases. The Tafilalet people meet in the Maider pass by the Daura, Bubut or Wahila, and move over the central plateau and pass Chech in the Tarhamant. The Dra'a meet at Tingut and go via Regbat and the edge of the Erg, and then across the central plateau to Tarhamant. Another raiding group are the Seguiet el Hamra. These people of the northern Sahara are nomads. The various confederations of the Tuareg, in the central Sahara, are grouped around hilly districts. The most important are the Awellimiden, on the left bank of the Middle Niger; and the Kel-Ul, grouped around the mountainous districts of Air or Asben, with Agades as centre; the two northern confederations, those of the Ahaggar and Asfer, being less powerful. North-west of Timbuktu, in the district or "kingdom" of Biru, is the oasis and town of Walata, a Tuareg settlement. The Tuareg are mostly a nomadic people of pre-Arab stock. All the men folk are veiled, and they have been known accordingly as the "People of the Veil." They were doubtless pushed into the fastnesses of the southern desert by Islamic invasions. Other mountainous districts in which a certain amount of rain falls regularly, and which contain a population above the average for the Sahara, are Tibesti and Borku, in the east-centre, and Adrar in the west. Tibesti and Borku are peopled by Tibbus, once thought to be almost pure negroes. This has, however, been disproved. They are light or dark bronze in colour. Their language is related to that of the Kanuri in Bornu, but it appears that the language of the Tibbu is the older. The Tibbus are probably of Hamitic stock. The western Adrar are peopled

mainly by Moors (Berbers).

Commerce.—From the earliest times Saharan commerce has been the monopoly of the nomad peoples. Salt and ivory were carried across the desert in very early times. In the middle ages the Jews possessed great influence in this part of Africa as organizers of trade. In 1447 the Genoese merchant traveller, Antonio Malfaute, visited the Oasis of Tuat and pointed out its importance as a trade centre between the Muslim countries surrounding the desert. He mentions the large quantities of copper carried south to the negro kingdoms of the Sudan, and the vegetable butter there produced. There is evidence that the Venetians and Genoese both had considerable interests in African trade.

Salt and date palms are the chief products of the Sahara at the present time. The principal sources of the salt supply are the rock salt deposits of the Juf (especially Taoudeni), the lakes of Kufara and the rock salt and brine of Bilma (*q.v.*).

Trade routes run (1) from Morocco to Cairo by Insalah and Ghadames, the route of West African pilgrims to Mecca, now largely superseded by the sea route from Tangier to Alexandria, (2) from Kuka (Lake Chad) to Murzuk and Tripoli; (3) from Kano and Zinder to Tripoli by Air and Ghat; (4) from Timbuktu to Insalah, Ghadames and Tripoli; (5) from Timbuktu to Insalah and thence to Algeria and Tunisia; (6) from Algeria—through Tuat and Timbuktu to the Niger. The Senusa movement brought into prominence the desert routes between Wadi in the south and Jalo and Benghazi in the north, which partially superseded some of the older routes. The long-established route from Darfur to the Kharga and Dakhla oases fell into disuse on the closing of the eastern Sudan by the Mahdist troubles. The great route leading from Tripoli via Ghadames and Ghat, to Zinder, Kano, and other great centres of the Hausa States maintains its importance, but the opening of trade from the side of the Niger by the British in the early years of the 20th century affected its value. The route across the western Sahara to Timbuktu is less used than formerly owing to the establishment by the French of a route from Senegal via Nioro to the Upper Niger. The old route, however, retains some importance on account of the salt trade from the Sahara, which centres at Timbuktu.

Railway Schemes.—Two principal routes for a railway across the desert have been suggested, the one taking an easterly line from Biskra through Warqala to Air (Agades) and Zinder, the other starting from the terminus of the most westerly railway already existing, and reaching Timbuktu via Igli and the Tuat oases. A third suggested route is one from Igli to the Senegal, still farther west.

Political Divisions.—The western Sahara, in the main, is administered within French West Africa while the eastern regions of the desert fall into Italian Libya, Egypt and Anglo-Egyptian Sudan. The French first acquired an interest in the Sahara by their conquest of Algiers (1830-45). They gradually extended their influence southward with the purpose of forming a junction with their possessions on the Senegal. The acquisition of Tunisia (1881) largely increased the hold of the French on the Sahara, and the work of French pioneers to the south of Algeria was recognized by the Anglo-French agreement of 1890, which assigned to France the whole central Sahara from Algeria to a line from Say, on the Niger, to Lake Chad. The southern limit of the territory was, however, not strictly defined until 1898, when a new agreement gave to France a rectangular block south of the line mentioned, including the important frontier town of Zinder. A further agreement in 1904 again modified the frontier in favour of France. To the north-east and east the boundary of the French sphere was made to run south-east from the intersection of 23½° N. with 16° E., following this south to the western frontier of Darfur and the Anglo-Egyptian Sudan. French Sahara is thus connected with the French possessions in West Africa and with the Congo-Shari territories of France on the south-east. The Spanish possessions are known as Rio de Oro. In the south the French influence extends beyond the Sahara, reaching the coast in Senegal, French Guinea, Ivory coast, Togo and Dahomey. The French Sahara proper may be very roughly estimated at about 1,500,000 sq. miles. Over the whole of French West Africa

there is a governor-general, who is assisted by a council. The seat of the General Government is at Dakar. Under the governor-general the various colonies are administered by lieutenant-governors.

Exploration.—The Egyptians penetrated the Libyan and Nubian deserts at points, and Carthaginians and Phoenicians were acquainted with the northern fringe of the desert in the west. Jews and Genoese in the middle ages learned much about the Sahara in the course of trade, and their knowledge was mapped by Jewish cartographers in Majorca in the 14th and 15th centuries. In 1819 Capt. G. F. Lyon and Joseph Ritchie penetrated from Tripoli to Murzuk. In 1822 came the journey of Oudney, Clapperton and Denham, from Tripoli to Lake Chad, and a year or two later Maj. A. G. Laing reached Timbuktu, also from Tripoli. In 1828 René Caillié crossed from Timbuktu to Morocco. Heinrich Barth, in the course of his great journey (1849-1856), commenced from Tripoli under the leadership of James Richardson, traversed a considerable portion of the Sahara. Between 1859 and 1861 Henri Duveyrier explored parts of the Tuareg domain. Knowledge of the northern Sahara, from Morocco to Tripoli, was largely increased by the journeys of Gerhard Rohlfs, begun in 1861; Rohlfs subsequently crossing (1865) from Tripoli to Lake Chad by nearly the same route as that previously taken by Barth. In 1873-74 Rohlfs visited the oases in the north of the Libyan desert, and in 1878-79 reached the oasis of Kufara. A French expedition under Col. Paul Flatters, after penetrating far south of Algeria, was massacred (1881) by Tuareg. Farther west, in 1880, Dr. Oskar Lenz started from Morocco, partly by a new route, to Timbuktu. In 1892 the Sahara was crossed from Lake Chad to Tripoli by the French Colonel Monteil.

In 1899 the central Sahara, from Algeria to Air, was traversed by Fernand Fourau. The great desideratum was the opening up of a route to the Niger countries, which might in time divert the trade from Tripoli to Algeria. In 1890 Fourau, who in 1883 had undertaken a first journey of exploration south of Warqala, reached the Tademait plateau in 28° N., fixing the position of many places, and in 1892-93 came the first of his long series of expeditions undertaken with a view of penetrating the country of the Azjer Tuareg, the powerful confederacy which lay on the route to Air and Lake Chad. Fourau finally reached Zinder, the important trade centre on the borders of Nigeria, in 1899.

In the central Sahara, French posts were gradually pushed farther south under a military organization. Subsequent travellers gathered much information respecting the mapping, geology, and other features of this part of the Sahara. Subsequent work in the Sahara is associated with the names of Laperrine, Arnaud, Cortier, Nègre, Villatte, Gautier and Chudeau, on the French side, while Vischer, Haywood, Hassanein Bey, Buchanan, Augéras, Godefroy, Harding King, and F. R. Rodd have contributed much to our knowledge of the peoples and their environment.

SAHARANPUR, a city and district of British India, in the Meerut division of the United Provinces. The city is situated on a stream called the Damaua Nadi, 998 mi. by rail from Calcutta. Pop. (1941) 108,263, of whom more than half are Mohammedans. It is an important railway junction. There are railway workshops, and a large wood-carving industry.

The DISTRICT of SAHARANPUR has an area of 2,134 sq.mi. It forms the most northerly portion of the Doab, or alluvial tableland between the Ganges and Jumna. The population in 1941 was 1,179,643. The district contains the towns of Roorkee and Hardwar.

SAHOS or SHOHOS, Africans of Hamitic stock living to the west of Massawa. Probably akin to the Gallas and Afars. They are mostly Mohammedans, some few being Christians.

SAID HALIM, PRINCE (1863-1921), Turkish statesman, the son of Halim Pasha and the grandson of Mohammed Ali, the founder of the present Egyptian dynasty, was born in Cairo and was educated in Turkey, completing his studies in Geneva. Exiled because of his sympathy with the Young Turkish movement, he affiliated himself to the Committee of Union and Progress in Paris. After the revolution of July 1908 he returned to Constantinople and was nominated senator. At various times from 1908 to 1918 he was president of the council of state, minister for foreign affairs and general secretary to the Union and Progress party. On June 17, 1913, he became Grand Vizier, in which capacity he endeavoured to settle the questions of Armenian reforms, Mosul oil and the participation of English, French and Russian capital in the Baghdad railway. He also endeavoured to establish close relations with Greece. Said Halim favoured a Turco-German alliance, but sought to keep Turkey neutral in World War I. On its entry into the war he tendered his resignation, which was refused, and he remained in office until Feb. 1917. After the Armistice of Mudros, Oct. 31, 1918, Said Halim was imprisoned by the British in Malta. Released in 1921, he was assassinated in Rome on Dec. 6, 1921.

SAID PASHA, MOHAMMED (d. 1928), Egyptian statesman, succeeded Boutros Pasha as prime minister of Egypt in 1910. He held office for four difficult years, in which he succeeded in carrying out various administrative reforms and an extension of provincial government. In May 1919 he formed a non-political ministry in the heat of the revolutionary movement. A bomb thrown at him in the street in September of that year exploded harmlessly in the roadway. In Nov. 1919, when he was informed of the coming of the Milner mission to Egypt, Said Pasha resigned with his cabinet. He was minister of education in Zaghlul's cabinet (1924), and he was acting prime minister during Zaghlul's absence in Europe. He resigned in Oct. 1924, and presently resigned his membership of the Ward party. He was returned to parliament as an independent member for Alexandria in Jan. 1925. Said Pasha died on July 20, 1928.

SAIGA (*Saiga tatarica*), a desert-dwelling antelope inhabiting the Khirgiz steppe. A century ago it extended as far west

as Poland. During the later Tertiary period the saiga was widely distributed in Europe and Alaska.

SAIGO TAKAMORI (1832-1877), Japanese patriot, was born in Satsuma in 1832. From early youth he took a prominent part in the politics of his clan, and owing to his extreme opinions with regard to the expediency of abolishing the Tokugawa administration, he was banished (1858) to the island of Oshima (Satsuma), where he attempted unsuccessfully to commit suicide. Ultimately he rose to high rank in the newly organized imperial government, but in 1873 he retired from the cabinet by way of protest against its decision not to take armed action against Korea. Thenceforth he became the rallying point of a large number of men dissatisfied with the new administration, and in 1877 he headed a rebellion which taxed all the resources of the central government. After several months of desperate fighting, Saigo and a small remnant of his followers made a swift retreat to Kagoshima, and fell fighting (Sept. 14) within sight of their homes.

SAIGON, capital of the colony of Cochinchina and of French Indo-China on the right bank of the river Saigon, 34 mi. from the sea. Pop. (1936) 111,000 of which 11,760 were French. The town is enclosed by the Saigon river, the Arroyo Chinoise and the Arroyo de l'Avalanche except on the southwest, where it adjoins the twin city of Cholon (q.v.). Double rows of trees along fine boulevards, with public gardens, cafes and other French features, make it the "Little Paris of the East." Buildings like the government house, law courts, theatres and cathedral are distinctly French. The well-equipped port was visited by 581 vessels in 1939, and exported 2,000,000 tons of rice, teak, rubber, hides, pepper, copra, gums, kapok, etc. The chief industries of Saigon and Cholon are rice and sawmilling, electric power, alcoholic beverages, textiles, soap and chemicals. The state railways connect Saigon with northern Indo-China, while highways extend to Tonkin and to Luang Prabang in Laos (q.v.).

Saigon is the seat of two chambers of the court of appeal of French Indo-China, of tribunals of first instance and of commerce, and of the vicar apostolic of Cochinchina.

Before the French conquest, Saigon, then known as *Gai-dinh-thanh*, was the capital of Lower Cochinchina, which consisted of the "six southern provinces" of the Annamese empire, and constituted a vice-royalty under the government of a *kinhluoc*. The French captured it in 1859, and it was part of the territory ceded in 1862.

SAILCLOTH AND SAILMAKING. Sailcloth, now more commonly called canvas (q.v.) or, in the United States, duck, is usually a double warp, single weft fabric of the same structure as bagging (see BAGGING AND BAGS) and tarpaulin, although it is sometimes made with single threads of warp. Hemp and ramie are occasionally used in the manufacture of this cloth, but flax and cotton are the chief fibres employed. Many of the sails of fishing smacks and similar vessels are made entirely of cotton—the fabric sometimes retaining its natural colour, but more often dyed or stained tan. Since most of the larger vessels are now driven by steam or oil, the quantity of cloth used for sails is comparatively small. A large quantity of cloth, however, is used on steamships for covers, and for coal bags, sailcloth buckets, etc.

The very best kind of sailcloth is made from long flax, as this fibre possesses flexibility, lightness and strength combined. The number of threads per inch of warp varies from 14 double threads to 48 double threads, and from 12 to 36 shots per inch of weft, while the usual widths are 18, 24, 30 and 36 inches. Cotton canvas has for its limits about 26 to 54 threads of warp per inch, and 15 to 46 shots per inch; the warp yarn for cottons may be 2, 3 or several ply.

Sailmaking.—This is a very ancient industry, but is naturally much less important than it was before the introduction of steamships. The operations of the sailmaker may be stated as follows. The dimensions of mast and yards and sail plan being supplied, the master sailmaker is enabled to determine the dimensions of each sail—after due allowance for stretching—in terms of cloths and depth in yards—if a square sail, the number of cloths in the head, number in the foot and the depth in yards; if a fore-

and-aft sail (triangular), the number of cloths in the foot and the depth in yards of the luff or stay and of leech or after-leech; if a fore-and-aft sail (trapezium form), the number of cloths in the head, number in foot and the depth of mast or luff and of after-leech. These particulars obtained, there is got out what is technically termed a "casting," which simply means the shape, length, etc., of each individual cloth in the sail. These figures are given to the cutter, who proceeds to cut out the sail cloth by cloth in consecutive order, numbering them 1, 2, 3, 4, etc.; the series of cloths thus cut out are handed over to the workman, who joins them together by carefully made double flat seams, sewn with twine specially prepared for the purpose, with about 120 stitches in a yard. In the heavy sails the seam is about 1½ in. in width, and in the British navy stuck or stitched in the middle of the seam to give additional strength; the seams in the lighter sails are about ½ in. wide. The whole of the cloths are then brought together, and spread out, and the tabling (or hemming, so to say) is turned in and finished off with about 72 stitches to a yard. Strengthening pieces or "linings" are affixed where considered necessary, in courses and top-sails such pieces as reef-bands, middle-bands, foot-bands, leech-linings, bunt-line cloths; in top-sails (only) a top-lining or brim; in other and lighter sails such pieces as mast-lining clew and head, tack and corner pieces; holes, such as head, reef, stay (luff), mast, cringle, bunt-line, etc., are also made where required, a grommet of line of suitable size being worked in them to prevent their being cut through. The next thing to be done is to secure the edges of the sail. Bolt-rope, a comparatively soft rope made from the finer hemp yarn (Italian) is used for this purpose; in the British navy it ranges from ½ in. (increasing in size by quarter inches) up to 8 in. inclusive; it is then neatly sewn on with roping twine specially prepared, the needle and twine passing between and clear of every two strands of the rope in roping.

Where slack sail has to be taken in, it is the practice to leave it to the judgment of the sail-maker; but where possible it is better to set up the rope by means of a tackle to a strain approximate to what it will have to bear when in use, and whilst on the stretch mark it off in yards, as also the edge of the sail in yards, so that by bringing the marks together in roping the sail will stand flat. In the British navy the largest size of rope sewn on to a sail is six inches; sizes above this are used for foot and clew ropes of top-sails and courses, being first wormed, parcelled (that is, wound round with strips of worn canvas), tarred and served over with spun yarn; the foot of the sail is then secured to it by being marled in. Where two sizes of bolt-rope used in roping a sail have to be connected, it is effected by a tapered splice. Cringles (similar to the handle of a maund) formed by a strand of bolt-rope, mostly having a galvanized iron thimble in them as a protection, are then stuck where necessary, as at the corners, sides or leeches, mast or luff; they are required either for making stationary or hauling "taut" by tackle or otherwise certain parts of the sail when in use. Fore-and-aft sails, such as spankers, gaff-sails and storm try-sails, are reduced in size by reef-points made of stout line (four to 20 lb.), crow-footed in the middle, a hole being pierced through every seam; one-half of the point is passed through and the crowfoot sewn firmly to the sail; the number of reefs depends upon the size of the sail, and the reefs are placed parallel to the foot. (T. W.)

UNITED STATES

Sailcloth or canvas is better known by the American trade as numbered duck. England manufactures a great deal from flax, while the U.S. mostly uses cotton. It is a plain woven fabric of heavy construction which varies with its use and is usually of plied warp and filling yarns (although in some cases the warp yarn may be single and drawn two ends per dent). Duck is used for many purposes including sails, tents, tarpaulins, bags, awnings, fire hose, wearing apparel such as overalls, hunting coats, belts, etc. The number of warp ends per inch vary from 26 to 48 and may be 2 to 5 ply and from 16 to 34 filling picks per inch 2 to 8 ply.

Specifications adopted by the Cotton Duck Association specify that duck shall be made of cotton, free from waste and thoroughly

cleaned, evenly woven, free from all sizing and free from an excessive number of avoidable imperfections in manufacture. Duck is numbered as follows: No. 1 duck is 22 in. wide and weighs 18 oz. per linear yard and is taken as the basis. For each ounce under 18 the number is increased by one which would make a 17 oz. duck $\frac{2}{3}$, 16 oz. $\frac{1}{3}$ and so on up to $\frac{1}{12}$ which weighs 7 ounces. Duck heavier than 18 oz. per yard is numbered by ciphers, a cipher being added for each ounce increase in weight. Thus $1/0=19$ oz. duck; $2/0=20$ oz. duck. Duck is made as heavy as $20/0$ which would weigh 38 oz. per yard. However, duck above $2/0$ is very seldom used.

The numbering of duck conforms in England and the United States in number only. English specifications are based on a 24 in. fabric and on two ply yarn warp and filling for all numbers, while in the United States 22 in. is the standard width and designates that each number shall be more than two ply and varies with the number and the weight per running yard for specified widths in exact proportion. Thus a 24 in. duck would weigh $\frac{1}{12}$ more than the standard 22 in. goods, while 11 in. duck would weigh one-half as much as the standard width. Duck is made in widths from 14 to 120 in., but the most common widths are 22, 28 and 36 in., and are delivered in standard lengths of 110 to 120 yd. differing from the English requirements of 40 yd. lengths. Duck in the United States is known as hard, medium or soft texture. Hard duck is made from $2/0-\frac{1}{12}$, and medium texture $2/0-\frac{2}{12}$.

The English specifications for a $\frac{1}{12}$ duck specifies it should weigh 18½ oz. per yard, 24 in. wide, be delivered in a 39 yd. bolt, to weigh 46 lb. containing 26 lb. of warp, 660 double ends (approximately 28 ends per inch) and 20 lb. of filling, breaking 340 lb. in the warp and 480 lb. in the filling, using the Avery method of breaking a 24×1 in. test strip. Comparing this with the U.S. Government specification a $\frac{1}{12}$ duck should weigh 18 oz. per linear yard, 22 in. wide, have as a minimum 26 ends and 19 picks per inch of 5 ply warp and filling, and specified widths should weigh in proportion to the 22 in. standard (that is, a $\frac{1}{12}$ duck 24 in. wide should weigh 19½ oz. per yard). The fabric when tested by the $1 \times 1 \times 3$ in. grab method, should break 440 lb. in the warp and 370 lb. in the filling. The difference in breaking strength is partially due to the method employed, therefore no comparison can be made. (R. T. F.)

SAINFOIN (*Onobrychis viciifolia*) is a low-growing perennial plant of the pea family (Leguminosae), with a woody rootstock, whence proceed the stems, which are covered with fine hairs and bear numerous long pinnate leaves, the segments of which are elliptic. The flowers are borne in close pyramidal or cylindrical clusters on the end of long stalks. Each flower is about half an inch in length with lanceolate calyx-teeth shorter than the corolla, which latter is pink, with darker stripes of the same colour. The pods or legumes are flattened, wrinkled, somewhat sickle-shaped and crested, and contain a single olive-brown seed. In Great Britain the plant is a native of the calcareous districts of the southern counties. It is native through central Europe and Siberia and is sparingly naturalized in the eastern United States.

SAINT. The articles on the different Saints are to be found in their proper alphabetical places, followed not preceded by the word saint, as Peter, Saint; Patrick, Saint, etc.

The term was originally applied, e.g. in the New Testament and also in the most ancient monuments of Christian thought, to all believers. In ancient inscriptions it often means those souls who are enjoying eternal happiness, or the martyrs. For a long time, too, *sanctus* was an official title, particularly reserved for bishops (v. *Anaclea Bollantiana*, xviii. 410-411). It was not till almost the 6th century that the word became a title of honour specially given to the dead whose cult was publicly celebrated in the churches. It was to the martyrs that the Church first began to pay special honour. We find traces of this in the 2nd half of the 2nd century, in the *Martyrium Polycarpi* (xviii. 3) in connection with a meeting to celebrate the anniversary of the martyr's death. Another passage in the same document (xvii. 3) shows clearly that this was not an innovation, but a custom already established among the Christians. It does not follow that it was henceforth

universal. The Church of Rome does not seem to have inscribed in its calendar its martyrs of an earlier date than the 3rd century. The essential form of the cult of the martyrs was that of the honours paid to the illustrious dead; and these honours were officially paid by the community. Each church first confined itself to celebrating its own martyrs; but it was not long before it became customary to celebrate the anniversaries of martyrs of other churches. Finally the famous ascetics began to share in the honours paid to the martyrs.

The cult of the saints early met with opposition, in answer to which the Church Fathers had to defend its lawfulness and explain its nature. The Church of Smyrna had early to explain its position in this matter with regard to St. Polycarp: "We worship Christ, as the Son of God; as to the martyrs, we love them as the disciples and imitators of the Lord" (*Martyrium Polycarpi*, xvii. 3). St. Cyril of Alexandria defends the worship of the martyrs against Julian, St. Asterius and Theodoret against the pagans in general, and they all lay emphasis on the fact that the saints are not looked upon as gods by the Christians, and that the honours paid to them are of quite a different kind from the adoration reserved to God alone. St. Jerome argued against Vigilantius with his accustomed vehemence, and especially meets the objection based on the resemblance between these rites and those of the pagans. But it is above all St. Augustine who in his refutation of Faustus, as well as in his sermons and elsewhere, clearly defined the true character of the honours paid to the saints: "Non eis templa, non eis altaria, non sacrificia exhibemus. Non eis sacerdotes offerunt, absit, Deo praestantur. Etiam apud memorias sanctorum martyrum cum offerimus, nonne Deo offerimus? . . . Quando audisti dici apud memorias sancti Theogenis: offero tibi, sancte Theogenis, aut offero tibi Petre, aut offero tibi Paule?" (*Sermo*, 273, 7; cf. *Contra Faustum*, xx. 21). The undoubted abuses which grew up, especially during the middle ages, raised up, at the time of the Reformation, fresh adversaries of the cult of the saints. The council of Trent, while reprobating all superstitious practices in the invocation of the saints, the veneration of relics and the use of images, expresses as follows the doctrine of the Roman Church: "That the saints who reign with Christ offer to God their prayers for men; that it is good and useful to invoke them by supplication and to have recourse to their aid and assistance in order to obtain from God His benefits through His Son our Saviour Jesus Christ, who alone is our Saviour and Redeemer."

BIBLIOGRAPHY.—See H. Thurston, art. "Saints and Martyrs, Christian" in *Hastings, Encyclopedia of Religion and Ethics*, xi. 51 ff.; L. Duchesne, *Origines du culte chrétien*, 6th ed. (1905).

ST. AFFRIQUE, a town of France, in the department of Aveyron, on the Sorgues, 68 mi. N.N.W. of Beziers on the railway to Clermont Ferrand. Pop. (1936) 5,179. St. Afrique grew up in the 6th century around the tomb of St. African, bishop of Comminges. An old bridge over the Sorgues and some megaliths in the neighbourhood, especially the dolmen at Tiergues, are notable.

ST. ALBANS, EARLS OF. The English title of earl of St. Albans was first borne by Richard Bourke, or de Burgh, 4th earl of Clanricarde (d. 1635), who was made earl of St. Albans in 1628.

The second creation of an earl of St. Albans was in 1660, when Henry, Baron Jermyn, was made an earl under this title. See below.

ST. ALBANS, CHARLES BEAUCLERK, 1st Duke of, cr. 1684 (1670-1726), a natural son of Charles II. by Nell Gwynne. Born in London on May 8, 1670, Charles was made Baron Hedington and earl of Burford in Dec. 1676. He took service with the emperor Leopold I., being present at the siege of Belgrade in 1688. After the battle of Landen in 1693, William III. made him captain of the gentlemen pensioners, and four years later gentleman of the bedchamber. His Whig sentiments prevented his advancement under Anne, but he was restored to favour at the accession of George I. He died at Bath on May 10, 1726. His wife Diana, daughter and heiress of Aubrey de Vere, last earl of Oxford, was a well-known beauty, who became lady of the bedchamber to Caroline, princess of Wales, and survived until Jan. 15, 1742.

ST. ALBANS, HENRY JERMYN, EARL OF (c. 1604-1684), son of Sir Thomas Jermyn of Rushbrooke, Suffolk, was vice chamberlain and then master of the horse to Queen Henrietta Maria. He accompanied Henrietta Maria in 1644 to France, where he continued to act as her secretary. In the same year he was made governor of Jersey, and conceived the idea of ceding the Channel Islands to France as the price of French aid to Charles against the parliament. When Charles II. went to Breda, Jermyn remained in Paris with Henrietta Maria, who persuaded her son to create him earl of St. Albans in 1660. Gossip even asserted a secret marriage between the queen and Jermyn. At the Restoration St. Albans received various appointments, and he contributed to the close secret understanding between Charles II. and Louis XIV., taking part in the preliminaries of the Treaty of Dover in 1669. In 1664 he obtained a grant of land in London near St. James's Palace, where Jermyn street preserves the memory of his name, and where he built the St. Albans' market on a site afterwards cleared for the construction of Regent street and Waterloo place. The earl, who was a friend and patron of Abraham Cowley, died in January 1684.

ST. ALBANS, a city, municipal borough, and market town in the St. Albans parliamentary division of Hertfordshire, England, on the L.M.S. and L.N.E. railways, 20 mi. northwest of London. Pop. (est. 1938) 36,200. Area 8 sq. mi. St. Albans became the seat of a bishop in 1877; the diocese covering most of Hertfordshire and Bedfordshire, with very small portions of Buckinghamshire, Cambridgeshire and Middlesex. The great cathedral, or abbey church, is finely situated on the steep hill above the small river Ver.

History.—Shortly after the martyrdom of St. Alban, probably in 303, a church was built on the spot, and in 793 Offa, king of Mercia, who professed to have discovered the relics of the martyr, founded in his honour a monastery for Benedictines, which became one of the richest and most important houses of that order in the kingdom. The abbots, Ealdred and Ealmer, at the close of the 10th century began to break up the ruins of the old Roman city of Verulamium for materials to construct a new abbey church; but its erection was delayed till the time of William the Conqueror, when Paul of Caen, a relative of Archbishop Lanfranc, was in 1077 appointed abbot. The church was built on the model of St. Stephen's, Caen, but on a larger scale. It was consecrated in 1115, but had been finished some years before. Of the original Norman church the principal portions now remaining are the eastern bays of the nave, the tower and the transepts, but the main outlines of the building are still those planned by Paul. It is thus one of the most important specimens of Norman architecture in England, with the special characteristic that, owing to the use of the flat broad Roman tile, the Norman portions are peculiarly bare and stern.

About 1155 Robert de Gorham repaired and beautified the early shrine and rebuilt the chapter-house and part of the cloister; but nothing of his work now remains except part of a very beautiful doorway discovered in recent times. About 1200 Abbot John de Cella pulled down the west front and portions of the north and south aisles. He began the erection of the west front in a new and enriched form, and his work was continued by his successor William de Trumpington in a plainer manner. In 1257 the eastern portion was pulled down, and between the middle of the 13th and the beginning of the 14th century a sanctuary, ante-chapel and lady chapel were added, all remarkably fine specimens of the architecture of the period. In 1323 two great columns on the south side suddenly fell, and this necessitated the rebuilding of five bays of the south aisle and the Norman cloisters. Various incongruous additions were made during the Perpendicular period, and much damage was also done during the dissolution of the abbey to the finer work in the interior. Structural dangers gave rise to an extensive restoration and partial rebuilding, begun under the direction of Sir Gilbert Scott, and completed in 1894 by Lord Grimthorpe, some of whose work was, and remains, the subject of much adverse criticism. The abbey's extreme length outside is 550 ft., which is exceeded by Winchester by 6 ft. The nave (297 ft.) is the longest Gothic

nave in the world and exceeds that of Winchester by about 20 ft. The length of the transepts is 175 ft. inside. The monastic buildings have all disappeared except the great gateway.

St. Michael's church (within the site of Verulamium) and St. Stephen's were originally constructed in the 10th century. Considerable portions of the Norman buildings remain. The former contains the tomb of Lord Chancellor Bacon. The restored clock-house in the market place was built by one of the abbots in the reign of Henry VIII.

To the southwest of St. Albans stood the ancient Verulamium (*q.v.*), one of the oldest towns in Britain, on Watling street. The corporation bought the site (104 ac.) in 1929 and a museum was built. The ruins served as a quarry not only to the builders of the abbey, but also for the other churches and the monastic buildings of St. Albans, and Roman bricks are found even in the fabric of the churches of neighbouring villages, as at Sandridge, 2½ mi. northeast. After being burned by Boadicea (A.D. 61), Verulamium revived, and its church was famous early in the 8th century. The Saxon royal residence of Kingsbury is variously assigned to the 6th and 8th centuries. In the 9th and 10th centuries the abbots enlarged the town, which was confirmed to them as a borough by Henry II. In 1253 a charter gave borough jurisdiction to the goodmen of St. Albans; and there were several succeeding charters. In 1877 St. Albans became a city. The famous "model" parliament of 1295 was held at St. Albans. Two burgesses were returned to the parliament of 1306-07, but after 1336 such right fell into abeyance until its resumption in 1553. Its abolition, because of bribery, took place in 1852.

During Wat Tyler's insurrection the monastery was besieged by the townspeople, many of whom were executed in consequence. At St. Albans the Lancastrians were defeated on May 21, 1455, their leader, the duke of Somerset, being killed and Henry VI taken prisoner; here, too, Queen Margaret defeated the earl of Warwick on Feb. 17, 1461. During the civil wars the town was garrisoned for the parliament. One of the earliest printing presses in the kingdom was set up in the abbey, and a number of books were printed there in the late 15th century.

Battle of St. Albans, May 22, 1455. The first battle in the Wars of the Roses wherein the smaller Lancastrian force was defeated by the Yorkists and King Henry VI taken prisoner. A subsequent battle at the same place on Feb. 17, 1461, ended in the Lancastrians defeating Warwick and regaining possession of King Henry VI's person. See *ROSES, WARS OF THE*.

See *Victoria County History, Herts*, vol. ii.; Peter Newcome, *The History of the Abbey of St. Albans* (London, 1793); and *Chronica monasterii S. Albani*, ed. by H. T. Riley for "Rolls" series (1863-76).

SAINT ALBANS, a city of northwestern Vermont, U.S.A., a port of entry and county seat of Franklin county; 3 mi. from Lake Champlain (St. Albans bay) and 17 mi. from the Canadian border. It is on federal highway 7, and is served by the Central Vermont railway. Pop. (1950) 8,552. The city is 385 ft. above the level of the lake and is surrounded by hills with fine views of the Green mountains, Lake Champlain and the Adirondacks beyond.

St. Albans bay is a famous fishing ground. The city is a summer resort and touring centre; headquarters of the railway, which employs some 500 persons in its offices and shops, and of various activities of the federal government; and an important shipping point for maple sugar and dairy products, variegated marble and other products of the region and its factories. It is the headquarters of the customs district of Vermont. The first settlement was made in 1774.

The town was organized in 1788, incorporated in 1859 and chartered as a city in 1897. It has a mayor-city council form of government. On Oct. 19, 1864, it was raided from Canada by a party of Confederate soldiers (not in uniform), who looted three banks and wounded several citizens. They escaped to Canada, where the leader and 12 others were arrested, but not deprived of the \$208,000 they had taken. Later \$88,000 of this was refunded by the Canadian government. In 1866 and 1870 the Fenians made St. Albans a base for attacks on Canada, and U.S. troops were sent there to preserve neutrality.

ST. ALDWYN, MICHAEL EDWARD HICKS BEACH, 1st EARL (1837-1916), English statesman, son of Sir Michael Hicks Beach, 8th Bart., whom he succeeded in 1854, was born in London on Oct. 23, 1837, and was educated at Eton and Christ Church, Oxford. He entered parliament as Conservative M.P. for East Gloucestershire in 1864, and held various offices between 1868 and 1880. In 1885 he was elected for West Bristol, and the Conservative party having returned to power, became chancellor of the exchequer and leader of the house of commons. After Gladstone's brief Home Rule ministry in 1886 he entered Lord Salisbury's next cabinet again as Irish secretary, making way for Lord Randolph Churchill as leader of the house; but his eyesight compelled him to resign in 1887 and meanwhile Goschen replaced Lord Randolph as chancellor of the exchequer. From 1888 to 1892 Sir Michael Hicks Beach returned to active work as president of the board of trade, and in 1895-Goschen being transferred to the admiralty—he again became chancellor of the exchequer. In 1899 he lowered the fixed charge for the national debt from 25 to 23 millions—a reduction imperatively required, apart from other reasons, by the difficulties found in redeeming consols at their then inflated price. When compelled to find means for financing the war in South Africa, he insisted on combining the raising of loans with the imposition of fresh taxation; and besides raising the income tax each year, up to 1s. 3d. in 1902, he introduced taxes on sugar and exported coal (1901), and in 1902 proposed the reimposition of the registration duty on corn and flour which had been abolished in 1869 by Lowe. On Lord Salisbury's retirement in 1902 Sir Michael Hicks Beach also left the government.

He accepted the chairmanship of the Royal Commission on Ritualistic Practices in the Church, and he did valuable work as an arbitrator; he was a firm advocate of free trade and by his campaign against Joseph Chamberlain's protectionist programme did much to prevent Balfour from committing his party to that policy.

When Balfour resigned in 1905 he was raised to the peerage as Viscount St. Aldwyn (1906), and was created an earl in 1915. He died in London on April 30, 1916.

ST. AMAND-LES-EAUX, a town of northern France, in the department of Nord, at the junction of the Elnon with the Scarpe, 22 mi. S.E. of Lille by rail. Pop. (1946) 14,218. St. Amand owes its name to St. Amand, bishop of Tongres, who founded a monastery here in the 7th century. The abbey was laid waste by the Normans in 882 and by the count of Hainaut in 1340.

The town was captured by Mary of Burgundy in 1477, by the count of Ligne, Charles V's lieutenant, in 1521, and finally in 1667 by the French. The town has mineral waters and mud baths. The discovery of statues and coins in the mud shows that these must have been used during the Roman period.

ST. AMAND-MONT-ROND, a town of central France, capital of an arrondissement in the department of Cher, 39 mi. S.E. of Bourges on the railway to Montluçon. Pop. (1946) 10,990. The town grew up round a monastery founded by St. Amand, a follower of St. Columban, in the 7th century.

SAINT-AMANT, MARC ANTOINE DE GERARD, SIEUR DE (1594-1661), French poet, was born near Rouen in the year 1594, the son of a merchant. He obtained a patent of nobility, and attached himself to different great noblemen—the duc de Retz and the comte d'Harcourt among others. He saw military service and sojourned at different times in Italy, in England—a sojourn which provoked from him a violent poetical attack on the country, *Albion* (1643)—in Poland, where he held a court appointment for two years, and elsewhere. Saint-Amant's later years were spent in France; and he died at Paris on Dec. 29, 1661. Saint-Amant has left a not inconsiderable body of poetry. His *Albion* and *Rome ridicule* set the fashion of the burlesque poem, a form in which he was excelled by his follower Paul Scarron. In his later years he devoted himself to serious subjects and produced an epic, *Moïse sauvé* (1653). His best work consists of Bacchanalian songs, his *Débauche* being one of the most remarkable convivial poems of its kind.

The standard edition is that in the *Bibliothèque Elzévirienne*, by M. C. L. Lévet (2 vols., 1855).

SAINT ANDRÉ, ANDRÉ JEANBON (1749-1813), French revolutionary, was born at Montauban (Tarn-et-Garonne) on Feb. 25, 1749. In July 1793 he became president of the Convention, entered the Committee of Public Safety and was sent on mission to the Armies of the East. On Sept. 20, 1793, he obtained a vote of one hundred million francs for constructing vessels, and reorganized the military harbours of Brest and Cherbourg. After a mission in the south (July 1794-March 1795) in which he showed great moderation, he was arrested on May 28, 1795, but was released by the amnesty of the year IV. He was then appointed consul at Algiers and Smyrna (1798), imprisoned by the Turks for three years, and subsequently became prefect of the department of Mont-Tonnerre (1801) and commissary-general of the three departments on the left bank of the Rhine. He died at Mainz on Dec. 10, 1813.

See Lévy-Schneider, *Le Conventionnel Jeanbon St. André* (1901).

ST. ANDREWS, city, royal burgh, university town and seaport of Fifeshire, Scotland. Pop. (1938) 8,383. It is situated on a bay of the North Sea, 1½ mi. S.E. of Dundee by the L.N.E.R., via Leuchars junction. It occupies a plateau of sandstone rock about 50 ft. high, on the north breaking off in precipitous cliffs. The Eden enters St. Andrews bay N.W. of the golf links, which rank amongst the finest in the world. The Royal and Ancient Golf club, founded in 1754, is the legislative authority of the game. There is a marine biological station. The city was never surrounded by walls, and of its ancient gates the West Port only remains. The Martyrs' memorial, erected to the honour of martyrs of the Reformation epoch, stands at the west end of the Scores on a cliff overlooking the sea.

The cathedral originated partly in the priory of Canons Regular founded by Bishop Robert (1122-1159). At the end of the 17th century some of the priory buildings were still entire and considerable remains of others existed, but nearly all traces have now disappeared except portions of the wall and the archways. The wall is about three-quarters of a mile long, and bears turrets at intervals.

The cathedral was founded by Bishop Arnold (1159-1162), to supply more ample accommodation than was afforded by the church of St. Regulus. The principal portions extant, partly Norman and partly Early English, are the east and west gables and part of the nave and the south transept. The plan of the cathedral is marked out on the turf.

The castle, on a rocky promontory, is supposed to have been erected by Bishop Roger about the beginning of the 13th century as an episcopal residence, and was strongly fortified. It was destroyed, but rebuilt towards the close of the century. There remains a portion of the south wall enclosing a square tower, the "bottle dungeon" below the northwest tower, the kitchen tower and a subterranean passage. The grounds have been laid out as a public garden.

The town church, formerly the church of the Holy Trinity, was originally founded in 1112 by Bishop Turgot, but was rebuilt about 1800 with the exception of the square tower and spire, and was splendidly restored in 1907-09, the original lines being followed as closely as possible. In this church John Knox first preached in public, and in it, on June 4, 1559, he delivered the famous sermon which led to the stripping of the cathedral and the destruction of the monastic buildings. The church contains a monument to James Sharp, archbishop of St. Andrews (assassinated 1679). In South street is the ruin of the north transept of the chapel of the Blackfriars' monastery founded by Bishop Wishart in 1274; but the Observantine monastery, founded about 1450 by Bishop Kennedy, has disappeared, except the well.

The university of St. Andrews, the oldest in Scotland, owed its origin to a society formed in 1410 by Lawrence of Lindores, abbot of Scoon, and others. A charter was issued in 1411 by Bishop Henry Wardlaw (d. 1440), and six bulls were obtained from Benedict XIII in 1413 confirming the charter and constituting the society a university. The lectures were delivered in various parts of the town until 1430, when Wardlaw allowed the lecturers the use of a building called the Paedagogium, or St. John's. St.

Salvator's college was founded and richly endowed by Bishop Kennedy in 1456; seven years later it was granted the power to confer degrees in theology and philosophy, and by the end of the century was regarded as a constituent part of the university. In 1512 St. Leonard's college was founded, and the original Paedagogium nominally changed into a college, with the parish church of St. Michael of Tarvet annexed to it; but its actual erection into a college did not take place until 1537, when it was dedicated to the Blessed Virgin Mary of the Assumption. The outline of the ancient structure is preserved, but its general character has been much altered by various restorations. It forms two sides of a quadrangle. The University library, which includes the older college libraries, was founded before the middle of the 17th century and rebuilt in 1764. The lower hall in the older part of the building was used at times as a provincial meeting-place for the Scottish parliament. When the constitution of the colleges was remodelled in 1579 St. Mary's was set apart for theology; and in 1747 the colleges of St. Salvator and St. Leonard were formed into the United college. The buildings of St. Leonard's are now occupied as a school for girls. The college chapel is in ruins. The United college occupies the site of St. Salvator's college, but the old buildings have been removed, with the exception of the college chapel, now used as the university chapel and the parish church of St. Leonard's, a fine Gothic structure, containing an elaborate tomb of Bishop Kennedy and Knox's pulpit; the entrance gateway, with a square clock tower; and the janitor's house with some classrooms above. Younger hall is used for university functions. University college, Dundee, founded in 1881, was in 1897 affiliated to the university of St. Andrews. The Advanced Medical School of St. Andrews (1898) and the Dental school (1914) are in Dundee. In 1892 provision was made within the university for the instruction of women.

St. Andrews was probably the site of a Pictish stronghold, and tradition declares that Kenneth, the patron saint of Kennoway, established a Culdee monastery here in the 6th century. The foundations of the little church dedicated to the Virgin were discovered on the Kirkcubright in 1860. Another Culdee church of St. Mary on the Rock is supposed to have stood on the Lady's Craig, now covered by the sea. At that period the name of the place was Killmorynt (Gaelic, "The church of the king's mount") or Muckross. St. Andrews is said to have been made a bishopric in the 9th century, and when the Pictish and Scottish churches were united in 908, the primacy was transferred to it from Dunkeld, its bishops being thereafter known as bishops of Alban. It became an archbishopric during the primacy of Patrick Graham (1466-1478). The town was created a royal burgh in 1124. In the 16th century St. Andrews was one of the most important ports north of the Forth, but it fell into decay after the Civil War.

SAINT ARNAUD, JACQUES LEROY DE (1801-1854), marshal of France, was born at Paris on Aug. 20, 1801. He entered the army in 1817, retired from the service in 1827, and re-entered it at thirty as a sub-lieutenant. He took part in the suppression of the Vendée émeute, and was for a time on General (Marshal) Bugeaud's staff. But his debts and the scandals of his private life compelled him to go to Algeria as a captain in the Foreign Legion. In 1848 he was placed at the head of a brigade during the revolution in Paris. On his return to Africa, it is said because Louis Napoleon considered him suitable to be the military head of a *coup d'état*, an expedition was made into Little Kabylia, in which St. Arnaud provided his superiors with the pretext for bringing him home as a general of division (July 1851). He succeeded Marshal Magnan as minister of war and superintended the military operations of the *coup d'état* of the 2nd of December (1851) which placed Napoleon III. on the throne. A year later he was made marshal of France and a senator, remaining at the head of the war office till 1854, when he set out to command the French in the Crimea, his British colleague being Lord Raglan. He died on board ship on Sept. 29, 1854, shortly after commanding at the battle of the Alma. His body was conveyed to France and buried in the Invalides.

See *Lettres du Maréchal de Saint Arnaud* (Paris, 1855; 2nd edition with memoir by Sainte-Beuve, 1858).

ST. ASAPH, a cathedral village-city of Flintshire, north Wales, on the Rhyl-Denbigh branch of the L.M.S. about 6 mi. from each of these towns. Pop. (1951) 9,358. Its Welsh name, Llanelwy, is derived from the Elwy, between which stream and the Clwyd it stands. Asaph, to whom the cathedral (the smallest in Great Britain, excluding converted parish churches) is dedicated, was bishop here in the 6th century. The small, irregularly built town has also a parish church, remains of a Perpendicular chapel near Ffynnon Fair (St. Mary's Well) and almshouses founded in 1678 by Bishop Barrow. The hill on which St. Asaph stands is Bryn Paulin, with early associations. The early cathedral, of wood, was burned by the English in 1247 and 1282, and that built by Bishop Anian in the 13th century (Decorated) was mostly destroyed during the raids of Owen Glendower (c. 1402). Bishop Redman's building (c. 1480) was completed by the erection of the choir about 1770. Further restoration took place in the 19th century. The church is plain, cruciform, chiefly Decorated but partly Early English, with a square tower; it has a library of nearly 2,000 volumes (some rare). In 1920 the then bishop of St. Asaph was enthroned in his cathedral as the first archbishop of the disestablished church in Wales.

SAINT AUGUSTINE, a city of northeastern Florida, U.S.A., on the coast, 38 mi. S.E. of Jacksonville; a port of entry and the county seat of St. Johns county. It is on federal highway 1 and the East Coast Inland waterway, and is served by the Florida East Coast railway.

The population in 1950 was 13,555; and in 1940 it was 12,090. The population is frequently doubled during tourist seasons.

The city occupies a narrow peninsula formed by the Matanzas and San Sebastian rivers, and is separated from the ocean by the northern end of Anastasia Island (½ mi. wide), where is located one of the world's best bathing beaches. It is the oldest city in the United States.

Many old houses remain, including the oldest house in the United States.

Pt. Marion (originally the Castle of San Marco), oldest standing fortification in the United States, is a well preserved specimen of Spanish architecture, built of coquina, begun about 1638 and finished in 1756. The old arsenal reconstructed in 1835 by the United States became state headquarters of the national guard. A

BY COURTESY OF THE ST. AUGUSTINE CHAMBER OF COMMERCE

wall and moat formerly ran across the peninsula at the northern edge of the city, and the city gate which was in this wall still stands, a picturesque ruin, at the end of St. George street. The Roman Catholic church was built in 1791. The post office was the Spanish government building; the public library and the historical society both occupy buildings of historic interest. There is a beautiful modern church (Presbyterian) built in 1890 by Henry M. Flagler as a memorial to his daughter. St. Augustine is both a winter and a summer resort. The general offices and shops of the railway are there. In 1915 the city adopted a commission-

manager form of government.

On St. Augustine's day (Aug. 28), 1565, Pedro Menéndez de Avilés sighted this coast, and on Sept. 6 he landed with his band of colonists and began to fortify the peninsula. In 1586 Sir Francis Drake captured the fort and burned the town, and in 1665 it was pillaged by Capt. John Davis, an English freebooter. Conflicts with the English settlements in South Carolina and Georgia were frequent after 1681. When Florida was ceded to England in 1763 most of the Spanish population of St. Augustine went to Cuba; when in 1783 it came again under Spanish rule, most of the English left for the Carolinas, Georgia, or the West Indies; and when in 1821 it passed to the United States, the Spanish inhabitants remained. On Jan. 7, 1861, three days before Florida passed her Ordinance of Secession, a State force compelled the small garrison to evacuate the fort, but on March 11, 1862, it was retaken without bloodshed and was then held by the Federals until the close of the war.

ST. AUSTELL, market town, urban district, Penryn and Falmouth parliamentary division, Cornwall, England, 14 mi. N.E. of Truro, on G.W. railway. Pop. (1951) 23,634. Area 28.6 sq. mi. To the north the high ground on which St. Austell stands culminates in Hensbarrow Downs (1,034 ft.). Holy Trinity church is Perpendicular, with Decorated chancel, richly ornamented. The town is the centre of the china clay (kaolin) district, and some 3,000 persons are ordinarily employed in the industry, exports being mainly to the Potteries and Lancashire. Nearby is Menacuddle Well, a good example of an Early English baptistry.

ST. BARTHOLOMEW or ST. BARTHELEMY, French West Indian island, 17° 55' N. and 63° 60' W., about 130 mi. N.W. of Guadeloupe, of which it is a dependency. The horns of an irregular crescent enclose the bay of St. Jean, pointing north; the surface culminates in a central limestone hill 1,003 ft. high. It is 9 sq. mi. in area, and timberless. Gustavia, on the southwest coast has a small but safe harbour. Lorent is the only other town. The inhabitants, mainly of French and Negro descent, are English-speaking, and numbered 2,331 in 1946. St. Bartholomew was occupied by France in 1648 and ceded to Sweden in 1784. In 1877 it was again acquired by France at the cost of £11,000.

ST. BARTHOLOMEW, MASSACRE OF. This was the name given to the massacre of the Huguenots, which began in Paris on St. Bartholomew's Day, Aug. 24, 1572. The initiative for the crime rests with Catherine de' Medici. Disquieted by the growing influence of Admiral Coligny, who against her wishes was endeavouring to draw Charles IX. into a war with Spain, she resolved to have him assassinated. The attempt failed, however, and Catherine then determined to massacre all the Huguenot leaders.

After holding a council with the Catholic leaders, including the Duke of Anjou, Henry of Guise, the Marshal de Tavannes, the Duke of Nevers, and René de Biague, the keeper of the seals, she persuaded the king that the massacre was a measure of public safety, and on the evening of Aug. 23 succeeded in wringing authorization from him.

The massacre began on Sunday at daybreak, and continued in Paris till Sept. 17. Once let loose, it was impossible to restrain the populace. From Paris the massacre spread to the provinces till Oct. 3. The Duc de Longueville in Picardy, Chabot-Charny (son of Admiral Chabot) at Dijon, the Comte de Matignon (1545-97) in Normandy and other provincial governors refused to authorize the massacres. François Hotman estimates the number killed in the whole of France at 50,000. Catherine de' Medici received the congratulations of all the Catholic powers, and Pope Gregory XIII. commanded bonfires to be lighted and a medal to be struck.

See H. Mariéjol, "La Réforme et la Ligue" (1904), in vol. vi. of the *Histoire de France*, by E. Lavisse, which contains a complete bibliography of the subject.

ST. BENOÎT-SUR-LOIRE, a village of France, in the department of Loiret, on the Loire, 23 mi. E.S.E. of Orléans. Pop. (1946) 508. St. Benoît has a huge basilica, only survival of a 7th century monastery to which the relics of St. Benedict were brought from Monte Cassino. In the crypt is a modern shrine containing

the remains of St. Benedict, which still attract many pilgrims. The establishment was very important during the middle ages, owing partly to its school. In 1562 it was pillaged by the Protestants and, though the buildings were restored by Richelieu, the abbey declined. The basilica (1025-1218) has a narthex of two stories and two sets of transepts, surmounted by a square central tower.

SAINT BERNARD, a city of Hamilton county, Ohio, U.S., 15 mi. N.E. of Cincinnati; served by several railways for freight. Pop. (1950) 7,066; (1940) 7,387; (1930) 7,487 by federal census. It is a residential suburb of Cincinnati, and has various manufacturing industries.

ST. BERNARD PASSES, two passes across the main chain of the Alps, both traversed by motor roads. The Great St. Bernard (8,094 ft.) leads (53 mi.) from Martigny (anc. *Octodurus*) in the Rhone valley (Switzerland) to Aosta (anc. *Augusta Praetoria*) in Italy. It was known in Roman times. The hospice on the pass was founded (or perhaps refounded) by St. Bernard of Menthon (d. about 1081), and since the 12th or early 13th century has been in charge of a community of Austin canons, the mother-house being at Martigny. In former days the servants of the canons, and the famous dogs, saved many lives, especially of Italian workmen. In May 1800 Napoleon led his army over the pass, which was then traversed by a bridle road only. The Little St. Bernard (7,178 ft.) also was known in Roman times, and the hospice refounded by St. Bernard of Menthon, though it is now in charge of the military and religious order of SS. Maurice and Lazarus. The pass leads (39 mi.) from Bourg St. Maurice in the Isère valley (Savoie) to Aosta, but is much less frequented by travellers than its neighbour oppositely.

There is no certain mention of the road over the pass of the Great St. Bernard (*Alpis Poenina*, *Poeninus Mons*) before 57 a.d. when Julius Caesar sent Servius Galba over it. Even in Strabo's time it was impassable for wheeled traffic; we find that Augustus Praetoria originally had but two gates, one opening towards the Little St. Bernard (*Alpis Graia*), the other towards Eporedia (Ivrea), but none towards the *Alpis Poenina*. The military arrangement of the German provinces rendered the construction of the road necessary, and it is mentioned as existing in A.D. 69. Remains of it cut in the rock, some 1½ ft. in width, still exist near the lake at the top of the pass. On the plain at the top of the pass is the temple of Jupiter Poeninus (Penninus), remains of which were excavated in 1890-1893, though objects connected with it had long ago been found. The oldest of the votive-tablets which can be dated belongs to the time of Tiberius, and the temple may be attributed to the beginning of the empire; objects, however, of the first Iron age (4th or 5th century B.C.) were also found and many Gaulish coins. Other buildings, probably belonging to the post station at the top of the pass, were also discovered. Many of the objects found then and in previous years, including many votive-tablets, are in the museum at the hospice of the Great St. Bernard.

The Little St. Bernard was known to the Romans as *Alpis Graia*. It derived its name from the legend that Hercules, returning from Spain with the oxen of Geryon, crossed the Alps by this route, though the legend rather suits the route through the Maritime Alps. According to some modern scholars, Hannibal passed this way over the Alps (see *HANNIBAL*), and Putsch in Pauly-Wissowa, *Realencyklopädie* i, 1604). In any case it was the principal pass over the Alps into Gallia Comata until the pass of the *Alpis Cottia* (Mont Genève) was opened by Cn. Pompeius in 75 B.C., and became the principal route, though the road was only completed under Augustus by Cottius in 3 B.C. Various remains of the road are visible, and those of a building (possibly a temple of Jupiter) have been found on the summit of the pass.

See *Notizi degli scavi* (1883), 7 (1894), 46; and C. Promis, *Antichità di Aosta* (Turin, 1867), 115 sqq.

ST. BERTRAND-DE-COMMINGS, a village of S.W. France at the foot of the Pyrenees in the department of Haute-Garonne, about 70 mi. S.W. of Toulouse by rail and road. St. Bertrand-de-Comminges (*Lugdunum Convenarum*) was founded in 72 B.C. and by the end of the 5th century became the seat of a bishopric suppressed at the Revolution. The town was destroyed

towards the end of the 6th century by Guntrum, king of Burgundy. St. Bertrand stands about 1 mi. from the left bank of the Garonne on the slopes of an isolated hill crowned by its celebrated cathedral of Notre Dame. The façade of the church with its square tower and the first bay with its aisles are Romanesque, and belong to an 11th century church begun by Bishop Bertrand, afterward canonized. Pop. (1946) 243.

ST. BRIEUC, a town of western France, capital of the department of Côtes-du-Nord. 63 mi. N.W. of Rennes by the railway to Brest. Pop. (1946) 36,674. St. Brieuc owes its origin and its name to the missionary St. Bricius, who came from Wales in the 5th century, and whose tomb afterward attracted crowds of pilgrims. The place was defended in 1375 by Olivier de Clisson against the duke of Brittany, and later attacked by the same Clisson in 1394, the cathedral suffering greatly in both sieges.

In 1593 the town was pillaged by the Spaniards, in 1601 ravaged by the plague, and in 1628 surrounded by walls of which no traces remain. Between 1602 and 1768 the states of Brittany several times met at St. Brieuc. It stands 290 ft. above the sea, between 1 and 2 mi. from the English channel and less than a mile from the right bank of the Gouët, at the mouth of which is its seaport, Le Légué. St. Brieuc is the seat of a bishopric in the province of Rennes, and has a 13th-century cathedral, partially rebuilt in the 18th, and afterward restored.

ST. CATHARINES, a city of Ontario, Canada, and the capital of Lincoln county, on the Welland canal and the Canadian National and Niagara, St. Catharines and Toronto electric railways, 35 mi. S. of Toronto. Pop. (1951) 37,984. It is the centre of the Niagara fruit belt. Chief industries include wineries, paper and textile mills, automotive parts and mining machinery plants. It is the site of the annual Royal Canadian Henley regatta and Ontario's largest outdoor horseshow.

ST. CHAMOND, a manufacturing town of east-central France, in the department of Loire, 7½ mi. E.N.E. of St. Etienne, on the railway from St. Etienne to Lyons. Pop. (1946) 14,820. St. Chamond, founded in the 7th century by St. Ennemond or Chamond, archbishop of Lyons, became the chief town of the Jarret, a little principality formed by the valley of the Gier. Silk-milling was introduced in the town in the middle of the 16th century by Gayotti, a native of Bologna. There are remains of a Roman aqueduct.

SAINT CHARLES, a city of eastern Missouri, U.S.A., on the north bank of the Missouri river, 22 mi. N.W. of Saint Louis; county seat of St. Charles county. It is on federal highway 40, and is served by the Missouri-Kansas-Texas and the Wabash railways. Pop. (1950) 14,314. Saint Charles was settled in 1769 by Louis Blanchette, a Frenchman, and later came under Spanish rule. In 1849 it was incorporated as a city. In 1820 it became the first capital of the state and continued as such until 1826.

SAINT CLAIR, an anthracite-mining borough of Schuylkill county, Pennsylvania, U.S.A., on Mill creek, 3 mi. N. of Pottsville; served by the Pennsylvania and the Reading railways. Pop. (1950) 5,856. It was settled in 1825 and incorporated in 1850.

SAINT CLAIR RIVER, the outlet for Lake Huron, which in turn receives the waters from Lakes Superior and Michigan. Forming part of the boundary between the State of Michigan and the Province of Ontario, Canada, it flows in a southerly direction into Lake St. Clair with a fall of about 5.8 ft. in 40 miles. The river discharges through seven mouths, the one known as the south channel being used for deep-draught vessels, while several of the other channels are used for small craft. The south channel was improved by the dredging of separate channels for up-bound and down-bound traffic, extending from deep water in the river into Lake St. Clair.

In 1937 a project, not including compensating works improving the north channel outlet and adding to the width and depth of the southeast bend was completed. The U.S. congress authorized the widening of the channel at the southeast bend to 700 ft. in March 1945 and further improvements in both sections were authorized in July 1946. The river water level fluctuates with the levels of the lakes above and below. From about the year 1910 on, the difference between the highest and lowest monthly mean levels during the

navigation season has been about 4 ft. Occasional fluctuations due to winds of high velocity may be 3.5 ft. in six hours. Near the head of the river are the cities of Port Huron, Mich., and Sarnia, Ont., both of which handle some water-borne commerce but the great bulk of the traffic moves through the river without intermediate stop. This traffic is composed principally of iron ore, grain and limestone down-bound and coal up-bound.

ST. CLAUDE, a town of eastern France, capital of an arrondissement in the department of Jura, 42 mi. S.E. of Lons-le-Saunier by rail. Pop. (1946) 10,749. The town is situated 1,300 ft. above sea level at the western base of Mont Bayard, among the heights of the eastern Jura at the confluence of the Bienné and the Tacon. The cathedral of St. Pierre, once the abbey-church, dates from the 14th to the 18th centuries.

ST. CLOUD, a town of northern France, in the department of Seine-et-Oise, on the left bank of the Seine, 2 mi. W. of the fortifications of Paris by road. Pop. (1946) 17,614. The town is named after Clodoald or Cloud, grandson of Clovis, whose tomb was discovered in a crypt near the present church. He had granted the domain to the bishops of Paris, who possessed it as a fief till the 18th century. At St. Cloud Henry III and the king of Navarre (Henry IV) established their camp during the league for the siege of Paris and there the former was assassinated. The castle, at that time a plain country house belonging to Pierre de Gondy, archbishop of Paris, was acquired in 1658 by the duke of Orleans, who built the palace which perished in 1870. It was at St. Cloud that Bonaparte executed the coup d'état of the 18th Brumaire (1799); after he became emperor the palace was his favourite residence, and there he celebrated his marriage with Marie Louise. In 1815 it was the scene of the signing of the capitulation of Paris. Seized by the Prussians at the beginning of the investment of Paris in 1870, St. Cloud was sacked during the siege. St. Cloud, built on a hill slope overlooking the river, the Bois de Boulogne and Paris, is one of the favourite resorts of the Parisians. Every September, at the time of the pilgrimage of St. Cloud, a fair lasting four weeks is held in the park, which is famous for its beauty. Within its precincts are situated the national Sevres porcelain manufactory.

ST. CLOUD, a city in central Minnesota, U.S., on the Mississippi river, 70 mi. N.W. of Minneapolis, in the counties of Benton, Sherburne and Stearns, and county seat of the latter. It is on federal highways 10 and 52, is served by the Great Northern and Northern Pacific railways, and by air and bus. Pop. (1950) 28,410. The city ranks first in the nation in the production of coloured granite and second in the production and processing of all types of granite. A large car manufacturing shop of the Great Northern railway is located there. Other important industries include an optical works and factories for the production of floor-sanding machines, refrigerators, boats, playground equipment, brooms, airline tanks, neon signs, frost shields and many other products. The processing of dairy products is of major importance. Among the city's many institutions are the Minnesota State reformatory, the U.S. veterans hospital, Saint Cloud Orphanage, Saint Raphael's and Saint Joseph's homes for the aged, and a state teachers college, Saint John's university for men and Saint Benedict's college for women are within a few miles of the city. St. Cloud was settled in 1852, platted in 1854, incorporated as a village in 1868 and chartered as a city in 1889. In 1912 it adopted a commission-council form of government. Before the days of the railroads it was the terminus of the Hudson's Bay company for unloading the furs brought down from the Red river valley in wooden ox-carts.

ST. CROIX or SANTA CRUZ, the largest of the West Indian islands purchased from Denmark by the United States in 1917. It lies 65 mi. S.E. of Puerto Rico, in 17° 40' N. and 64° 14' W., is 22 mi. long, varies in breadth from 1 mi. to 6 mi. and has an area of 82 sq. mi. Pop. 12,003 (1950). Hills parallel with the

western coast culminate in Mount Eagle (1,164 ft.). The narrower part is also hilly, but the south shore has marshy tracts with brackish lagoons. Sugar is the staple product, but other crops are being encouraged. The capital, picturesque Christiansted (pop. 4,112) is situated at the head of an inlet on the north shore, but its harbour is largely choked with mud. The only other town, Føderiksted (pop. 1,961) stands on an open roadstead on the west coast. The climate is healthful, with a mean annual temperature of 74° F. and an average annual rainfall of 45.7 in.

St. Croix was discovered in 1493 by Columbus, and owned in turn by Dutch, English and Spanish. In 1657 it was taken by France, and was given to the Knights of Malta in 1653. Denmark purchased it in 1733. Slavery was abolished in 1848 after a violent insurrection. See ST. THOMAS; VIRGIN ISLANDS.

See annual Reports of the governor of the Virgin islands.

ST. CYR-L'ÉCOLE, a town of France in the department of Seine-et-Oise, 3 mi. W. of Versailles at the end of the old park of Louis XIV. Pop. (1946) 4,458. Its importance is due to the famous military school (*école spéciale militaire*) in which officers for the cavalry and infantry are trained, established in 1808 in a convent where Racine's *Esther* and *Athalie* were first acted. The convent was suppressed at the Revolution.

ST. DAVID'S (TYDDEW), a cathedral village-city of Pembrokeshire, Wales, situated near the sea to the south-east of St. David's head, the most westerly promontory of south Wales. Pop. (1931) 1,580. St. David's is 10 mi. from Nettleton G.W.R. station, and about 16 mi. S.W. from Fishguard. The little town, locally known as "the city," stands in a lofty position near the cathedral close, and consists of five streets focusing on the square, called Cross Keys, the ancient market place still possessing its market cross (restored 1873). The origin of the fine little cathedral and its village "city" in an area so remote under modern conditions is of special interest. North-west Pembrokeshire, like most western promontories of Britain, France and Spain, is remarkably rich in old stone monuments (menhirs, dolmens and stone circles), a fact pointing in all probability to its being on the coastwise and transpennine route frequented by prehistoric traders from the Mediterranean to Ireland. (See PEMBROKESHIRE.)

The little boats of old were driven hither and thither at the mercy of wind and tide, so the coastland of St. David's head became dotted with alternative landing places, e.g., Porth y Rhaw, St. Non's Bay, Porth Clais, Porth Stinian, Whitesand Bay, which seem to have made the neighbourhood important in pre-Christian times, as one may judge from folk tradition, monuments on the headland, etc.

The pre-Christian tradition was continued by the Celtic saints moving between Ireland and Wales. In early mediaeval days the same route grew important, as pilgrims moved to and from the shrine of St. Iago da Compostella in north-west Spain. (See Hartwell Jones, "Celtic Britain and the Pilgrim Movement," *Y Cymmrodor* 1912.) The little landing places on the shore now had Christian chapels, where prayers were possibly said for safe voyages. The most important ruins at present are those of St. Justinian. At a focus behind a group of these small ports, in the quiet sheltered, well-watered valley of the Alun, the fine cathedral of SS. David and Andrew was built, and on the high ground around, as if sheltering it still further, the "village-city" grew. Throughout the middle ages the cathedral was the centre of pilgrimage and the mediaeval roads (often marked by sacred wells) may be traced across Pembrokeshire focusing on St. David's. Two pilgrimages to St. David's were popularly thought to equal one to Rome itself. The early holders of the see ventured, while the central government was weak, to exercise metropolitan rights over much of south Wales, but the increasing power of the Norman penetration reached St. David's and Anselm's forcible appointment of Bernard—a Norman monk—to be bishop in 1125 made St. David's a suffragan see of Canterbury. A conciliatory step, it would appear, was the canonization of David about 1120. Gerald de Barri (Giraldus Cambrensis) strove vainly to regain the ancient power of St. David's from 1199-1203.

The cathedral church is partly built of a beautiful purple-hued

sandstone, quarried locally. Its proportions are: length (exclusive of the Trinity and Lady chapels) 254½ ft.; breadth of nave and aisles, 51½ ft.; breadth of transepts, including tower, 116 ft.; and height of central tower, 116 feet. The earliest and main portion of the existing fabric was erected under Bishop Peter de Leiz (1176-98) in the transitional Norman-English style. Bishop David Martin (1296-1328) built the Lady chapel; Bishop Henry de Gower (1328-47) made many additions in the Decorated style, including the stone roof screen and southern porch; and Bishop Edward Vaughan (1509-22) erected the Trinity chapel between the choir and Lady chapel. The cathedral suffered severely during the changes brought about by the Reformation and at the hands of Bishop William Barlow (1536-48) and again during the civil wars of the 17th century. Subsequent restorations took place. The interior of the nave, separated by six wide bays from the aisles, is imposing with its triforium and clerestory. It has an elaborate roof of Irish oak, the gift of Treasurer Owen Pole (c. 1500). The nave is divided from the choir by Bishop Gower's fine stone screen, while the choir contains the richly carved stalls erected by Bishop Tully (1460-81), the episcopal throne, and an oak screen that serves to separate choir and presbytery. Bishop Vaughan's chapel contains fine Tudor fan-vaulting, and the Lady chapel decorated sedilia. To the north of the cathedral is the ruined shell of the beautiful chapel with an adjoining tower, forming part of the college of St. Mary, founded by John of Gaunt and Bishop Adam Houghton in 1377. On the west bank of the Alun stand the ruins of the episcopal palace erected by Bishop Gower (c. 1342). The palace was built for residential purposes rather than for defense and occupies three sides of a quadrangle 120 ft. square, and, though roofless and deserted for nearly three centuries, retains most of its principal features. The great hall, 96 ft. by 33 ft., possesses a traceried wheel window; the chief portal is still imposing; and the chapel retains its curious bell turret; while the peculiar but graceful arcaded parapet of the roof extends intact throughout the whole length of the building. Partially dismantled by Bishop Barlow (c. 1540) the half-ruined palace was occasionally occupied by succeeding bishops prior to the civil wars. The Close contains the deanery and other residences of the cathedral clergy, mostly occupying the sites of ancient buildings. It formerly owned four gateways, of which the South or Tower gate alone remains.

ST. DENIS, a suburb ½ mi. north of Notre Dame de Paris, capital of an arrondissement in the department of Seine. Pop. (1946) 69,927. St. Denis, an important junction on the northern railway, stands in a plain on the right bank of the Seine, which is here joined by the canal of St. Denis. It has numerous metallurgical works, where railway material, naval engines and the like are constructed, distilleries of spirits, glassworks, potteries and manufactories of drugs, chemical products, oils, nickel plate and pianos. The name and fame of the town are derived from the abbey founded by Dagobert I on the spot where St. Denis, the apostle of Paris, was interred.

St. Denis, the ancient *Catulliacum*, was a town of no pretensions till the foundation of its abbey, which became one of the most powerful in France. The rebuilding of the church, begun in the 12th century by Suger, was completed in the 13th century. Among the many domains of the abbey was the French Vexin. It was held during the later middle ages by the French kings and vassals of the abbey, and to this fact is due their adoption of the oriflamme or red banner of St. Denis as the royal standard. Louis XIV reduced the abbey to the rank of a priory; and at the Revolution it was suppressed, the tombs being violated and the church sacked (1793). Louis XVIII caused all the articles belonging to St. Denis to be brought back to their original site, and added numerous other monuments from the suppressed abbeys. But it was not until after 1848 that, under the direction of Viollet-le-Duc, the basilica recovered its original appearance. St. Denis which was the key of Paris on the north, was more than once pillaged in the Hundred Years' War, suffering especially in 1358 and 1406. A sanguinary battle, in which the Catholic leader Constable Anne de Montmorency found victory and death, was fought between Huguenots and Catholics in the neighbourhood

on Nov. 10, 1567.

The church exhibits the transition from the Romanesque to the Gothic style. The west front was built between 1137 and 1140. The right-hand tower is almost pure Romanesque; that on the left was Gothic, but its spire was struck by lightning in 1837. The porch formed by the first three bays contains some remains of the basilica of Pippin the Short and Charlemagne, by whom the church was rebuilt. The nave proper (235 ft. long and 57 wide) has seven bays, and dates, as well as most of the choir and transepts, from the reign of St. Louis. The secondary apse (*rond-point*) and its semicircular chapels (consecrated in 1144) are considered as the first perfected attempt at Gothic. The transepts have fine façades, the north of the 12th, the south of the 13th century, each with two unfinished towers; if the plan had been fully carried out there would have been six towers beside a central spire in lead. The church contains a series of tombs of the kings and princes of the royal houses of France. The most remarkable are those of Louis XII and Anne of Brittany, executed from 1516 to 1532; of Henry II and Catherine de' Medici, a masterpiece by Germain Pilon (1564-1583); of Louis of Orleans and Valentine of Milan, from the old church of the Celestines at Paris (1502-1515); of Francis I and Claude of France, one of the most splendid tombs of the Renaissance, executed under the direction of Philibert Delorme (1550-1560); and that of Dagobert, which, though considerably dilapidated, ranks as one of the most curious of mediæval (13th-century) works of art. In the apse some stained glass of the time of Suger remains.

The crypt dates partly from the 10th or 11th century. In the centre is the vault where the coffin of the king used to lie until, to make room for that of his successor, it was removed to its final resting place. It is at present occupied by the coffin of Louis XVIII, the last sovereign whose body was borne to St. Denis. Besides fine statues, the crypt contains the Bourbon vault, in which among other coffins are deposited the remains of Louis XVI and Marie Antoinette.

See F. de Guilhaume, *Monographie de l'église royale de St. Denis* (Paris, 1848).

ST. DIÉ, a town of eastern France, capital of an arrondissement in the department of Vosges, 38 mi. N.E. of Épinal by rail. Pop. (1940) 15,637. St. Dié (*Deodatum*, *Theodota*, *S. Deodati Fanum*) grew up round a monastery founded in the 7th century by St. Deodatus of Nevers, who retired to this place. In the 10th century the community became a chapter of canons. Among the privileges enjoyed by them was that of coining money. Though they co-operated in building the town walls, the canons and the dukes of Lorraine soon became rivals for the authority over St. Dié. The institution of a town council in 1628, and the establishment in 1777 of a bishopric which appropriated part of their spiritual jurisdiction, greatly diminished the influence of the canons; and with the Revolution they were swept away. During the wars of the 15th, 16th and 17th centuries the town was repeatedly sacked. It was also partially destroyed by fire in 1065, 1155, 1554, and 1757. St. Dié is on the Meurthe in a basin surrounded by well-wooded hills. The cathedral has a Romanesque nave (12th century) and a Gothic choir; the portal of red stone dates from the 18th century. A fine cloister (13th century), containing a stone pulpit, communicates with the Petite-Église or Notre-Dame, 12th-century Romanesque. St. Dié is the seat of a bishop and of a sub-prefect.

ST. DIZIER, a town of northeastern France, in the department of Haute-Marne, 45 mi. N.N.W. of Chaumont by rail, on the Marne and the Haute-Marne canal. Pop. (1940) 19,532. It is an important centre of the iron trade. It dates from the 3rd century, when the relics of Bishop St. Didier were brought there.

ST. DUNSTAN'S. St. Dunstan's is a charity for the treatment, training and lifelong aftercare of men and women blinded on war service. It was founded in 1915 by Sir Arthur Pearson, himself blind during the last ten years of his life. The work began in a house called "St. Dunstan's" in Regent's park, London. Its purpose then was the care of British soldiers, sailors and airmen blinded in or as a result of, World War I, of whom there were

nearly 3,000. During World War II, its benefits were extended to include men and women of the services subsidiary to the armed forces, and to policemen, firemen, members of the merchant navy and fishing fleet, and all personnel of the civil defense, nursing and medical services who might be blinded on duty. On the death of Sir Arthur Pearson, Lady (Arthur) Pearson, occupied the office of president of the organization, and in 1947 Sir Neville Pearson, their only son, took her place. The chairman of the council was Sir Ian Fraser, an officer blinded in 1916.

On completion of treatment, patients are transferred to the training centre for one to two years. The centre is residential and there is no charge for board, lodging, education or training in any of the regular occupations or professions, or special courses. St. Dunstan's also provides all necessary apparatus, books and equipment and makes grants for special needs, children's maintenance and education, etc. Early weeks are spent learning typewriting, braille reading, games and pastimes, learning to look after daily needs, walking alone, etc. Training for a career then follows. Subjects studied include public affairs, the law, the church, physiotherapy, telephone operating, public and commercial administration, shopkeeping, factory work including machine minding, lecturing, journalism and a variety of handicrafts. The St. Dunstan trainee then returns to his own home. Thereafter, until the end of his life, he remains under the organization's care.

St. Dunstan's is associated with the Scottish National Institution for the War-Blinded (Newington house, Edinburgh) in caring for war-blinded Scotsmen. St. Dunstan's, with Newington house, is recognized by the government departments concerned as the official centre for the training, re-education, settlement and aftercare of blinded service men and women, and has branches and affiliations throughout the commonwealth and empire. St. Dunstan's receives no state aid, but has considerable endowments and is supported by voluntary contributions. The administrative offices are at 191, Marylebone road, London, N.W. 1. (I. Fr.)

STE. ANNE DE BEAUPRÉ, pop. (1951) 1,827, a village of Montmorency county, Quebec, Canada, at the junction of the Ste. Anne river with the St. Lawrence, and on the Canadian National railway system 21 mi. northeast of the city of Quebec. It stands in a rolling agricultural country, with hills in the background; and near by on the Ste. Anne river, are beautiful falls and excellent fishing. Ste. Anne is a notable Roman Catholic place of pilgrimage; annual pilgrimages are made from all over Canada and the United States to see Ste. Anne's shrine and to participate in special religious services. Among the sights of interest is a huge panoramic painting of the "Day of Crucifixion" on a canvas 45 ft. high and 360 ft. in circumference. Ste. Anne is the headquarters of the French-Canadian Redemptorists and the seat of their college.

SAINTE-BEUVE, CHARLES AUGUSTIN (1804-1869), French critic, was born at Boulogne-sur-Mer on Dec. 23, 1804. He was a posthumous child. His father, a native of Picardy, and controller of town-dues at Boulogne, was a man of literary tastes; his mother was half English, her father, a mariner of Boulogne, having married an Englishwoman. Charles Augustin was sent to a boarding school in Paris to attend the classes of the Collège Charlemaigne, and then of the Collège Bourbon. He then studied medicine, but after four years abandoned it to join the staff of the new Liberal newspaper, *The Globe*, in which he published the excellent articles on the French poetry of the 16th century afterwards separately published as *Tableau historique et critique de la poésie française au XVI^e siècle* (2nd ed., 1842). In 1829 he made his first venture as a poet with the *Vie, poésies, et pensées de Joseph Delorme*. His own name did not appear; but Joseph Delorme, that "Werther in the shape of Jacobin and medical student," as Guizot called him, was the Sainte-Beuve of those days himself. In 1830 came his second volume of poems, the *Consolations*. But the critic in him grew to prevail more and more and pushed out the poet. Sainte-Beuve was at this time a devoted Catholic and a little later for a very short period a disciple of Lamennais. But he gradually separated from his Catholic friends, and at the same time a coldness grew up between him and Victor Hugo, whose warm friendship he had won by an

early article on *Odes et Ballades*. He became the lover of Madame Hugo, and a definite separation between the former friends ensued in 1834. In 1831 the *Revue des deux mondes* was founded, and from the first Sainte-Beuve was one of the most active and important contributors. He brought out his novel of *Volupté* in 1834, his third and last volume of poetry, the *Pensées d'aïdri*, in 1837. He had long meditated work on Port-Royal, which took shape in a series of lectures delivered at Lausanne in 1838. The book occupied him at intervals until 1848—*Port Royal* (5 vols. 1840-48; 5th ed., 1888-91).

In 1840 Victor Cousin, then minister of public instruction, appointed him one of the keepers of the Mazarin library, an appointment which gave him rooms at the library, and a competence, and leisure for study. With a Greek teacher, M. Pantasides, he read and re-read the Greek poets. Articles on Homer, Theocritus, Apollonius of Rhodes, and Meleager in the *Revue des deux mondes* were fruits of his new Greek studies. But in general his subjects were taken from the great literature of his own country. Seven volumes of *Portraits*, contributed to the *Revue de Paris* and the *Revue des deux mondes*, exhibit his work in the years from 1832 to 1848, a work constantly increasing in range and value. In 1844 he was elected to the French Academy as successor to Casimir Delavigne, and was received there at the beginning of 1845 by Victor Hugo.

In March 1848 was published an account of secret-service money distributed in the late reign, and Sainte-Beuve was put down as having received the sum of one hundred francs. This sum appears to have been in reality paid for alterations to a smoky chimney in the library, but Sainte-Beuve was annoyed at the imputation and resigned his chair. He lectured for a time at Liège, but returned to Paris within a year. Dr. Véron, the editor of the *Constitutionnel*, proposed to him that he should supply that newspaper with a literary article for every Monday; and thus the famous *Causeries du lundi* were started. Sainte-Beuve now lived in the small house in the Rue Montparnasse (No. 11), which he occupied for the remainder of his life, and where in 1850 his mother, from whom he seems to have inherited his good sense, tact and finesse, died at the age of eighty-six. For three years he continued writing every Monday for the *Constitutionnel*; then he passed, with a similar engagement, to the *Moniteur*. In 1857 his Monday articles began to be published in volumes, and by 1862 formed a collection in 15 volumes; they afterwards were resumed under the title of *Nouveaux lundis*, which now make a collection of 13 volumes more.

In 1854 he was nominated to the chair of Latin poetry at the college of France. He was rudely interrupted by the students, and resigned; he was then appointed lecturer on French literature at the Ecole Normale Supérieure. Here he lectured for four years. During this period his contributions to the *Moniteur* were intermittent. He now returned to a regular Monday article for the *Constitutionnel*.

The Empire was tardy in acknowledging his merits, and it was not until 1865 that he received the senatorship with its income sufficient to make him independent, and his health was failing him. He could seldom attend the meetings of the senate; the part he took there, however, on two famous occasions—when the nomination of Ernest Renan to the college of France came under discussion in 1867, and the law on the press in the year following—offended the majority in that conservative assembly and delighted those who "belonged" to use his own phrase, "to the diocese of free thought." He gave further pleasure in this diocese by leaving the *Moniteur* at the beginning of 1869, and contributing to a Liberal Journal, the *Temps*. This defection finally alienated him from the Bonapartists, and lost him the friendship of the Princess Mathilde. His literary activity suffered little abatement, but pain made him at last unable to sit to write; he could only stand or lie. He died in his house in the Rue Montparnasse on Oct. 13, 1869.

The root of Sainte-Beuve's criticism is his single-hearted devotion to truth. What he called "fictions" in literature, in politics, in religion, were not allowed to influence him. Some one had talked on his being tenacious of a certain set of literary opinions. "I hold very little," he answers, "to literary opinions; literary

opinions occupy very little place in my life and in my thoughts. What does occupy me seriously is life itself and the object of it." "I am accustomed incessantly to call my judgments in question anew, and to re-cast my opinions the moment I suspect them to be without validity." "What I have wished" (in *Port-Royal*) "is to say not a word more than I thought, to stop even a little short of what I believed in certain cases, in order that my words might acquire more weight as historical testimony." To all exaggeration and untruth, from whatever side it proceeded, he had an antipathy. "I turn my back upon the Michiels and Quinets, but I cannot hold out my hand to the Veuillots."

But Sainte-Beuve could not have been the great critic he was had he not had, at the service of this love of truth and measure, the conscientious industry of a Benedictine. "I never have a holiday. On Monday towards noon I lift up my head, and breathe for about an hour; after that the wicket shuts again and I am in my prison cell for seven days." The *Causeries* were at this price. They came once a week, and to write one of them as he wrote it was indeed a week's work.

To mental independence, industry, measure and lucidity, his criticism adds the merit of happy temper and disposition. Sainte-Beuve has more, as a critic, than the external politeness which once at any rate distinguished his countrymen; he has a personal charm of manner due to a sweet and humane temper. He complained of *un peu de dureté*, "a certain dose of hardness," in the new generation of writers. The personality of an author had a peculiar importance for him; the poetical side of his subjects, however latent it might be, always attracted him and he always sought to extricate it. This was because he had the instincts of the true poetic nature. As a guide to bring us to a knowledge of the great personalities in French literature he is unrivalled.

Библиография.—See his "Ma Biographie" in *Nouveaux lundis*, xiii, *Lettres à la princesse* (1872); *Correspondance* (1877-78) and *Nouvelle Correspondance* (1880); the *Vicomte d'Haussonville's Sainte-Beuve* (1875); Scherer, *Études critiques sur la littérature contemporaine*, iv (1863-65); G. Michaut, *Sainte-Beuve avant les Lundis* (1903); L. F. Choisy, *Sainte-Beuve, L'Homme et le poète* (1921); G. Michaut, *Sainte-Beuve* (1921); L. F. Mott, *Sainte-Beuve* (1925).

SAINTE-CLAIRE DEVILLE, ÉTIENNE HENRI (1818-1881), French chemist, was born on March 11, 1818, in the island of St. Thomas, West Indies, where his father was French consul. In 1844, having graduated as doctor of medicine and doctor of science, he was appointed to organize the new faculty of science at Besançon, where he acted as dean and professor of chemistry from 1845 to 1851. He succeeded A. J. Balard at the École Normale, Paris, in 1851, and in 1859 became professor at the Sorbonne in place of J. B. A. Dumas (q.v.). He died at Boulogne-sur-Seine on July 1, 1881.

He began his experimental work in 1841 with investigations of oil of turpentine and tolu balsam, in the course of which he discovered toluene (q.v.). His most important work was in inorganic and thermal chemistry. In 1849 he discovered nitrogen pentoxide, the first of the so-called anhydrides of the monobasic acids to be isolated. In 1855 he devised a method by which aluminum (q.v.) could be prepared on a large scale by the aid of sodium, the manufacture of which he also developed. His best known contribution to chemistry is his work on the phenomena of reversible reactions (see REACTION KINETICS).

ST. ELMO'S FIRE, the glow accompanying the brushlike discharges of atmospheric electricity which usually appears as a tip of light on the extremities of pointed objects such as church towers or the masts of ships during stormy weather. It is commonly accompanied by a crackling or hissing noise.

St. Elmo's fire, or corona discharge, is commonly observed on the periphery of propellers, along the wing tips, windshield and nose of aircraft flying in dry snow, ice crystals, or in the vicinity of thunderstorms. The discharge may be sufficiently strong to cause a noisy disturbance in the radio, called static, which may obliterate all other signals. The corona discharge from an aircraft may initiate a lightning discharge which, striking the aeroplane, may cause small structural damage, impair the radio or temporarily blind the pilot. Various flight procedures, in addition to mechanical and electrical devices designed to reduce the charge accumu-

lation, are utilized as safeguards in preventing or minimizing discharges. The name St. Elmo is an Italian corruption, through *Sant' Ermo*, of St. Erasmus, the patron saint of Mediterranean sailors, who regard St. Elmo's fire as the visible sign of his guardianship.

See Hazlitt's edition of Brandt and Ellis's *Antiquities* (1905), s.v. "Castor and Pollux." (E. J. Mr.)

STE.-MARIE-AUX-MINES or MARKIRCH, a town of France in the department of Haut-Rhin intersected by the Lièpvrette, an affluent of the Rhine. Pop. (1946) 6,217. The once productive silver, copper and lead mines of the neighbourhood were worked from the 9th till the 19th century. The main industries of the place are weaving and dyeing. The river was at one time the boundary between the German and French languages, the German-speaking inhabitants on the right bank were Protestants and subject to the counts of Rappoltstein, while the French inhabitants were Roman Catholics and under the rule of the dukes of Lorraine.

ST. EMILION, a town of southwestern France, in the department of Gironde, 23 mi. from the right bank of the Dordogne and 27 mi. E.N.E. of Bordeaux by rail. Pop. (1946) 766. The town derived its name from a hermit who lived there in the 7th and 8th centuries. The town has remains of ramparts of the 12th and 13th centuries. The parish, once collegiate church, dates from the 12th and 13th centuries. A Gothic cloister adjoining the church. A belfry (12th, 13th and 15th centuries) commanding the town is built on the terrace, beneath which are hollowed in the rock the oratory and hermitage of St. Emilion, and adjoining them a large ancient monolithic church. Remains of a monastery of the Cordeliers (15th and 17th centuries) and of a building (13th century) known as the Palais Cardinal, are also to be seen. St. Emilion is celebrated for its wines.

SAINTES-PALAYE, JEAN BAPTISTE LA CURNE (or **LACURNE**) DE (1697-1781), French scholar, was born at Auxerre on June 6, 1697. His father, Edme, had been gentleman of the bedchamber to the duke of Orleans, brother of Louis XIV, a position which descended to his son. In 1724 he had been elected an associate of the Académie des Inscriptions et Belles-Lettres, and from this time he devoted himself exclusively to the work of this society. He began a series of studies on the chroniclers of the middle ages for the *Historiens des Gaules et de la France* (edited by Dom Bouquet). Raoul Glaber, Helgaud, the *Gesta* of Louis VII, the chronicle of Morigny, Rigord and his continuator, William le Breton, the monk of St. Denis, Jean de Venette, Froissart and the Jouvencel. His *Glossaire de la langue française* was ready in 1756, but remained in manuscript for more than a century. He died on March 1, 1781.

See the biography of La Curne, with a list of his published works and those in manuscript, at the beginning of the tenth and last volume of the *Dictionnaire historique de l'ancien langage français, ou glossaire de la langue française depuis son origine jusqu'au siècle de Louis XIV*, published by Louis Favre (1875-81).

SAINTES, a town of western France, capital of an arrondissement in the department of Charente-Maritime, 47 mi. S.E. of La Rochelle by the railway from Nantes to Bordeaux. Pop. (1946) 23,441. Saintes (*Mediolanum* or *Mediolanum*), the capital of the Santones, was a flourishing town before Caesar's conquest of Gaul; in the middle ages it was capital of the Saintonge. Christianity was introduced by St. Eutropius, its first bishop, in the middle of the 3rd century. Charlemagne rebuilt its cathedral. The Normans burned the town in 845 and 854. Richard Coeur de Lion was besieged and captured there by his father Henry II. In 1242 St. Louis defeated the English there, but the town was not permanently recovered from the English until the reign of Charles V. It has Roman remains, of which the best preserved is the arch of Germanicus, dating from the reign of Tiberius. This formerly stood on a Roman bridge destroyed in 1843, when it was removed and reconstructed on the right bank of the river. Ruins of baths and of an amphitheatre are also to be seen. The large amphitheatre dates probably from the close of the 1st or beginning of the 2nd century and was capable of holding 20,000 spectators. Saintes was a bishop's see till 1790; the cathedral of St. Peter, built in the early 12th century, was rebuilt in the 15th

century and again after it had been almost destroyed by the Huguenots in 1568. It has a 15th century tower. The church of St. Eutropius (6th century, rebuilt in the 11th having had its nave destroyed in the Wars of Religion) stands above a large, well-lighted crypt adorned with richly sculptured capitals and containing the tomb of St. Eutropius (4th or 5th century). The fine stone spire dates from the 15th century. Notre-Dame (11th and 12th centuries) has a noble clock tower and is now desecrated. The old *hôtel de ville* (16th and 18th centuries) contains a library. Small vessels ascend the river as far as Saintes, which carries on trade in grain, brandy and wine, has iron foundries and railway works and manufactures earthenware and tiles.

ST. ÉTIENNE, an industrial town of east-central France, capital of the department of Loire, 310 mi. S.E.E. of Paris and 36 mi. S.W. of Lyons by rail. Pop. (1946) 177,966. At the close of the 12th century St. Étienne was a parish of the Pays de Gier belonging to the abbey of Valbenoite. By the middle of the 14th century the coal trade was developing, and in the early 15th century Charles VII allowed the town to build fortifications. The manufacture of firearms for the state was begun at St. Étienne under Francis I and was put under the surveillance of state inspectors early in the 18th century. The manufacture grew rapidly. The first railways opened in France were the line between St. Étienne and Andrézieux on the Loire in 1828 and that between St. Étienne and Lyons in 1831. In 1856 St. Étienne became the administrative centre of the department.

St. Étienne stands on the Furens, which flows through it from southeast to northwest, partly underground, and is important for the silk manufacture. The town is the seat of a prefect, of tribunals of first instance and of commerce, of a chamber of commerce and of a board of trade-arbitrators and has schools of mining, chemistry and dyeing, etc.

The town owes its importance chiefly to the coal basin which extends between Firminy and Rive-de Gier over an area 20 mi. long by 5 mi. wide and is second only to those of Nord and Pas-de-Calais in France. The mineral is of two kinds—smelting coal, said to be the best in France, and gas coal. There are manufactures of ribbons, trimmings and other goods made from silk and mixtures of cotton and silk. This industry dates from the early 17th century and is carried on chiefly in small factories (electricity supplying the motive power). The attendant industry of dyeing is carried on on a large scale. The manufacture of steel and iron and of heavy iron goods such as armour-plating is important. Firearms are manufactured at the national factory under the direction of artillery officers. Private firms make both military rifles and sporting-guns, revolvers, etc. Other industries are the manufacture of elastic fabrics, glass, cartridges, liqueurs, hemp cables, etc. Weaving machinery, cycles, automobiles and agricultural implements are also made.

ST. EUSTATIUS and SABA, two Netherlands West Indian islands located respectively 9 mi. and 16 mi. N.W. of St. Kitts. Politically, they are part of the colony of Curacao (q.v.). St. Eustatius (area: 7 sq.mi.; pop. 1950, 955) is composed of volcanic hills and intervening valleys. There is an open roadstead off Oranjestad on the west. Saba (5 sq.mi.; pop. 1950, 1,110) is a volcanic cone rising 2,351 ft. from the sea. Its town, Bottom, can be approached from the shore 800 ft. below only by steps in the solid rock known as "the Ladder." Some of the best boats in the Caribbean are built there; the wood is imported and the vessels, when completed, are lowered over the face of the cliffs. Many men from both islands are employed as seamen on ships elsewhere, so that women predominate by 50% in Saba and more than 20% in St. Eustatius. Remittances home are an important factor in the islands' economy. (L. W. Be.)

SAINT-ÉVREMOND, CHARLES DE MARGUETEL DE SAINT-DENIS, SEIGNEUR DE (1610-1703), was born at Saint-Denis-le-Guast, near Coutances, on April 1, 1610. He served through a great part of the Thirty Years' War, distinguishing himself at the siege of Landrecies (1637), when he was made captain. During his campaigns he studied the works of Montaigne and the Spanish and Italian languages. In 1639 he met Gassendi in Paris, and became one of his disciples. He was present at Rocroy,

at Nordlingen and at Lerida. For a time he was personally attached to Condé, but offended him by a satirical remark and was deprived of his command in the prince's guards in 1648.

During the Fronde, Saint-Evremond was a steady royalist. The duke of Candale (of whom he has left a very severe portrait) gave him a command in Guienne, and Saint-Evremond, who had reached the grade of *maréchal de camp*, is said to have saved 50,000 livres in less than three years. He was one of the numerous victims involved in the fall of Fouquet. His letter to Marshal Créquy on the peace of the Pyrennes, which is said to have been discovered by Colbert's agents at the seizure of Fouquet's papers, seems a very inadequate cause for his disgrace. Saint-Evremond fled to Holland and to England, where he was kindly received by Charles II and was pensioned. After James II's flight to France Saint-Evremond was invited to return, but he declined. Hortense Mancini, the most attractive of Mazarin's attractive group of nieces, came to England in 1670, and set up a *salon* for love-making, gambling and witty conversation, and here Saint-Evremond was for many years at home. He died on Sept. 29, 1703, and was buried in Westminster abbey.

Saint-Evremond empowered Des Maizeaux to publish his works after his death, and they were published in London (2 vols., 1705), and often reprinted. His masterpiece in irony is the so-called *Conversation du maréchal d'Hocquincourt avec le père Canaye* (the latter a Jesuit and Saint-Evremond's master at school).

His *Oeuvres mêlées*, edited from the MSS. by Silvestre and Des Maizeaux, were printed by Jacob Tonson (London, 1705, 2 vols.; 2nd ed., 3 vols., 1709), with a notice by Des Maizeaux. His correspondence with Ninon de Lenclos, whose fast friend he was, was published in 1752; *Le Comédien des académies*, written in 1643, was printed in 1650. Modern editions of his works are by Hippéau (Paris, 1852), C. Giraud (Paris, 1865), and a selection (1881) with a notice by M. de Lescure.

ST. GALL, a canton in northeast Switzerland, bordered by the principality of Liechtenstein and by Vorarlberg (Austria). It entirely surrounds the canton of Appenzel, which formerly belonged to the abbots of St. Gall. Five other cantons lie along its north, west and south borders.

Its area is 777.2 sq.mi., of which about 88% are reckoned "productive," forests covering about 165 sq.mi. and vineyards only about 1 sq.mi. The altitude above sea level varies from 1,309 ft. (the Lake of Constance) to 10,667 ft. (the Ringelspitz) in the extreme south. There are nearly 3 sq.mi. of glaciers but slightly over one-quarter of the unproductive area consists of lakes, including portions of the Lake of Constance, of the Wallensee, and of the Lake of Zürich, together with several small lakes wholly within its limits. The canton is mountainous in the south near its borders with the Grisons and Glarus, but towards Thurgau the surface is characterized by hummocky hill country. Considerable low-lying alluvial plains occur along the courses of the Linth and Rhine, particularly in those sections of the rivers which form, in part, its frontiers on the east and southwest. Within the canton, the most important streams are the upper River Thur and the lower and middle portions of its principal tributary, the Sitter. It has ports on the Lake of Constance (Rorschach) and of Zürich (Rapperswil), while Weesen is the chief town on the Wallensee. Probably the most fashionable watering place is Ragatz, receiving the hot mineral waters (95° F.) of Pfäfers by means of a 3 mi. conduit. The main railway lines from Zürich past Sargans for Coire, and from Sargans past Rorschach for Constance skirt its borders, while the capital is on the direct railway line from Zürich past Wil to Rorschach, and communicates by rail with Appenzel and with towns in the Toggenburg (q.v.). In 1930 the population of the canton was 286,362 of whom 279,230 were German-speaking, 4,989 Italian-speaking and 993 French-speaking, while there were 170,445 Catholics, 114,545 Protestants and 704 Jews; in 1950 the population was 300,106. The capital of the canton is St. Gall, population (1950) 68,011; the other most populous places (1950 census) are Rorschach (pop. 11,325), Altstätten (pop. 8,603), Gossau (pop. 8,316) and Wattwil (6,336). In the southern and more Alpine portion of the canton the inhabitants mainly follow pas-

toral pursuits, while in the central and northern regions agriculture is frequently combined with manufactures.

The canton is one of the most industrial in Switzerland. Cotton spinning is widely spread, though the characteristic industry is the manufacture of muslin, embroidery and lace, chiefly at the capital and at Altstätten; the value of the embroidery and lace exported from the canton, though fluctuating, normally amounts to about one-seventh of the total export trade of Switzerland. Ores of iron and of manganese are raised in the Gonzen mine near Saragans. The canton is divided into 14 administrative districts, which comprise 91 communes.

The existing constitution dates from 1890. The legislature (*Grossrat*) of 174 deputies is elected on the principle of proportional representation. Each commune of 1,500 Swiss inhabitants or less has a right to one member, and as many more as the divisor 1,500 justifies. Members hold office for three years. The seven members of the executive (*Regierungsrat*) also hold office for three years and are elected by the combined communes. The two members of the federal *Ständerat* are named by the legislature, while the 13 members of the federal *Nationalrat* have, since 1911, been elected by a scheme of proportional representation, using the popular vote. The right of "facultative referendum" and of "initiative" as to legislative projects has, since 1875 and 1890 respectively, belonged to any 4,000 electors, but in case of "initiative" in constitutional matters (1861) 10,000 must sign the demand. The canton of St. Gall, a great part of which formerly belonged to the abbots of St. Gall, is one of the later political units, having been formed in 1803, from numerous districts, some of which, e.g., Gaster, Usnach and Gams, had been controlled by the adjacent and older cantons since the 15th century.

ST. GALLEN (Fr. ST. GALL), capital of the Swiss canton of that name, is situated in the upland valley of the Steinach, 2,195 ft. above sea-level. Its population is almost all German-speaking, while the Protestants and Catholics each comprise about half the population, with a small number of Jews. In 1920 the population was 70,437; in 1930 63,947, and in 1947 62,360, a decrease due partly to World Wars I and II.

St. Gallen owes its origin to St. Gall, an Irish hermit, who in 614, built his cell in the forest which then covered the site, and lived there till his death in 640. About the middle of the 8th century the collection of hermits' dwellings was transformed into a regularly organized Benedictine monastery. For the next three centuries this was one of the chief seats of learning and education in Europe. About 954 the monastery and its buildings were surrounded by walls as a protection against the Saracens, and this was the origin of the town.

In 1311 St. Gallen became a free imperial city, and about 1353 the guilds, headed by that of the cloth-weavers, obtained the control of the civic government, while in 1415 it bought its liberty from the German king Sigismund. This growing independence did not please the abbots, who had been made princes of the Empire in 1204, and there followed a long struggle between them and their rebellious subjects of St. Gallen and Appenzell. In 1411 the Appenzellers became "allies" of the Swiss confederation, as did the town of St. Gallen a few months later, this connection becoming an "everlasting" alliance in 1454, while in 1457 the town was finally freed from the abbot. After further conflicts, the abbot in 1490 concluded an alliance with the Swiss which reduced his position almost to that of a "subject district." The townsmen adopted the Reformation in 1524, and this new cause of difference further envenomed their relations with the abbots. Both abbot and town were admitted regularly to the Swiss diet, but neither succeeded in its attempts to be received a full member of the Confederation. In 1798 and finally in 1805 the abbey was secularized, while out of part of its domains and those of the town the canton *Santis* (now St. Gall) was formed, with St. Gallen as capital.

St. Gallen is by rail 9 m. S.W. of Rorschach, its port on the lake of Constance, and 53 m. E. of Zürich. The older or central portion of the town retains the air of a small rural capital, but the newer quarters present the aspect of a modern commercial

centre. Its chief building is the abbey church of the celebrate old monastery (dating in its present form from 1756-1765). It has been a cathedral church (Catholic) since 1846. The famous library is housed in the former palace of the abbot, and is one of the most renowned in Europe by reason of its rich treasure of early mss. and printed books. Other portions of the monastic buildings are used as the offices of the cantonal authorities, and contain the extensive archives both of this monastery and of the of Pfäfers.

See *Dict. geogr. de la Suisse*, vol. iv. (1906).

SAINT-GAUDENS, AUGUSTUS (1848-1907), American sculptor, was born in Dublin, Ireland, on March 1, 1848, the son of a French father, a shoemaker by trade, and an Irish mother and was taken to America in infancy. He was apprenticed to cameo-cutter, studying in the schools of Cooper Union (1861) and the National Academy of Design, New York (1865-1866). His earliest work in sculpture, made upon the eve of his departure in 1868, for Paris, was a bronze bust of his father, Bernard P. I. Saint-Gaudens. After some delay he was admitted as a pupil of Joutfroy in l'Ecole des Beaux-Arts, and two years later, with his fellow-student Mercé, he went to Italy, where he remained three years. While in Rome he executed his statues "Hiawatha" and "Silence." Returning in 1873 to New York he made, the following year, an admirable bust of the statesman, William M. Evarts, and was commissioned by John La Farge to execute relief of adoring angels for St. Thomas' Episcopal Church, New York, a work which immediately won the esteem of his brother artists. The church was destroyed by fire a few years later. His statue of Admiral Farragut, Madison Square, New York, was ordered in 1876, exhibited at the Paris salon of 1880 and unveiled in 1881. It was received with enthusiasm and from its first appearance Saint-Gaudens was recognized as a new leader in art. To this period also belong the "Randall" of the "Sailor Snug Harbor," Staten Island, and the beautiful caryatides of the Vanderbilt fireplace, preserved in the Metropolitan Museum.

At all times throughout his life the sculptor found diverse from more serious tasks in modelling portraits of friends in lo relief. Among these may be noted the medallions and plaques of Bastien-Lepage and Dr. Henry Schiff (1880); Homer Saint-Gaudens and the children of Prescott Hall Butler (1881); Mrs. Stanford White (1884); Robert Louis Stevenson (1887); William M. Chase and the children of Jacob H. Schiff (1888); Kenyon Cox (1889), etc. Yet another form of sculpture was developed in his high-reliefs of Dr. Henry Bellows (1885) and Dr. McCosh (1889), and the lovely "Amor Caritas," which, with variations, long occupied his mind. His noble statue of Lincoln was unveiled in 1881 in Lincoln park, Chicago, and was at once accepted as the country ideal. In Springfield, Mass., his unique "Deacon Chapin," known as "The Puritan," appeared also in 1887. The Adams memorial (1891) in Rock Creek cemetery, Washington, D.C., is considered by many to be Saint-Gaudens' greatest work; indeed not a few rate it as America's highest artistic achievement. The mysterious draped figure with shadowed face is often called "Grief," but the sculptor had no such intention; "Peace" or "Nirvana" better convey the meaning. The Garfield memorial in Fairmount park Philadelphia, was completed in 1895. The Shaw memorial, Boston, a monument to Robert G. Shaw, colonel of a negro regiment in the Civil War, was begun in 1884 and occupied the master intermittently for more than 12 years, being dedicated in 1891. It is a large relief in bronze, measuring some 15 by 11 ft., and containing many marching soldiers, led by their young officer on horse back. The year 1897 saw likewise the completion of the "Logan" on a fiery steed, in Grant park, Chicago.

Another famous equestrian statue is the "General Sherman" which was begun in 1892 and dedicated in 1903. Standing at the entrance of Central park at 59th Street and Fifth Avenue, New York, this golden group of the mounted commander led by a beautiful winged "Victory" is one of the most impressive of the city's monuments. The "Sherman" was shown with other works of Saint-Gaudens at the Paris Exposition of 1900, receiving the highest honours. The sculptor was made an officer of the Legion of Honour and corresponding member of the Institute of

France. A bronze copy of his "Amor Caritas" was purchased by the French Government. Other important works are the Peter Cooper memorial, New York; the "Parnell," in Dublin; the Phillips Brooks monument in Boston and a fine seated figure of Lincoln, recently erected on Chicago's lake front. Saint-Gaudens died at Cornish, N.H., on Aug. 3, 1907. He is rightly regarded as America's greatest sculptor and his work continues to exert a powerful and beneficent influence in the United States. In 1877 he married Augusta F. Homer and left a son, Homer Saint-Gaudens, now director of fine arts of the Carnegie Institute, Pittsburgh, Pa. His brother Louis (1854-1913) also a sculptor, assisted Augustus Saint-Gaudens in some of his creations.

Lewis Hind, *Augustus Saint-Gaudens* (1908); Homer Saint-Gaudens, *The Reminiscences of Augustus Saint-Gaudens* (1913). (L. T.)

ST. GAUDENS, a town of France, capital of an arrondissement in the department of Haute-Garonne, 7 m. from the river Garonne, 57 mi. S.W. of Toulouse on the railway to Tarbes. Pop. (1936) 4,684. St. Gaudens derives its name from a martyr of the 5th century, at whose tomb a college of canons was established. It was important as a capital of the Nebouzan, as the residence of the bishops of Comminges and for its cloth industry. The church, once collegiate, dates chiefly from the 11th and 12th centuries, but the main entrance is flamboyant Gothic.

SAINT-GERMAIN, COMTE DE (c. 1710-c. 1780) called *der Wundermann*, a celebrated adventurer. Of his parentage and place of birth nothing is definitely known; the common version is that he was a Portuguese Jew. He knew nearly all the European languages, and spoke German, English, Italian, French (with a Piedmontese accent), Portuguese and Spanish. Grimm affirms him to have been the man of the best parts he had ever known. He was a musical composer and a capable violinist. His knowledge of history was comprehensive, and his accomplishments as a chemist, on which he based his reputation, were in many ways real and considerable. He pretended to have a secret for removing flaws from diamonds, and to be able to transmute metals. The most remarkable of his professed discoveries was of a liquid which could prolong life, and by which he asserted he had himself lived 2,000 years.

Saint-Germain is mentioned in a letter of Horace Walpole's as being in London about 1743, and as being arrested as a Jacobite spy and released. Walpole says: "He is called an Italian, a Spaniard, a Pole; a somebody that married a great fortune in Mexico and ran away with her jewels to Constantinople; a priest, a fiddler, a vast nobleman." At the French court, where he appeared about 1748, he exercised for a time extraordinary influence and was employed on secret missions by Louis XV.; but, having interfered in the dispute between Austria and France, he was compelled in June 1760, on account of the hostility of the duke of Choiseul, to remove to England. He appears to have resided in London for one or two years, but was at St. Petersburg in 1762, and is asserted to have played an important part in connexion with the conspiracy against the emperor Peter III. in July of that year, a plot which placed Catherine II. on the Russian throne. He then went to Germany, where, according to the *Mémoires authentiques* of Cagliostro, he was the founder of freemasonry, and initiated Cagliostro into that rite. He was again in Paris from 1770 to 1774, and after frequenting several of the German courts he took up his residence in Schleswig-Holstein, where he and the Landgrave Charles of Hesse pursued together the study of the "secret" sciences. He died at Schleswig in or about 1780-1785, although he is said to have been seen in Paris in 1789.

Andrew Lang in his *Historical Mysteries* (1904) discusses the career of Saint-Germain, and cites the various authorities for it. Saint-Germain figures prominently in the correspondence of Grimm and of Voltaire. See also Oettinger, *Graf Saint-Germain* (1846); F. Bülow, *Geheime Geschichten und räthselhafte Menschen*, Band I. (1850-60); Lascelles Wrixall, *Remarkable Adventures* (1863); and U. Birch in the *Nineteenth Century* (January 1908).

SAINT-GERMAIN, CLAUDE LOUIS, COMTE DE (1707-1778), French general, was born on April 15, 1707, at the

Château of Vertambos. He entered the army, but left France, apparently on account of a duel, and fought in the armies of the elector palatine and the elector of Bavaria. Then, after a brief service under Frederick the Great of Prussia, he joined Marshal Saxe in the Netherlands, and was created a field-marshal of the French army. On the outbreak of the Seven Years' War (1756) he was appointed lieutenant-general, but he fell a victim to court intrigues and professional jealousy. He resigned his commission in 1760 and accepted an appointment as field-marshal from Frederick V. of Denmark, being charged in 1762 with the reorganization of the Danish army. On the death of Frederick in 1766 he returned to France, bought a small estate in Alsace near Lauterbach, and devoted his time to religion and farming. In October 1775 he was appointed minister of war by Louis XVI., but his efforts to effect economies and to introduce Prussian discipline in the French army brought on such opposition that he resigned in September 1777. He died in his apartment at the arsenal on Jan. 15, 1778.

ST. GERMAIN, TREATY OF (see also VERSAILLES, TRIANON, and NEULLY, TREATIES OF). Austria and Hungary had up to 1918 formed a diplomatic unit, but in Oct. 1918 they were virtually two separate states. The Armistice of Nov. 4 still recognized Austria-Hungary as a diplomatic unit, but Austria was proclaimed a Republic Nov. 12, as was Hungary Nov. 16. The Armistice concluded by the Powers direct with Hungary (Nov. 13) recognized that Power's *de facto* independence of Austria.

All the Powers, except the United States, early asserted that the "Fourteen Points," etc., did not apply to the settlements with Austria and Hungary. In Jan. 1919 it was known that even Wilson favoured including in Italy part of the Slovene population of Istria and Carniola, and would make Italy further concessions. On April 14 he agreed to grant Italy the Tirol south of the Brenner Pass, with about 250,000 Germans, as well as the Trentino, as already agreed by France and Great Britain. It was known also that the Czechoslovak State would include over 3,000,000 Germans. Austria was to be reduced to some two-thirds of her German-speaking territories. In mid-April the French Prime Minister Clemenceau obtained from the Allies the further important decision to prohibit union between Austria and Germany without the unanimous consent of the Council of the League. This was embodied in the draft treaty with Germany of May 6, and formed article 80 of the Treaty of Versailles of June 28, appearing as article 88 of the Treaty of St. Germain, and article 72 of the Treaty of Neuilly.

On May 2 the Austrian delegation was invited to Paris. On June 2 they were presented with a very imperfect draft treaty, followed by a more detailed one on July 20. Austria made great protests, turning mainly on two points. She asserted the applicability of the "Fourteen Points" to her case, and her right therefore to retain all her German subjects. President Wilson alone was willing to extend the application of the "Fourteen Points" to Austria; the treaty assigned 3,500,000 Germans to Czechoslovakia, about 250,000 to Italy. The other main point of dispute was how far Austria must accept the responsibilities of old Austria-Hungary. The Allies finally decided that the Austrian Republic was not a new State but an old one lopped off certain outlying provinces and endowed with a new government. The Allies recognized this government *de facto* by accepting their credentials on May 22 and *de jure* on Sept. 10, by signing the treaty with them at St. Germain-en-Laye. It came into force on July 16 1920.

Part I. The Covenant, and *Part XIII.* Labour, are as in the Treaty of Versailles.

Part II. of the Austrian Treaty details the borders of the new Austrian State.

Part III. Political Clauses for Europe.—This deals with technical details such as the financial obligations of the former Austrian empire affecting Italy, Yugoslavia, Czechoslovakia and Rumania. Articles 49-50 arranged for a plebiscite in two areas of the Klagenfurt basin. This plebiscite, taken in 1920, went in Austria's favour. West Hungary, with about 333,000

souls, was transferred from Hungary to Austria but ultimately, in 1921, without its chief town (see *BURGENLAND*). Further clauses in Part III dealt with the protection of racial and religious minorities. Article No. 82 prohibits Austria from alienating her independence (*i.e.*, joining Germany) otherwise than with the consent of the Council of the League of Nations.

Part IV. Austrian Interests Outside Europe.—As in the Treaty of Versailles this part provides for a total renunciation of state properties immovable and movable outside Europe, and also of treaties, capitulations, concessions, etc., in the following countries: Morocco, Egypt, Siam and China.

Part V. Military, Naval and Air Clauses followed the general lines of the similar clauses in the Treaty of Versailles but showed somewhat more consideration to Austria. A long-service voluntary force not exceeding 30,000 was allowed. The manufacture of arms, etc., was confined to a single factory (article 132). The naval clauses were very drastic; the whole Austro-Hungarian navy was broken up or distributed among the Allies, Austria only retaining four patrol boats on her inland waters. The air clauses were as in the German treaty.

Part VI. Prisoners of War and Graves, **Part XI.** Aerial Navigation, were as in the German Treaty, with a few very small alterations.

Part VII. Penalties provided for the trial before Allied military tribunals of Austrian offenders against the laws and customs of war. This provision was not executed.

Part VIII. Reparations; **Part IX.** Financial Clauses; **Part X.** Economic Clauses.—By article 177 Austria accepted responsibility for herself and her Allies for causing loss and damage to the Allied (Entente) governments by the war. The rest of the "Reparation Chapter" followed the corresponding section in the German treaty. No lump sum was fixed, but discretion was, in effect, given to the Reparation commission to fix it. Austria handed over her whole commercial fleet and much livestock to the Allies. Czechoslovakia, Yugoslavia, Poland and Rumania had, however, to contribute to expenses incurred by the Allies in liberating their territory from Austria. The financial clauses involved many complex questions as to the allocation of pre-war debt and the distribution of war debts. All these provisions were somewhat relaxed by the Supreme council on March 17, 1921, and the process was completed by Austria placing her finances under control of the league in Sept. 1922 (see *AUSTRIA*).

Part XII. Ports, waterways and railways, merely stressed some points in the corresponding section of the German treaty. See *Treaty Series*, No. II (Cmd. 400 of 1919); also H. W. V. Temperley (ed.), *A History of the Peace Conference of Paris*; vol. IV. and v. (Institute of International Affairs, London, 1921).

ST. GERMAIN-EN-LAYE, a town of northern France, in the department of Seine-et-Oise, 13 mi. W.N.W. of Paris by rail. Pop. (1936) 21,638. Built on a hill on the left bank of the Seine and on the edge of a forest 10,000 to 11,000 ac. in extent, St. Germain has a bracing climate, which makes it a place of summer residence for Parisians.

A monastery in honour of St. Germain, bishop of Paris, was built in the forest of Laye by King Robert. Louis VI built a castle close by. Burned by the English, rebuilt by Louis IX, and again by Charles V, this castle was completed by Francis I. A new castle was begun by Henry II and completed by Henry IV; it was subsequently demolished, except the so-called Henry IV pavilion. The old castle has been restored. James II of England died at St. Germain.

ST. GERMAN'S, a village and parish of Cornwall, England, situated on the Lynher creek 9½ mi. W. by N. of Plymouth by the G.W.R. Pop. of parish (1931) 1,964. St. German's has associations with early Christianity in Britain, and is supposed to have been the original seat of the Cornish bishopric. It was the see of Bishop Burthold, who died in 1027. Under Leofric, who became bishop of Crediton and Cornwall in 1046, the see was removed to Exeter. Bishop Leofric founded a priory at St. German's and bestowed upon it half the lands which then constituted the bishops' manor of St. German's. There was then a market on Sundays, but at the time of Domesday it had seriously

declined. The bishop in 1311 obtained a grant of a market on Fridays and a fair at the feast of St. Peter ad Vincula. In 1343 the prior sustained his claim to a prescriptive market and fair at St. German's. After the suppression the borough belonging to the priory remained with the crown until 1610. Meanwhile Queen Elizabeth created it a parliamentary borough and from 1563 to 1832 it returned two members. The 12th century church of St. Germanus has much Norman work, with Early English, Perpendicular and Decorated additions.

ST. GILLES, a town of southern France, in the department of Gard, on the canal from the Rhone to Certe, 12½ mi. S.S.E. of Nîmes by road. Pop. (1936) 4,399. In the middle ages St. Gilles, the ancient *Valis Flaviana*, was the seat of an abbey founded in the 7th century by St. Aegidius (St. Gilles). It acquired wealth and power under the counts of Toulouse, who added to their title that of counts of St. Gilles. The church was founded 1116. The lower part of the Romanesque front (12th century) has three bays decorated with columns and bas-reliefs. There is a 12th century crypt. St. Gilles was the seat of the first grand priory of the Knights Hospitallers in Europe (12th century) and was their place of embarkation for the east. In 1226 the township of St. Gilles was united to the crown. In 1562 the Protestants ravaged the abbey, which they occupied till 1622, and in 1774 it was suppressed. The town has an important trade in wines.

ST. GOTTHARD PASS, an important motor and railway route from northern Europe to Italy. It takes its name from St. Gotthard, bishop of Hildesheim (d. 1038), but does not seem to be mentioned before the early 13th century perhaps because the access to it lies through two very narrow Alpine valleys much exposed to avalanches. The hospice on the summit is first mentioned in 1331, and from 1683 onward was in charge of two Capuchin friars. But in 1775 the buildings near it were damaged by an avalanche, while in 1799-1800 everything was destroyed by the French soldiery. Rebuilt in 1834, the hospice was burnt in March 1905. The mule path (dating from about 1293) across the pass served for many centuries. The carriage road was only constructed between 1820 and 1830. Beneath the pass is the St. Gotthard tunnel (pierced in 1872-1880, 9½ mi. in length, and attaining a height of 3,786 ft.), through which runs the railway (opened in 1882) from Lucerne to Milan (175½ mi.). The railway runs first along the northern and eastern shores of Lake Lucerne, from Lucerne to Flüelen (32½ mi.), and then up the Reuss valley past Altdorf and Wassen, near which is the first of the famous spiral tunnels, to Göschenen (56 mi. from Lucerne). Here the line enters the tunnel and gains, at Airolo, the valley of

A SECTION OF THE ST. GOTTHARD PASS IN THE FREMOLA VALLEY

the Ticino or the Val Leventina, which it descends, through several spiral tunnels, till at Biasca (38 mi. from Göschenen) it reaches more level ground. Thence it runs past Bellinzona to Lugano (30½ mi. from Biasca) and reaches Italian territory at Chiasso, 35 mi. from Milan. The railway is now the property of the Swiss Government.

ST. HELENA (*hél-én-p*), an island and British possession in the S. Atlantic, 15° 55' 26" S., 5° 42' 30" W. (Ladder Hill observatory). Area 47 sq.mi., extreme length, southwest to northeast 10½ mi., extreme breadth 6½. The island is wholly of volcanic

origin, the activity being long extinct, while subaerial denudation has greatly modified it and marine erosion has formed perpendicular cliffs 450-2,000 ft. high on the east, north and west sides. Its principal feature, a semicircular ridge of mountains, with the culminating summit of Diana's peak (2,704 ft.), is the northern rim of a great crater; the southern rim having been breached hypothetically forms the centre of the ring. From the crater wall outwards water-cut gorges stretch in all directions, widening as they approach the sea into valleys, some of which are 1,000 ft. deep. These valleys contain small streams. Springs of pure water are abundant. Along the enclosing hillsides caves have been formed by the washing out of the softer rocks. The lavas are basalts, andesites, trachytes and phonolites; there is much volcanic ash, tuff, scoriae, etc., and conspicuous features are formed by rocks, representing a late period of activity. Such features are Ass's Ears, Lot's Wife and the Chimney. There are several subsidiary craters. The only practicable landing-place is on the leeward side at St. James's bay. From the head of the bay a narrow valley extends for 1½ mi. The greatest extent of level ground is in the northeast of the island, where are the Deadwood and Longwood plains, over 1,700 ft. above the sea.

Although the island is within the tropics its climate is healthful and temperate. This is due to the southeast trade-wind, and to the effect of the cold waters of the South Atlantic current. The temperature varies on the sea level from 68° to 84° in summer and 57° to 90° in winter. The higher regions are about 10° cooler. The rainfall varies considerably.

Flora and Fauna.—St. Helena has three vegetation zones: (1) the coast zone, extending inland for 1 mi. to 1½ mi., now "dry, barren, soilless, lichen-coated, and rocky" with little save prickly pears, wire grass and *Mesembryanthemum*; (2) the middle zone (400-1,800 ft.), extending about three-quarters of a mile inland, with shallower valleys and grassier slopes—the English broom and gorse, brambles, willows, poplars and Scotch pines being the prevailing forms; and (3) the central zone, about 3 mi. long and 2 mi. wide, the home, for the most part, of the indigenous flora. Of 38 flowering plants all save *Scirpus nodosus* are peculiar to the island; several indigenous plants are dying out. The indigenous flora shows affinities with African flora, but in recent years many species have become extinct. The exotic flora gives the island almost the aspect of a botanic garden. The oak, thoroughly naturalized, grows alongside of the bamboo and banana. Among other trees and plants are the common English gorse; *Rubus pinatus*, *Hypochoeris radicata*, the *Buddleia Madagascariensis*; *Physalis peruviana*; the common castor-oil plant; and the pride of India. The flax (*Phormium tenax*) was introduced from New Zealand with great commercial success. The government gave encouragement to the cultivation of lily bulbs (*Lilium longiflorum*) for export, and at the agricultural experiment station tested pyrethrum, pelargonium (for distillation of geranium oil) and carob beans (*Ceratonia siliqua*) with a view to the introduction of new industries.

St. Helena has no indigenous vertebrate land fauna. The only land groups well represented are beetles and land shells. Some two-thirds of the 203 known species of beetles are weevils and a vast majority wood-borers, a fact which bears out the tradition of forests having once covered the island. A South American white ant (*Termes tenuis*, Hagen.), introduced from a slave ship in 1840, soon became a plague at Jamestown. Practically everything had to be rebuilt with teak or cypress. Fortunately it cannot live in the higher parts of the island. Besides domestic animals the only land mammals are rabbits, rats and mice, the rats being especially abundant. Probably the only endemic land bird is the wire bird, *Aegialitis sanctae Helenae*; the averdevat, Java sparrow, cardinal, ground-dove, partridge (possibly the Indian *chukar*), pheasant and guinea fowl are all common. There are no freshwater fish, beetles or shells. Of 65 species of sea-fish caught 17 are peculiar to St. Helena; economically the more important kinds are gurnard, eel, cod, mackerel, tunny, bullseye, cavalley, flounder, hog-fish, mullet and skulpin.

Population.—When discovered the island was uninhabited. The majority of the population are of mixed European (British,

Dutch, Portuguese), East Indian and African descent. The original European settlement was made by John Dutton with a few soldiers and followers sent in 1659 by the (British) East India company to annex the island. Subsequently more soldiers and settlers were sent from England, and their numbers were augmented by members of the crews of ships returning to Europe from the east. From 1840 onward for a considerable period there was an influx of freed slaves of West African origin. The estimated population in 1940 was 4,710, of whom nearly half lived in Jamestown, the port and seat of government. Longwood, where Napoleon died in 1821, is 3½ mi. E. of Jamestown.

Industries.—Less than a third of the area of the island is suitable for farming. The principal crop is potatoes. Cattle and sheep are raised but there is no outside market, and fish curing and lace making are carried on. Local trade received a severe blow when, with completion of the Suez canal, ships en route from Europe to the orient ceased to call at the island. The principal exports are fibre, tow, rope and twine, and small quantities of wool are also sold. The only banking institution is the government savings bank. The coins of both the United Kingdom and the Union of South Africa are legal tender in the colony. There is a regular monthly mail steamship service to England and to South Africa, and cable communication with all parts of the world.

The governor (who also acts as chief justice) is aided by an executive council comprising the officer commanding the troops and the government secretary, *ex officio*, and nominated residents of St. Helena, generally three in number. The revenue in 1940 was £33,720, and the expenditure £33,365. Under the provisions of the Colonial Development and Welfare act, 1940, the British government assigned to St. Helena £12,200 to develop the water supplies and agricultural and educational facilities. Elementary education is provided (1940) in 9 schools, 3 maintained by the government and the others state-aided. St. Helena is the seat of an Anglican bishopric established in 1859. Ascension and Tristan da Cunha are included in the diocese. (J. I. P.; X.)

History.—The island was discovered on May 21, 1502, by the Portuguese João da Nova, on his voyage home from India, and by him named St. Helena. The Portuguese found it uninhabited, imported livestock, fruit trees and vegetables, built a chapel and one or two houses, and left their sick there to be taken home, if recovered, by the next ship, but they formed no permanent settlement. Its first known permanent resident was Fernando Lopez, a Portuguese in India, who had turned traitor, and had been mutilated by order of Albuquerque. He preferred being marooned to returning to Portugal in his maimed condition, and was landed at St. Helena in 1513, with three or four Negro slaves. By royal command he visited Portugal some time later, but returned to St. Helena, where he died in 1546. In 1584 two Japanese ambassadors to Rome landed at the island. The first Englishman known to have visited it was Thomas Cavendish, who touched there in June 1588 during his voyage round the world. Another English seaman, Captain Kendall, visited St. Helena in 1591, and in 1593 Sir James Lancaster stopped at the island on his way home from the east. In 1603 the same commander again visited St. Helena on his return from the first voyage equipped by the East India company. The Portuguese had by this time given up calling at the island, which appears to have been occupied by the Dutch about 1645. The Dutch occupation was temporary and ceased in 1651, the year before they founded Cape Town. The (British) East India company appropriated the island immediately after the departure of the Dutch, and in 1659 they despatched a small force of troops and others under John Dutton to form a settlement. The company were confirmed in possession by a clause in their charter of 1661. The fort built by the company was named after the duke of York (James II). On New Year's Day, 1673, the Dutch succeeded in capturing St. Helena, but they were ejected the following May 5 by Sir Richard Munden. By a new charter granted in Dec. 1673 the East India company were declared "the true and absolute lords and proprietors of the island." Since that date St. Helena has been in the undisturbed possession of Great Britain, though in 1706 two ships anchored off Jamestown were carried off by the French. In 1673 the inhabitants had num-

bered about 1,000, of whom nearly half were Negro slaves. In 1810 the company began the importation of Chinese from their factory at Canton. During the company's rule the island prospered: homeward-bound vessels, numbering hundreds in a year, anchored in the roadstead, and stayed for considerable periods refitting and revictualling. Large sums of money were thus expended in the island, where wealthy merchants and officials had their residence. The plantations were worked by slaves, who were subjected to very barbarous laws until 1792, when a new code of regulations ensured their humane treatment and prohibited the importation of any new slaves. Later it was enacted that all children of slaves born on or after Christmas day 1813 should be free, and between 1826 and 1836 all slaves were set at liberty.

Among the governors appointed by the company to rule at St. Helena was one of the Huguenot refugees, Capt. Stephen Poirier (1697–1707), who attempted unsuccessfully to introduce the cultivation of the vine. A later governor (1741–42) was Robert Jenkins (*q.v.*) of "Jenkins' ear" fame. Dampier visited the island twice in 1691 and 1701; Halley's mount commemorates the visit paid by the astronomer Edmund Halley in 1676–78—the first of a number of scientific men who have visited on the island.

In 1815 the British government selected St. Helena as the place of detention of Napoleon Bonaparte. He was brought to the island in October of that year and lodged at Longwood, where he died in May 1821. During this period the island was strongly garrisoned by regular troops, and the governor, Sir Hudson Lowe, was nominated by the crown. After Napoleon's death the East India company resumed full control of St. Helena until April 22, 1834, on which date it was, in virtue of an act passed in 1833, vested in the crown. As a part of call the island continued to enjoy a fair measure of prosperity until about 1870. Since that date the great decrease in the number of vessels visiting James-town has deprived the islanders of their principal means of subsistence. When steamers began to be substituted for sailing vessels and when the Suez canal was opened (1869) fewer ships passed the island; of those that still pass the greater number are so well found that it is unnecessary for them to call. The withdrawal in 1906 of the small garrison, hitherto maintained by the imperial government, was another cause of depression, but during World War I (1914–18) a garrison was again sent to the island. During the South African War (1899–1902) some thousands of prisoners were detained at St. Helena, which has also served as the place of exile of several Zulu chiefs, an ex-sultan of Zanzibar and others. In 1922 Ascension Island (*q.v.*), up to that time under the care of the British admiralty, was made a dependency of St. Helena. Similarly, Tristan da Cunha (*q.v.*) and the associated islands of Nightingale, Inaccessible and Gough, became dependencies of St. Helena in 1938. The island was of strategic importance in the naval operations of World War II.

ST. HELENS, a municipal, county and parliamentary borough, Lancashire, England, 12 mi. N.E. of Liverpool, on the L.M.S. and L.N.E. railways. Pop. (1951) 120,276. Area 12.4 sq.mi. A canal communicates with the Mersey. The town is wholly of modern development. Among buildings and institutions are the town hall, the Gamble institute, a technical school and library. This is the principal seat in England for the manufacture of crown, plate and sheet glass; there are also art glass works, copper smelting and refining works, chemical works, iron and brass foundries, potteries and patent medicine works. There are collieries in the neighbourhood. To the north are ruins of Windlesham abbey and St. Thomas' well. The town was incorporated in 1868, became a parliamentary borough in 1885 (returning one member) and a county borough in 1888.

ST. HELIER, the chief town of Jersey, the largest of the Channel Islands. Pop. (1937) 24,686. Area 3.3 sq.mi. It lies on the eastern side of St. Aubin's bay. The harbour is flanked on the W. by a rocky ridge on which stands Elizabeth castle,

and on the east by a promontory on which stands Fort Regent. The parish church is a cruciform building with embattled tower, partly 14th century. It contains a monument to Major Peiron, who lost his life in opposing the French attack on Jersey in 1781. The French leader, Baron de Rullecourt, is buried in the churchyard. A large canvas by John Singleton Copley depicting the scene is in the National gallery, London, and a copy is in the court house of St. Helier. This building (*la Cohue*), in Royal square, is the meeting place of the royal court and deliberative states of Jersey. Victoria college was opened in 1852 and commemorates a visit of Queen Victoria and the prince consort to the island in 1846. A house in Marine terrace is distinguished as the residence of Victor Hugo (1802–1885). Elizabeth castle dates from 1551–1590; and in 1646 and 1649 Prince Charles resided here. In 1649 he was proclaimed king, as Charles II, in Jersey by the royalist governor George Carteret. On coming to the throne he gave the island the mace which is still used in the meetings of the court and states. Close to the castle are remnants of a hermitage-chapel (9th or 10th century) traditionally connected with St. Helierus, which has given the name of the Hermitage to the rock on which it stands.

ST. HUBERT, a small town of Belgium in the province of Luxembourg and in the heart of the Ardennes. Pop. (1939) 3,025. Its abbey church contains the shrine of St. Hubert, and has an annual pilgrimage. According to tradition the church and a monastery attached to it were founded in the 7th century by Plectrude, wife of Pippin of Herstal. The second church was built in the 11th century, but burned in the 16th century. The present building has been restored in modern times and presents no special feature. The spot where St. Hubert is supposed to have met the stag with the crucifix between its antlers is about 5 mi. from the town. St. Hubert is the patron saint of huntsmen.

ST. HYACINTHE, a city and port of entry of Quebec, Canada, and capital of St. Hyacinthe county, 50 mi. E.N.E. of Montreal, on the left bank of the river Yamaska and on the Canadian National railway. Pop. (1951) 20,216. It is the seat of a Roman Catholic bishop, and contains a classical college, a technical school, a dairy school, two monasteries and several other educational and charitable institutions. Manufactures include organs, leather, shoes, silks, furniture, woollens and mill machinery. The city is an important distributing centre for the surrounding district.

ST. IMIER, a town in the west of the canton of Bern, Switz., on the railway from Biel to La-Chaux-de-Fonds. It lies at the foot of Mont Solei (4,240 ft.), which is ascended by a funicular railway. It is the centre of the watchmaking industry, a health resort, and a place for winter sports. The inhabitants, (1950) 5,972, are French-speaking and generally Protestant.

SAINTINE, JOSEPH XAVIER (1798–1865), French novelist and dramatist, whose real surname was BONIFACE, was born in Paris on July 10, 1798. In 1823 he produced a volume of poetry in the manner of the Romantics, entitled *Poemes, odes, épitres*. In 1836 appeared *Picciola*, the story of the comte de Charney, a political prisoner in Piedmont, whose reason was saved by his cult of a tiny flower growing between the paving stones of his prison yard. This story is a masterpiece of the sentimental kind, and has been translated into many European languages. He produced many novels and dramas, and died on Jan. 21, 1865.

ST. IVES, a market town, municipal borough and seaport of Cornwall, England, 10 mi. N.N.E. of Penzance, on the G.W.R. Pop. (1951) 9,037. Area 6.8 sq.mi. It lies near the west horn of St. Ives bay on the north coast. The site has associations with Celtic Christianity and is supposed to take its name from St. Ives, or Ia, an Irish martyr, accompanying St. Piran on his missionary journey to Cornwall in the 5th century. St. Ives was a mere chapel of Leland, an unimportant member of the distant manor of Ludgvan Leaze (which in Domesday appears as Ludum), and did not grow in the middle ages. In order to augment the influence of the Tudors in parliament, Philip and Mary in 1558 invested it with the privilege of returning 2 members. Its affairs were at that time administered by a headwarden, who after 1598 appears under the name of portreeve. In 1639 a charter

of incorporation was granted under which the portreeve became mayor with aldermen and burgesses. Provision was made for four fairs and for markets on Wednesdays and Saturdays, also for a grammar school. A new charter was granted in 1685. In 1832 St. Ives lost one of its members, and since 1885 has formed the St. Ives division. The older streets near the harbour are narrow and irregular, but on the upper slopes a residential area has developed. The small harbour, built in 1767, has silted up and at the lowest tides is dry. The fisheries for pilchard, herring and mackerel are important. St. Ives is a thriving holiday resort (summer pop. 13,000), and has a town planning scheme.

ST. IVES, a market town and municipal borough in Huntingdonshire, England, mainly on the left bank of the Ouse, 5 mi. E. of Huntingdon, by the Eastern Region railway. Pop. (1951), 3,077. Area, 3.3 sq. mi. The river is crossed by an old bridge said to have been built by the abbots of Ramsey early in the 11th century. A building over the centre pier was once used as a chapel. The church of All Saints is Perpendicular, with earlier portions. Oliver Cromwell was a resident in St. Ives in 1634-35. There is a considerable agricultural trade. St. Ives was noted for its eight-day fair beginning on Monday in Easter week, first granted to the abbot of Ramsey by Henry I. In the reign of Henry III merchants from Flanders came to the fair, which had become so important that the king granted it to be continued beyond the eight days if the abbot agreed to pay a fee of £50 yearly for the extra days. The fair, with a market on Monday granted to the abbot in 1286, survives, and was purchased by the town in 1874, the year of incorporation, from the duke of Manchester. The markets are extremely important to St. Ives and were substantially altered to give greater facilities for auction sales. The Norris library and museum, opened in 1933, is mainly devoted to books and collections relating to the county.

ST. JEAN-D'ANGÉLY, a town of western France, in the department of Charente-Maritime, 33 mi. E. of Rochefort by rail. Pop. (1946) 6,606. St. Jean is named after the neighbouring forest of Angély (*Angeriacum*). Pippin I of Aquitaine in the 9th century established there a Benedictine monastery, afterward reputed to possess the head of John the Baptist. This relic attracted hosts of pilgrims; a town grew up, took the name of St. Jean-d'Angély, afterward d'Angély, was fortified in 1131, and in 1204 received a charter from Philip Augustus. The possession of the place was disputed between French and English in the Hundred Years' War, and between Catholics and Protestants at a later date. Louis XIII took it from the Protestants in 1621 and changed its name to Bourg-Louis. St. Jean lies on the right bank of the Boutonne, which is navigable for small vessels.

ST. JEAN-DE-LUZ, a coast town of southwestern France, in the department of Basses-Pyrénées, at the mouth of the Nivelle, 14 mi. S.W. of Bayonne on a branch of the Southern railway. Pop. (1946) 10,234. From the 14th to the 17th century St. Jean-de-Luz enjoyed a prosperity due to its mariners and fishermen. Its vessels were the first to set out for Newfoundland in 1520. In 1558, the Spaniards attacked and burned the town. In 1627, however, it was able to equip 80 vessels, which succeeded in saving the island of Ré from the duke of Buckingham. In 1660 the treaty of the Pyrenees was signed at St. Jean-de-Luz. At that time the population numbered 15,000. The cession of Newfoundland to England in 1713, the loss of Canada, and the silting-up of the harbour contributed to the decline of the town's maritime trade. St. Jean-de-Luz is situated in the Basque country on the bay of St. Jean-de-Luz, the entrance to which is protected by breakwaters and moles. It has a 13th-century church, the chief features of which are the galleries in the nave, which, by the Basque custom, are reserved for men.

ST. JOHN, OLIVER (c. 1598-1673), English statesman and judge, was the son of Oliver St. John of Cayshoe, Bedfordshire, and great-grandson of the first Lord St. John of Bletso in 1559, and a distant cousin of the 4th baron who was created earl of Bolingbroke in 1624. Oliver was educated at Queens' college, Cambridge, and was called to the bar in 1626. He got into trouble with the court in connection with a seditious publication, and associated himself with the future popular leaders John Pym and

Lord Saye. In 1638, in a notable speech, he defended Hampden on his refusal to pay Ship Money. In the same year he married, as his second wife, Elizabeth Cromwell, a cousin of Oliver Cromwell, to whom his first wife also had been distantly related. The marriage led to an intimate friendship with Cromwell. St. John was member for Totnes in both the short and the long parliament, where he acted in close alliance with Hampden and Pym, especially in opposition to the impost of Ship Money (q.v.). In 1641, with a view of securing his support, the king appointed St. John solicitor general. Nonetheless he took an active part in promoting the impeachment of Strafford and in preparing the bills brought forward by the popular party in the commons, and was dismissed from office in 1643. On the outbreak of the Civil War, he became recognized as one of the parliamentary leaders. In the quarrel between the parliament and the army in 1647 he sided with the latter, and throughout enjoyed Cromwell's confidence.

In 1648 St. John was appointed chief justice of the common pleas. He refused to act as one of the commissioners for the trial of Charles. In 1651 he went to The Hague on an unsuccessful mission to negotiate a union between England and Holland, but in the same year he successfully conducted a similar negotiation with Scotland. After the Restoration he published an account of his past conduct (*The Case of Oliver St. John*, 1660), which saved him from any more severe vengeance than exclusion from public office. He retired to his house in Northamptonshire till 1662, when he went to live abroad. He died on Dec. 31, 1673.

See the above-mentioned *Case of Oliver St. John* (1660), and St. John's *Speech to the Lords*, Jan. 7th, 1640, concerning Ship-money (1640). See also Mark Noble, *Memoirs of the Protectoral House of Cromwell*, vol. II (2 vol., 1787) and C. H. Firth's art. in *Dict. of Nat. Biog.*, vol. x (1897).

SAINT JOHN, the capital of St. John county, New Brunswick, Canada, in 45° 14' N., and 66° 3' W., 481 mi. from Montreal. Pop. (1951) 50,779. It is situated at the mouth of the St. John river on a rocky peninsula. With it are incorporated the neighbouring towns of Carleton and Portland.

Saint John was visited in 1604 by the Sieur de Monts (1560-1630) and his lieutenant Champlain, but it was not until 1635 that Charles de la Tour (d. 1666) established a trading post, called Fort St. Jean (see Parkman, *The Old Régime in Canada*), which existed under French rule until 1758, when it passed into the hands of Britain. In 1783 a body of United Empire Loyalists landed at Saint John and established a city, called Parr Town until 1785 when it was incorporated with Conway (Carleton), under royal charter, as the city of Saint John. It soon became and remained the largest town in the province, but for military reasons was not chosen as the capital. (See *FREDERICTON*.) Its growth was checked by several destructive fires, especially that of June 1877. It was rebuilt of stone and brick.

The river enters the harbour through a rocky gorge, which is passable by ships during each ebb and flow of the tide. Saint John is the Atlantic terminus of the Canadian Pacific railway and one of the termini of the Canadian National railways, and joins with Halifax in being one of the chief winter ports of Canada. The harbour is deep, sheltered, free from ice and always accessible, with 32 ft. of water at low tide and 58 to 60 ft. at high tide. It is the distributing centre for a large district, rich in agricultural produce and lumber. It also has an important fishery trade. There are textile works and engineering shops. Among the exports are timber, pulp, fish, cattle, apples, dairy produce, metal manufactures and motorcars. The industries include a structural steel plant with two dry docks, each 1,150 ft. long. Saint John has a municipal airport for both land and sea planes and air service connecting with Trans-Canada at Moncton.

ST. JOHN, one of the Virgin Islands of the United States, formerly the Danish West Indies. It lies 4 mi. E. of St. Thomas and is 10 mi. long and 2½ mi. wide; area, 19 sq. mi. It is a mass of rugged mountains, the highest of which is Camel mountain (1,270 ft.). Although one of the best watered and most fertile of the Virgin group, it has little commerce. It is a free port, and possesses in Coral bay the best harbour of refuge in the Antilles. The village of Cruz Bay lies on the northern coast. Pop. (1950) 749.

ST. JOHN, a river of New Brunswick, Canada, rising in two branches, one in the state of Maine, U.S., and the other in the province of Quebec. The U.S. branch, known as the Walloostook, flows northeast to the New Brunswick frontier, where it turns southeast and for 80 mi. forms the international boundary. A little above Grand Falls the St. John enters Canada and flows through New Brunswick into the Bay of Fundy at St. John. Its total length is 399 mi. It is navigable for large steamers as far as Fredericton (86 mi.), and in spring and early summer for smaller vessels to Grand Falls (220 mi.), where a series of falls and rapids form a descent of 70 to 80 ft. Above the falls it is navigable for 65 mi. It drains an area of 26,000 sq. mi., of which half is in New Brunswick, and receives numerous tributaries, of which the chief are the Aroostook, Allagash, Madawaska (draining Lake Temiscouata in Quebec), Tobique and Nashwaak.

ST. JOHN OF JERUSALEM, KNIGHTS OF THE ORDER OF THE HOSPITAL OF, known also later as the **KNIGHTS OF RHODES** and the **SOVEREIGN ORDER OF THE KNIGHTS OF MALTA**. The history of this order divides itself naturally into four periods: (1) from its foundation in Jerusalem during the first crusade to its expulsion from the Holy Land after the fall of the Latin kingdom in 1291; (2) from 1309–1310, when the order was established in Rhodes, to its expulsion from the island in 1522; (3) from 1529 to 1798, during which its headquarters were in Malta, and (4) its modern development, as reconstituted after its virtual destruction in 1798.

Early Development.—Ever since Jerusalem became a centre of Christian pilgrimage, a hospital or hospice for pilgrims had existed there; and early in the 11th century one of these was restored, served by Benedictines and later dedicated to St. John the Baptist. When, in 1099, the crusaders surrounded the Holy City, the head of this hospital was a certain Gerard (*q.v.*) who is said to have assisted them during the siege. After the capture of the city he used his popularity to enlarge and reconstitute the hospital and adopted for his order the Augustinian rule. Donations and privileges were thereafter showered upon the new establishment in both Syria and Europe. In 1113 Pope Paschal II took the order and its possessions under his immediate protection (bull of Feb. 15 to Gerard), his act being confirmed in 1119 by Calixtus II and subsequently by other popes. Gerard was indeed, as Pope Paschal called him, the institutor of the order, if not its founder. It retained, however, during his lifetime its purely eleemosynary character. The armed defense of pilgrims may have been part of its functions, but its organization as an aggressive military force was the work of Raymond du Puy who succeeded as grand master on the death of Gerard (Sept. 3, 1120). The statesmanlike qualities of Raymond rendered his long mastership epoch-making for the order; and from 1137, when the knights accepted custody of the newly fortified castle of Bait Jibrin, they took a regular part in the wars of the Cross. During the second crusade Raymond was present at the council of the leaders held at Acre in 1148, which resulted in the ill-fated expedition against Damascus. The failure at Damascus was repaired five years later by the capture of Ascalon (Aug. 1153), in which the grand master and his knights had a conspicuous share.

Meanwhile, in addition to its ever-growing wealth, the order had received from successive popes privileges which rendered it, like the companion order of the Temple, increasingly independent of and obnoxious to the secular clergy. During the 30 years of Raymond's rule the hospital, which Gerard had instituted to meet a local need, had become universal, and establishments were formed east and west. After Oct. 1158, when his presence is attested at Verona, this master builder of the order disappears from history; he died some time between this date and 1160 when the name of another grand master, Gilbert d'Assailly, appears.

Organization of the Order.—The rule of the hospital, as formulated by Raymond du Puy, was based upon that of the Augustinian canons (*q.v.*). Its further developments, of which only the salient characteristics can be mentioned here, were closely analogous to those of the Templars (*q.v.*), whose statutes regulating the life of the brethren, the terms of admission to the order, the maintenance of discipline and the scale of punishments, cul-

minating in expulsion are, *mutatis mutandis*, closely paralleled by those of the Hospitallers.

Within the order were the three classes of knights, chaplains and serving brothers. The dominant class was that of the knights, in whose hands lay all power within the order. At its head was the master who held office for life. His powers were limited only by the statutes and customs and by the chapter general which, however, was only an occasional body summoned by himself. He was assisted in the exercise of his authority by the great officers of the order—prior, preceptor, marshal, hospitaller, drapier and treasurer—to whom were added, shortly after 1300, the turcopoler and admiral. The unit of provincial administration was the priory (England constituted one, while in Italy there were seven), and within each of these there were a number of commanderies (there were 36 in England at the end of the middle ages). As the order increased in size, the brethren came to be grouped in nations or tongues, and in the 14th century the division of the order into its seven tongues (Provence, Auvergne, France, Italy, Spain, England, Germany) was a recognized feature of its constitution. One of the great officers was placed at the head of each tongue; priors and commanderies were reserved for the brethren of the tongue concerned, and disputes were settled within the assembly of the tongue. From the latter middle ages the Hospitallers were rather a federation of national societies than a united cosmopolitan order.

In two important respects the knights of St. John differed from the Templars. The latter were a purely military organization; the Hospitallers, on the other hand, were at the outset preponderantly a nursing brotherhood, and though this character was subordinated during their later period of military importance, it never disappeared. It continued to be a rule of the order that in its establishments it was for the sick to give orders, for the brethren to obey. The chapters were largely occupied with the building, furnishing and improvement of hospitals, to which were attached learned physicians and surgeons who had the privilege of eating with the knights. The revenues of particular properties were charged with providing luxuries (*e.g.*, white bread) for the patients, and the various provinces of the order with the duty of forwarding blankets, clothes, wine and food for their use. The Hospitallers, moreover, encouraged the affiliation of women to their order, which the monastic and purely military rule of the Templars sternly forbade.

The Knights in Syria.—As the wealth and military resources of the orders grew, so did their influence in the affairs of the Latin states. The military feudal class among the Syrian Franks had never been sufficiently numerous to ensure effective settlement, and it was continuously impoverished by a variety of causes. As a result the orders acquired castles which lay magnates could no longer afford to maintain, and with the buildings the knights secured the appurtenances—lands and rights over tenants. The Hospitallers acquired Bait Jibrin in 1137, Krak (Crac) des Chevaliers and an extensive border area to the north and east in 1142, Arca and Jebel Akkar in 1170, Chastel Ruge in 1177 and Margat, which later became the headquarters of the order, in 1186. To this extent the military orders were replacing the feudal aristocracy as landlords. It was a change in the balance of power which weakened the monarchy of Jerusalem, for the orders were not bound to the king by the same ties of allegiance as were the feudatories.

The role which the orders were enabled to play in the affairs of the kingdom was reflected in events. The Templars refused to take part in invasions of Egypt led by King Amalric I, but the Hospitallers encouraged the project, supplied the king with an important contingent of his army and bargained with him for the price of that support almost as an independent power. In the problems of regency and succession which followed the death of Amalric in 1174, the masters of the military orders emerged as figures of the first importance, and when Baldwin V died in 1185 all the castles of the kingdom were given into their custody.

These problems weakened the kingdom at a time when Saladin's power was advancing and prepared the way for the disasters of 1187: the annihilation of the Christian army at Hattin and the loss of Jerusalem (*see* **CRUSADES**). The Hospitallers played a full

part in the vain military effort to avert these defeats. After Hattin, Saladin spared the lives of nearly all his prisoners except the Templars and Hospitallers whom he massacred in cold blood. This uncharacteristic act is a measure of the respect in which the knights were held by the Moslems. The Hospitallers were again prominent in the ensuing third crusade and especially distinguished themselves in King Richard of England's victory at Arsuf (1191). During the following decade there was a steady development of the property and privileges of the order.

During the 13th century the Latin states in Syria were less securely established than they had been during the 12th century: the settlement grew progressively weaker until, with the loss of Acre in 1291, it was finally extinguished. The authority of the monarchy was compromised by the succession of women and by the civil war provoked by the conduct of the emperor Frederick II in Syria and Cyprus, and was never subsequently resurrected. The way was left clear for certain groups, such as baronial families, Italian merchant communities and the military orders, to follow their particular interests unchecked by higher authority.

In this way the Hospitallers played a part in weakening Latin Syria. They were engaged in frequent disputes with dioceses and with the Templars. From 1199, in opposition to the Templars, they supported an Armenian claimant to the principality of Antioch and were not reconciled to its prince Bohemund IV until 1231. They held aloof from the efforts of Frederick II to recover Jerusalem. In 1240-41 they and the Templars gave differing advice to the crusaders Thibaut IV of Champagne and Richard of Cornwall in their efforts to negotiate a truce with the Moslems. The two orders again took different sides in the war between the Venetians and Genoese which devastated Acre between 1256 and 1268. In 1236 it had come to the attention of Pope Gregory IX that, in pursuance of their own private quarrels, the knights were contemplating alliance with the sect of the Assassins, and he sternly rebuked them both on this account and because of their backsliding from the ideals of their order (*see* his letters translated in E. J. King's *The Knights Hospitallers in the Holy Land*, pp. 234-236).

It must be emphasized that in these respects the knights were no worse than their contemporaries in Syria and that there is another side to the picture. The order was to the fore in all the major attacks made on the Moslems during the 13th century. It played a distinguished part in the invasions of Egypt by the forces of the fifth crusade in 1218-21 and by those of St. Louis in 1249-50. It joined the expeditions led by Andrew II of Hungary (1217) and by Thibaut of Champagne (1239). It maintained the great strongholds of Krak and Margat, which up to their loss (1271 and 1285 respectively) continued to serve as bulwarks against Moslem attack and as bases from which Christian raids were organized. The order accepted the custody of the exposed city of Ascalon in 1243 and that of the fortified monastery on Mount Thabor in 1257. At all times it spared neither men nor resources to hold the Moslems at bay.

In the years 1258-60 there were signs of the military orders composing their differences, but it was already too late. In 1260 Bibars, the Mameluke sultan of Egypt, was already free from the Tatar threat, and in 1265 he began the series of conquests which culminated in the fall of Acre in 1291 and in the expulsion of the Franks from Syria. The headquarters of the order were moved to Cyprus. Under a great master Guillaume de Villaret, the order was drastically reformed by a series of statutes between 1301 and 1304. In 1308 a new chapter in its history began when the knights conquered Rhodes from the Byzantines: the order was to rule that island as a sovereign power for more than two centuries.

The Knights in Rhodes.—The character and aims of the order were profoundly affected by their newly acquired sovereignty. The Hospitallers ruled an island too narrow to monopolize their energies but occupying a position of vast commercial and strategic importance. Close to the Anatolian mainland, commanding the outlet of the archipelago and lying in the direct trade route between Europe and the east, Rhodes had become the chief distributing point in the lively commerce which, in spite of papal objections, Christian traders maintained with the Moslem states; the

Hospitallers were thus divided between their duty as sovereign, which was to watch over the interests of their subjects, and their duty as Christian warriors, which was to combat the infidel. In view of the fact that the crusading spirit was everywhere declining, it is not surprising that their policy was henceforth directed less by religious than by political and commercial considerations. Not that they altogether neglected their duty as protectors of the Cross: they became a naval power and maintained a fleet of galleys until the loss of Malta; their consuls in Egypt and Jerusalem watched over the interests of pilgrims; their hospitals were still maintained for the service of the sick and the destitute. But, side by side with this, secularization proceeded apace; even toward the infidel the attitude of the knights was necessarily influenced by the fact that their supplies of provisions were mainly drawn from the Moslem mainland. By the 15th century their crusading spirit had grown so weak that they even attempted to negotiate a commercial treaty with the Ottoman sultan; the project broke down on the refusal of the knights to accept the sultan's suzerainty.

Throughout its occupation of Rhodes, the hospital was always ready to give all possible support to any major attack on the Moslems. In 1344 its galleys took part in the conquest of Smyrna, a town which the knights continued to hold until 1402. They contributed to the force that Peter I of Cyprus led to the temporary capture of Alexandria in 1365. A contingent was at the disaster of Nicopolis in 1396. They showed courage and great military skill in defending Rhodes. In 1440 and 1444 they repelled attacks launched from Egypt. In 1480 the garrison, commanded by the grand master Pierre d'Aubusson, held at bay an Ottoman fleet and army. A still greater attack was mounted in 1522 by Suleiman the Magnificent. Reinforcements failed, the Christian powers sent no assistance, and in the next year the knights capitulated, withdrawing with all the honours of war to Crete. Their occupation of Rhodes had postponed for about two centuries the appearance of the Ottomans as a first-rate naval power in the Mediterranean, a debt which Europe never sufficiently acknowledged. When the emperor Charles V received news of the final siege he exclaimed: "Nothing in the world has been so well lost as Rhodes!" But he would give no help in the plans for its recovery, but instead he gave to the hospital the island of Malta and the fortress of Tripoli.

The Knights in Malta.—The settlement of the Hospitallers in Malta was contemporaneous with the Reformation, which profoundly affected the order. In England the refusal of the grand prior and knights to acknowledge the royal supremacy led to the confiscation of their estates by Henry VIII, and though not formally suppressed, the English organization practically ceased to exist. The knights of Malta, as they came to be known, nonetheless continued their vigorous warfare. In 1550 they defeated the redoubtable corsair Dragut, but in 1551 their position in Tripoli, always precarious, became untenable and they capitulated to the Turks and concentrated their forces in Malta. On May 18, 1565, the Ottoman fleet appeared off the island and one of the most famous sieges in history began. It was ultimately raised in September on the appearance of a large relieving force dispatched by the Spanish viceroy of Sicily, after 25,000 of the enemy had fallen. The memory of the grand master Jean Parisot de la Valette, the hero of the siege, who died in 1568, is preserved in the city of Valette which was built on the site of the struggle.

In 1571 the knights shared in the victory of Lepanto. This crowning success, however, was followed during the 17th century by a long period of depression due to internal dissensions and culminating during the Thirty Years' War, the position of the order being seriously affected by the terms of the peace of Westphalia (1648). The character of the order at this date became more exclusively aristocratic, and its wealth, partly acquired by commerce and partly derived from the contributions of the commanderies scattered throughout Europe, was enormous. The wonderful fortifications, planned by French architects and improved by every grand master in turn, the magnificent churches, chapels, *auberges* and the great library founded in 1650 were the outward and visible signs of the growth of a corresponding luxury in the private life of the order. Nevertheless, under Ramon Perellos

(1697–1720) and Antonio Manoel de Vilhena (1722–36), the knights restored their prestige in the Mediterranean by victories over the Turks. In 1741 Emmanuele Pita, a man of strong character, became grand master. He expelled the Jesuits, resisted papal encroachments on his authority and, refusing to summon the general chapter, ruled as a despot. Emanuel, prince de Rohan (d. 1797), who was elected grand master in succession to Francisco Jimenes de Texada in 1775, made serious efforts to revive the old spirit of the order. The last great expedition of the Maltese galleys was worthy of its noblest traditions. They were sent to carry supplies for the sufferers from the great earthquake that destroyed Messina in 1783. They had long ceased to be effective fighting ships and survived mainly as gorgeous state barges in which the knights sailed on ceremonial pleasure trips.

The French Revolution was fatal to the order. Rohan made no secret of his sympathy with the losing cause in France, and Malta became a refuge-place for the *émigrés*. In 1792 the vast possessions of the order in France were confiscated; six years later the Directory resolved on the forcible seizure of Malta itself. When Napoleon occupied the island on his way to Egypt in 1798 the grand master Ferdinand von Hompesch organized no resistance, and the knights' long rule of the island came to an end. With this the history of the order of St. John practically ends.

The Order in Modern Times.—After their expulsion from Malta, the knights ceased to be a territorial power and lost their *raison d'être* as a military order. After 1814 Malta was retained by the British, and subsequent French expansion into North Africa extinguished the Barbary corsairs. But the order continued to exist, although much reduced in size, and to fulfil the original purpose of its founder. Since its first beginnings it had never ceased to serve the poor and sick, and from the early 19th century the order, in all its forms, has continued to discharge this Christian work in accordance with its own splendid tradition.

After establishing itself temporarily, first at Catania and then at Ferrara, the order moved to Rome in 1834, where its headquarters remained. The pope, as first superior of the order, appointed a grand master in 1801, but between 1805 and 1879 appointed only lieutenant masters. But the renown gained by the order in the relief of suffering was such that in 1879 the pope re-established the mastership. The third of the restored line, Prince Ludovico Chigi della Rovere Albani, died in 1951. The order, organized into the Italian and German tongues, still retained certain diplomatic privileges and at mid-20th century had accredited representatives with five governments, including that of Spain.

In addition, there remained two orders of St. John of Jerusalem of Protestant origin. During the Reformation in Germany the master of the knights of Brandenburg adopted the new religion. They remained divided from the main order, but joined with it again in 1763. This bailiwick of Brandenburg was suppressed in 1810, but it was restored by the king of Prussia 43 years later. It was not recognized by the order in Rome, but continued as an independent Protestant body. It supports a number of hospitals in Germany and in many respects provided a model for the second Protestant order, that in England.

The grand priory of England, like other religious orders in that country, came to an end as a result of the religious settlement of Henry VIII and Elizabeth I. The grand masters in Malta continued to appoint titular grand priors of England, but the order had neither roots nor property there. Its restoration in the 19th century was due to the initiative taken by the French knights, whose organization was temporarily revived between 1814 and 1818. The Greek War of Independence raised hopes that the order might regain Rhodes; English support was needed, and as a means to this end the French worked for the revival of the English priory, so that in 1837 Sir Robert Peel became prior of the Venerable Tongue of England. The English knights hoped to become a Protestant branch of the main order, but the lieutenant masters in Rome ruled that Protestants could not be admitted, and in 1858 the English knights proclaimed themselves an independent order. By its constitution of 1871 (which subsequently was little amended) it became the Order of St. John of Jerusalem in Eng-

land under the headship of its own prior. Between 1861 and 1888 that office was held by William Drogo Montagu, seventh duke of Manchester, and during that period the philanthropic work of the order assumed the modern forms: the life saving medal was instituted in 1874; the ophthalmic hospital was founded in Jerusalem in 1882; and the St. John's Ambulance brigade followed in 1888, growing from an association which the order had founded ten years earlier. Also in 1874, the order acquired the site and remains of the priory at Clerkenwell which had been the headquarters of the Hospitaliers in England from the 1140s until 1559. It became an imperial order, incorporated by royal charter as the Order of the Hospital of St. John of Jerusalem in the British realm. The reigning monarch is its sovereign head, and it has subordinate commanderies in certain of the dominions. From 1888 the prince of Wales (after 1901 King Edward VII) was its grand prior, until in 1910 that office was assumed by Arthur duke of Connaught.

The British order added to its lustre by outstanding work in the medical field in World Wars I and II.

BIBLIOGRAPHY.—For further study the work of J. Delaville Le Roux is essential; his great edition of the *Cartulaire général des Hospitaliers de Saint-Jean de Jérusalem, 1100–1310*, 4 vol. (Paris, 1894–1904) is of fundamental importance, and his *Les Hospitaliers en Terre Sainte et à Chypre, 1100–1310* (Paris, 1904) is based on his own study of the cartulary. See also his *Les Hospitaliers à Rhodes jusqu'à la mort de Philibert de Naillac, 1310–1321* (Paris, 1913). Among the best works in English are J. M. Kemble's introduction to *The Knights Hospitaliers in England*, Camden Soc. (London, 1857); W. Porter, *History of the Knights of Malta*, 2 vol. (London, 1853; 2nd ed., 1883); and E. J. King, *The Knights Hospitaliers in the Holy Land* (London, 1931) and *The Knights of St. John in the British Empire* (London, 1934).

(R. C. SMC.; X.)

ST. JOHNS (ST. JEAN), a city and port of entry of Quebec, Canada, and capital of St. Johns county, 27 mi. S.E. of Montreal by rail, on the Richelieu river and at the head of the Chambly canal. Pop. (1951), 19,305. A large export trade in lumber, grain and farm produce is carried on, and its mills and factories produce flour, silk, pottery, hats, etc. Three railways, the Canadian National, Canadian Pacific and Central Vermont, enter St. Johns. On the opposite bank of the river is the flourishing town of St. Jean d'Iberville (usually known simply as Iberville), connected with St. Johns by several bridges.

ST. JOHN'S, the capital of Newfoundland, a province of Canada, on the east coast of the island, in the peninsula of Avalon, in 47° 33' 54" N. and 52° 40' 18" W. It is the most easterly city of the American continent. Pop. (1951) 52,873, mostly of Irish descent and Roman Catholics. It stands on rising ground on the north side of a landlocked harbour, which opens suddenly in the lofty coast. The entrance, known as The Narrows, guarded by Signal hill (320 ft.) and South Side hill (620 ft.), is about 1,400 ft. wide, narrowing to 600 ft. between Pancake and Chain rocks. At the termination of the Narrows the harbour trends suddenly to the west, thus completely shutting out the ocean swell. The port has sufficient water for vessels of 30 ft. draught. There is good wharf accommodation, with a graving and a floating dock.

St. John's was first settled by Devonshire fishermen early in the 16th century. It was twice sacked by the French, and captured by them in the Seven Years' War (1756), but recaptured in the same year, and remained in British possession. Both in the American Revolution and the War of 1812 it was the headquarters of the British fleet. The old city, built entirely of wood, was twice destroyed by fire (1816–1817 and 1846). Half of it was again swept away in 1892, but new and more substantial buildings were erected, notably the Anglican and Roman Catholic cathedrals. Education is in the hands of the various religious bodies. St. John's practically monopolizes the commerce of the island, being the centre of the cod, seal and whale fisheries. The chief industries are connected with the outfitting of the fishing vessels, or with the disposal and processing of their catch. Although nearly all the commerce of the island is sea-borne a narrow-gauge railway (operated by the Canadian National system) runs from St. John's to Port aux Basques on the southwest corner of the island, from whence a railway ferry connects with Sydney, N.S. St. John's is also on Trans-Canada Air Lines flights. The city imports iron,

coal, cattle and general produce, and exports fish, oil, wood pulp and paper.

SAINT JOHNSBURY, a town of northeastern Vermont, U.S., the county seat of Caledonia county, and a village of the same name; 37 mi. E.N.E. of Montpelier, on the Passumpsic river and federal highways 2 and 5. It is served by the Canadian Pacific, the Maine Central and the St. Johnsbury and Lamoille County railways. Pop. (1950) 7,370; (1940) 7,437. It is the home of the Fairbanks platform scale, invented there in 1830 by Thaddeus Fairbanks and manufactured there from 1837, and of the largest maple-sugar plant in the country. The town was settled in 1786 by Jonathan Arnold, and was named after Hector St. John de Crèvecoeur, author of *Letters from an American Farmer* (1782). The village was incorporated in 1853. In 1923 the town adopted a city-manager government.

ST. JOHN'S WORT, the general name for species of *Hypericum* (family Hypericaceae), especially *H. perforatum*, small shrubby plants with slender stems, sessile opposite leaves which are often dotted with pellucid glands, and showy yellow flowers. *H. androsaemum* is tutsan (*Fr. tout saine*), so called from its healing properties. *H. calycinum* (Rose of Sharon), a creeping plant with large almost solitary flowers 3 to 4 in. across, is a plant of southeast Europe which has become naturalized in Great Britain in various places in hedges and thickets. The genus comprises about 250 species of herbs or undershrubs, native mostly to temperate and subtropical regions. About 30 species, chiefly herbaceous, are found in North America, widely distributed across the continent but most numerous in the eastern states and adjacent Canada. Many species are cultivated.

ST. JOSEPH, a city of southwestern Michigan, U.S., on Lake Michigan, at the mouth of the St. Joseph river and immediately west of Benton Harbor; a port of entry and the county seat of Berrien county. It is on federal highways 12, 31 and 33, and is served by the New York Central, the Chesapeake and Ohio and the South Shore Electric railways, and by motorbus lines.

The population was 10,223 in 1950 and 8,963 in 1940 by the federal census. St. Joseph and Benton Harbor, connected by a wide thoroughfare and a ship canal, are practically one community, with a combined population estimated at 35,000, which is doubled in summer by visitors. The surrounding country is the famous Michigan fruit belt. The traffic of the harbour in 1949 amounted to 372,747 tons.

St. Joseph has a variety of industries employing more than 6,000 persons. Principal manufactured products are washing machines, castings, industrial rubber goods, paper boxes, pistons and piston pins, printing products and hosiery.

In 1679 La Salle built Ft. Miami on or near the site of St. Joseph. The present city was settled in 1829, incorporated as a village in 1836 and chartered as a city in 1891.

ST. JOSEPH, a city of northwestern Missouri, U.S., on the east bank of the Missouri river, 55 mi. N.W. of Kansas City; a port of entry and the county seat of Buchanan county. It is on federal highways 36, 59, 71, 169 and 275; and is served by the Burlington Route, the Chicago Great Western, the Missouri Pacific, the Rock Island, the Santa Fe and the Union Pacific railways, and by Mid-Continent Airlines. Pop. (1950) 78,588; (1940) 75,711. The city covers 15 sq.mi. on bluffs above the river, graded down considerably in the business and eastern residential section. There are numerous public and parochial schools, churches, hotels with 2,200 guest rooms, and hospitals. Just east of the city is a state hospital for the insane (1874). The leading industries are livestock feeding and meat packing, grain production and milling; the principal products are paper tablets, flour and mixed feeds, cereals, pharmaceuticals, beer, garments, candy, jewellery, mattresses, dairy products, caskets, cabinets, brick, livestock serum, Christmas decorations and artificial trees, structural steel, tile, cinder blocks, tents, chemicals, vinegar, millinery, caps, hats, textiles, canned foods, wire rope, fabricated houses, plastic signs, fluorescent fixtures and battery cables. The daily *St. Joseph News-Press* was established in 1903 by a merger of the *Daily News* and *Evening Press*.

In 1826 Joseph Robidoux, a French Canadian, established an

Indian trading post there, known as Blacksnake Hills. After the "Platte Purchase" in 1836 other settlers came in, and in 1843 Robidoux laid out a town, which he named in honour of his patron saint. It became the county seat in 1846 and in 1851 was chartered as a city. It developed early into an important trading centre, and was a busy outfitting point during the years of heavy travel by prospectors and other emigrants to the Rocky mountains and the Pacific coast. On April 3, 1860, the first rider of the "Pony Express" galloped out of St. Joseph (the eastern terminus of the service during the 18 months of its operation), and a year later Lincoln's inaugural address was carried through to Sacramento (nearly 2,000 mi.) in 7 days and 17 hours. During the Civil War St. Joseph was held continuously by the Unionists, but local sentiment was bitterly divided. After the war a period of rapid development set in, which increased the population from 8,932 in 1860 to 19,565 in 1870, and to 77,403 in 1910.

SAINT-JUST, ANTOINE LOUIS LÉON DE RICHEBOURG DE (1767-1794), French revolutionary leader, was born at Decize in the Nivernais on Aug. 25, 1767. At the outbreak of the Revolution he was elected an officer in the National Guard of the Aisne. He assumed a stoical demeanour united to a tyrannical policy. He entered into correspondence with Robespierre, who, flattered by his worship, admitted him to his friendship. Thus supported, Saint-Just became deputy to the National Convention, where he made his first speech on the condemnation of Louis XVI—gloomy, fanatical, remorseless in tone—on Nov. 13, 1792. In the convention, in the Jacobin club, and among the populace he was dubbed the "St. John of the Messiah of the People." In the name of the Committee of Public Safety he drew up reports to the convention upon the absorbing themes of the overthrow of the party of the Girondins (report of July 8, 1793), of the Hébertists, and finally, of that denunciation of Danton which consigned him and his followers to the guillotine. Camille Desmoulins said of Saint-Just—"the youth with the beautiful countenance and the long fair locks—"He carries his head like a Holy Sacrament." "And I," he savagely replied Saint-Just, "will make him carry his like a Saint Denis." The threat was not vain: Desmoulins accompanied Danton to the scaffold.

Saint-Just proposed that the National Convention should, through its committees, direct all military movements and all branches of the government (report of Oct. 10, 1793). This was agreed to, and Saint-Just was despatched to Strasbourg to superintend the military operations. It was suspected that the enemy without was being aided by treason within. Saint-Just "organized the Terror," and soon the heads of all suspects sent to Paris were falling under the guillotine. But there were no executions at Strasbourg, and Saint-Just repressed the excesses of J. G. Schneider, who, acting as public prosecutor to the revolutionary tribunal of the Lower Rhine, had ruthlessly applied the Terror in Alsace. Schneider was sent to Paris and guillotined. The conspiracy was defeated, the frontier was delivered and Germany invaded. On his return Saint-Just was made president of the convention. Later, with the army of the north, he placed before the generals the dilemma of victory over the enemies of France or trial by the dreaded Revolutionary tribunal; and before the eyes of the army he organized a force charged with the slaughter of those who should seek refuge by flight. He succeeded again, and Belgium was gained for France (May, 1794).

Meanwhile affairs in Paris looked gloomier than ever, and Robespierre recalled Saint-Just to the capital. Saint-Just proposed a dictatorship. At the famous sitting of the 9th Thermidor, he presented as the report of the committees of General Security and Public Safety a document expressing his own views, a sight of which had been refused to the other members of committee the previous evening. Then the storm broke. He was interrupted, and the sitting ended with an order for Robespierre's arrest, which entailed that of Saint-Just. On the following day, July 28, 1794, 22 men, nearly all young, were guillotined. Saint-Just maintained his proud self-possession to the last.

See *Oeuvres de Saint-Just, précédées d'une notice historique sur sa vie* (1833-34); E. Fleury, *Études révolutionnaires* (2 vols., 1851), with which cf. articles by Sainte-Beuve (*Causeries du lundi*, vol. v), Cuvil-

lier-Fleury (*Portraits politiques et révolutionnaires*); E. Hamel, *Histoire de Saint-Just* (1859), which brought a fine to the publishers for outrage on public decency; F. A. Aulard, *Les Orateurs de la Législative et de la Convention* (2nd ed., 1905); M. Lénier, *Saint-Just* (1922). *The Œuvres complètes de Saint-Just* were edited with notes by C. Vélajay (1908).

ST. JUST (St. Just in Penwith), a market town of Cornwall, England, 7 mi. W. of Penzance. Pop. of urban district (1951) 4,122. Area 12 sq. mi. The town lies in a wild district 1 mi. inland from Cape Cornwall, which is 4 mi. N. of Land's End.

ST. KILDA (Gaelic *Hirta*, "the western land"), largest of a small group of about sixteen islets of the Outer Hebrides, Inverness-shire, Scotland. It is included in the civil parish of Harris, and is situated 40 mi. W. of North Uist. It measures 3 mi. from E. to W. and 2 mi. from N. to S. Except at the landing place on the southeast, the cliffs rise sheer out of deep water, and on the northeast side the highest eminence in the island, Conaigher, forms a precipice 1,220 ft. high. The inhabitants, an industrious Gaelic-speaking community who numbered 36 in 1930, were that year evacuated at their own request and were settled mainly in Morvern parish, Co. Argyll. The island is practically cut off from the world for eight months of the year. It has been in the possession of the Macleods for hundreds of years except for the period 1779–1871.

ST. KITTS or ST. CHRISTOPHER, an island in the British West Indies, forming, with Nevis and Anguilla, one of the presidencies in the colony of the Leeward Islands. It is a long oval with a narrow neck of land projecting from the southeastern end, total length 23 mi., area 68 sq. mi. Mountains traverse the central part from northwest to southeast, the highest being Mount Misery (3,711 ft.). The island is well watered, fertile and healthy, and its climate is cool and dry (temperature between 78° and 85° F.; average annual rainfall 38 in.). The rim of land formed by the skirts of the mountains, and the valley of Basseterre are cultivable. The higher slopes of the hills afford pasturage; the summits are crowned with dense woods. Sugar is the chief product and export, followed by sea-island cotton. Primary education is free and compulsory. In 1950 there were 17 government and 2 subsidized private primary schools and three government-aided secondary schools. Basseterre (pop. 12,194), on the southwest coast, is the island's port as well as capital of the presidency. St. Kitts was discovered in 1493 by Columbus but was not occupied until 1623, when Thomas Warner made the first English settlement in the West Indies there. It was seized by the French three times between 1666 and 1782 and held for short periods, but remained British from 1783.

The island had a population of 29,818 by the 1946 census, mostly Negro. (L. W. BE.)

SAINT-LAMBERT, JEAN FRANÇOIS DE (1716–1803), French poet, was born at Nancy on Dec. 26, 1716. He entered the army and, when Stanislaus Leszczyński was established in 1737 as duke of Lorraine, he became an official at his court at Lunéville. He left the army after the Hanoverian campaign of 1756–57, and devoted himself to literature, producing a volume of descriptive verse, *Les Saisons* (1766), now never read, many articles for the *Encyclopédie*, and some miscellaneous works. He was admitted to the Academy in 1770. His fame, however, comes chiefly from his amours. He was already high in the favour of the marquise de Boufflers, Stanislaus's mistress, whom he addressed in his verses as *Doris* and *Thémire*, when Voltaire in 1748 came to Lunéville with the marquise du Châtelet. Her infatuation for him and its fatal termination are known to all readers of the life of Voltaire. His subsequent liaison with Madame d'Houdetot, Rousseau's Sophie, proved permanent. He published in 1798 the *Principe des moeurs chez toutes les nations ou catéchisme universel*, and published his *Œuvres philosophiques* two years before his death on Feb. 9, 1803. Madame d'Houdetot survived until Jan. 28, 1813.

See G. Maugras, *La Cour de Lunéville* (1904) and *La Marquise de Boufflers* (1907); also the literature dealing with Rousseau and Voltaire.

ST. LAURENT, LOUIS STEPHEN (1882–), Canadian statesman, born on Feb. 1, 1882, at Compton, Que., studied

at St. Charles college, Sherbrooke, and Laval university, Quebec, Que. Called to the bar at Quebec in 1905, he practised law until Dec. 10, 1941, when he entered federal politics as minister of justice and attorney general. He was later secretary of state for external affairs, and on Nov. 15, 1948, became the 17th prime minister of Canada.

St. Laurent was first elected to parliament as Liberal member for Quebec East on Feb. 9, 1942, and was returned in the 1945 and 1949 elections.

ST. LAWRENCE. The river St. Lawrence, in North America, with the five fresh-water inland seas (see GREAT LAKES), Superior, Michigan, Huron, Erie and Ontario, forms one of the great river systems of the world, having a length of 1,900 mi. from the source of the river St. Louis (which rises near the source of the Mississippi and falls into the head of Lake Superior) to Cape Gaspe, where it empties into the Gulf of St. Lawrence. The river is here considered as rising at the foot of Lake Ontario, where the name St. Lawrence is first applied to it.

The river, to the point where it crosses 45° N. in its north-easterly course, forms the boundary line between the state of New York and the province of Ontario; thence to the sea it is wholly within Canadian territory, running through the province of Quebec. At Point des Monts, 260 mi. below Quebec, it is 26 mi. wide, and where it finally merges into the Gulf of St. Lawrence, 150 mi. farther on, it is 90 mi. wide, this stretch being broken by the large island of Anticosti, lying in the mouth. The character of the river banks varies with the geological formations through which it runs. Passing over the Archaean rocks of the Laurentian from Kingston to Brockville the shores are very irregular, and the river is broken up by protrusions of granite and gneiss into a large number of picturesque islands, "The Thousand Islands," frequented as a summer resort. From Brockville to Montreal the river runs through flat-bedded Cambro-Silurian limestones, with rapids at several points, which are run by light-draught passenger boats. For the up trip the rapids are avoided by canalization. From Montreal to Three Rivers the course is through an alluvial plain overlying the limestones, the river at one point expanding into Lake St. Peter, 20 mi. long by 10 mi. wide, with a practically uniform depth of 10 ft. Below Three Rivers the banks grow gradually higher until, after passing Quebec through a cleft in slate rocks of Cambrian age, the river widens, washing the feet of the Laurentian mountains on its north shore; while a more moderately hilly country, terminating in the Shick-shock mountains of the Gaspé Peninsula, skirts its south shore.

From Kingston, at the head of the river, to Montreal (170 mi.), navigation is limited to vessels of 14 ft. draught. From Montreal to Quebec (160 mi.), a ship channel has been dredged to a depth of 30 ft.; below Quebec the river is navigable by vessels of any draught. The locks of the present canals are 45 ft. wide, with an available depth of 14 ft. and a minimum length of 270 ft.; but plans are under consideration for a new ship canal allowing vessels of 25 or 30 ft. draught to enter Lake Ontario, from which the new Welland canal of the same depth leads to the Upper Lakes.

In the stretch between Montreal and Quebec the ship channel is a national work, and improvements have been undertaken to secure everywhere a minimum depth of 30 ft. and a width of 450 ft. The river from Kingston to the sea is well supplied with aids to navigation. In the dredged portions lights are arranged in pairs of leading lights on foundations sufficiently high and solid to resist the pressure of ice movement, and there is an elaborate system of fog alarms, lighted and other buoys, as well as telegraphic, wireless and telephonic communication, storm signal, weather and ice-reporting stations and a lifesaving service.

Montreal, at the head of ocean navigation, the largest city in Canada, is an important distributing centre for all points in western Canada, and enjoys an extensive shipping trade with the United Kingdom. Quebec is the summer port used by the largest steamers in the Canadian trade. There are numerous flourishing towns on the river, from Kingston, a grain transferring port, to the sea. Large quantities of lumber are handled at mills along the river.

A natural highway between all points west of the Maritime Provinces and Europe, the St. Lawrence permits ocean traffic to penetrate 1,000 m. into the heart of the country. It is, moreover, the shortest freight route from the Great Lakes to Europe. From Buffalo to Liverpool via New York involves rail or barge canal transport of 496 m. and an ocean voyage of 3,034 nautical miles. Via Montreal there is a 14-ft. transport of 348 m. and river and ocean voyage of 2,772 nautical miles. From Quebec to Liverpool by Cape Race is 2,801 nautical miles, while the route by Belle Isle, more nearly a great circle course, usually taken between July and October, is only 2,633 nautical miles. On the other hand the St. Lawrence is not open in winter and the average time between the arrival of the first vessel at Montreal from sea and the departure of the last ocean vessel is seven months. From Kingston to Quebec the river freezes every winter, except at points where the current is rapid. Below Quebec, although there is border ice, the river never freezes. Efforts have been made to lengthen the season of navigation by using specially constructed steamers to break the ice; and it is claimed that the season of navigation could be materially lengthened, and winter floods prevented by keeping the river open to Montreal. Winter ferries are maintained at Quebec, between Prince Edward Island and Nova Scotia, and between Newfoundland and Sydney, Cape Breton.

The river above tide water is not subject to excessive flooding, the maximum rise in the spring and early summer months, chiefly from northern tributaries from the Ottawa eastward, being 10 feet. The Great Lakes serve as impounding reservoirs for the gradual distribution of all overflows in the west. At Montreal, soon after the river freezes, there is a local rise of about 10 ft. in the level in the harbour, caused by restriction of the channel by anchor ice; and in the spring when the volume is augmented, this obstruction leads to a further rise. To prevent flooding of the lower parts of the city a dike was built in 1887 along the river front, which prevented a serious flooding in 1899.

Tides enter the Gulf of St. Lawrence from the Atlantic chiefly through Cabot strait (between Cape Breton and Newfoundland), which is 75 m. wide and 250 fathoms deep. The tide entering through Belle Isle strait, 10 m. wide and 30 fathoms deep, is comparatively little felt. The greatest range is attained in Northumberland strait and in Chaleur bay, where it amounts to 10 feet. At the entrance to the estuary at Anticosti it has again the oceanic range of about 6 ft., and proceeds up the estuary with an ever-increasing range, which attains its maximum of 19 ft. at the lower end of Orleans island, 650 m. from the ocean at Cabot strait. At Quebec, 30 m. farther up, the range is nearly as great; but at 40 m. above Quebec it is largely cut off by the Richelieu Rapids, and finally ceases to be felt at Three Rivers, at the lower end of Lake St. Peter, 760 m. from the ocean.

The St. Lawrence provides ample water-power, which is being increasingly used, and from Lake Superior to the gulf there are numerous points on its tributaries where power has been developed.

Nearly all the rivers flowing into the St. Lawrence below Quebec are stocked with salmon. In the salt water of the gulf and lower river, mackerel, cod, herring, smelt, sea-trout, striped bass and other fish are caught for market.

The St. Lawrence is spanned by the following railway bridges: (1) A tuss bridge near Cornwall. (2) A tuss bridge with a swing at Coteau Landing. (3) A cantilever bridge at Caughnawaga. (4) The Victoria Jubilee bridge, 6,592 ft. long by 67 ft. wide, with 25 spans, double railway and trolley tracks, driveways and sidewalks. (5) A cantilever bridge, having a central span of 1,800 ft., crosses the river at a point 7 m. above Quebec. The southern half of the superstructure, while in course of erection in August 1907, fell, killing 78 men, and necessitating a serious delay in the completion of the work.

Discovery of St. Lawrence.—The St. Lawrence was discovered by Jacques Cartier, commissioned by the king of France to explore and trade on the American coast. Cartier entered the strait of Belle Isle in 1534; but Breton fishermen had previously resorted there in summer and penetrated as far as Brest, 11 leagues west of Blanc Sablon, the dividing line between Quebec

and Labrador. Cartier circled the gulf, but missed the entrance to the river. On his second voyage in 1536 he named a bay on the north shore of the gulf, which he entered on Aug. 10, the feast of St. Lawrence, *Baye Saint Laurents*, and the name gradually extended over the whole river, though Cartier himself always wrote of the River of Canada. Early in September, he reached "Canada," now Quebec, and on Oct. 2 reached Hochelaga, now Montreal. No permanent settlement was then made. The first, Tadousac, at the mouth of the Saguenay, was established by Champlain in 1603, and Quebec was settled by him in 1608. Between that time and 1616 Champlain explored the whole river system as far west as Lake Huron, reaching it by way of the Ottawa river, and taking possession of the country in the name of the king of France. It became British by the treaty of Paris, in 1763.

Dawson, *The St. Lawrence, its Basin and Border Lands* (New York, 1905) (historical); *St. Lawrence Pilot* (7th ed., Hydrographic Office, Admiralty, London, 1905); *Sailing Directions for the St. Lawrence River to Montreal* (United States Hydrographic Office publication, No. 108 D, Washington, 1907); *Annual Reports of the Canadian Departments of Marine and Fisheries, Public Works, and Railways and Canals, Ottawa; Transactions* (Royal Society, Canada, 1908-9), vol. v, sec. iii; T. C. Keefer on "Ice Floods and Winter Navigation of the St. Lawrence," *Transactions* (Canadian Society of Civil Engineers, Presidential Address of W. P. Anderson, on improvements to navigation on St. Lawrence, 1904). (W. F. A.)

ST. LEGER, SIR ANTHONY (c. 1496-1559), lord deputy of Ireland, eldest son of Ralph St. Leger, a gentleman of Kent, was educated abroad and at Cambridge. He quickly gained the favour of Henry VIII., and was appointed in 1537 president of a commission for inquiring into the condition of Ireland. In 1540 he was appointed lord deputy of Ireland. His first task was to repress disorder, and he at once proceeded with severity against the Kavanaghs, permitting them, however, to retain their lands, on their accepting feudal tenure on the English model. By a similar policy he exacted obedience from the O'Mores, the O'Tooles and the O'Conors in Leix and Offaly; and having conciliated the O'Briens in the west and the earl of Desmond in the south, the lord deputy carried an act in the Irish parliament in Dublin conferring the title of king of Ireland on Henry VIII. and his heirs. Conn O'Neill, who in the north had remained sullenly hostile, was brought to submission by vigorous measures. For the most part, however, St. Leger's policy was one of moderation and conciliation—rather more so, indeed, than Henry VIII. approved. St. Leger's personal influence was proved by an outbreak of disturbance when he visited England in 1544, and the prompt restoration of order on his return some months later. St. Leger retained his office under Edward VI., and again effectually quelled attempts at rebellion by the O'Conors and O'Byrnes. From 1548 to 1550, he was in England. He was recalled from Ireland in 1551. Under Mary he was again lord deputy from 1553 to 1556, when he was recalled on a charge of falsifying accounts. He died (March 16, 1559) before the investigation was completed.

His great-grandson, SIR WILLIAM ST. LEGER, took part in "the flight of the earls" (see O'NEILL) in 1607, and spent several years abroad. Having received a pardon from James I. and large grants of land in Ireland, he was appointed president of Munster by Charles I. in 1627. He supported Strafford, actively assisting in raising and drilling the Irish levies destined for the royalist service. In the great rebellion of 1641 he executed martial law in his province with the greatest severity, hanging large numbers of rebels, often without much proof of guilt. He was still struggling with the insurrection when he died at Cork on July 2, 1642.

A biography of Sir Anthony St. Leger will be found in *Athenae Cantabrigienses*, by C. H. Cooper and T. Cooper (Cambridge, 1858); see also *Calendar of State Papers relating to Ireland, Hen. VIII.—Elizabeth*; *Calendar of Letters and Papers of the Reign of Henry VIII.*; *Calendar of State Papers* (Domestic Series), Edward VI.—James I.; *Calendar of Carew MSS.*; J. O'Donovan's edition of *Annals of Ireland by the Four Masters* (7 vols., Dublin, 1857); Richard Bagwell, *Ireland under the Tudors* (3 vols., London, 1885-90); J. A. Froude, *History of England* (12 vols., London, 1867-70). edited by Sir J. T. Gilbert (Dublin, 1882-91).

ST. LEONARDS, EDWARD BURTENSHAW SUGDEN, 1st BARON (1781-1875), lord chancellor of Great Britain, was the son of a hairdresser of Duke street, Westminster, and was born on Feb. 12, 1781. After practising for some years as a conveyancer, he was called to the bar at Lincoln's Inn in 1807, having already published his well-known treatise on the *Law of Vendors and Purchasers* (14th ed., 1862). His parliamentary career was noticeable for his opposition to the Reform bill of 1832. He was appointed solicitor general in 1829, was lord chancellor of Ireland in 1834 and again from 1841 to 1846.

Under Lord Derby's first administration in 1852 he became lord chancellor and was raised to the peerage as Lord St. Leonards. In this position he devoted himself with energy and vigour to the reform of the law; in 1855 he was offered the great seal again, but had to refuse. He died at Boyle farm, Thames Ditton, on Jan. 20, 1875.

Lord St. Leonards was the author of various important legal publications, many of which have passed through several editions. See J. R. Atley, *Lives of the Victorian Chancellors*, vol. II.

ST. LIZIER-DE-COUSERANS, a village of southwestern France in the department of Ariège on the right bank of the Salat, 1 mi. N.N.W. of St. Girons. Pop. (1946) 1,008. St. Lizier, in ancient times one of the 12 cities of Novempopulania under the name of *Lugdunum Consorannorum*, was later capital of the Couserans and seat of a bishopric (suppressed at the Revolution) to the holders of which the town belonged. It has a cathedral of the 12th and 14th centuries with a fine Romanesque cloister, and also remains of Roman ramparts. The old episcopal palace (17th century) and the adjoining church (14th and 17th centuries), once the cathedral with its fine chapter hall (12th century), remain. The Salat is crossed by a bridge of the 12th or 13th century.

ST. LÔ, a town of northwestern France, capital of the department of Manche, 474 mi. W. by S. of Caen by rail. Pop. (1946) 5,659. St. Lô, called *Briovera* in the Gallo-Roman period, owes its present name to St. Lô (Laudus), bishop of Coutances (d. 568). In the middle ages St. Lô became an important fortress and a centre for the weaving industry. In 1574 the town, which had embraced Calvinism, was stormed by the Catholics and many of its inhabitants massacred. In 1800 it was made capital of its department in place of Coutances.

In the *hôtel de ville* is the "Torigni marble," the pedestal of an ancient statue, the inscriptions on which relate chiefly to the annual assemblies of the Gallic deputies held at Lyons under the Romans.

ST. LOUIS, the chief city of Missouri, U.S., is situated in a central position in the Mississippi drainage system, on the west bank of the river, about 20 mi. below its confluence with the Missouri, 200 mi. above the influx of the Ohio and about 1,270 mi. above the Gulf of Mexico. Area 61.37 sq.mi.; pop. (1950) 856,623; (1940) 816,048; (1930) 821,960; (1920) 773,897; (1910) 687,029; (1900) 575,238; (1890) 451,770 by the federal census. In 1940, 9.8% were foreign-born and 13.4% nonwhite.

Physical Features.—The city spreads along the river front for about 10 mi. and westward about 7 mi. Near the river the land rises rapidly for about one-third of a mile and then gradually, the uplands in the western part of the city being about 300 ft. above high-water mark. The river front and railroad routes have been the principal determining factors in the situation of industrial areas.

History.—In 1763 Gilbert Antoine de St. Maxent and Pierre Laclede Liguest, merchants of New Orleans, organized a firm which obtained from the French director-general of Louisiana the exclusive right to trade with the Missouri river Indians and with those west of the Mississippi above the Missouri. On Feb. 15, 1764, a party of workmen headed by Auguste Chouteau landed at the site previously selected by Laclede for his trading post and on the following day began work.

In addition to Laclede's original party, settlers came from Cahokia; others who desired to escape from English rule in the Illinois country came, and at the end of the first year 40 families

were living at St. Louis. The town was named by Laclede in honour of Louis XV, but for many years it was locally known as Laclede's village, and as Paincourt. Within its borders and in the general neighbourhood were several mounds erected by a prehistoric people.

In 1765, when the British military took possession of the Illinois country east of the Mississippi, Louis St. Ange de Bellverie, the French commandant, retired with his soldiers to St. Louis, and continued to rule over that part which had been ceded to Spain in 1763, but over which Spain had not asserted her authority. St. Ange was left in control by the Spanish until Feb. 7, 1770, when he was superseded by Don Pedro Píernas, the first Spanish lieutenant governor of Upper Louisiana.

In 1772 the village had a population of 399 whites and 198 slaves. During the administration of St. Ange only one street had a name, the Rue Royale, which now bears the prosaic name of Main street. Later the road which ran to the Bonhomme settlement (Walnut street) was known as the Rue Bonhomme; Market street was the Rue de la Tour; Second street, Rue de l'Eglise.

Modern Third street ran along rising ground in the rear of the village; there the barns were located and it was known as the Rue des Granges. West and northwest of the village lay the common fields, a fenced area in which each settler could, by permission, secure a lot for tillage. To the south and southwest the settlers enclosed a large tract for common pasturage and wood supply.

Excepting the Spanish officials, soldiers and a few traders, the inhabitants were French, and all were Roman Catholics. Families intermarried to such an extent that it is said that at the time of the transfer to the United States, two-thirds of the inhabitants were related. The traders carried on an extensive traffic with the Indian tribes along the Mississippi and Missouri rivers, and monopolized the trade with the Osage. Several large fortunes were made in furs and many families of St. Louis trace their ancestry back to the French fur traders of Spanish days.

The great market was New Orleans; thither the inhabitants shipped their surplus flour and packs of furs. Of the early traders the most prominent were the Chouteaus, Auguste and Pierre, who for many years enjoyed a monopoly of the Osage trade and built up a substantial fortune.

In May 1780 a force of British regulars and Indians descended on the city, but the Spanish soldiery and the settlers beat off the invaders. In 1803 about half of the inhabitants of Upper Louisiana were Americans, but few became residents of St. Louis. Under Spanish rule the town grew slowly and at the close of the regime contained only 180 houses, most of which were scattered along two streets which ran parallel with the river.

On March 9, 1804, Carlos Dehault DeLassus, the Spanish lieutenant governor, formally delivered Upper Louisiana to Capt. Amos Stoddard of the United States army, who had been authorized to act as agent and commissioner of the French republic; and on March 10 Stoddard took possession of Upper Louisiana for the United States. In 1804 congress created the district of Louisiana and placed it under the jurisdiction of the officers of Indiana territory. St. Louis became the governmental headquarters for the district. In 1805 the district of Louisiana was cut off from the jurisdiction of Indiana and made into the territory of Louisiana. St. Louis was again chosen as the seat of government. In 1812 the territory of Missouri was created, with St. Louis still the territorial capital.

In 1808 the town of St. Louis was created as a result of a petition of about 160 inhabitants, but it was not until 1809 that St. Louis was legally incorporated as a town by the court of common pleas. In 1808 the *Louisiana Gazette* was established, this being the first newspaper west of the Mississippi river. The publication of the territorial laws in 1808 marked the appearance of the first book to be printed in what is now the state of Missouri. By 1815 the population probably did not exceed 2,600. Not until 1819 were primitive fire engines supplied by private subscription. In 1821, at the time of the admission of Missouri to the union, there were 621 buildings and a population of 5,600. In 1822 the state legislature incorporated St. Louis as a city.

During the territorial period the composition of the population had undergone a distinct change. The French element, although still socially and financially prominent, was being engulfed by people from Virginia and Kentucky, but there was also a sprinkling of New Englanders and the Irish were numerous enough in 1819 to form a Hibernian Benevolent society.

The fur trade continued to be a principal source of wealth. Up to 1809, with the exception of the original firm of Maxent, Lacledé and Company, and the later Clamorgan company, the trade had been largely a matter of individual enterprise, aided occasionally by special concessions such as the Chouteau monopoly of the Osage trade.

But in 1807 Manuel Lisa ascended the Missouri river and built a post at the mouth of the Big Horn and, in 1809, formed the St. Louis Missouri Fur company. A rival organization headed by William H. Ashley in 1822 founded a company which later became known as the Rocky Mountain Fur company; the American Fur company, of which John Jacob Astor was the principal figure, established an office in St. Louis in 1822 and soon became the dominant factor in the fur trade. Astor retired in 1834 and the western department of the company was sold to Pratte, Chouteau and Company.

This organization continued to control most of the western fur trade until 1860. St. Louis was also the outfitting place for much of the trade with the North Mexican provinces.

After 1812 St. Louis attracted many settlers including a large foreign element, which, in the 1820s and 1830s was predominantly German. The failure of the reform movement of 1848 brought another tide of German migration. In 1840 the population was 16,469; after that the growth was rapid, the population in 1850 being 77,860 and ten years later 160,773. In 1817 steamboats began to operate to St. Louis, in 1832, 80 steamboats arrived; in 1838, 154, and in 1845, 213. In 1854 St. Louis ranked third in enrolled tonnage among U.S. cities. After that the river traffic increased tremendously; in 1860 5,178 vessels arrived at St. Louis and 5,218 departed, the total tonnage for the year being 844,039.

In the 1830s St. Louis, like other towns in the west, became interested in the development of railroads. The Pacific Railroad company, the parent of the Missouri Pacific, was organized in 1850; the line was begun in 1851, and the first 40 mi. were opened to Franklin (Pacific), Mo., two years later. In 1856 it reached Jefferson City, and Sedalia in 1861. A southwestern branch of the Missouri Pacific was opened to Rolla in 1861. The St. Louis and Iron Mountain railway, incorporated in 1851, was opened from St. Louis to Pilot Knob, Mo., in 1858. The St. Louis, Kansas City and Northern railway was completed as far as Macon, Mo., in 1859. Thus before the Civil War St. Louis became the terminal for four western railroads. The Ohio and Mississippi railroad, to Cincinnati, was completed in 1857; it connected with the Baltimore and Ohio railroad, thus giving St. Louis rail access to the Atlantic coast.

By 1860 the city extended for about six and one-half miles along the river front and reached westward between three and four miles. Most of the houses were built of brick, as were many of the sidewalks. Soft coal was used as fuel, frequently creating a pall of smoke. Missouri was a slave state, but only 1,500 slaves were owned in St. Louis and most of these were in domestic service. The Germans and the newcomers from the north were abolitionists. Many of the businessmen, regardless of their views on the slavery question, were opposed to secession. They feared that a break in the union would be injurious to business, and felt that it was vital to St. Louis to have the Mississippi river under the control of the United States.

Soon after Abraham Lincoln's election it became evident that Gov. Claiborne Jackson was a secessionist and intended to take the state out of the union. He was backed by a secessionist legislature. The state government authorized the election of delegates to assemble in convention to consider the question of the secession of Missouri. The delegates concluded that there was no adequate cause for Missouri to dissolve her connection with the union.

The next step of the unionists was to prevent the St. Louis

arsenal from falling into the hands of the secessionists. Capt. Nathaniel Lyon, with the assistance of the "Wide Awakes," who had been transformed into military companies known as "home guards," succeeded in protecting the arsenal and in shipping most of its guns to Illinois. The governor then authorized the assembly of militia near St. Louis. A camp, named after the governor, was laid out on the western outskirts of the city. Lyon and Francis Blair believed that the purpose of the establishment of Camp Jackson was the seizure of the city. On May 10, 1861, Lyon sent three columns of home guards to capture the camp. The force was overwhelming and Frost, the commander, surrendered without a struggle.

An unfortunate outbreak of violence occurred while the prisoners were under guard and about 25 people, several of them civilians, were killed or wounded. For 48 hours the citizens were in a state of panic, but when no other acts of violence occurred, the excitement subsided, and those who had fled returned to their homes.

After the Camp Jackson episode the wavering took a firm stand on one side or the other. But it soon became evident that the city was overwhelmingly unionist in sentiment. Lynch's "slave pen," a place where adult slaves had been sold at auction, was closed, and the slave pen where children were sold was soon transformed into a military prison. Eminent citizens hoped that the warring factions in the state might be brought into agreement by a conference of the leaders. On June 11 Governor Jackson and Gen. Sterling Price met Blair and Lyon in a conference at the Planters' hotel, but no agreement was reached. The governor hastened to Jefferson City, issued a call for 50,000 troops and then evacuated the capital.

Throughout the Civil War St. Louis remained a unionist stronghold. There Gen. John C. Frémont, in command of the western department, established his headquarters, and from there Gen. Henry Halleck directed movements in the Mississippi valley. Thousands of troops were encamped in and about the city. For many months St. Louis was under martial law; thousands of prisoners of war, and about 40,000 refugees were cared for during the war. St. Louis was the headquarters of the Western Sanitary commission which had charge of much of the war relief work.

Cultural Development.—For a quarter of a century after the Civil War the city was the centre of a remarkable philosophic and cultural movement. Its inspirer was Henry Conrad Brokmeyer (1828-1906), who later became prominent in state politics and was lieutenant governor of Missouri in 1876-80. Brokmeyer, a Prussian from Minden, arrived at St. Louis in 1856. He attracted William T. Harris, a brilliant graduate of Yale university, who taught in the St. Louis schools during 1858-67 and was superintendent of schools during 1867-80.

Brokmeyer and Harris gathered about them a group of idealistic thinkers and formed a philosophical society which became the sponsor of *The Journal of Speculative Philosophy* (1867-93), the first periodical of the sort in English. For many years Harris, its editor, was the foremost exponent of Hegelian philosophy in the United States.

Economic Progress.—After the Civil War St. Louis grew with unusual rapidity; by 1870 the population was 370,864. In ten years it had almost doubled; St. Louis had become the principal distribution point for the Mississippi valley. But it soon found its supremacy challenged by Chicago, when the railroads made Chicago the terminal for lines to the Pacific coast. After 1870 the Mississippi and Ohio rivers gradually lost their importance as highways and the railroads became the great carriers of interstate commerce.

After 1870 the history of St. Louis was mainly economic. It retained its prominence as a wholesale centre and also became one of the great manufacturing cities in the world.

Louisiana Purchase Exposition.—In 1898 a site on the western outskirts of the city was selected for an exposition to celebrate the 100th anniversary of the purchase of Louisiana from France. The grounds covered 1,240 ac., of which 250 were under roof. The total cost, apart from individual exhibitions, was about \$45,500,000, of which the national government con-

tributed \$5,000,000 and the city and citizens of St. Louis \$10,000,000. The exposition was opened to the public in 1904. During the seven months of its existence, 12,804,616 paid admissions were collected, and total admissions were 19,694,855. Two permanent buildings remained from it, the Jefferson memorial, the home of the Missouri Historical society, and the Art building.

Later Developments.—In 1933 the city determined to turn its central river front district into a national park, at a cost of \$30,000,000. The federal government agreed to put up three-fourths of the money and the city one-fourth. By 1941 the 40-block site had been cleared. The normal Republican city was ruled by a Democratic administration (for the first time in 24 years) from 1933 to 1941, when a Republican mayor was heavily victorious again. In the municipal elections of April 1949 the Democrats won control of the city government from the Republicans who had been in control since 1941.

City Zones.—From 1840 to 1880 the river front was the busiest part of the city. Along the central part for 3.7 mi. stretches the levee. When the railroads took the place of the river as the principal means of transportation, the importance of the levee declined. River traffic, however, underwent some revival with the establishment by the government of a line of steel barges between St. Louis and New Orleans.

Beginning at Fourth street and extending west to 14th on high ground between Market street and Delmar boulevard is the skyscraper business district. The largest retail establishments, several of them department stores, are on Olive street and Washington avenue. In this district are commercial hotels, theatres, clubs, office buildings, wholesale houses and factories. The downtown district extends westward. In 1923 a bond issue of \$87,352,500 for public improvements was voted, including \$6,000,000 for a memorial plaza and building, \$5,000,000 for a municipal auditorium and \$4,000,000 for a new courthouse. The plaza extends from Market street to Olive street and from 12th to 15th streets making a remarkable civic centre. At the south end are the city hall, municipal courts and auditorium; at the north the public library. Facing 12th between Market and Chestnut streets is the courthouse.

Adjacent to the downtown retail district on every side are wholesale and jobbing houses, warehouses and factories. Here are most of the plants which produce shoes and shoemaking machinery, garments, drugs and medicines. To the west of the downtown district, spreading out like a fan and extending as far as Grand avenue, was the finest residential district in the 1870s. A \$2,600,000 plaza, with a \$60,000 Carl Milles fountain, was built opposite Union station.

Olive, Market, Delmar (once Morgan street) and other thoroughfares were widened. A depressed superhighway, completed in 1937, traverses the city from east to west.

Industrial Development.—St. Louis is a leading U.S. industrial area. Its advantageous position near the sources of supply of raw materials, the proximity of a vast, thickly populated area and of the soft-coal fields of Illinois, railroad and highway facilities and electric power make it a natural centre for large industrial plants, and for jobbing and wholesale houses. There were 2,960 factories employing 244,516 people in 1947 in the St. Louis industrial area. Leading industries are assembling and manufacturing automobiles, shoes, drugs, chemicals, beer, electric goods, tobacco, brick, terra-cotta and other clay products, railway and street cars, stoves, ranges and furnaces, steel and lead, hardware, various kinds of machinery, clothing, boxes and woodenware products. St. Louis is one of the largest centres of shoe manufacture in the United States. It is one of the largest of all markets for furs, hides, wool, horses and mules, grain, dry goods, millinery and men's hats. It is a centre for the manufacture of poultry and livestock feed and of meat packing. The total value of factory products in 1947 in the city's industrial area was \$1,296,471,000.

The metropolitan district in 1950 had a population of 1,673,467, and the outlying regions were growing more rapidly than the city proper. Metropolitan St. Louis is a rapidly expanding industrial unit, but the outlying communities oppose enlarging the

city boundary. The principal industrial areas followed naturally the lines of transportation; hence industry and warehousing gravitated early to the river front where rail as well as water transport was convenient. (The decline of the river steamboat was to cause many old buildings of the levee district to lose value and to bring about the razing of 40 blocks.)

Other manufacturing areas grew up along the railroads branching through the city. St. Louis is strategically located with respect to transportation. Thirteen major railroads converge there, six major air lines use the municipal airport, numerous truck lines provide service and the navigable water system connects with all of the principal mid-continent cities.

St. Louis is also a wholesale centre, with its preferential trade territory being 14 states in the middle west. The United States census of distribution credited it with \$3,047,000,000 of wholesale business of all types in 1948. Total retail sales of stores in St. Louis city were estimated at \$978,300,000 in 1949. Adjacent to the industrial sections are densely populated tenement districts where most of the unskilled foreign-born and Negro labourers live. The industrial area includes several cities on the Illinois side, such as East St. Louis, National City, Madison and Granite City.

South of East St. Louis is the Cahokia power plant, which supplies power to many St. Louis industrial plants.

The Eads bridge, the first across the Mississippi at St. Louis, was completed in 1874, but was not successful until 1889, when the Terminal Railroad association was formed. In 1951 it controlled 368 mi. of track, the Eads and Merchant's bridges and the Union station, and had 137 switching locomotives (84 diesel and 55 steam). The McKinley bridge, built by the Illinois Traction company, is independent. In 1918 the St. Louis Municipal (or free) bridge was completed; it was later named the Douglas MacArthur bridge.

Other bridges spanning the Mississippi at or near St. Louis are: East St. Louis Veterans Memorial, Chain of Rocks, Jefferson Barracks and Lewis and Clark.

Education.—The first permanent kindergarten and kindergarten training school in connection with public schools in the United States were established in St. Louis in 1873. The city in 1951 maintained the Harris Teachers and junior college for white students, the Stowe Teachers and junior college for Negro students, 7 high schools for white and 2 for Negro children, 2 technical high schools, 7 evening schools, 106 elementary schools for white and 37 for Negro children, a division of audiovisual education, an FM radio station, and a large stadium for high school athletics. The registration in the high schools for 1949-50 was 18,473; in the technical high schools, 4,060; in the elementary schools, 72,625; and in the evening schools in the adult education program, 3,659 (average nightly attendance). There were 5,008 employees in the public schools, 3,764 of whom were in the department of instruction. The day schools cost the city \$18,974,729 for the year 1949-50. The Roman Catholic Church maintained 22 high schools with an enrolment of 7,654, and 76 elementary schools with an enrolment of 28,838. The Lutheran Church (Missouri synod) maintained in 1950 1 high school and 21 elementary schools. In or near St. Louis there are a number of excellent private schools. The National Council of Christians and Jews instigated a new approach in education in St. Louis, as elsewhere, through its program in intergroup relations carried through the American Council on Education.

Washington university and St. Louis university are the most important institutions of higher learning. The former (1853) is made up of the college of liberal arts, the schools of engineering, architecture, business and public administration, social work, law, medicine, dentistry, nursing and fine arts, the Henry Shaw school of botany, the university college, the summer school, the graduate school of arts and sciences and the Sever institution of technology. Most of the buildings are in the Tudor-Gothic style of architecture. The faculty in 1950-51 numbered 1,411 and the students 12,048. Endowment in 1950-51 was \$30,244,000. The institution is nonsectarian. St. Louis university was founded by a Catholic bishop as St. Louis academy in 1818, renamed St. Louis

gardt, architects

4. Municipal auditorium, facing the Memorial plaza. The building has an opera house with a seating capacity of 3,500 persons and an arena seating 12,500 persons. The Plaza Commission, consisting of members of seven firms of architects, designed the building

college in 1820 and incorporated as St. Louis university in 1832. A Jesuit institution, it was the first university west of the Mississippi river to receive a charter. The university is composed of the college of arts and sciences, the schools of divinity, medicine, dentistry, law, commerce and finance, and nursing, the graduate school, the college of philosophy and letters, the institute of technology and the Parks college of aeronautical technology. In addition St. Louis university is affiliated with six corporate colleges, some located in St. Louis county. The faculty in 1950-51 numbered 1,285 and the students 8,943, both exclusive of the corporate colleges. The endowment in 1950-51 was \$4,052,066.

Other institutions of higher learning in St. Louis or its suburbs are the St. Louis Roman Catholic Theological seminary (Kenrick seminary) (Roman Catholic, 1818), St. Stanislaus seminary (Roman Catholic, 1823), Lindenwood college, St. Charles (1827), Shurtleff college, Alton, Ill. (1827), McKendree college, Lebanon, Ill. (1828), Monticello college, Godfrey, Ill. (1835), Concordia Theological seminary (Lutheran Church-Missouri synod, 1839), Eden Theological seminary (German Evangelical Synod of North America, 1850), Principia college, Elsah, Ill. (1858), and Jefferson college (1940).

Libraries and Museums.—In addition to the libraries of Washington and St. Louis universities, there are the public library (1,026,529 vol., 929,835 pamphlets and 27,673 maps) with a circulation close to 2,000,000, 20 branches in its own or other buildings and 2 bookmobiles; the Mercantile library (191,290 vol. and pamphlets); the Missouri Historical society, housed in the Jefferson memorial in Forest park, with a collection of about 80,000 vol. and pamphlets, and about 1,000,000 manuscripts pertaining primarily to the history of the Mississippi valley. The society also maintains an archaeological and historical museum and houses the Charles Lindbergh trophies and medals.

An association of music lovers maintains a symphony orchestra. In Forest park is the open-air municipal theatre, which seats 10,000. The City Art museum in Forest park houses a valuable collection of paintings, statuary, tapestries and other works of art.

The Artists' guild offers prizes to encourage artists and gives frequent art exhibits.

Hospitals.—The chief hospitals are the Barnard Free Skin and Cancer, Barnes, Jewish, St. Louis Children's, St. Luke's, St. Mary's, the Shriners' (for crippled children), Evangelical Deaconess, De Paul, Missouri Baptist, St. John's, St. Louis City, Homer G. Phillips, Bliss Psychopathic, Robert Koch, McMillan, St. Louis Maternity, Firmin Desloge, Lutheran, Missouri Pacific, Frisco Employee's, Bethesda and Veterans' Administration.

Newspapers; Water Supply.—The chief newspapers are the *Post-Dispatch* and the *Globe-Democrat*. Foreign language newspapers include weeklies in Jewish, Italian, German, Hungarian, Bohemian and Polish.

The waterworks are near Chain of Rocks park in the extreme northern part of the city, where large settling basins and a filtering plant are located. The Mississippi is the source of supply. After 1923 additional waterworks were built at Howard's Bend on the Mississippi river about 30 mi. above its mouth, with a reservoir at Olivette.

Parks and Public Buildings.—The most notable park is Forest park (1,380 ac.), portions of which have been left wild. The western part was used for the Louisiana Purchase exposition of 1904. In the park are the City Art museum, Jefferson memorial, field house, municipal theatre, two public golf links, tennis courts, baseball and soccer fields and zoological gardens. Other large parks are Tower Grove (277 ac.), Carondelet (180 ac.), O'Fallon (159 ac.), Fairground (131.46 ac.) and Tilles (58 ac.).

The Missouri Botanical garden (125 ac.), one of the finest in the United States, was a gift to the city from Henry Shaw (1800-89), who also endowed the botanical school of Washington university. The city maintains 69 parks covering about 3,000 ac. and 44 playgrounds for children.

Of historical interest are the Old Cathedral (Catholic) and the old courthouse, the latter being the scene of the Dred Scott trial. The most imposing public buildings are the city hall, courthouse,

public library, municipal auditorium, Union station, federal building, art museum and Jefferson memorial. Churches include the Roman Catholic cathedral, the Westminster Presbyterian, Christ Church cathedral (Episcopalian), Second Baptist, St. John's Methodist Episcopal, First Church of Christ Scientist and Temple Israel.

Government.—In 1840 a police force composed of a captain, three lieutenants and 28 privates was organized. In 1841 the boundaries were enlarged and the city was divided into five wards. In 1842 voting by ballot was introduced, and an engineering department composed of the city engineer, street commissioner and superintendent of the waterworks was established. A health department was created in 1843. The following year the taxpaying qualification for voters was removed. In 1859 an amendment to the charter provided that the city council was to be a one-chamber body called the common council and composed of 20 members, two from each of the wards. In 1861 the legislature established the metropolitan police of St. Louis, and placed it under the control of a board of police commissioners appointed by the governor. The mayor was an ex-officio member of the board. The police department was then made independent of city government. In 1866 the council was again made bicameral. In 1871 the number of wards was increased to at least 12.

Up to 1876 St. Louis and St. Louis county were a judicial unit, and jointly controlled the courthouse, jail, insane asylum and poor farm. By an act of the state legislature in 1875 provision was made for the separation of the city and county, for the city to extend its boundaries and for a new charter. In 1876 the provisions were carried into effect. The courthouse, jail, insane asylum and poor farm became the property of the city and the old county debt became a city obligation. Under the charter of 1876 the city was divided into 28 wards. The mayor was to hold office for four years and was given extensive power of appointment. The municipal assembly was bicameral, being composed of a council of 13 and a house of delegates composed of one member from each ward. The mayor appointed a board of public improvements composed of the street, sewer, water, harbour and wharf and park commissioners. Each commissioner was head of a department. The charter also provided for a health department, for an elective school board of 28 members, one from each ward, for a board of assessors and a board of equalization.

In 1914 a new charter went into force. Under this charter the mayor holds office for four years and is given large powers of appointment and supervision. The board of aldermen is made up of a president and 28 aldermen, who hold office for four years. The board is a legislative body and has large powers, especially over money bills. The mayor appoints the members of the board of public service; this is composed of the president of the board and directors of public utilities, of streets and sewers, of public welfare and of public safety. Each is the head of a department. The department of finance is headed by a comptroller; the law department is headed by the city councillor. The charter provides for two city courts, for a board of standardization, a board of estimate and apportionment and a city plan commission. One of the reasons for the adoption of a new charter was the desire to safeguard the city against the machinations of politicians and political rings. To effect this, provisions were introduced for the recall of officials, for the initiation of legislation by petitions signed by 5% of the voters and for the referendum upon ordinances if called for by 2% of the registered voters.

SAINT LOUIS, administrative seat of the French sub-colonies Senegal (q.v.) and Mauritania, first capital (1895-1902) of French West Africa (q.v.), a considerable regional market, and the onetime French West African port for overseas and Senegal river trade.

Located at the point where the Senegal reaches a dune-covered sand bar, behind which it flows 12 mi. before entering the sea, it is near the climatic division between Sahara and Sudan. Its original site, and present commercial core and locale of the Senegalese government, is a bar-shaped island 13 mi. long. This is connected by two short bridges with native fishermen's quarters and the Mauritanian government offices on the main sand bar, and by a bridge 2,132 ft. long, with a suburb at the mainland terminal of the railroad to Dakar (q.v.), 168 mi. south. The total population (1936 census) was 33,100; (1938) 35,929 including 1,000 Europeans.

Vessels drawing up to 10 ft. can cross the bar and navigate the river during the rains (July-September inclusive), but water traffic has been supplanted by rails. Founded in 1659 by Dieppe merchants, Saint Louis is the oldest colonial establishment in Africa belonging to France. After 1854 it became the base of military expeditions leading to the formation of French West Africa. Made one of the two original communes in Senegal in 1872, its citizens may vote for a representative in the French chamber of deputies. Institutions include a secondary school on the model of a French *lycée*, a school for sons of Moslem chiefs (specializing in administration, law and accounting), and a hospital.

See R. Rousseau, "Le site et les origines de Saint-Louis," *La Géographie* 44 (1925). (D. Wm.)

ST. LOUIS-SAN FRANCISCO RAILWAY COMPANY, popularly known as "The Frisco," was incorporated on Aug. 28, 1916, as successor to a company formed in 1876, having for its purpose the construction of a railroad from St. Louis, Mo., to the Pacific coast. This original plan, however, did not fully materialize. The present railroad comprises a total of 5,175 mi. of road, extending from St. Louis and Kansas City, Mo., through Missouri, Kansas, Oklahoma, Arkansas into Texas, and crossing the Mississippi river at Memphis, Tenn., it passes through Tennessee, Mississippi, Alabama and Florida to the port of Pensacola on the Gulf of Mexico. The railway serves a rapidly developing section of the United States. The more important industries in the territory are iron and steel and other manufactures in St. Louis and Kansas City, Mo., Memphis, Tenn., and Birmingham, Ala.; the mid-continent oil fields; coal mining; lead and zinc mining; livestock raising; grain and cotton growing; and fruit and dairying in the great Ozark region.

(J. M. Kv.; X.)

ST. LUCIA, the largest of the British Windward Islands, West Indies, in 13° 54' N. and 60° 59' W., 24 mi. S. of Martinique and 21 mi. N.E. of St. Vincent. Area 233 sq. mi., length 27 mi., maximum breadth 14 mi.; circumference 150 mi. It is considered one of the loveliest of the West Indian islands. It is a mass of mountains, rising steeply from the water, their summits bathed in perpetual mist. The highest of these is Morne Gimie (3,143 ft.), but the Pitons (2,619 ft. and 2,467 ft.) are the chief natural features—two immense pyramids of rock rising abruptly from the sea with their slopes, inclined at a 60° angle, clothed on three sides with dense verdure. Near Petit Piton is Soufrière, a low-lying volcanic crater. The boiling sulphur springs which give Soufrière its name are at Ventine, 2½ mi. S.E. of the town of Soufrière. Rainfall averages 91 in. a year, the temperature averages 80° F.

History—St. Lucia was discovered by Columbus in 1502 and named after the saint on whose day it was sighted. The Dutch are said to have built a fort there, but the first attempt to settle was made by Englishmen in 1655. Carib resistance compelled its abandonment. From this time until the island became definitely a British possession in 1814 it was the scene of fiercely recurring

struggles between England and France; and 13 British regiments gained the right to inscribe the name St. Lucia on their colours. In the first half of the 17th century it was included in royal grants made by the kings of England and France; but English settlers were long deterred by the unlucky reputation which St. Lucia gained after a second disastrous attempt at colonization in 1638, frustrated by sickness and native hostility. The French were more successful, sending settlers from Martinique in 1650, by whom a treaty was made with the Caribs ten years later. England defeated the French shortly afterward, and regained the island, but it was restored by the peace of Breda in 1667.

Another British settlement under a grant of 1722 was frustrated by France. In 1748 the two nations agreed to regard St. Lucia as neutral. In 1762 it was captured by Rodney and Monckton, only to be given up once more by the treaty of Paris. In 1778 it again surrendered to the British, who used its harbours as a naval base; and it was from Gros Islet bay that Rodney sailed before his famous victory over de Grasse in April 1782. Between 1782 and 1803 the possession of St. Lucia passed six times between England and France, England having to suppress a vigorous revolutionist party, aided by insurgent slaves, before gaining possession in 1803, confirmed by a final cession in 1814. From this time the island was administered as a crown colony—under Barbados from 1838 to 1885.

Representative government was obtained by the constitution of 1924 which introduced an elective element into the legislative council, and the constitution of 1936 provided for an unofficial majority in the council.

French influence on the development of St. Lucia has been very great, and is illustrated by the preponderance of the Roman Catholic Church and the survival of a French patois. In the years following 1763 French planters came from St. Vincent and Grenada and formed cotton and sugar plantations. In 1772 the population was said to number 15,000, mostly slaves. In 1834, when the slaves were emancipated there were in St. Lucia more than 13,000 Negro slaves, 2,600 free Negroes and 2,300 whites. Prosperity was greatly retarded by the frequent wars, by epidemics of cholera and smallpox and by the decline of the sugar-cane industry. Improvement came with the increase of banana and cocoa cultivation, and resuscitation of sugar-cane cultivation.

The excellent landlocked harbour of Castries, one of the best in the West Indies, gives St. Lucia great strategic importance. In 1940, as part of its "destroyer-bases" agreement with Great Britain, the United States acquired on 99-yr. lease a naval and air base on Gros Islet bay, 4 mi. from Castries, along with other facilities. These were all relinquished by 1949, but the United States retained the right to re-establish them in the event of war or grave emergency.

Population and Economic Conditions—The population of St. Lucia was estimated at 79,500 in 1950. Castries (pop. 7,056), the capital, on the N.W. coast, was almost completely destroyed by fire in June 1948, but rebuilding on a carefully planned basis began shortly thereafter. The bulk of the inhabitants of the island are Negroes and mulattoes; the rest are whites or of East Indian extraction. A French patois is generally spoken by most, gradually being supplanted by English. The government subsidizes primary education through grants-in-aid to the island's denominational primary schools (principally Roman Catholic) and two secondary schools.

Government is under an appointed administrator (subordinate to the governor of the Windward Islands, of which colony St. Lucia forms part). The legislative council is partly appointed, partly elected.

The colony's essentially agricultural economy is dominated by sugar raising. In 1950 St. Lucia produced 10,441 tons of sugar. Although much of the land is held in large estates, there were more than 4,000 individual proprietors in 1949. Fishing is carried on extensively for the local market and provided full-time employment for 1,750 persons in 1949. In addition to sugar and sugar products, copra and coconuts, cacao, bananas and lime products are exported to non-West Indian areas. There is also a flourishing charcoal trade with Barbados. In 1950 exports totalled £309,071

in value; imports, principally flour, rice and other foodstuffs and a wide variety of manufactured goods, were valued at £1,093,372.

External communication is by steamer service which is irregular but fairly frequent, and by air. St. Lucia enjoys better air service than any other of the British West Indian islands except Jamaica and Trinidad.

ST. MAIXENT (L'École), a town of western France, in the department of Deux Sèvres, on the Sèvre Niortaise, 15 mi. N.E. of Niort by rail. Pop. (1946) 5,440. The fine abbey church, built from the 12th to the 15th century, was in great part destroyed by the Protestants in the 16th century and rebuilt from 1670 to 1682 in flamboyant Gothic. There is a Romanesque nave and a lofty 15th century tower over the west front. The crypt contains the tomb of St. Maxentius, second abbot of the monastery, which was founded about 460. The prosperity of the town was at its height after the promulgation of the edict of Nantes, when it numbered 12,000 inhabitants.

ST. MALO, a seaport of western France, capital of an arrondissement in the department of Ille-et-Vilaine, 51 mi. N.W. of Rennes by rail. Pop. (1946) 11,311.

In the 6th century the island on which St. Malo stands was the retreat of Abbot Aaron, who gave asylum in his monastery to Malo (Maclovius or Malovius), a Cambrian priest, who afterwards became bishop of Aleth (now St. Servan); the see was transferred to St. Malo only in the 12th century. In the 17th century the maritime power of St. Malo attained some importance. In Nov. 1693 and July 1695 the English vainly bombarded it. The St. Malo shipowners financed the Rio de Janeiro expedition of Duguay-Trouin in 1711 and also lent the king large sums for carrying on the war of the Spanish Succession. In June 1758 the English inflicted great loss on the royal shipping in the harbour of St. Servan, but another expedition in the following September received a complete check. In 1778 and during the wars of the Empire the St. Malo privateers resumed their activity. In 1789 St. Servan was separated from St. Malo, and in 1801 St. Malo lost its bishopric.

St. Malo is situated on the English channel on the right bank of the estuary of the Rance at its mouth. It is a garrison town surrounded by ramparts which include portions dating from the 14th, 15th and 16th centuries but as a whole were rebuilt at the end of the 17th century and restored in the 19th century. The most important of the gates are that of St. Vincent and the Grande Porte, defended by two massive 15th-century towers. The granite island on which St. Malo stands communicates with the mainland on the northeast by a causeway known as the "Sillon" (furrow), commanded by the old 14th and 15th century castle, flanked with four towers, one of which, the great keep, is an older and loftier structure. In the sea round about lie other granite rocks, which have been turned to account in the defenses of the coast. The rocks and beach are continually changing their appearance, owing to the violence of the tides; spring tides sometimes rise 50 ft. above low-water level, and the sea sometimes washes over the ramparts. The harbour of St. Malo lies south of the town in the creek separating it from the neighbouring town of St. Servan. Including the contiguous and connected basins belonging to St. Servan, it comprises an outer basin, a tidal harbour, two wet-docks and an inner reservoir, affording a total length of quays of over 2 mi. The wet-docks have a minimum depth of 13 to 15 ft. on sill, but the tidal harbour is dry at low water. The great bulk of trade is with England, the exports comprising large quantities of fruit, dairy produce, early potatoes and other vegetables and slate. The principal imports consist of coal and timber. The Southern railway maintains a regular service of steamers between Southampton and St. Malo. The port carries on shipbuilding and equips a fleet for the Newfoundland cod-fisheries. The industries also include iron- and copper-founding and the manufacture of portable forges and other iron goods and rope. The town is the seat of a sub-prefect and has a tribunal of commerce.

St. Malo is largely frequented for sea-bathing, but not so much as Dinard, on the opposite side of the Rance. The town presents a tortuous maze of narrow streets and small squares lined with high and sometimes quaint buildings. Above all rises the stone spire (1859) of the cathedral, a building begun in the 12th century but added to and rebuilt at several subsequent periods.*

SAINT-MARC GIRARDIN (1801–1873), French politician and man of letters, whose real name was MARC GIRARDIN, was born in Paris on Feb. 22, 1801. After a brilliant university career in Paris he began in 1828 to contribute to the *Journal des Débats*, on the staff of which he remained for nearly half a century. At the accession of Louis Philippe he was appointed professor of history at the Sorbonne and master of requests in the Conseil d'État. Soon afterwards he exchanged his chair of history for one of poetry, continuing to contribute political articles to the *Débats* and sitting as deputy in the chamber from 1835 to 1848. He was charged in 1833 with a mission to study German methods of education and issued a report advocating the necessity of newer methods and of technical instruction. In 1844 he was elected a member of the academy. During the revolution of Feb. 1848 Girardin was for a moment a minister, but after the establishment of the republic he was not re-elected deputy. After the war of 1870–71 he was returned to the Bordeaux assembly by his old department—the Haute Vienne. His Orleanist tendencies and his objections to the republic were strong, and though he at first supported Thiers, he afterwards became a leader of the opposition to the president. He died on April 1, 1873, at Morsang-sur-Seine, before Thiers was actually driven from power.

His chief work is his *Cours de littérature dramatique* (1843–63), a series of lectures better described by its second title, *De l'usage des passions dans le drame*.

See Hatzfeld and Meunier, *Les Critiques Littéraires du XIX^e siècle* (1894).

SAINT-MARTIN, LOUIS CLAUDE DE (1743–1803), French philosopher, known as "le philosophe inconnu," the name under which his works were published, was born at Amboise on Jan. 18, 1743. While in garrison at Bordeaux he came under the influence of Martinez de Pasquales, who taught a species of mysticism drawn from cabalistic sources and endeavoured to found a secret cult with magical or theurgical rites. In 1771 Saint-Martin left the army to become a preacher of mysticism, first in Paris, and then in England, Italy, Switzerland and the French provinces. At Strasbourg in 1783 he met Charlotte de Boecklin, who introduced him to the writings of Jacob Boehme and inspired in him a semi-romantic attachment. He was brought up a strict Catholic and always remained attached to the church, although his first work, *Of Errors and Truth*, was placed upon the Index. He died at Aunay, near Paris, on Oct. 23, 1803.

His chief works are a translation of the works of Boehme; *Lettre à un ami sur la Révolution Française*; *Eclair sur l'association humaine*; *De l'esprit des choses*; *Ministère de l'homme-esprit*. Other treatises appeared in his *Oeuvres posthumes* (1807). Saint-Martin's ideal society was "a natural and spiritual theocracy," in which God would raise up men of mark, who would regard themselves strictly as "divine commissioners" to guide the people.

See A. J. Matter, *Saint-Martin, le philosophe inconnu* (1862); A. Franck, *La Philosophie mystique en France à la fin du dix-huitième siècle* (1866); A. E. Waite, *The Life of Louis Claude de Saint-Martin* (1901). There are English translations of *The Ministry of Man* (the *Spûri* (1864) and of *Select Correspondence* (1863) by E. B. Penny.

ST. MARTIN, an island in the West Indies, about 5 mi. S. of the British island of Anguilla in 18° N. and 63° W. It is 37 sq. mi. in area and nearly triangular in form, composed of conical hills, culminating in Paradise peak (1,024 ft.). It is the only island in the Antilles owned by two European powers; 20 sq. mi. in the N., belonging to France, form a dependency of Guadeloupe, while the rest, belonging to Holland, is a dependency of Curaçao. Sugar, formerly its staple, has been succeeded by salt. The chief town of the French area is Marigot, a free port on the W. coast; of the Dutch, Philipsburg, on the S. St. Martin was first occupied by French freebooters in 1638, but ten years later the division be-

tween France and Holland was peaceably made. The inhabitants, mostly English-speaking Negroes, numbered in 1946, 6,786 in the French part, and in the Dutch (1947) 1,697.

ST. MARYLEBONE; see **MARYLEBONE, ST.**

SAINT MARYS, a city of Auglaize county, Ohio, U.S.A., on the Saint Marys river, 85 mi. W.N.W. of Columbus. It is served by the New York Central and the Nickel Plate railways. Population was 6,211 in 1950, 5,532 in 1940 and 5,433 in 1930 by the federal census. It is in the gas and oil region of the state, and has various manufacturing industries. A mile west is Lake Saint Marys (17,600 ac.), constructed as a reservoir to supply the Miami and Erie canal (abandoned about 1900), and now developed as a pleasure resort.

Saint Marys is on the site of a Shawnee village, where James Girty (captured in Pennsylvania when a boy of 13 by a French and Indian force and adopted by the Shawnees) established a trading post in 1782. For this reason the place was for some years called Girty's Town. Ft. Saint Marys was built in 1784 or 1785 by Gen. Wayne; Ft. Barbee in 1812 by Col. Joshua Barbee at the instance of Gen. Harrison. The town was laid out in 1823 and became a city in 1903.

SAINT MARYS, a borough of Elk county, Pennsylvania, U.S.A., on Elk creek and federal highway 130, at an altitude of 1,700 ft.; served by the Pennsylvania railway. The population of the borough was 7,852 in 1950, and 7,653 in 1940 by federal census. The borough was incorporated in 1848.

ST. MAWES, village in parish of St. Just-in-Roseland, Cornwall, England, on an arm of Falmouth harbour. Pop. of parish (1931) 970. There is a considerable fishing industry. The harbour is guarded by a large circular castle dating from the time of Henry VIII. St. Mawes was a borough, 1562-1835.

ST. MICHAEL'S (*São Miguel*), the largest island in the Portuguese archipelago of the Azores. Pop. (1940), 148,018; area, 288 sq.mi. See **AZORES**.

ST. MICHAEL'S MOUNT, a lofty pyramidal island, exhibiting a curious combination of slate and granite, rising 400 yd. from the shore of Mount's bay, Cornwall, England. It is united with Marazion by a natural causeway passable only at low tide. If its questionable identity with the Mictis of Timaeus and the Ictis of Diodorus Siculus be allowed, St. Michael's Mount is one of the most historic spots in the west of England. It was possibly held by a religious body in the Confessor's time and given by Robert, count of Mortain, to Mount St. Michael, of which Norman abbey it continued to be a priory until the dissolution of the alien houses by Henry V, when it was given to the abess and Convent of Syon. It was a resort of pilgrims, encouraged by Pope Gregory (11th century). The Mount was captured by Henry Pomeroy in the reign of Richard I. John de Vere, earl of Oxford, seized it and held it against the king's troops in 1473. Perkin Warbeck occupied it in 1497. Humphry Arundell, governor of St. Michael's Mount, led the rebellion of 1549. During the reign of Queen Elizabeth it was given to Robert, earl of Salisbury, by whose son it was sold to Sir Francis Basset, whose brother, Sir Arthur Basset, held it against the parliament until July 1646. It was sold in 1659 to Colonel John St. Aubyn and is now the property of his descendant Lord St. Levan, who has a residence in the castle. The chapel is extra-diocesan. Many relics are preserved in the castle. The chapel of St. Michael, a beautiful 15th century building, has an embattled tower. The harbour, widened in 1823 to allow vessels of 500 tons to enter, has a pier dating from the 15th century. Pop. (1931) 71.

ST. MIHIEL, a town of northeastern France, in the department of Meuse, on the right bank of the Meuse and the Canal de l'Est. 23 mi. S. by E. of Verdun by rail. Pop. (1946) 4,335. St. Mihiel is famous for its Benedictine abbey of St. Michael, founded in 709. The abbey buildings (occupied by the municipal offices) date from the end of the 17th century and the beginning of the 18th century, and the church from the 17th century. The church of St. Étienne, chiefly in the flamboyant Gothic style, contains a magnificent Holy Sepulchre by Ligier Richier. St. Mihiel formerly possessed fortifications and two castles, destroyed in 1635.

Battle of St. Mihiel, 1918.—In his first conference with the

commander-in-chief of the French armies, Gen. Pershing visualized the reduction of the St. Mihiel salient as the first U.S. operation in World War I. In accordance with studies made at his headquarters in Sept. 1917, he planned that the decisive U.S. effort would be against the German railroad system north and east of the Meuse river and the ore deposits in the vicinity of Metz and Longwy, with the elimination of the St. Mihiel salient as a necessary preliminary. Though early American control of the Woerwe sector was agreed (May 19, 1918) the demands for American troops to assist the Allies in meeting the Germans elsewhere limited further steps along these lines to the creation of supply installations. At Bombon, on July 24, the commanders-in-chief, having determined to maintain the offensive, accepted Gen. Pershing's proposal that his army should undertake to reduce the St. Mihiel salient before the autumn rains began about the middle of September. This operation harmonized with the Château Thierry offensive and the British and French attacks against the Amiens and Ypres-Lys salients, made in order to free strategic railroads, preparatory to more extended operations. The counter-offensives against the Marne and Amiens salients in July and Aug. had gained such advantages that it was apparent the emergency which justified the dispersion of American divisions had passed. On Aug. 9, final decision was given for the immediate assembly of the American army for an attack against the St. Mihiel salient.

The American troops in France—at this time over 1,300,000—were sufficient for the offensive, but they were dispersed along the front from Switzerland to the Channel. While the I Army Headquarters, two corps and corps troops and seven divisions were operating in the Marne offensive, other American divisions were holding sectors in the Vosges and Lorraine and several were training as reserves behind the British front. To assemble these combat and service troops into an army and undertake a major operation within the short period available and with the staffs so recently organized was an extremely difficult task. Deficiencies in artillery, aviation and special troops, caused by shipment of an undue proportion of infantry and machine guns to assist the Allies, were largely met by the French. While the I American army was given a distinct and independent mission, Gen. Pershing suggested, as expedient, that it should function under the nominal direction of Gen. Pétain, the French commander-in-chief, in order to assure co-ordination on the part of the French armies adjacent to the I army and to provide French units needed at the outset for supply services. To all intents and purposes the I army was entirely independent of French command, as all plans were prepared and all movements and operations ordered by the commander of the I army. The initial battle plan approved by Marshal Foch by Aug. 17, contemplated as an ultimate objective the general line: Mariemont (east of the Moselle), the heights south of Goré, Mars la Tour, Etain and the employment of 25 divisions under Gen. Pershing's personal direction. In furtherance of this plan, the scattered divisions, corps and service troops were first gathered in areas about Chaumont and Neufchâteau and then, beginning Aug. 28, the army advanced to its battle position.

The I American army took command of the front from Port-Sur-Selle (east of the Moselle) to Watronville (north of Les Eparges) from the II and VIII French Armies on Aug. 30. On this day, at I American Army headquarters (Ligny-en-Barrois), Marshal Foch discussed with Gen. Pershing a general plan for future operations and proposed employing American divisions under French command in the Champagne and Meuse-Argonne regions with a material reduction of the St. Mihiel forces in order to make available American troops for these new operations. Gen. Pershing could not accept such plans as they would require the immediate separation of the recently formed I American army into several groups delaying further the formation of a distinct American army. Moreover, an enormous amount of preparations had already been made in supplies and munitions and in construction of roads, railroads, regulating stations and other installations for the supply of the army on a particular front. While willing to accept the employment of the American army as a unit where desired, Gen. Pershing would not entertain proposals for its dis-

ruption. At a later conference on Sept. 2, the employment of the American army as a unit was conceded and a decision reached to the effect that after reducing the St. Mihiel salient, the I American army would attack by Sept. 25 between the Meuse river and Argonne forest (see MEUSE-ARGONNE OPERATION). As a result of the decisions, the depth of the St. Mihiel operation was limited to the line Vigneulles, Thiaucourt, Regnieville. The number of divisions to be used was reduced and the time shortened. There were 15 American divisions (each equal in size to 2 French divisions) and 4 French divisions available, 6 of which would be in reserve. Furthermore, 2 army corps headquarters and corps troops, practically all army artillery and aviation and the 1st, 2nd and 4th divisions, the first 2 destined for a leading part in the St. Mihiel attack, were all due to be withdrawn and started for the Meuse-Argonne by the fourth day of the battle.

The salient had been held by the Germans since Sept. 1914. It covered the most sensitive section of the enemy's position on the western front; i.e., the Mézières-Sedan-Metz railroad and the Briey Iron Basin; it threatened the entire region between Verdun and Nancy and interrupted the main railroad line from Paris to the east. Its primary strength lay in the natural defensive features of the terrain itself. The western face of the salient extended along the rugged, heavily-wooded eastern heights of the Meuse; the southern face followed the heights of the Meuse for 5 mi. to the east and then crossed the plain of the Woëvre, including within the German lines the detached heights of Louvemont and Mont Sec, which dominated the plain and afforded the enemy unusual facilities for observation. The enemy had reinforced the positions by every artificial means during a period of four years. Having concentrated by night movements over 600,000 men on the battlefield, the troops of the I army were deployed in attack positions on the night of Sept. 11. On the south face of the salient was the I corps (4 divisions in line) extending from the Moselle westward. On its left was the IV corps (3 divisions in line) with left facing Mont Sec. These 2 corps were to deliver the main attack, the advance pivoting on the centre of the I corps. The left of the IV corps was to advance toward the heart of the salient where contact would be made with the V corps from the west. On the western face of the salient lay the V corps (3 divisions in line) extended from Mouilly via Les Eparges to Watronville. While the centre division made a deep advance to gain contact with the IV corps on the south, the rest of the corps was to limit its advance while covering the flanks of the centre division. Between the IV and V corps around the apex of the salient, the II French corps (3 divisions in line) covering 24 mi., had the mission of attacking to hold the enemy in the salient. American artillery and aviation were greatly augmented by French artillery and aviation and assisted indirectly by the British independent air force located south of Nancy. The heavy artillery could reach the railroads entering Metz.

Gen. Foch's Army Detachment C held the salient on Sept. 12 with 8 divisions in line and 3 divisions in immediate reserve. While the Germans had an inkling of a possible American attack as early as Sept. 1, the magnitude and imminence were not suspected. An American ruse at Belfort, which comprised extensive preparation for an attack in that region, proved misleading to the enemy. A decision having been made to withdraw in face of a serious attack at St. Mihiel, preparations for a deliberate and methodical withdrawal were under way, some dismounted batteries having been displaced, when the Americans launched their attack at dawn on Sept. 12. After four hours' violent artillery preparation, accompanied by small tanks, the I and IV corps advanced. The infantry of the V corps attacked at 8 A.M. The operation was carried out with precision. Just after daylight of the 13th, elements of the IV and V corps joined at Vigneulles, 11 mi. N.E. of St. Mihiel. The enemy was overwhelmed, and all objectives were reached on the afternoon of Sept. 13. During the 14th and 15th, while the two German counterattacks were repulsed by the I corps, the Americans advanced along the Moselle to the line Jaulny-Pagny-sur-Moselle. On Sept. 14-16, local operations continued, American patrols advancing to Dampvieux, eastern edge of Etang de Lachaussée, Jonville and Fresnes-en-Woëvre. The swiftness with

which the operation was carried out enabled the Americans to smother the opposition to such an extent that they suffered less than 7,500 casualties during the actual period of the advance. During the battle the Germans engaged four new divisions and drew into local reserve several other divisions.

The Americans captured nearly 16,000 prisoners (over 4,000 in the salient proper), 443 guns and large stores of material and supplies. The moral result of the victory was striking. An American army had suddenly appeared and crushed the enemy in one of his strongest positions. No form of propaganda could overcome the depressing effect on the enemy of this demonstration of ability to organize a large American force in so short a time and drive it successfully through its defenses. The strength of the I American army in the battle totalled over 500,000 Americans and 100,000 French, approximately 2,900 cannons, 400 tanks and 1,000 aeroplanes. (H. A. D.R.; J. J. P.)

ST. MORITZ, loftiest (6,037 ft.) and most populous village of the Upper Engadine in the Swiss canton of the Grisons. Pop. (1941) 2,305; about half were German-speaking, the rest chiefly Romansch and Italian. About half were Protestant and half Roman Catholic. It is built above the north shore of the lake of the same name, and is 56 mi. from Coire by the Albula railway. The village is about 1 mi. north of the baths, an electric tramway connecting the two. Both are ordinarily frequented by foreign visitors. The baths (chalybeate, sparkling with free carbonic acid) were already well-known in the 16th century.

ST. NAZAIRE, a town of France, capital of an arrondissement in the department of Loire-Inférieure, 40 mi. W.N.W. of Nantes by rail and 29 mi. by river. Pop. (1936) 38,627. According to remains discovered, St. Nazaire seems to occupy the site of the ancient *Corbilo*, placed by Strabo among the more important maritime towns of Gaul. At the close of the 4th century the site of Corbilo was occupied by Saxons, and their conversion to Christianity being effected one or two hundred years later by St. Felix of Nantes, the place took the name of St. Nazaire. Under the Second Empire it was chosen as the site of the new harbour for Nantes, because the ascent of the Loire was becoming difficult. St. Nazaire, on the Loire at its mouth, is a modern town. It possesses a granite dolmen 10 ft. by 5 ft. resting horizontally on two other stones. The harbour, accessible to largest ships, is separated from the estuary by a narrow strip of land and comprises an outer harbour and entrance, two floating docks, three graving docks and the extensive shipbuilding yards of the Loire Co. and of the General Transatlantic Co. whose steamers connect St. Nazaire with Mexico, the Antilles and the Isthmus of Panama. Ships for the navy and the mercantile marine are built, and there are important steelworks, blast furnaces, forges and steam saw-mills.

The town is the seat of a sub-prefect and has a board of trade-arbitrators, a chamber of commerce and a tribunal of commerce.

ST. NEOTS (pronounced St. Neets), a market town in Huntingdonshire, England, on the right bank of the Ouse, 5½ mi. N. of London by the L.N.E.R. Pop. of urban district (1938) 4,087. Area 2.2 sq.mi. A stone bridge, built in 1589 from the ruins of a former priory, here crosses the river and connects the county with Bedfordshire.

St. Mary's church is a fine Perpendicular building of the later 15th century, with original oak roof.

ST. NICOLAS, town, province of East Flanders, Belgium, 12 mi. southwest of Antwerp, a railway junction on the Antwerp-Ghent line, with linen manufactories of its own, and the central market of Waes; formerly barren and bleak downs, it is now highly productive. Pop. (est. 1939) 42,190.

ST. NICOLAS or **ST. NICOLAS DU PORT**, a town of north-eastern France, in the department of Meurthe-et-Moselle, on the left bank of the Meurthe, 8 mi. S.E. of Nancy by rail. Pop. (1936) 5,078. The town has a fine Gothic church (15th and 16th century), possessing a finger joint of St. Nicolas, formerly the object of pilgrimages which were themselves the origin of well-known fairs. The fairs declined after 1635, when the Swedes sacked the town. Important saltworks are nearby.

ST. OMER, a town and fortress of northern France, capital of an arrondissement in the département of Pas-de-Calais, 42 mi. W.N.W. of Lille on the railway to Calais. Pop. (1946) 18,106.

Omer, bishop of Thérouanne, in the 7th century established the monastery of St. Bertin, from which that of Notre-Dame was an offshoot. In the 9th century the village which grew up round the monasteries was named St. Omer. In 1559 St. Omer became a bishopric and Notre-Dame was raised to the rank of cathedral. The town and monastery were surrounded by walls by 980. Situated on the borders of frequently disputed territories, St. Omer long continued subject to siege and military disaster. In 1071 Philip I and Count Arnulf III of Flanders were defeated at St. Omer by Robert the Frisian. In 1127 the town received a communal charter from William Clito, count of Flanders. In 1493 it came to the Low Countries as part of the Spanish dominion. In 1677, after 17 days' siege, Louis XIV forced the town to capitulate; and the peace of Nijmegen permanently confirmed the conquest. In 1711 St. Omer, on the verge of surrendering to Prince Eugene and the duke of Marlborough owing to famine, was saved by the darning of Jacqueline Robin, who brought provisions into the place. St. Omer ceased to be a bishopric in 1801.

At St. Omer begins the canalized portion of the Aa, which reaches the sea at Gravelines, and under its walls connects with the Neufossé canal, which ends at the Lys. There are two harbours outside and one within the city. The old cathedral belongs almost entirely to the 13th, 14th and 15th centuries. A heavy square tower finished in 1499 surmounts the west portal. The church contains interesting paintings, a colossal statue of Christ seated between the Virgin and St. John (13th century, originally belonging to the cathedral of Thérouanne) and the cenotaph of St. Omer (13th century). The richly decorated chapel in the transept contains a wooden figure of the Virgin (12th century), the object of pilgrimages. Some arches and a lofty tower are all that remain of the abbey church of St. Bertin. St. Sepulchre (14th century) has a beautiful stone spire and stained-glass windows. There is a fine collection of records in the town hall, which was built of the materials of the abbey of St. Bertin. There are several houses of the 16th and 17th centuries; of the latter the finest is the Hôtel Colbert, once the royal lodging. St. Omer is the seat of a sub-prefect, of a court of assizes, of a tribunal of commerce, of a chamber of commerce, and of a board of trade arbitrators. It was the British headquarters during part of World War I. The industries include the manufacture of linen goods, sugar, soap, tobacco pipes and mustard, the distilling of oil and liqueurs, dyeing, salt-refining, malting and brewing.

The suburb of Haut Pont to the north of St. Omer is inhabited by a special stock, which has remained faithful to the Flemish tongue, its original costume and its peculiar customs, and is distinguished by honesty and industry. The ground which these people cultivate has been reclaimed from the marsh, and the *lègres* (*l.s.*, the square blocks of land) communicate with each other only by boats floated on the ditches and canals that divide them. At the end of the marsh, on the borders of the forest of Clairmarais, are the ruins of the abbey founded in 1140 by Thierry d'Alsace, to which Thomas Becket betook himself in 1165.

SAINTEONGE, one of the old provinces of France, of which Saintes (*q.v.*) was the capital, was bounded on the north-west by Aunis, on the north-east by Poitou, on the east by Angoumois, on the south by Guyenne, and on the west by Guyenne and the Atlantic. It now forms a small portion of the département of Charente and the greater part of that of Charente Inférieure. Originally occupied by the Gaulish *Santonnes*, whose name it preserves, the district subsequently formed part of Aquitania Secunda. It formed the bishopric of Saintes and was divided into two *pagi*: *Santonicensis* (whence Saintonge) and *Alienensis* (Aunis). Divided between the kings of England and France in 1259 it was wholly ceded to the king of England in 1360, but reconquered by Du Guesclin in 1371. Up to 1789 it was in the same *gouvernement* with Angoumois, but for judicial purposes Saintonge was under the parlement of Bordeaux and Angoumois under that of Paris.

See D. Massiou, *Histoire politique, civile et religieuse de la Saintonge*

et de l'Aunis (6 vols. 1836-39; 2nd ed., 1846); P. D. Rainsuet, *Biographie saintongaise* (1852). See also the publications of the *Société des archives hist. de la Saintonge et de l'Aunis* (1874 seq.).

ST. PANCRAS, a metropolitan borough of London, England, bounded east by Islington, southeast by Finsbury, south by Holborn and west by St. Marylebone and Hampstead, and extending north to the boundary of the county of London. Pop. (1938) 179,400. Area, 4.2 sq.mi. In the centre of the borough are Camden Town and Kentish Town and the three great railway termini of Euston, St. Pancras and King's Cross, with their extensive goods depôts and adjacent hotels. To the south of this lies the residential district of Bloomsbury, one mainly of boarding houses and private hotels, and with several fine squares. Still further south is a shopping district adjoining the main shopping thoroughfares. North of the railway stations are the residential districts adjoining Hampstead Heath and Regent's Park, including Gospel Gate, part of Highgate and the Holly Lodge Estate (the property of the late Baroness Burdett-Coutts), which was bought in 1923 for a garden suburb. In the northern part also are considerable open spaces, the largest of which are Waterloo Park, part of Regent's Park, Parliament Hill and Fields (bought for the public in 1886) and Ken Wood, purchased in 1919. The last contains Ken Wood House, with a noted collection of pictures.

A thoroughfare, called successively Tottenham Court Road, Hampstead Road, High Street Camden Town, Kentish Town Road, and Highgate Road, runs from south to north; Euston Road crosses it in the south, and Camden Road and Chalk Farm Road branch from it at Camden Town. The parish church of St. Pancras in the Fields, near Pancras Road, has lost its ancient character owing to reconstruction, though retaining several early monuments. Among institutions, University College, Gower Street, was founded in 1826, and provides education in all branches common to universities excepting theology. It was partly burned in World War II. With the department of medicine is connected the University College hospital (1833) opposite the college. There are several other hospitals; among them the Royal Free hospital (Gray's Inn road); the British (Forbes Winslow memorial) hospital for functional mental disorders; the London Skin hospital; and the Elizabeth Garrett Anderson Hospital for Women. The site of the Foundling hospital (in the old Lamb's Conduit Fields) has been transformed into a permanent open-air study and play centre for children through a fund initiated for the purpose by Lord Rothermere. The hospital moved in 1926 to Redhill, Surrey, and in 1935 to Berkhamstead, Herts. Other institutions are the British Medical association in Tavistock square (1925), the Royal Veterinary college and the North Western Polytechnic (1929). The Mary Ward (formerly Passmore Edwards) Settlement, first named for its principal benefactor, was founded largely through the instrumentality of Mrs. Humphry Ward. In Euston road are the headquarters of the Society of Friends in Great Britain. The new buildings were completed in 1926. St. Pancras has three parliamentary divisions, each returning one member. Many of the inhabitants are employed in work connected with the railways. There are also extensive furniture and piano-making industries.

St. Pancras is mentioned in Domesday as belonging to the chapter of St. Paul's Cathedral, in which body the lordship of the manors of Cantelows (Kentish Town) and Tottenham (Tottenham Court) was invested. Camden Town takes its name from Baron Camden (d. 1794), lord chancellor under George III. King's Cross was so called from a statue of George IV., erected in 1830, greatly ridiculed and removed in 1845, but an earlier name, Battle Bridge, is traditionally derived from the stand of Queen Boadicea against the Romans, or from one of Alfred's contests with the Danes.

SAINT PAUL, the capital city of Minnesota, U.S.A., a port of entry, the judicial seat of Ramsey county, and federal headquarters for the state; 2 mi. below the head of navigation on the Mississippi river and 1,836 mi. from its mouth. It is on federal highways 10, 12, 32 and 61; and is served by the Burlington Route, the Chicago Great Western, the Chicago, Milwaukee, St. Paul and Pacific, the Chicago, St. Paul, Minneapolis and Omaha, the Great Northern, the Minneapolis and St. Louis, the Northern Pacific, the Rock Island, the Soo Line and electric interurban rail-

ways, a terminal switching and belt line, motor coach and truck lines. Air service is supplied by Capital, Mid-Continent, Northwest and Western air lines.

The population was 271,606 in 1930, of whom 44,743 were foreign-born white (largely from the Scandinavian countries, Germany and Canada); 1950 federal census 309,474. The Twin

WEATHER GRAPH OF SAINT PAUL. THE THERMOMETER INDICATES THE ANNUAL MEAN TEMPERATURE; THE MIDDLE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE; THE CURVES ABOVE AND BELOW, THE HIGHEST AND LOWEST EVER RECORDED. THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION: (BLACK) TOTAL PRECIPITATION (INCLUDING MELTED SNOW); (WHITE) SNOWFALL.

Cities (Saint Paul and Minneapolis) and their immediate suburbs constitute a great urban community of about 1,107,000.

Transportation Facilities.—Saint Paul is picturesquely located on a series of benches or terraces of irregular breadth and height, reaching a maximum of 266 ft. above the level of the river and merging in an elevated rolling plateau. It occupies 55.44 sq.mi., mostly on the north (or "east") bank of the Mississippi, but including an area in a bend of the river on the south side, opposite the heart of the business district. Six highway bridges and several used by railways cross the river within the city limits, connecting the main part of the city with the "west" side, and connecting Saint Paul with Minneapolis. Because of the irregular nature of the terrain and the numerous railways entering the city, there are 67 other bridges spanning railroad tracks and valleys. Saint Paul is indeed "the port of entry to the great northwest." The nine railway systems have an aggregate mileage of 59,259 mi., one-fourth of the total railway mileage of the United States. They enter the city along the foot of the bluffs, or through a narrow valley giving access to the highlands back of the city. All use the Union depot, completed in 1926 at a cost of \$15,000,000. A switching and interchange railway, serving all the lines, handles 775,000 cars in a year.

After a long period during which the river, originally the principal artery of commerce, had scarcely been used, regular barge service on the upper Mississippi was again inaugurated (by the Inland Waterways corporation) in the summer of 1927. Shipments in and out of the port of Saint Paul in 1949 totalled 1,300,821 tons. There are three municipal terminals for handling general cargo, grain, coal and ore and passenger service. Many motor truck lines and numerous bus lines operate in and out of the city in all directions.

On the south bank of the river, opposite the river terminal and little more than a mile from the courthouse, the principal rail-

way freight terminals and the bus depot, is the municipal airport (375.6 ac.).

The city is the northwestern headquarters for the U.S. railway mail service and U.S. district engineer.

Buildings and Parks.—Dominating the view as the city is approached from the south and the east is the sky line of the loop section with the state capitol in the background. Prominent in this sky line is the new city hall and courthouse. Costing \$4,000,000, this structure departs from the typical monumental public building and places full emphasis upon the utilization of space, and it depends for beauty upon its simplicity of lines, mass and shadows, rather than upon columns and ornaments; and secondly, on the works of art contained in it and the excellence of the interior finish.

The state capitol stands on high ground north of the business district, where it commands a view of the entire city. Designed by Cass Gilbert, Saint Paul architect, this structure of Minnesota granite and white Georgia marble, with massive central dome, was completed in 1905 at a cost of \$4,500,000. Included in the state building group are the state office building and the State Historical society building. Other prominent buildings are the federal building and the municipal auditorium, which seats more than 12,000 in the main arena and in addition has a theatre section, numerous smaller halls, conference rooms and exhibit areas. The residential sections of the city, mostly on high ground, are beautiful with trees, shrubbery and wide lawns. The most noted street, Summit avenue, 200 ft. wide, winds for part of its length along the edge of the bluff, commanding fine views of the river gorge and the lower terraces of the city. Adjoining the city on the southwest is the Fort Snelling military reservation of 2,000 ac. The picturesque original fort, built in 1822, still stands high on the bluff. The city's park system covers 2,207 ac. including nine large parks (up to 600 ac.) connected by drives and river boulevards and 80 smaller triangles and monument sites. Harriet Island, opposite the business section of the city, has been made a pleasure ground. Three of the parks contain large lakes and golf courses, and there are 53 lakes in the county. Indian Mounds park (named from the Sioux burial mounds which it encloses) on Dayton's bluff commands a magnificent view of the Mississippi. Next to it are the grounds of the state fish hatchery, one of the best equipped in the country.

On the northern edge of the city, bounded by it on three sides, are the 260-ac. grounds and beautiful buildings (owned by the state) of the Minnesota Agricultural society, the scene of the annual state fair, the largest one in the United States, with an attendance in 1950 of 905,563.

Schools and Churches.—In the northwestern corner of the city, adjoining the fair grounds, is the farm campus (419 ac.) of the state university, where the schools of agriculture and the main agricultural experiment station are located. Saint Paul is the seat also of Macalester college (Presbyterian, founded in 1885); Hamline university (Methodist, chartered 1854); the College of St. Thomas (Roman Catholic, 1885); the College of St. Catherine (Roman Catholic, 1905); Bethel college and seminary (Baptist); Luther Theological seminary; and St. Paul theological seminary (Roman Catholic); the St. Paul College of Law; and a number of secondary and special training schools under various auspices, including one for the training of laboratory technicians. The public schools are housed in 73 buildings, most of them modern in construction. The system includes eight athletic fields and 52 playgrounds. The public library occupies an entire block. In one wing is the valuable Hill reference library, maintained by the heirs of James J. Hill, and part of his famous gallery of paintings, which included the best collection of the Barbizon school in America. The law library of the state is housed in the capitol, and the collection of the Minnesota Historical society has a fine building of its own. Two daily newspapers are published. The *Pioneer-Press*, established in 1853, is one of the oldest newspapers in the northwest.

Saint Paul is the see of a Roman Catholic archdiocese. The Cathedral of Saint Paul is one of the notable ecclesiastical structures of the country.

There are 281 churches, representing all the principal faiths and denominations. The charitable agencies which depend for support on voluntary contributions are financed through a joint annual campaign, which raises about \$1,500,000. The community chest and several of the larger philanthropic agencies are housed in a central administration building provided by the Amherst H. Wilder charity, a trust fund of about \$3,800,000, established in 1910 for the benefit of the poor of the city.

Government.—Saint Paul operates under a charter adopted in 1912 and effective Jan. 1, 1914, establishing a commission form of government. Elections are held biennially. The voters elect a mayor, a comptroller and six councilmen or commissioners; three justices of the peace, two municipal judges and four constables. The mayor assigns each commissioner to one of the six departments of government (public safety, public works, public utilities, parks and public buildings, finance, and libraries, auditorium and museums) as its administrative head. Saint Paul's public schools are administered by a school board of seven members, authorized by city charter amendment in 1950. Fiscal powers relating to tax levy and budget control are retained by city council and comptroller under basic charter provisions. The mayor is ex-officio president of the council and has the veto power over its acts, but they may be passed over his veto by four votes. The comptroller is also the civil service commissioner. A city planning board was created in 1928. In 1922 it submitted a general city plan, and in 1924 a zoning ordinance was adopted. Saint Paul has a low death rate, a low infant mortality, high level literacy, a high percentage in school attendance, high percentage of home ownership and an index figure for cost of living below the average. The valuation of taxable property for 1950 was \$533,034,198.

Trade and Manufactures.—Saint Paul, near the head of navigation on the Mississippi river, became the railroad centre of the northwest in the days when the river was the principal artery of transportation. Because of these transportation advantages, it also became the distributing centre of the northwest. Today the wholesalers and jobbers distribute food, dry goods, clothing, general merchandise, hardware, petroleum products, printing specialties and farm implements nationally and internationally. The South Saint Paul (adjacent to Saint Paul) livestock market has grown so that it is second only to Chicago in the receipt and slaughter of livestock.

Poultry, dairy and food products from the surrounding agricultural area are also processed in large quantities. Printing and publishing is one of the major industries of Saint Paul. Among the firms in this field are the world's largest publishers of law books and the largest producers of calendars and advertising specialties in the United States. Automobiles and accessories, wearing apparel and furs, foundries and machine shops are also important in the industrial life of the city. Saint Paul supplies the world with the familiar cellulose tapes and produces abrasives and other products. More than 800 manufacturers in the Saint Paul industrial area make about \$600,000,000 worth of products annually. The city has an important agricultural industry in the production of mushrooms, which are raised in large quantities in the caves in the sandstone bluffs on the west side of the river. The caves are also used to age cheese, most of which is a Roquefort type developed at the University of Minnesota farm school and called "Minnesota blue." Saint Paul has 18 banks, with total resources of \$547,819,228 in 1950. Debts to individual accounts in that year amounted to \$5,601,766,572. The federal land bank and the federal intermediate credit bank for the northwest are both located in Saint Paul.

History.—The site of Saint Paul was known to the Indians as *Imnisha*, the White Rock. It was occasionally used as a camping place, but it was not until about 1800 that an Indian village was established there. The first white visitor of record was the Jesuit missionary, Father Louis Hennepin, in 1680, but probably the traders Pierre Radisson and Médart, sieur de Groseilliers, were there in 1658. Robert, sieur de la Salle, mentions the locality in a letter written in 1682. In 1766 Jonathan Carver (*q.v.*) of Massachusetts made an adventurous journey by way of Mackinac across Wisconsin and into Minnesota, and his heirs claimed the

entire site of Saint Paul and much adjacent territory on the ground of an alleged grant made to him by the Indians. In 1809 Lieut. Zebulon M. Pike, sent by Thomas Jefferson to take possession of the region, bought most of the ground now occupied by the city, as well as the Fort Snelling reservation, from the Sioux for 60 gal. of whiskey and a few presents, to which congress later added \$2,000 in cash. In 1823 the first steamboat made its way up the river. In 1837 the site was opened to settlement. By 1840 there were about 200 settlers, mainly French, living by hunting, fishing and trading. To them came Father Lucien Gaultier, and under his guidance they built a church of logs in 1841 on the crest of the bluff and dedicated it to Saint Paul. The place came to be known as Saint Paul's Landing, later shortened to Saint Paul. On the organization of the territory of Minnesota in 1849, the village of 32 houses was designated as the capital. It was incorporated as a city in 1854.

ST. PAUL, a volcanic island in the southern Indian ocean, in 38° 42' 50" S., 77° 32' 29" E., 60 m. S. of Amsterdam island, belonging to France. The island was attached to the general government of Madagascar by decree (1924) at the same time as other islands of the southern seas. The two islands belong to two separate eruptive areas characterized by quite different products; and the comparative barrenness of St. Paul contrasts with the dense vegetation of Amsterdam. On the north-east of St. Paul, which has an area of 23 sq.m., is a land-locked bay, representing the old crater, with its rim broken down on one side by an explosion, forming a natural harbour. The highest point is 862 ft. above the sea. Inaccessible cliffs occur on the south-west side. The oldest rocks are a trachyte which occurs at Nine Pin rock; this was followed by an extrusion of basalts, then by basic lavas, scoriae, palagonite tuffs, and basaltic ashes and finally basalt flows proceeded from the crater. The only remaining indications of volcanic activity are the warm springs and emanations of carbon dioxide. The island is uninhabited but the waters are well stocked with fish (see C. Vélain, "St. Paul et Amsterdam," *Annales de Géographie*, t. ii, p. 329).

ST. PAUL'S ROCKS, a number of islets in the Atlantic, nearly 1° N. of the equator and 540 m. from South America, in 29° 15' W. The whole space occupied does not exceed 1,400 ft. in length by about half as much in breadth. Besides sea-fowl the only land creatures are insects and spiders. Fish are abundant, seven species being collected by the "Challenger." Darwin considered the rocks not of volcanic origin; later investigators maintain that they probably are eruptive.

ST. PETER, a city of Minnesota, U.S.A., on the west bank of the Minnesota river, 75 mi. S.W. of Minneapolis; county seat of Nicollet county. It is served by the Chicago and North Western and the Chicago, St. Paul, Minneapolis and Omaha railways, and by bus lines. Pop. (1950) 7,766. St. Peter is an important grain, livestock, dairying, limestone and lumber market, and is the seat of a state hospital for the insane and of Gustavus Adolphus college (Swedish Evangelical Lutheran, 1862). The city was founded about 1852, incorporated as a village in 1865, and chartered as a city in 1891. In 1857 a bill making it the state capital passed the legislature, but was not signed by the governor.

ST. PETER PORT, the chief town of Guernsey, one of the Channel Islands. Pop. (1931) 16,318. It lies on a steep slope above its harbour, on the east coast of the island. The harbour is enclosed by breakwaters, the southernmost of which connects with the shore and continues beyond an islet on which stands Castle Cornet (12th century). A sea wall extends more than a mile towards the port of St. Sampson. To the south of the town is Fort George. The old boundaries of the town are marked by five stones. St. Peter's, the town church, standing low by the side of the quay, dates from various periods, with possible remnants of Norman walls, and has fine details of the 14th and 15th centuries. The Elizabeth college for boys was founded by Queen Elizabeth Hauteville house, the residence of Victor Hugo from 1856 to 1870, is preserved as he left it, and the authorities of the city of Paris are now its trustees. Among other works which he produced in this island fastness was *Les Travailliers de la Mer* (1863), unsurpassed even among the works of its author for

splendour of imagination and for pathos. The church of St. Sampson, consecrated 1111, is the oldest in the island.

The original harbour was built under King Edward I, if not earlier; it was added to under Queen Elizabeth, and outside this harbour lay a roadstead, landward of the islet of Castle Cornet. Most of this roadstead was enclosed by breakwaters in the mid 19th century, and the large harbour thus formed has had its quays increased by the completion in 1930 of a jetty projecting out into the pool. A large export trade in fruit, vegetables and flowers is carried on.

ST. PETERSBURG: see LENTINGRAD.

SAINT PETERSBURG, a city of Pinellas county, Fla., U.S., on the west coast, 20 mi. S.W. of Tampa; served by the Atlantic Coast Line and the Seaboard Air Line railways, by National, Delta and Eastern airlines and by Cuban and South American air freight lines. The city covers 58 1/2 sq. mi. on the southern tip of Pinellas peninsula; it is bordered on the west and south by the Gulf of Mexico and on the east and northeast by Tampa bay. The 7-mi. Gandy bridge connects St. Petersburg with Tampa, 20 mi. across the bay. Three causeways across Boca Ciega bay on the west connect the city with the Gulf Beach keys along the Gulf of Mexico; a 13-mi. lower bay bridge to Bradenton and Key West was under construction in 1951. The city has 33 mi. of water front, a municipal airport, solarium, swimming pools and 6 mi. of water-front park with piers and marina. Assessed valuation in 1950 was \$164,982,627; the form of government is commission-manager. Apartments and numerous guest homes care for a tourist industry of 500,000 annually. The setting is subtropical, the climate mild and equable. Beginning in 1910, a local newspaper has given away its entire edition on any day in which the sun has not shown at press time (2 P.M.), an average of four times a year. St. Petersburg is a spring training baseball centre. The commerce of its international airport (Pinellas county) in 1949 amounted to 7,080,546 lb. of air freight, third largest in poundage in the U.S., and included fish, fruit, winter vegetables, flowers and bulbs, cattle, furniture, drugs, jewellery and automobiles transhipped to foreign countries. St. Petersburg was platted in 1885, became a town in 1887 and was incorporated as a city in 1903. In 1950 it had 402 manufacturing firms employing 4,000 persons with an industrial pay roll in excess of \$7,000,000.

SAINT-PIERRE, BERNARDIN DE (1737-1814), French man of letters, was born at Havre on Jan. 19, 1737. He was educated at Caen and at Rouen, and became an engineer. According to his own account he served in the army, taking part in the Hesse campaign of 1760, but was dismissed for insubordination, and, after quarrelling with his family, was in some difficulty. He appeared at Malta, St. Petersburg, Warsaw, Dresden, Berlin, holding brief commissions as an engineer and rejoicing in romantic adventures. He came back to Paris in 1766 poorer than he set out. He came into possession of a small sum at his father's death, and in 1768 he set out for the Isle of France (Mauritius) with a government commission, and remained there three years, returning home in 1771. On his return from Mauritius he was introduced to D'Alembert and his friends, but he was most attracted to J. J. Rousseau, of whom in his last years he saw much, and on whom he formed both his character and his style. His *Voyage à l'île de France* (2 vols., 1773) gained him a reputation as a champion of innocence and religion, and in consequence, through the exertions of the bishop of Aix, a pension of 1,000 livres a year. The *Études de la nature* (3 vols., 1784) was an attempt to prove the existence of God from the wonders of nature.

His masterpiece, *Paul et Virginie*, appeared in 1789 in a supplementary volume of the *Études*, and his second great success, much less sentimental and showing not a little humour, the *Chambré indienne*, not till 1790. In 1792 he married a very young girl, Félicité Didot, who brought him a considerable dowry. For a short time in 1792 he was superintendent of the Jardin des Plantes, and on the suppression of the office received a pension of 3,000 livres. In 1795 he became a member of the Institute. After his first wife's death he married in 1800, when he was sixty-three, another young girl, Désirée Pellopo, and is said to have been very happy with her. On Jan. 21, 1814 he died at his house at Eragny, near Pontoise.

Paul et Virginie has been pronounced gaudy in style and unhealthy in tone. Bernardin's merit lies in his breaking away from the arid vocabulary which more than a century of classical writing had brought upon France, in his genuine preference for the beauties of nature, and in his attempt to describe them faithfully. After Rousseau, and even

more than Rousseau, Bernardin was in French literature the apostle of the return to nature, though both in him and his immediate follower Chateaubriand there is still much mannerism and unreality.

Almé Martin, disciple of Bernardin and the second husband of his second wife, published a complete edition of his works in 18 volumes (1818-20), afterwards increased by seven volumes of correspondence and memoirs (1826). *Paul et Virginie*, the *Chambré indienne*, etc., have often been separately reprinted. See also Arvidé Barin's *Bernardin de Saint Pierre* (1891).

SAINT-PIERRE, CHARLES IRÉNÉE CASTEL, Abbé de (1658-1743), French writer, was born at the Château de Saint-Pierre l'Église near Cherbourg on Feb. 18, 1658. His father was *bailli* of the Cotentin, and Saint-Pierre was educated by the Jesuits. In Paris he frequented the salons of Madame de la Fayette and of the marquis de Lambert. He was presented to the abbacy of Tyron, and was elected to the Academy in 1695. In the same year he gained a footing at court as almoner to Madame. But in 1718, in consequence of the political offence given by his *Discours sur la polysynodie*, he was expelled from the Academy. He died in Paris on April 29, 1743.

Saint-Pierre's works are almost entirely occupied with an acute criticism of politics, law and social institutions. They had a great influence on Rousseau, who left elaborate examinations of some of them, and reproduced not a few of their ideas in his own work. His *Projet de paix perpétuelle*, which was destined to exercise considerable influence on the development of the various schemes for securing universal peace which culminated in the Holy Alliance, was published in 1713 at Utrecht, where he was acting as secretary to the French plenipotentiary, the Abbé de Polignac. His works were published at Amsterdam in 1738-40 and his *Annales politiques* in London in 1757. A discussion of his principles, with a view to securing a just estimation of the high value of his political and economic ideas, is given by S. Siéglér Pascal in *Un Contemporain ignoré au XVIII^e siècle*. See *Projets de l'abbé de Saint-Pierre*, 1658-1743 (Paris, 1900).

ST. PIERRE and MIQUELON, the largest islands of two small groups 10 mi. off the south coast of Newfoundland; united area about 93 sq. mi. Both islands are rugged masses of granite, with a few small streams and lakes, a thin covering of soil and scanty vegetation. Area of St. Pierre group, 10 sq. mi.; Miquelon group, 83 sq. mi. The population of the two islands in 1950 was 4,605, the capital city of St. Pierre having 3,999 people.

The islands were occupied by the French in 1604 and fortified in 1696. In 1702 they were captured by the British and held till 1763, when they were given back to France as a fishing station. They are thus the sole remnant of the French colonies in North America. Taken by the English in 1778, restored to France in 1783, again captured and depopulated by the English in 1793, recovered by France in 1802 and lost in 1803, the islands have remained in undisputed French possession since 1814 (treaty of Paris). Their importance is due to their proximity to the Grand Banks. Fisheries of codfish, haddock, and other fish are carried on in the bay between the islands.

The islands are administered by a French governor, assisted by a council of 14 members elected by universal franchise. Administration of the islands and public services is carried out by a governor, assisted by a private council. In 1946 a general council, composed of 14 members elected by universal franchise, assumed a large part in the administration of this territory. It acquired power particularly over the local budget and the fixing of customs, tariffs and all other taxes. The territory of St. Pierre and Miquelon is represented in the French parliament by a member in the national assembly and by a senator in the council of the republic. It elects, as well, a representative to *Assemblée de l'Union française*.

See Henricque, *Les Colonies françaises*, t. II (Paris, 1889); Levasseur, *La France*, t. II (Paris, 1893); *L'Année coloniale*, yearly from 1899.

(C. Cr.)

ST. POL, COUNTS OF. The countship of St. Pol-sur-Ternoise owed its importance to its position between the countship of Flanders and the lands of the Capetian kings of France. It appears at the beginning of the 11th century bounded by the Aa, the Lys and the Canche. The *castrum* of St. Pol, built c. 1023 near Ternoise, commanded the crossroads to Thérouanne, Béthune and Arras. Formerly vassals of the count of Flanders through the count of Boulogne, the Candavènes, who formed the first dynasty of St. Pol (1025-1205), were able to resist Flemish

domination, particularly in the time of Hugh II (1081-1126), relying instead on the Capetians. The same policy prevailed under the two following dynasties, to which the county, now owing allegiance to the counts of Artois, successively fell in female succession; viz., the house of Châtillon (1205-1371), particularly devoted to Philip the Fair in his struggle against Guy of Dampiere (see also Blois, Countess of), and the house of Luxembourg-Ligny (1371-1482), one of the last members of which, Louis, constable of France was beheaded in 1475 on the order of Louis XI. The French kingdom thus became possessed of the county, which passed to the house of Bourbon-Vendôme, then to that of Orléans-Longueville.

See P. Feuchère, "Les Origines du Comté de St. Pol," *Revue du Nord* (Lille, 1952).

ST. POL-DE-LÉON, a town of N.W. France, in the department of Finistère, about 1 mi. from the shore of the English channel, and 13½ mi. N. of Morlaix by the railway to Roscoff. Pop. (1946) 5,812. In the 6th century a Welsh monk, Paul, became bishop of the small town of Léon, and lord of the domain in its vicinity, which passed to his successors and was increased by them. St. Pol-de-Léon is a quaint town with several old houses. The cathedral (13th and 14th centuries) is largely in the Gothic style. The west front has a projecting portico and two towers with granite spires. Within the church there are beautifully carved stalls of the 16th century, a wooden shrine containing the bell of St. Pol-de-Léon, said to cure headache and diseases of the ear, and a huge baptismal font, popularly regarded as the stone coffin of Conan Meriadek, king of the Bretons. Notre Dame du Kreizker is mainly late 14th century. Fishing is carried on.

ST. PÖLTEN, an old town and bishopric in Lower Austria, annexed by Germany in 1938, on the left bank of the Traisen.

Inhabited since the Roman period, the modern town grew up around an abbey founded there in the 9th century and dedicated to St. Hippolytus, whose name in corrupted form was adopted for the town. St. Pölten is an important railway junction and has a considerable development of industries, notably cotton-spinning and the manufacture of iron and hardware. In addition, several religious institutions have grown up around the old abbey church. Pop. (1934), 36,619; (1939) 45,037.

SAINT PRIEST, EMMANUEL LOUIS MARIE GUIGNARD, vicomte de (1789-1881), French politician, third son of the following, took part in the invasion of France in 1814. At the Restoration he was in the service of the duke of Angoulême, and during the Hundred Days tried to raise Dauphiné in the royal cause. He served in Spain in 1823, and after two years at Berlin became French ambassador at Madrid, where he negotiated in 1828 the settlement of the Spanish debt. After the July revolution Frederick VII. made him a grandee of Spain with the title of duke of Almazan. He arranged the escape of the duchess of Berry in Provence in 1832, and was imprisoned for 10 months. He arranged an asylum in Austria for the duchess, and returned to Paris, where he was a leader of legitimist society until his death at Saint Priest, near Lyon on Feb. 26, 1881.

SAINT PRIEST, FRANÇOIS EMMANUEL GUIGNARD, CHEVALIER, then comte de (1735-1821), French statesman, was born at Grenoble on March 12, 1735. He entered the army at the age of fifteen, leaving it in 1763 with the grade of colonel. After four years as representative of the court of France at Lisbon, he went to Constantinople, where he remained, with a short interval, until 1785, and married Wilhelmina von Ludolf, daughter of the Neapolitan ambassador. After a few months at the Hague, he joined Necker's ministry as minister without portfolio, and in Necker's second cabinet held office as minister of the interior until Dec. 1790. In 1795 he joined the comte de Provence at Verona as minister of the household. He followed the exiled court to Blankenburg and Mittau, retiring in 1808 to Switzerland.

He wrote *Mémoires sur l'ambassade de France en Turquie et le commerce des français dans le Levant* (ed. C. Schefer, 1877); and *Examen des assemblées provinciales* (1787).

ST. PRIVAT, a village of Lorraine, 7 mi. N.W. of Metz. The village and the slopes to the west played a great part in the battle

of Gravelotte (Aug. 18, 1870). (See Metz and Franco-German War.)

At St. Privat occurred the famous repulse of the Prussian Guard by Marshal Canrobert's corps.

ST. QUENTIN, a manufacturing town of northern France, capital of an arrondissement in the department of Aisne, 32 mi. N.N.W. of Laon by rail. Pop. (1946) 48,556. St. Quentin (anc. *Augusta Veromandorum*) stood at the meeting-place of five military roads. In the 3rd century it was the scene of the martyrdom of Gaius Quintinus. The date of the foundation of the bishopric is uncertain, but about 532 it was transferred to Noyon. Towards the middle of the 7th century St. Eloi (Eligius), bishop of Noyon, established a collegiate chapter at St. Quentin's tomb, which became a famous place of pilgrimage. The importance of the town was increased during the middle ages by the rise of its cloth manufacture. The town was surrounded by walls in 883. It came under Pippin, grandson of Charlemagne, one of the principal domains of the counts of Vermandois, and in 1080 received from Count Herbert IV a charter which was extended in 1103. From 1420 to 1471 St. Quentin was occupied by the Burgundians. In 1557 it was taken by the Spaniards (see below). Two years later the town was restored to the French, and in 1560 it was assigned as the dowry of Mary Stuart. During the Franco-Prussian War St. Quentin repulsed the German attacks of Oct. 8, 1870; and in January 1871 it was the centre of the great battle fought by General Faidherbe. In World War I St. Quentin was held by the Germans from the end of Aug. 1914 to Oct. 1, 1918.

The town stands on the right bank of the Somme, at its junction with the St. Quentin canal (which unites the Somme with the Scheldt) and the Croizat canal (which unites it with the Oise). The collegiate church of St. Quentin, a fine Gothic building of the 12th, 13th, 14th and 15th centuries, damaged during World War I, was reopened in 1920. It has no west façade but terminates at that end in a tower and portal of Romanesque architecture; it has double transepts. The choir (13th century) has remains of a choir screen of the 14th century. Under the choir is a crypt of the 11th century, containing the tombs of St. Quentin (Quintin) and his fellow-martyrs Victorinus and Gentianus. The hôtel-de-ville of St. Quentin (only slightly damaged) is a Gothic building of the 14th, 15th and 16th centuries, with a flamboyant façade, adorned with curious sculptures. St. Quentin is the seat of a subprefect, of a tribunal of commerce, of a board of trade-arbitrators, and a chamber of commerce. The town has recovered its industrial activity and is the centre of a district which manufactures cotton and woollen fabrics. St. Quentin produces chiefly window-curtains and carries on the spinning and preliminary processes and the bleaching and finishing. Other industries are the making of embroideries by machinery and by hand, and the manufacture of iron goods, machinery and chemical products. Trade is in grain, flax, cotton and wool.

1. **Battle of 1557**.—An army of Spaniards under Emmanuel Philibert of Savoy, invading France from the Meuse, joined an allied contingent of English troops under the walls of St. Quentin, which was then closely besieged. Admiral Coligny threw himself into the town, and the old Constable Montmorency prepared to relieve it. On St. Lawrence's Day, Aug. 10, the relieving column reached the town without difficulty, but time was wasted in drawing off the garrison, for the pontoons intended to bridge the canal had marched at the tail of the column, and when brought up were mismanaged. The besiegers, recovering from their surprise, formed the plan of cutting off the retreat of the relieving army. Montmorency had thrown out the necessary protective posts, but at the point which the besiegers chose for their passage the post was composed of poor troops, who fled at the first shot. Thus, while the constable was busy with his boats, the Spanish army filed across the Bridge of Rouvry, some distance above the town, with impunity, and Montmorency, in the hope of executing his mission without fighting, refused to allow the cavalry under the duc de Nevers to charge them, and miscalculated his time of freedom. The Spaniards, enormously superior in force, cut off and destroyed the French gendarmes who formed the vanguard of the column, and then headed off the slow-moving infantry south of Essigny-le-

The Opposing Forces.—Between Nov. 1, 1917 and March 21, 1918, the German divisions on the western front were increased from 146 to 192, troops being withdrawn from Russia, Galicia, Italy and the East. By these means the German armies in the West were reinforced by no less than 18,492 officers and 553,794 other ranks. Finally it was decided to make available 62 divisions for the main attack. These troops were systematically trained in new tactics of mobile warfare behind the front, while

FRENCH FRONT LINE
 (1) MARCH 21
 (2) PRIOR TO ATTACK ON 8TH OF JUNE

PLAN OF THE BATTLE OF ST. QUENTIN

To mystify the enemy as to the frontage selected for the main attack, subsidiary operations were prepared all along the Allied front, in Flanders, Champagne and the Argonne. From March 14 onwards the crown prince's army group was to bombard the enemy's headquarters on his front and make a show of bringing up reinforcements, and Gallwitz's army group was to carry out an attack on Verdun up to the point of engaging his infantry. The forming up for deployment of the attacking armies was begun on March 10, the divisions being organized in groups normally in a depth of three lines. The first or assault line was made the strongest, and was moved close up to the

front on March 20. The second line of divisions was some three to five km. in rear, and the third seven to ten km. behind the second line; the third line was to be held in reserve under the higher command, and was only to be used as the operations developed.

The Prelude.—On the British side, while the seriousness of the menace was appreciated, there was an apparently well-grounded belief in the power of the defence to stop a German attack. But these defensive calculations, like so many offensive actions throughout the previous three years, underrated the infinite value of surprise, which for three thousand years of recorded warfare has proved the master-key to victory. The real significance of the Cambrai attack on Nov. 20 previous had been that the British had revived the use of such a key, forging it from an amalgam of armour and the caterpillar tank. Unhappily, the effect of this tank key was largely lost because when inserted in the lock they had not the power to turn it fully, through exhausting their strength in the Passchendaele mud. (*See YPRES, BATTLES OF, 1917.*)

In the German counter-attack of Nov. 30 Ludendorff had used a key similar in principle if different in design—a short, sharp bombardment with gas and smoke shell, followed up by an influx of infantry, specially trained in the new infiltration tactics. It would seem that by the following March the British had not sufficiently taken this lesson to heart. For, just as were the V. Army's subsequent excuses of weak numbers and a long line, the command had expressed ample confidence beforehand in its power to resist the onslaught. As a result, when the original front was forced, an inadequate preparation and co-ordination of the measures to block the enemy's path further back was revealed. The Army Command had failed to arrange for the blowing up of certain causeways and G.H.Q. had not given it a definite order. Worse still was the confusion caused by the fact that in the case of the more important railway bridges, this duty was entrusted to the railway authorities instead of the local commanders, and in this way the vital railway bridge at Peronne was allowed to fall undestroyed into German hands.

If this was good luck for the Germans, their thorough and skilful preparations for the initial assault had earned them success—although here again fortune favoured them. Ludendorff's solution for breaking the deadlock was a compound of wider frontages of attack, new infantry tactics, and, above all, for surprise, a lavish use of gas in a brief but intense artillery bombardment. For it, masses of artillery were brought up close to the front line in concealment, and against the V. Army front opened fire without preliminary ranging. This was to be followed by the infiltration of many dispersed little groups of automatic rifles and machine-guns. But the effect of the gas-gained surprise was immensely increased by nature, which in the early hours of March 21 provided a thick mist, which cloaked the infiltrating assailants as much as it masked the defending machine-guns. Without this aid it is questionable how far the German tactical surprise would have succeeded, and in this lay the essential inferiority of the German method of surprise, which still depended on unarmoured infantry, compared with the British surprise at Cambrai, and later, on Aug. 8, 1918, which was achieved by armoured machines.

The Attack, March 21.—While the bombardment, with a lavish mixture of gas and smoke shell, opened at 4.30 A.M. the German infantry attack did not begin until 9.40 A.M., when a general move forward was made under the cover of a creeping barrage, supplemented by low-flying aircraft. The British outpost zone was overrun almost everywhere by midday, but this was inevitable, and had been foreseen. But the northern attack met such stubborn resistance against the right of Byng's III. Army that it had not seriously penetrated the main battle zone even by the night of the 22nd, and, despite putting in successive reinforcements, the capture of Vaulx-Vraucourt was then the high-water mark of its progress. On most parts of Gough's V. Army front the battle-zone resistance was just as firm, but the flood found a way through on the 21st near La Fère, on the extreme right, at Essigny and Ronsoy. The resistance of the

21st Division at Epéhy for a time checked this last breach from spreading northward, but it began to crumble so deeply that the neighbouring sectors were affected. Southward, near St. Quentin, the line sagged still more deeply, and on the night of the 22nd Gough felt compelled to order a general retirement to the line of the Somme.

On the 23rd Ludendorff gave the XVIII. Army, his left or southern wing, a limited permission to exploit this opportunity along the line of least resistance. But for several days he still pinned his faith and reserve strength to his right wing, despite the relatively small progress of his XVII. Army in the north and by the enforced postponement of its intended supplementary attack towards Arras, where Byng had anticipated the blow by a partial withdrawal. When the postponed blow was attempted on the 28th it collapsed under a storm of fire from the expectant defence. No fog came to the German aid. At last Ludendorff threw his weight into the push along the Somme westward, although he still held his left wing in a tight rein. But by that time the new surge towards Amiens was almost as stagnant, its impetus slackening far less because of the resistance than because of the exhaustion of the German troops and the difficulty of supply in so rapid and deep an advance. This was accentuated because their route had taken them across the desert formed by the old battlefields of 1916. On March 30 and April 4 they made fresh attempts, but the effect was and could only be local. For the resistance in the south had been given time, and relief from pressure, to harden into a crust which the belated intervention of fresh German reserves could not break.

On April 4 the great battle to all intents and purposes came to an end. The initial success had been great; since March 21 from a base of 74 m. a penetration of no less than 38 m. had been effected; the ground lost in 1916 and abandoned in 1917 had been more than made good, and vast quantities of stores as well as 90,000 prisoners and 1,200 guns had been captured. The British Armies had been seriously defeated, and 20 French divisions had been drawn into the battle; yet, in spite of the fact that 90 German divisions had been engaged, neither the transition to a war of movement nor the separation of the British and French forces had been achieved.

Conclusion.—The supreme features of this great offensive are, first, the immensity of its outward results compared with any previous offensive in the west; second, its ineffectiveness to attain decisive results. For the first it would be both unjust and untrue to blame the defending troops. They achieved miracles of heroic endurance, and the prolonged resistance in most of the battle zone is the proof. The real cause of the subsequently rapid flow-back lay in the frequent breakdown of control and communication. During three years of trench warfare the British had built up an elaborate and complex system, largely dependent on the telephone, and when the static suddenly became fluid they paid the inevitable penalty of violating those fundamental axioms of war—simplicity and flexibility.

On the German side, Arras was the actual rock on which their plan broke, and by which their advance was diverted into less profitable channels. It is possible that military conservatism cost them dear. For Colonel Bruchmüller, the famous artillery battle-piece "producer," brought from the eastern front for this offensive, has revealed that while Hitler's army carried out his surprise bombardment designs, Below's in the north clung to their old-fashioned methods, refusing to dispense with preliminary ranging. But if Hitler scored at the outset, his onrush slackened as his supplies and reinforcements failed with the distance covered, and when due tribute has been paid to the sturdy resistance, the German advance is seen really to have beaten itself.

(B. H. L. H.)

ST. RÉMY (-DE-PROVENCE), a town of southeastern France in the department of Bouches-du-Rhône, 15 mi. N.E. of Arles by road. Pop. (1936) 3,625. It lies to the north of the range of hills named the Alpines or Alpilles in a valley of olive trees. The church has a 14th-century spire. About a mile to the south are Gallo-Roman relics of the ancient Glanum, destroyed about 480, including a triumphal arch and a fine three-storied

mausoleum. Near by is the old priory of St. Paul-de-Mausole with a Romanesque church and cloister.

ST. RIQUIER, a town of northern France, in the department of Somme, 8 mi. N.E. of Abbeville by rail. Pop. (1936) 1,313. St. Riquier (originally *Centula*) was famous for its abbey, founded about 625 by Riquier (*Richarius*), son of the governor of the town. It was enriched by King Dagobert and prospered under the abbacy of Angilbert, son-in-law of Charlemagne. The fine Flamboyant church of the 15th and 16th centuries has a richly sculptured west front. The treasury, among other valuable relics, possesses a copper cross said to be the work of St. Eloi (*Eligius*). In 1544 the town was burned by the English, an event which marks the beginning of its decline.

SAINTS, BATTLE OF THE. This battle was fought between the fleets of England and France in the channel between the islands of Dominica and Guadeloupe on April 12, 1782. It takes its name from the Saints Is. in the channel. The French had 35 battleships under the Comte de Grasse based on Martinique, and their object was to give the British fleet the slip, and capture Jamaica. The British fleet of 36 ships was based on St. Lucia and was under Rodney.

The British Admiral kept close watch on the French movements. When, therefore, on April 8, the signal came that the French were out, the British were immediately after them on a northerly course. At dawn on April 9 the British van, under Hood, was close to de Grasse, who was forced to order his store-ships to make for Guadeloupe, sending two of his battleships to protect them. Hood was soon in action with the French rear, and his position was awkward in that he only, of the English, had made the Saints passage, the centre and rear being becalmed under the lee of Dominica. De Grasse was thus in a position to attack him with all his force, but he merely cannonaded his enemy from a distance. The British van suffered enough to make it necessary subsequently for it to change places with the rear, under Drake, but the arrival of Rodney caused de Grasse to withdraw, and the French battleship *Cato* was put out of action.

During the ensuing night and day the French gained somewhat and seemed likely to get clear away, but on the night of the 10th two battleships, the *Jason* and the *Zélé*, collided and the former was so seriously injured that de Grasse had to part with her. It would have been better for him had he dispensed with the *Zélé* also, for on the 11th she fell far behind the rest of the fleet, and it became clear that she would fall a victim to the British unless de Grasse turned to help her. This he did; and thus a general action was joined on April 12, the French by then having only 30 effective ships. The two fleets approached one another on opposite courses with the wind from the east; the British were sailing roughly north and the French south, the latter being the nearer to the wind. The fight began early, and by 10 o'clock the moment for the British to get on the same course as the French had arrived.

Rodney, however, never issued orders to this effect for, at this juncture, the wind shifted four points to the south. This meant that gaps appeared in the French line, and, more important, the English could turn to starboard and sail through them. Rodney and his flag-captain, Sir Charles Douglas, both grasped the possibilities of the situation, and the former decided to risk it. There were no signals for the movement so, relying on the force of example, Rodney took his flagship, the *Formidable*, stationed in the centre, through a convenient gap in the rear of the French centre. He was followed by the five ships immediately astern, all raking the French as they passed. A similar movement took place in the rear. Captain Affleck, in the *Bedford*, passing through the head of the same French squadron, was followed by Hood with the entire British rear. The French were thus broken into three bodies, de Grasse, in the *Ville de Paris*, with other ships of the centre being isolated between the two points of intersection, and, after a gallant defence, captured.

Rodney's officers blamed him for not putting up a more energetic pursuit, but he preferred to make sure of cutting the enemy off from their base. Actually the bad morale of the French, and the complete scattering of their fleet, rendered either alternative

nagatory.

SAINT-SAËNS, CHARLES CAMILLE (1835-1921), French composer, was born in Paris on Oct. 3, 1835. For a short time he studied composition under Halévy, and in 1852, and again in 1864, competed without success for the Grand Prix de Rome. In 1853, when only eighteen, he was appointed organist at the Church of St. Merry, and from 1861 to 1877 was organist at the Madeleine, in succession to Lefebvre-Wély. In 1867 his cantata "Les Noces de Prométhée" won a prize at the International Exhibition of that year but his first operas *La Princesse jaune* (1872) and *Le Timbre d'argent* (1877) had no great success. It was with his brilliantly effective "symphonic poems" *Le Rouet d'Omphale*, *La Danse Macabre*, *Phaëton* and *La Jeunesse d'Hercule* that he first attracted general attention as a composer, though his powers as a pianist had been recognised from the first. His success as a dramatic composer was however not long delayed.

Through the influence of Liszt, his Biblical opera *Samson et Dalila* was brought out at Weimar in 1877 when its merits were immediately recognised, though it was not until 1890 that it was first heard in France, namely at Rouen. This work, generally accepted as his operatic masterpiece, had been begun as far back as 1869, and an act had been heard at one of Colonne's concerts in 1875. The following year it was given in Paris at the Eden Theatre, and finally in 1892 it was produced at the Grand Opera, where it has remained ever since, one of the most attractive works of the *répertoire*. Its Biblical subject prevented its performance in London until 1909, when it was given at Covent Garden with great success. None of his works is better calculated to exemplify the dual tendencies of his style. The first act, with its somewhat formal choruses, suggests the influence of Bach and Handel, and is treated rather in the manner of an oratorio. The more dramatic portions of the opera are not uninfluenced by Meyerbeer, while in the *Dalila* music there are occasional suggestions of Gounod. But though Saint-Saëns was an eclectic he put the stamp of his own individuality on every scene of the opera.

After the production of *Samson et Dalila* Saint-Saëns stood at the parting of the ways and compromised to some extent between the traditional style of the French school and the newer Wagnerian methods. As the result none of his later operas—*Etienne Marcel* (Lyons, 1879), *Henry VIII.* (Grand Opera, 1883), *Proserpine* (Opéra-Comique, 1887), *Ascanio* (Grand Opera, 1890), *Phryné* (Opéra-Comique, 1893), *Les Barbares* (Grand Opera, 1901) achieved anything like the success of *Samson et Dalila*. But Saint-Saëns by no means confined his attentions to the stage, his compositions including examples in almost every department of the art. Among these may be mentioned the oratorios and cantatas *Oratorio de Noël*, *Les Noces de Prométhée*, *Le Déluge*, *La Lyre et la Harpe*; three symphonies; the four symphonic poems previously named; five piano-forte concertos; three violin concertos; the ballet *Zavotti*; many chamber works; a Mass and a Requiem, besides a quantity of piano and organ music, and many songs. His literary works in turn include *Harmonie et mélodie*, *Portraits et souvenirs*, and *Problèmes et mystères*, besides a volume of poems, *Rimes familières*. He died in Algiers on Dec. 16, 1921.

SAINTSBURY, GEORGE EDWARD BATEMAN (1845-1933), English man of letters, was born at Southampton on Oct. 23, 1845. He was educated at King's college school, London, and at Merton college, Oxford (B.A. 1868), and spent six years in Guernsey as senior classical master of Elizabeth college (1868-74). From 1874 to 1876 he was headmaster of the Elgin educational institute. He began his literary career in 1875 as a critic for the *Academy*, and for ten years was actively engaged in journalism, becoming an important member of the staff of the *Saturday Review*. From 1895 to 1915 he was professor of rhetoric and English literature at Edinburgh university. Saintsbury's work bears the mark of his vast range of reading. Among the most important of his many works are his *Short History of French Literature* (1882; 6th ed., Oxford, 1901); *A Short History of*

English Literature (1898; 3rd ed., 1903); an edition of the *Minor Caroline Poets* (3 vols., 1905-21); *A History of Criticism* (3 vols., 1900-04); *A History of English Prosody* (3 vols., 1906-21); *The History of English Criticism* (1911); and *A History of the French Novel* (1917-19).

ST. SERVAN, a town of western France, in the department of Ille-et-Vilaine, on right bank of the Rance, south of St. Malo, from which it is separated by the Anse des Sablons, a creek 1 mi. wide. Pop. (1936) 10,986. The "Cité" occupies the site of the city of Aleth, which at the close of the Roman empire supplanted Corseul as the capital of the Curiosolites. Aleth was not Christianized till the 6th century, when St. Malo became its first bishop. At the Revolution St. Servan became a separate commune from St. Malo. North of the town is a wet dock, forming part of the harbour of St. Malo. The dock is used chiefly by coasting and fishing vessels, a fleet starting annually for the Newfoundland codfisheries.

SAINT-SIMON, CLAUDE HENRI DE ROUVROY, COMTE DE (1760-1825), French socialist, was born in Paris on Oct. 17, 1760. He fought in the War of American Independence, was imprisoned in the Luxembourg during the Terror, and, on his release, amassed a small fortune by land speculation. He was also the originator of schemes to unite the Atlantic and Pacific by a canal, and to construct a waterway from Madrid to the sea. He continued his experiments throughout his life with the result that he was completely impoverished, and for some years before his death he was obliged to work nine hours a day to earn £40 a year. In 1823 he attempted suicide. He died two years later, on May 19, at Paris. Although a prolific writer his work attracted little attention while he lived and it was only after his death that his influence became considerable.

As a thinker Saint-Simon was deficient in system, clearness and consecutive strength; but his influence on modern thought is undeniable, both as the historic founder of French socialism and as suggesting much of what was afterwards elaborated into Comtism. Apart from the details of his socialistic teaching, his main ideas are simple, and are at once a reaction against the French Revolution and the militarism of Napoleon. So far was he from advocating fresh social revolt that he appealed to Louis XVIII. to inaugurate the new order of things. In opposition, however, to the feudal and military system, he advocated an arrangement by which the industrial chiefs should control society. In place of the mediaeval church the spiritual direction of society should fall to the men of science. What Saint-Simon desired, therefore, was an industrialist state directed by modern science in which universal association should suppress war, and society should be organized for productive labour by the most capable men. The social aim is to produce things useful to life.

Although the contrast between labour and capital is not emphasized by Saint-Simon, the cause of the poor is discussed, and in his greatest work, *The New Christianity*, it takes the form of a religion. It was this development of his teaching that occasioned his final quarrel with Comte. Previous to the publication of the *Nouveau Christianisme*, Saint-Simon had not concerned himself with theology; but here, beginning with a belief in God he endeavours to resolve Christianity into its essential elements and finally propounds this precept—"The whole of society ought to strive towards the amelioration of the moral and physical existence of the poorest class; society ought to organize itself in the way best adapted for attaining this end." This principle became the watchword of the entire school of Saint-Simon.

Of the disciples who propagated his doctrines the most important were Olinde Rodrigues, and Barthélemy Prosper Enfantin (*q.v.*), who together had received Saint-Simon's last instructions. Their first step was to establish a journal, *Le Producteur*, but it was discontinued in 1826. The sect, however, had begun to grow, and before the end of 1828, had meetings not only in Paris but in many provincial towns. An important departure was made in 1828 by Amand Bazard, who gave a "complete exposition of the Saint-Simonian faith" in a long course of lectures at Paris, which were well attended. His *Exposition de la doctrine de St. Simon* (2 vols., 1828-1830), which is by far the best account of it, won

more adherents. The second volume was chiefly by Enfantin, who along with Bazard stood at the head of the society, but who was superior in metaphysical power, and was prone to push his deductions to extremities. The revolution of July (1830) brought a new freedom to the socialist reformers. A proclamation was issued demanding the community of goods, the abolition of the right of inheritance, and the enfranchisement of women. Early next year the school obtained possession of the *Globe* through Pierre Leroux (*q.v.*), who had joined the school, which now numbered some of the ablest and most promising young men of France.

The members formed themselves into an association arranged in three grades, and constituting a society or family, which lived out of a common purse in the Rue Monsigny. Before long, however, the sect was split by dissensions between Bazard, a man of logical and solid temperament, and Enfantin, who desired to establish a fantastic sacerdotalism with lax notions as to the relation of the sexes. After a time Bazard seceded, together with many of the strongest supporters of the school. A series of extravagant entertainments given by the society during the winter of 1832 reduced its financial resources and discredited it in character. They finally removed to Ménilmontant, to a property of Enfantin, where they lived in a communistic society, distinguished by a peculiar dress. Shortly after the chiefs were tried and condemned for proceedings prejudicial to the social order; and the sect was broken up (1832).

Saint-Simonism.—In the doctrine of the followers of Saint-Simon we find a great advance on the confused views of the master. In the philosophy of history they recognize epochs of two kinds, the critical or negative and the organic or constructive. The former, in which philosophy is the dominating force, is characterized by war, egotism and anarchy; the latter, which is controlled by religion, is marked by the spirit of obedience, devotion and association. The two spirits of antagonism and association are the social principles whose prevalence determines the character of an epoch. The spirit of association, which tends more and more to prevail over its opponent, is to be the keynote of the social development of the future. Under the present system the industrial chief exploits the proletariat, the members of which, though nominally free, must accept his terms under pain of starvation. The only remedy for this is the abolition of the law of inheritance, and the union of all the instruments of labour in a social fund, which shall be exploited by association. Society thus becomes sole proprietor, intrusting to social groups and social functionaries the management of the various properties. The right of succession is transferred from the family to the state.

The school of Saint-Simon insists strongly on the claims of merit; they advocate a social hierarchy in which each man shall be placed according to his capacity and rewarded according to his works. This is, indeed, a most special and pronounced feature of the Saint-Simonian socialism, whose theory of government is a kind of spiritual or scientific autocracy, degenerating into the fantastic sacerdotalism of Enfantin. With regard to the family and the relation of the sexes the school of Saint-Simon advocated the complete emancipation of woman and her entire equality with man. The "social individual" is man and woman, who are associated in the exercise of the triple function of religion, the state and the family. In its official declarations the school maintained the sanctity of the Christian law of marriage. Connected with these doctrines was their famous theory of the "rehabilitation of the flesh," deduced from the philosophic theory of the school, which was a species of Pantheism, though they repudiated the name. On this theory they rejected the dualism so much emphasized by Catholic Christianity in its penances and mortifications, and held that the body should be restored to its due place of honour.

An excellent edition of the works of Saint-Simon and Enfantin was published by the survivors of the sect (47 vols., Paris, 1864-78). Of his other works the most important are, *Lettres d'un habitant de Genève* (1802); *Du Système Industriel* (1821); *Catholicisme des Industriels* (1823-24); *Nouveau Christianisme* (1825). See also Georges Weil, *Un Précurseur du socialisme, Saint-Simon et son œuvre* (Paris, 1894), and a history of the *École Saint-Simonienne*, by the same author

(1896); G. Dumas, *Psychologie de deux messies positivistes St. Simon et Comte* (1905); G. Brunet, *Mysticisme social de Saint-Simon* (1925); E. N. Butler, *The St-Simonian Religion in Germany* (1926); and M. Leroy, *Vie véritable de Saint-Simon* (1925).

SAINT-SIMON, LOUIS DE ROUVROY, DUC DE (1675-1755), French soldier, diplomatist and writer of memoirs, was born at Versailles on Jan. 16, 1675. The peerage granted to his father, Claude de St. Simon, is the central fact in his history. The boy had for godfather and godmother Louis XIV. and the queen. After some tuition by the Jesuits (especially by Sanadon, the editor of Horace), he joined the *mousquetaires gris* in 1692. He was present at the siege of Namur, and the battle of Neerwinden. At this time he chose to begin the crusade of his life by instigating, if not bringing, an action on the part of the peers of France against Luxembourg, his victorious general, on a point of precedence. He fought, however, another campaign or two (not under Luxembourg), and in 1695 married Gabrielle de Durfort, daughter of the maréchal de Lorges, under whom he latterly served. He seems to have regarded her with respect and affection; and she sometimes succeeded in modifying his aristocratic ideas. But as he did not receive the promotion he desired he flung up his commission in 1702. Louis took a dislike to him, and it was with difficulty that he was able to keep a footing at court. He was, however, intensely interested in all the transactions of Versailles, and by dint of a most heterogeneous collection of instruments, ranging from dukes to servants, he managed to obtain the extraordinary secret information which he has handed down.

His own part appears to have been entirely subordinate. He was appointed ambassador to Rome in 1705, but the appointment was cancelled before he started. At last he attached himself to the duke of Orleans and, though this was hardly likely to conciliate Louis's goodwill to him, it gave him at least the status of belonging to a definite party, and it eventually placed him in the position of tried friend to the acting chief of the state. He was able, moreover, to combine attachment to the duke of Burgundy with that to the duke of Orleans. Both attachments were no doubt all the more sincere because of his undying hatred to "the bastards," that is to say, the illegitimate sons of Louis XIV. It does not appear that this hatred was founded on moral reasons or on any real fear that these bastards would be intruded into the succession. The true cause of his wrath was that they had precedence of the peers.

The death of Louis seemed to give Saint-Simon a chance of realizing his hopes. The duke of Orleans was at once acknowledged regent, and Saint-Simon was of the council of regency. But he had little real influence with the regent. In 1721 he was appointed ambassador to Spain to arrange for the marriage (not destined to take place) of Louis XV. and the infanta. His own account of the cessation of his intimacy with Orleans and Dubois, the latter of whom had never been his friend, is, like his own account of some other events of his life, obscure. But there can be little doubt that he was practically ousted by the favourite. He survived for more than thirty years; but little is known of his life. His wife died in 1743, his eldest son a little later; he had other family troubles, and he was loaded with debt. When he died, at Paris on March 2, 1755, he had almost entirely outlived his own generation, and the prosperity of his house.

Saint-Simon was an indefatigable writer, and he began very early to set down in black and white all the gossip he collected, all his interminable legal disputes of precedence, and a vast mass of unclassified and almost unclassifiable matter. Most of his manuscripts came into the possession of the government, and it was long before their contents were published in anything like fullness. Saint-Simon, though careless and sometimes even ungrammatical, ranks among the most striking memoir-writers of France, the country richest in memoirs of any in the world. He has been compared to Tacitus, and for once the comparison is just. In the midst of his enormous mass of writing, phrases scarcely inferior to the Roman's occur frequently, and here and there are passages of sustained description equal, for intense concentration of light and life, to those of Tacitus or of any other historian. As may be expected from the vast extent of his

work, it is in the highest degree unequal. But he is at the same time not a writer who can be "sampled" easily, inasmuch as his most characteristic phrases sometimes occur in the midst of long stretches of quite uninteresting matter. The interest of the *Memoirs*, independent of the large addition of positive knowledge which they make, is one of constant surprise at the novel and adroit use of word and phrase. Some of Macaulay's most brilliant portraits and sketches of incident are adapted and sometimes almost literally translated from Saint-Simon.

The first edition of Saint-Simon (some scattered pieces may have been printed before) appeared in 1758. It was a mere selection in three volumes and was much cut down before it was allowed to appear. Next year four more volumes made their appearance, and in 1791 a new edition, still further increased. The whole, or rather not the whole, was printed in 1829-1830 and reprinted some ten years later. The real creator of Saint-Simon, as far as a full and exact text is concerned, was M. Chéruel, whose edition in 20 volumes dates from 1856, and was reissued again revised in 1872. The standard edition is that edited by A. de Boislisle for the *Grands Ecrivains de la France* Series. For criticism on Saint-Simon there is nothing better than Sainte-Beuve's two sketches in the 3rd and 15th volumes of the *Causeries du lundi*. The latter was written to accompany M. Chéruel's first edition. In English by far the most accurate treatment is in a Lothian prize essay by E. Cannan (Oxford and London, 1885).

ST. THOMAS, a city and port of entry of Ontario, Can., capital of Elgin county, on Kettle creek, 18 mi. S. of London and 8 mi. N. of Lake Erie. Pop. (1951) 17,942. It is an important station on the Canadian National, New York Central, London & Port Stanley, Chesapeake and Ohio, Wabash, and Canadian Pacific railways. A collegiate institute and Alma Ladies' college are located there. The New York Central railway shops and car-wheel foundry, flour, flax and planing mills, shoe and knitted-goods factories are among the chief industries.

ST. THOMAS (São Tomé), a volcanic island in the Gulf of Guinea immediately north of the equator (0° 23' N.) and in 6° 40' E. With the island of Príncipe (Príncipe's island, see below), and the small territory of Sarame around the fortress of São João Batista de Ajuda, on the coast of Dahomey, it forms the Portuguese province of S. Tomé and Príncipe. From the Gabon, the nearest point of the mainland of Africa, St. Thomas is distant 166 m., and from Cameroon 297 m. The length of the island is 32 m., the breadth W. to E. 21 m.; the area 400 sq. m.

From the coast the land rises towards lofty mountains (St. Thomas over 7,000 ft.). Malaria is common in the lower regions, but the unhealthiness of the island is largely due to the absence of hygienic precautions and to alcoholism. Conditions are now being improved. Manufacture of brandy ceased at the end of 1929. During the dry season (June to September) the temperature ranges in the lower parts between 66-2° and 80-6° F., and in the higher parts between 57-2° and 68°; in the rainy season it ranges between 69-8° and 89-6° in the lower parts, and between 64-4° and 80-6° in the higher parts. On Coffee mount (2,265 ft.) the mean of ten years was 68-9°, the maximum 90-5° and the minimum 47-3°. The heat is tempered by the equatorial ocean current. The rainfall is very heavy save on the north coast, but has steadily decreased of recent years, simultaneously with deforestation.

Communications.—There are 200 kilometres of good motor roads, and 500 km. of Decauville line are in use. A State railway of 19 km. runs from St. Tomé to Vila da Trindade and the Milagrosa plantation; 45 km. more are being laid. St. Tomé and Príncipe are connected with Europe by cable. S. Tomé has a wireless station communicating directly with Cape Verde, Angola, etc. Telephone lines link the capital with the principal settlements and plantations. Two Portuguese and one German steamship line maintain a monthly service, and other ships call frequently.

Agriculture and Trade.—The soil is extremely fertile, and three-fifths of the island is covered with forest. Among the products are oranges, lemons, figs, mangroves, and, in the lower districts, the vine, pineapple, guava and banana. The first object of cultivation was sugar, and to this the island owed its prosperity in the 16th century. Sugar has been displaced by coffee, and, principally, cocoa, introduced in 1795 and 1822 respectively. The cocoa zone lies between 650 and 2,000 ft. above the sea. Four-fifths of the total production of the island is cocoa. In 1907 the export of cocoa (including that from Príncipe) was over 24,000

tons, about a sixth of the world's supply. In 1912 it had risen to 35,706 tons, the Province then ranking as the second producing country in the world. 225,000 acres are under cocoa. In 1906 and 1918 plant diseases gave much trouble. These are now controlled; but labour difficulties and, especially, the severe competition of the west coast of Africa, particularly Nigeria, have caused a great diminution, production being now 15,000 tons.

Vanilla and cinchona bark both succeed well, the latter at altitudes of from 1,800 to 3,300 ft. In 1905, 125 tons of bark were exported. Production has since diminished. Rubber, cinnamon, camphor and the kola-nut are grown. Coffee, of splendid quality, reached its maximum production in 1902, when S. Tomé produced 1,769,959 kg. and Príncipe 247 kg. Products of the oil-palm in 1921 were 2,808,664 kg.

The chief exports in 1925, in order of their importance, were (in kilos): cocoa 20,861,000; coconut 3,338,000; coffee 171,953; and cinchona 70,807. In the same year imports (in tons) were, in order of importance: maize 2,635; rice 2,069; dried fish 1,830; and beans 1,674. In 1927 the chief exports from S. Tomé were (in kilos): cocoa, 15,767,156, valued at \$76,755,155.00; and coconut, 2,997,376, valued at \$4,419,045.25. From Príncipe: cocoa 1,000,692, value \$5,355,771.53; and coconut, 395,480, value \$68,476.56. Imports in 1925 (both islands) were valued at \$31,195,326.00 (£1-597,382), and exports at \$68,513,874.00, a favourable balance of £383,282 (\$ here means escudos, not dollars).

For 1926-27, the budget was balanced at revenue 10,213,658 escudos, and expenditure 9,173,658 escudos ordinary and 1,040,000 extraordinary. A new customs tariff protects Portuguese products, especially beer, cement (1,000 tons used annually), wines and distilled liquors.

Population.—At the last census, the inhabitants of S. Tomé were returned at 57,382, of whom 26,537 were natives, 29,894 imported labourers and 951 were classed as Europeans. The inhabitants, apart from the Europeans, consist (i) of descendants of the original settlers, who were convicts from Portugal, slaves and others from Brazil, and negroes from the Gabon and other parts of the Guinea coast. They are known as "natives" and use a Negro-Portuguese "língua de S. Tomé." (ii) On the south-west coast are Angolares—some 3,000 in number—descendants of 200 Angola slaves wrecked at Sete Pedras in 1544. They retain their Bunda speech and customs, and are expert fishermen and canoeists. (iii) Contract labourers from Cape Verde, Kabinda, etc., and Angola. These form the bulk of the population. In 1891, before the great development of the cocoa industry, the population was only 22,000. According to Aug. Chevalier (in *Occidente*, May 20, 1910), the population of St. Thomas and Príncipe combined in Dec. 1909 was 68,221, the "natives" being given at over 23,000.

St. Thomas, capital and chief port of the province, residence of the governor and of the Curador (the legal guardian of the *serviçais*, i.e., labourers), is situated on Chaves bay on the north-east coast. It is the starting point of a railway 9 m. long, which connects with the Decauville railways on the cocoa estates. Material has been acquired for the installation of a water supply; and plans are being made to supply the town and plantations with electricity produced by water power from the Contador river.

History.—St. Thomas was discovered in 1470 by the Portuguese navigators João de Santarém and Pedro de Escobar, who in the beginning of the following year discovered Annobon ("Good Year"). They found St. Thomas uninhabited. The first attempts at colonization were João de Paiva's in 1485; but nothing permanent was accomplished till 1493, when a body of criminals and of young Jews were sent to the island, and the present capital was founded by Alvaro de Carminha, in about 1500.

In the middle of the 16th century there were over 80 sugar mills on the island, which then had a population of 50,000; but in 1567 the settlement was attacked by the French, and in 1574 the Angolares began raids which only ended with their subjugation in 1603. In 1595 there was a slave revolt; and from 1641 to 1644 the Dutch, who had plundered the capital in 1600, held possession of the island. The French did great damage in 1709; the sugar trade had passed to Brazil and internal anarchy reduced St.

Thomas to a deplorable state. It was not until the later half of the 19th century that prosperity began to return.

The greatly increased demand for cocoa which arose in the last decade of the century led to the establishment of many additional plantations. Planters, however, were handicapped by the scarcity of labour. The difficulty was met by the recruitment of indentured natives from Angola, as many as 6,000 being brought over in one year. The mortality among these labourers was great, but they were well treated on the plantations. No provision was, however, made for their repatriation, while the great majority were brought by force from remote parts of central Africa and had no idea of the character of the agreement into which they were compelled to enter. The system was denounced in both Portugal and Great Britain as indistinguishable from slavery, though slavery had been abolished in Portuguese dominions in 1878. In March 1909 certain firms, British and German, as the result of investigations made in Angola and St. Thomas, refused any longer to import cocoa from St. Thomas or Príncipe islands unless the recruitment of labourers for the plantations was made voluntary. Representations to Portugal were made by the British government, and the Lisbon authorities stopped recruitment entirely from July 1909 to February 1910, when it was resumed under new regulations. British consular agents were stationed in Angola and St. Thomas to watch the working of these regulations. As one means of obviating the difficulties encountered in Angola the recruitment of labourers from Mozambique was begun in 1908, the men going out on a yearly contract.

The plantations are now well equipped and administered, with good houses and good labourers' quarters. There is an excellent medical service, government doctors visit all labour centres weekly, and there are special health regulations for the plantations. The labourers are well fed. In S. Tomé, mortality among negro labourers on plantations, in 1923-27, was 27.6 per 1,000, including infant mortality and accidents in work, as against a total mortality for the Province of 40 per 1,000. In 1927, 4,900 labourers, recruited in Angola, entered the colony. Many were repatriated to Angola, Mozambique and Cape Verde, after finishing their contracts. The number of labourers at the end of the year was 3,000 more than at the beginning. Recruiting is from Angola, Cape Verde and Mozambique. Labourers are contracted in their country of origin, in the presence of the authorities, for two or three years. On termination of their contracts, they are repatriated, unless they wish to re-engage. They are fed, lodged and clothed by the employers. Generally half of their earnings is treated as deferred pay, and paid on their return home, in the country of origin. Fulfilment of contracts is supervised by a State department, with a branch in Príncipe.

ST. THOMAS, an island in the West Indies and the most important, commercially, of the Virgin island group purchased by the United States from Denmark in 1917. Charlotte Amalie, the principal port and harbour of the Virgin islands, is situated near the middle of the southern coast of the island.

St. Thomas lies in 18° 20' N. and 64° 55' W., 40 mi. east of Puerto Rico, 1,442 mi. south, 20° E. from New York city and 1,000 mi. from the Panama canal. It is 12 mi. long, varies in width from 1 mi. to 3 mi. and has an area of 32 sq.mi., or 20,480 acres. It is of volcanic origin. The main ridge, peaks of a submerged range, extends east and west the length of the island. Its hills are steep and rocky and sparsely covered with vegetation, the original timber having been cut away for lumber and charcoal. Two summits, Crown mountain and Signal hill, rise above 1,500 feet. Many of the spurs of the ridge slope down to the shore and form protected bays where the buccaneers of the 17th and 18th

centuries found refuge. The climate is salubrious, particularly during the first quarter of the year when the trade winds blow. The mean temperature is 78° F., the thermometer rarely falling below 64° and rarely rising above 91°. The average rainfall is 38.23 in.; the driest weather is in March and the rainy season in October and November. Drinking water is stored in cisterns because of the dearth of wells.

After the abolition of slavery in 1848, agriculture became decadent. By 1917 the population was only 10,191 and it was 9,834 in 1930. By 1940, however, there were 11,765 inhabitants. The population in 1950 was 13,811, federal census. Destruction of the once profitable rum export trade as a result of United States prohibition of liquor contributed heavily to economic decline. From 1926 to 1933 the annual federal government contribution to the municipal treasury of St. Thomas and St. John averaged around \$100,000, but gradual improvement was made after 1931. By 1950 the federal contribution had increased to \$279,000. Improved hotels and a stimulation of the tourist trade, along with governmental encouragement of small landholdings, were important among the economic developments. Most of the island's agricultural and dairy produce is for local consumption and ship supplies. Native handicraft work and rum distilleries provide the chief direct exports.

St. Thomas Island was discovered and named by Christopher Columbus on his second voyage in 1493. The first colony was planted in 1657 by the Dutch who soon after abandoned it and migrated to New Amsterdam (New York). The Danes arrived and took formal possession in 1666, but their first colony also failed. The Danish West India company dispatched an expedition under Governor Jørgen Iversen which landed in St. Thomas harbour on May 25, 1672, and effected a permanent settlement. Later Huguenot refugees from St. Kitts were granted asylum.

In 1755 the king of Denmark acquired the company's rights and made the harbour a free port. The island was temporarily seized by England in 1801-02, and again held by her in 1807-15, but was restored to and held by Denmark until 1917, when it was sold to the United States.

The chief value of the island is the harbour of Charlotte Amalie, one of the best in the Antilles, important as a United States naval base. It is perfectly landlocked, with a bottlenecked entrance, and has a deserved reputation for refuge. It commands the gateway to the Caribbean through the Virgin passage and is a port of call for passenger steamers from New York and European ports bound for the Panama canal and Central America via the Lesser Antilles. There are ample coaling facilities, oil reservoirs, shipyards and machine shops, floating docks and wharves with electric cranes.

Charlotte Amalie, pop. 11,463 (known as St. Thomas city from 1927 to 1932), the seat of government of the Virgin Islands, lies on three low spurs of the island ridge, dubbed "Foretop, Maintop and Mizzen-top." A single level street parallel to the water front forms a common base for three cone-shaped clusters of white dwellings on the green background of the ridges. Government hill is one of the attractive residential sections, the location affording constant enjoyment of the breezes and panorama. English is the prevailing language, but Danish, Dutch, French and Spanish are also common. For general government, see VIRGIN ISLANDS.

See *West Indies Yearbook* (London and Montreal, annual), and *Annual Reports* of the governor of the Virgin Islands. (M. F. DE C.)

ST. TROND, town, province of Limburg, Belg., 18 mi. north-west of Liège in an important strategic position near the frontier. Pop. (1947 census) 79,020.

ST. VINCENT, JOHN JERVIS, EARL OF (1735-1823), British admiral, was the second son of Swynfen Jervis, solicitor to the admiralty, and treasurer of Greenwich hospital. He was born at Meaford, Staffordshire, on Jan. 9, 1735, and entered the navy on Jan. 4, 1749. He became lieutenant on Feb. 19, 1755, and served in that rank till 1759, taking part in the conquest of Quebec. He was made commander of the "Scorpion" sloop in 1759, and post-captain in 1760. During the peace he commanded the "Alarm" (32) in the Mediterranean, and when he was put on half pay he travelled in Europe, taking professional notes everywhere. While the War of American Independence lasted, he commanded the "Fourcroyant" (80) in

the Channel, taking part in the battle of Ushant (1778) (see KER-PÉL, AUGUSTUS) and in the various reliefs of Gibraltar. His most signal service was the capture (April 19, 1782) of the French "Pégase" (74) after a long chase. In 1783 he entered parliament as member for Launceston, and in the general election of 1784 as member for Yarmouth. In politics he was a strong Whig. On Sept. 24, 1787, he attained flag rank, and was promoted vice-admiral in 1793. From 1793 till 1795 he was in the West Indies co-operating with the army in the conquest of the French islands. On his return he was promoted admiral. In November 1795 he took command in the Mediterranean, where he maintained the blockade of Toulon, and aided the allies of Great Britain in Italy.

But in 1796 the occupation of Italy by the French armies closed all the ports to his ships, and Malta was not yet in the possession of Great Britain. Then the addition of the Spanish fleet to the French altered the balance of strength in the Mediterranean. The Spaniards were very inefficient, and Jervis would have held his ground, if one of his subordinates had not taken the extraordinary course of returning to England, because he thought that the dangerous state of the country required that all its forces should be concentrated at home. He was therefore obliged to act on the instructions sent to him and to retire to the Atlantic, withdrawing the garrisons from Corsica and other places. His headquarters were now on the coast of Portugal, and his chief duty was to watch the Spanish fleet at Cadiz. On Feb. 14, 1797, he gained a most complete victory against heavy odds. (See ST. VINCENT, BATTLE OF.) The determination to fight, and the admirable discipline of his squadron, which was very largely the fruit of his own care in preparation, supply the best proof that he was a commander of a high order. For this victory, which came at a very critical time, he was made an earl and was granted a pension of £3,000. His qualities as a disciplinarian were soon to be put to a severe test. In 1797 the grievances of the sailors, which were of old standing, and had led to many mutinies of single ships, came to a head in the great general mutinies at Spithead and the Nore. Similar movements took place on the coast of Ireland and at the Cape of Good Hope. (See NAVY AND NAVIES: History.) The spirit spread to the fleet under St. Vincent, and there was an undoubted danger that some outbreak would take place in his command. The peril was averted by his foresight and severity. He had always taken great care of the health of his men, and was as strict with the officers as with sailors. It must in justice be added that he was peculiarly fitted for the work. He carried his strictness with his officers to an extent which aroused the actual hatred of many among them, and exasperated Sir John Orde (1751-1824) into challenging him to fight a duel. Yet he cannot be denied the honour of having raised the discipline of the navy to a higher level than it had reached before; he was always ready to promote good officers, and the efficiency of the squadron with which Nelson won the battle of the Nile was largely due to him. His health broke down under the strain of long cruising, and in June 1799 he resigned his command.

When St. Vincent's health was restored in the following year he took the command of the Channel fleet, into which he introduced his own rigid system of discipline to the bitter anger of the captains. But his method was fully justified by the fact that he was able to maintain the blockade of Brest for 121 days with his fleet. In 1801 he became first lord and held the office till Pitt returned to power in 1803. His administration is famous in the history of the navy, for he now applied himself to the very necessary task of reforming the corruptions of the dockyards. Naturally he was fiercely attacked in and out of parliament. His peremptory character led him to do the right thing with the maximum of dictation at Whitehall as on the quarter-deck of his flagship. He also gave an opening to his critics by devoting himself so wholly to the reform of the dockyards that he neglected the preparation of the fleet for war. He would not recognize the possibility that the peace of Amiens would not last. Pitt made himself the mouthpiece of St. Vincent's enemies, mainly because he considered him as a dangerous member of the party which was weakening the position of England in the face of Napoleon. When Pitt's second ministry was formed in 1803, St. Vincent

refused to take the command of the Channel fleet at his request. After Pitt's death he resumed the duty with the temporary rank of admiral of the fleet in 1806, but held it only till the following year. After 1810 he retired to his house at Rochetts in Essex. The rank of admiral of the fleet was conferred on him in 1821 on the coronation of George IV, and he died on March 14, 1823. Lord St. Vincent married his cousin Martha Parker, who died childless in 1816. There is a monument to him in St. Paul's Cathedral, and portraits of him at different periods of his life are numerous. The earldom granted to Jervis became extinct on his death, but a viscountcy, created for him in 1801, passed by special remainder to Edward Jervis Ricketts (1767-1857), the second son of his sister Mary who had married William Henry Ricketts, of Longwood, Hampshire. The 2nd viscount took the name of Jervis, and the title is still held by his descendants. (D. H.)

The *Life* by J. S. Tucker (2 vols.), whose father had been the admiral's secretary (marred by excessive eulogy). See W. N. Anson, *Life of John Jervis, Admiral Lord St. Vincent* (1913); also W. L. Clowes, *The Royal Navy* . . . vol. iv. The life by Captain Brenton is rather inaccurate. The *Naval Career of Admiral John Markham* contains an account of the reforms in the navy. His administrations produced a swarm of pamphlets. Many mentions of him will be found in the correspondence of Nelson.

ST. VINCENT, a British island in the Windward group of the West Indies, lying about 13° 9' N, 61° 14' W, south of St. Lucia and west of Barbados. The island is about 18 ml. long, with a maximum width of 11 ml., and has an area of 133 sq. ml. Beautiful, thickly wooded volcanic hills form its backbone, with picturesque valleys intermingled. The highest summit is the volcano Soufrière (3,822 ft.) in the north. Two eruptions of Soufrière, in 1821 and in 1902, were especially disastrous, the latter devastating some of the most fertile parts of the island. The climate is fairly healthful and in winter very pleasant, but hurricanes are not infrequent. Two (in 1780 and in 1898) were especially destructive of both life and property. Rainfall averages 101.32 in. annually; the normal temperature range is from 66° to 88° F.

The colony of St. Vincent includes most of the Grenadines (q.v.) (area: 177 sq. ml.; 1946 pop. 4,479) and is part of the loosely federated Windward Islands colony. It has a common governor and shares some judicial institutions with the other Windward colonies, but has its own separate partly-appointed, partly-elected legislative body. Kingstown (1946 pop. 4,833), on the southwestern coast, is the capital as well as the chief port. The colony's population (1949 est. 66,170) is nearly 75% of Negro descent. Only 24% is white; the remainder of mixed or East Indian blood. A very few are of almost pure Carib stock. Primary education, free but not compulsory, is provided by 16 government and 22 government-subsidized schools (1949). There are two government secondary schools.

St. Vincent is predominantly agricultural and has a virtual monopoly of the world market for arrowroot, its principal crop. Sugar was formerly the colony's economic backbone but, in contrast with most of the other West Indian islands, became relatively unimportant, with an annual output of 2,000 to 2,500 tons. A distinctive and fancy quality molasses is produced. Sea Island cotton and peanuts and some coconuts, sweet potatoes and cassava are grown. The principal trade is with the United Kingdom, Canada, and the United States.

St. Vincent was discovered by Christopher Columbus on Jan. 22 (St. Vincent's day) 1498. Its Carib inhabitants, however, were left almost undisturbed for more than a century. In 1627 Charles I of England granted the island to the earl of Carlisle, but no effective occupation was made. In 1672 it was regranted to Lord Willoughby. Meanwhile, French and Dutch as well as English settlements were attempted, with the French dominant until the Seven Years' War, when Gen. Robert Monckton occupied it (1762). The treaty of Paris confirmed British possession, and settlement proceeded despite Carib refusal to accept British sovereignty. After some fighting in 1773, a treaty was concluded with the Caribs, who were granted lands in the north as a reserve. In 1779 the island was seized by the French, but was restored to Britain in 1783. In 1795 the Caribs rose, assisted by French from Martinique, and were finally subdued the following year. Most of

them were then deported to the Bay Islands (off Honduras). Emancipation of Negro slaves in 1834 was disastrous for the island's economy. In 1848 Portuguese labourers were introduced, followed by East Indians in 1861.

See Colonial Office, *Colonial Annual Reports*.

(L. W. Br.)

ST. VINCENT, BATTLE OF, fought on the 14th of February 1797, between the British and Spanish fleets, the most famous and important of many encounters which have taken place at the same spot. The battle first revealed the full capacity of Nelson, which was well known in the navy, to all his countrymen. In 1796 the Spanish government had made the disastrous alliance with the French republic, which reduced its country to the level of a pawn in the game against England. The Spanish fleet, which was in a complete state of neglect, was forced to sea. It consisted of 27 sail of the line under the command of Don José de Córdoba—fine ships, but manned in haste by drafts of soldiers, and of landsmen forced on board by the press. Even the flagships had only about eighty sailors each in their crews. Córdoba was drifting about with his unmanageable ships in two confused divisions separated from one another, in light winds from the west and west-south-west, at a distance of from 25 to 30 m. S.W. of the Cape. While in this position he was sighted by Sir John Jervis, of whose nearness to himself he was ignorant, and who had sailed from Lisbon to attack him with only 15 sail of the line. Jervis did not hesitate to give battle. Six Spanish ships were to the south of him, separated by a long interval from the others which were to the south-west. The British squadron was formed into a single line ahead, and was steered to pass between the two divisions of the Spaniards. The six vessels were thus cut off. A feeble attempt was made by them to molest the British, but being now to leeward as Jervis passed to the west of them, and being unable to face the rapid and well directed fire to which they were exposed, they sheered off. One only ran down the British line, and passing to the stern of the last ship succeeded in joining the bulk of her fleet to windward. As the British line passed through the gap between the Spanish divisions ships were tacked in succession to meet the windward portion of the enemy. If this movement had been carried out fully, all the British ships would have gone through the gap and the Spaniards to windward would have been able to steer unimpeded to the north, and perhaps to avoid being brought to a close general action. Their chance of escape was baffled by the independence and promptitude of Nelson. His ship, the "Captain" (74), was the third from the end of the British line. Without waiting for orders he made a sweep to the west and threw himself across the bows of the Spaniards. His movement was seen and approved by Jervis, who then ordered the other ships in his rear to follow Nelson's example. The British force was thrown bodily on the enemy. As the Spanish crews were too utterly unpractised to handle their ships, and could not carry out the orders of their officers which they did not understand, their ships were soon driven into a herd, and fell on board of one another. Their incompetence as gunners enabled the "Captain" to assail their flagship, the huge "Santissima Trinidad" (130), with comparative impunity. The "San Josef" (112), and the "San Nicolas" (80), which fell aboard of one another, were both carried by boarding by the "Captain." Four Spanish ships, the "Salvador del Mundo" and "San Josef" (112), the "San Nicolas" (80), and the "San Isidro" (74), were taken. The "Santissima Trinidad" is said to have struck, but she was not taken possession of. By about half-past three the Spaniards were fairly beaten. More prizes might have been taken, but Sir John Jervis put a stop to the action to secure the four which had surrendered. The Spaniards were allowed to retreat to Cadiz. Sir John Jervis was made Earl St. Vincent (q.v.) for his victory. The battle, which revealed the worthlessness of the Spanish navy, relieved the British government from a load of anxiety, and may be said to have marked the complete predominance of its fleet on the sea. (D. H.)

AUTHORITIES.—A very interesting account of the battle of Cape St. Vincent, *A Narrative of the Proceedings of the British Fleet, etc.* (London, 1797), illustrated by plans, was published immediately afterwards by Colonel Drinkwater Bethune, author of the *History of the Siege of*

Gibraltar, who was an eyewitness from the "Lively" frigate. See also James's *Naval History* (London, 1837); Captain Mahan, *The Influence of Sea Power on the French Revolution and Empire* (London, 1892); Professor Geoffrey Callender, *The Naval Side of British History* (1924).

ST. VITUS' DANCE (CHOREA MINOR; SYDENHAM'S CHOREA) is a name commonly applied to the neurological manifestations of rheumatic infection. The disease is characterized by irregular, involuntary and purposeless movements of muscle groups. These movements are most obvious in the extremities and face, but are present in the trunk and may involve muscles of phonation and swallowing. While the names are derived from descriptive terms applied to epidemics of dancing mania in the 14th, 15th and 16th centuries, common usage of the term chorea condones its retention. The name St. Vitus' dance originated in the fact that sufferers from the mania were wont to resort to the chapels of St. Vitus (more than one in Swabia, Ger.), the saint being believed to possess the power of cure.

Chorea is chiefly a disease of childhood, occurring most frequently between the ages of 5 and 15 years and much more frequently in females. It may occur in young adults and is an infrequent complication of pregnancy, when it is especially severe. Chorea has a close association with rheumatic fever and may be considered a peculiar manifestation of this disease. Episodes of chorea commonly occur in children who have had rheumatic fever. Patients with chorea who have evidence of systemic infection as indicated by fever, increase of white blood cells or of the sedimentation rate of red blood cells, have rheumatic heart disease as frequently as do those who have rheumatic fever. However, if these indications of systemic infection are absent, heart disease is uncommon, and if it does occur it is especially apt to be gradual stenosis of the mitral valve. Some effort has been made to separate rheumatic chorea from chorea of psychogenic origin on the basis of laboratory findings, but this differentiation is difficult to substantiate.

While emotional crises and anxiety may appear to be intimately related to the onset of chorea, they are a manifestation of the disease and do not precipitate it. Facial grimaces, tics and habit spasms are frequently confused with chorea, but these repetitive movements are quite different from the inco-ordinated purposeless movements of the disease. These movements, which are typical and recognizable, are usually preceded by or appear with, evidence of irritability and emotional instability, chiefly episodes of crying initiated by trivial incidents.

The symptoms vary in severity. They may be mild or completely incapacitating. They are often first considered as awkwardness. Inability to hold objects or to write properly and difficulty in walking are frequent. Vague identification of deterioration in ability to perform customary tasks is soon replaced by recognition of gross twitching of muscle groups, most easily observed in the extremities. The movements are more marked on one side but are present on both.

While there is debate concerning the pathological changes in the central nervous system, there is considerable evidence that both the emotional manifestations and the typical movements are related to changes in the cerebral cortex.

Attacks of chorea tend to be self-limited although the duration is several weeks. Recurrence is frequent. Recovery is hastened by rest in bed in a pleasant sympathetic environment, and patients improve quickly in hospitals or convalescent sanatoria. Sedation with phenobarbital is especially helpful, and administration of salicylates is often advisable. (D. E. C.)

SAINT-WANDRILLE, a village of northwestern France, in the department of Seine-Inférieure, 28 mi. west-northwest of Rouen by rail. Pop. (1946) 227.

Saint-Wandrille is celebrated for the ruins of its Benedictine abbey. The abbey was founded in the 7th century by St. Wandrille. In the 13th century it was burned down, and the rebuilding was not completed until the 16th century. Later it was practically destroyed by the Huguenots and was again restored. The demolition of the church was begun at the time of the Revolution. The abbey church belongs to the 13th and 14th centuries; portions of the nave walls supported by flying buttresses are standing, and

the windows and vaulting of the side aisles are in fair preservation. There is a cloister, from which a Renaissance door opens into the refectory, containing a richly ornamented lavabo. The refectory has graceful windows.

SAIONJI, KINMOCHI, PRINCE (1849-1940), Japanese statesman, was born in Oct. 1849, at Kyoto. When less than 20 years of age, he took part in the councils which led to the Restoration, and at 19 was commander in chief of an imperial army. In 1881 he commenced his official career, and in the following year accompanied Hirobumi Ito to Europe and the United States to investigate the parliamentary system. In 1885 Saionji was appointed minister to Austria; three years later he became vice-president of the house of peers and was raised to the privy council in 1894. In the same year he received the portfolio of education in the second Ito cabinet.

In July 1903 Saionji became the leader of the Seiyu-Kai and in 1906 prime minister; he was again premier from 1911 to 1912. In 1919 he represented Japan as chief envoy at the peace conference and in 1920 he was made prince. He was famous as Emperor Hirohito's chief adviser and as the last of Emperor Meiji's Genro (elder statesmen).

Saionji died Nov. 24, 1940.

SAIS (Egyptian *Sai*), an ancient city of the Egyptian Delta, lying westward of the Thermuthiac or Sebennytic branch of the Nile. It was the capital of the 5th nome of Lower Egypt and must have been important from remote times. In the 8th century a c. Sais held the hegemony of the Western Delta, while Bubastite families ruled in the east and the kings of Ethiopia in Upper Egypt. At the time when invasions by the Assyrians drove out the Ethiopian Tarasac again and again, the chief of the 20 princes to whom Esarhaddon and Assur-bani-pal successively entrusted the government was Niku, king of Sais and Memphis. His son Psammetichus (g.v.) was the founder of the 26th dynasty. Although the main seat of government was at Memphis, Sais remained the royal residence throughout this flourishing dynasty.

Neit, the goddess of Sais, was identified with Athena, and Osiris was worshipped there in a great festival.

The brick enclosure wall of the temple is still plainly visible near the little village of Sa-el-hagar (Sa of stone) on the east bank of the Rosetta branch; otherwise only crude brick ruins and rubbish heaps remain on the site, but a few relics conveyed to Alexandria and Europe in the Roman age have come down to our day, notably the inscribed statue of a priest of Neit who was high in favour with Psammetichus III, Cambyses and Darius. Bronze figures of deities are now the most interesting objects to be found at Sa-el-hagar.

SAISSET, BERNARD (d. c. 1314), French bishop, was abbot of Saint Antonin de Pamiers in 1268. Boniface VIII, detaching the city of Pamiers from the diocese of Toulouse in 1295, made it the seat of a new bishopric and appointed Saisset to the see. Of a headstrong temperament, Saisset as abbot brought to an end (1297) the struggle with the counts of Foix, begun two centuries before, for the lordship of the city of Pamiers, which had been shared between the counts and abbots by the feudal contract of *pariage*. As an ardent Languedocian he hated the French and opposed Philip IV. But when he tried to organize a general rising of the south, he was denounced to the king, perhaps by his old enemies the count of Foix and the bishop of Toulouse. Philip IV charged Richard Leneveu, archdeacon of Auge in the diocese of Lisieux, and Jean de Picquigni, vidame of Amiens, to make an investigation, which lasted several months.

Saisset was on the point of escaping to Rome when the vidame of Amiens surprised him by night in his episcopal palace. He was brought to Senlis and on Oct. 24, 1301, appeared before Philip and his court. He was charged with high treason, and Philip tried to obtain from the pope the canonical degradation of Saisset. Boniface VIII, who had supported Saisset against the count of Foix (when Saisset was a legate), ordered the king in Dec. 1301 to free the bishop, in order that he might go to Rome to justify himself. At the same time disagreement between Boniface and Philip became more acute, and in the process Saisset was forgotten. He

had been turned over in Feb. 1302 into the keeping of Jacques des Normands, the papal legate, and was ordered to leave the kingdom at once.

Saisset lived at Rome until after the incident at Anagni. In 1308 the king pardoned him and restored him to his see. He died, still bishop of Pamiers, about 1314.

BIBLIOGRAPHY.—J. M. Vidal, *Bernard Saisset, évêque de Pamiers* (Toulouse, 1906); Georges Digard, *Philippe le Bel et le Saint Siège de 1285 à 1304*, 2 vol. (Paris, Liège, 1936); C. de Vic and J. J. Vaissette, *Histoire générale de Languedoc*, new ed. (Toulouse, 1872-1905).

SAITO, MAKOTO, VISCOUNT (1858-1936), Japanese sailor and administrator, was born a commoner, at Iwate Ken. He joined the navy in 1873, and was rapidly promoted, being gazetted commander in 1897. The discipline of the Japanese navy, strict as it was, still left something to be desired, and when he became captain in 1898, Saito declared his intention of revising some of the existing regulations and enforcing a stricter observance of others. In the same year he was appointed vice-minister of the navy under Admiral Count Yamamoto. Two years later he was gazetted rear-admiral in recognition of his valuable services in the development of the navy along Western lines. He was promoted to vice-admiral in 1904 and became admiral in 1912. He received several decorations for his services in the Russo-Japanese war, where he profited by his experience as naval aide-de-camp to the Emperor in the Chino-Japanese conflict. He was minister for the navy in 1913 and 1914. After the upheaval of the Koreans in 1919 under the rule of Marshal Hasegawa, Baron Saito was appointed governor-general of Korea. His chief concern was education; there were only 250 schools in the peninsula at the time of his appointment, but by 1926, there were nearly five times that number. He was created baron in 1907, and was raised to the rank of viscount in 1925. He was appointed chief delegate to the naval disarmament conference at Geneva in 1927 and resigned his governor-generalship soon after. In Feb. 1936, he was assassinated.

SAJO or MOHI, BATTLE OF THE, 1241. This was the decisive battle in which the Mongols under Sabutai and Batu overthrew the Hungarian army under Bela, and thereby gained undisputed possession of Hungary, a conquest voluntarily abandoned next year (see MONGOL CAMPAIGNS). The date of the battle is usually reckoned as April 10, 1241, but other estimates place it on April 27, or even early in May. A week before the three wide-circling columns of the Mongol main army had converged and joined hands on the Danube near Gran, the Hungarian capital. Sabutai fell back slowly, luring Bela after him, away from the protection of the Danube. Meanwhile Sabutai had reconnoitred an ideal battle-ground in the plain of Mohi, a natural amphitheatre surrounded by the Sajo river and the famous hills of Tokay. After six days' pursuit the Hungarian army, including large contingents of Germans, Croats and French Knights Templar, camped here, while their apparently retreating foe crossed the river and disappeared out of sight. The Mongol plan was that while Batu fixed the Hungarians by a frontal attack across the river, Sabutai was to execute a wide manoeuvre back to the river, cross it lower down where he had reconnoitred a deep but fordable passage, and then fall upon the enemy's rear. During the night Batu turned on his track, and before dawn his advanced guard seized the bridge over the river to his front. The fire of catapults and archers covered the crossing of the main body. Then he moved forward to the attack and the battle was being hotly contested when, some hours later, Sabutai's surprise blow suddenly took the Hungarians in rear, dislocating both their formation and *moral*. The disruption of their host followed, and the fragments took flight, to shrink progressively under the Mongol pursuit, closely sustained for two days. Thousands were cut down on the field itself, the Knights Templar falling to the last man, but Bela, deserting his followers to their fate, made good his escape.

SAKA or SHAKA, the name of various tribes which invaded India from central Asia. More accurately, it denotes the tribe which invaded India 140-130 B.C. They are the Sacae of classical authors and the Se of the Chinese, representing an original Sek or Sök. The Chinese state that they were a pastoral tribe in the neighbourhood of the modern Kashgar.

About 160 B.C. the Saka were driven southward by the advance of the Yue-Chi (q.v.) from the east. One portion appears to have settled in western Afghanistan, hence called Sakasthana, in modern Persian Seistan. The other section occupied the Punjab and possessed themselves of Sind, Gujarat and Malwa. The rulers of these provinces bore the title of satrap (*kshatrapa* or *chhatrapa*) and were apparently subordinate to a king who ruled over the valley of Kabul and the Punjab. In 57 B.C. the Sakas were attacked simultaneously by Parthians from the west and by the Malava clans from the east and their power was destroyed.

Franke, *Beiträge zur chinesischen Quellen zur Kenntnis der Turkvölker und Skythen Zentralasiens* (Berlin, 1904); Vincent Smith, *Early History of India*, revised by S. M. Edwardes (Oxford, 1924); F. W. Thomas, "Sakastana," *Journal of the Royal Asiatic Society* (London, 1906).

SAKAI, a pre-Dravidian people of the Malay peninsula (see

BY COURTESY OF THE FIELD MUSEUM OF NATURAL HISTORY
A SAKAI HUNTER WITH HIS BLOWGUN

RACES OF MANKIND; MALAY PENINSULA). The wilder tribes live on jungle fruits and game hunted with the blowgun (q.v.); the more civilized grow yams, maize, sugarcane, rice and sago.

See Skakat and Blagden, *Pagan Tribes of the Malay Peninsula* (1906). (J. H. H.)

SAKÉ, national beverage of Japan. In nature it stands midway between beer and wine. It is made chiefly from rice (see BREWING), by fermentation with the mould *Aspergillus oryzae*. Saké contains 12 to 15% of alcohol and about 3% of solid matter (extractives), 0.3% of lactic acid, a small quantity of volatile acid, 0.5% of sugar and 0.8% of glycerin. There are about 20,000 saké breweries in Japan, and the annual output is about 150 million gallons. Saké is a yellowish-white liquid, its flavour somewhat resembling that of mader or sherry. (See WINE.)

SAKHALIN, an island in the North Pacific, 600 m. long, 162 to 103 broad, area 24,560 sq.m., lying between 45° 57' N. and 54° 24' N., separated from the mainland by the narrow, shallow strait of Tartary or Mamiya strait, which often freezes in winter in its narrowest part. By the treaty of Portsmouth (U.S.A.) 1905, the part south of 50° N. became Japanese, and that to the north, Russian. During the Civil War and war of intervention following the 1917 revolution, the Japanese occupied the whole island and did not evacuate the northern part until 1925. This northern territory forms three-fifths of the island and is part of the Far Eastern administrative area (see FAR EASTERN AREA). Structurally also it is linked with the mainland and not with the volcanic Japanese islands; native legends record it as a peninsula separated by a cataclysm. Sakhalin is imperfectly surveyed. Sokolov reports a western range in the Japanese part, dying down at 51° 45' N., and a second system starting from Cape Terpeniya, in the Japanese part, containing the highest elevations, and reaching 51° N., where it is intersected by the valley of the Tym and passes to the western side, containing the Engiz-pal mass, closely related to Mount Tiara near the eastern sea. Estimates of the maximum heights in the eastern chain vary between 2,000 and 5,516 ft. The western hills (Mount Kitotsi 2,478 ft.) are less rounded than those on the east. The valleys of the Poronaya and Tym rivers stretch northward from the Gulf of Patience, and there are narrow sandy coastal plains. The lower course of the Tym lies in barren tundra land, and its upper course is impeded by rapids; the southward flowing Poronaya is navigable for about 30 mi. There are other short rivers and numerous freshwater lakes, as well as salt lagoons near the coast. Sometimes the bays at the river mouths are temporarily converted into freshwater lakes by barriers thrown up by heavy seas, and later washed away again.

The whole island has a cold, foggy climate, with heavy rainfall in summer, and bitter cold and severe storms in winter. Snow falls

from October to May and may remain in places till July, while on the high land it re-commences in August; drifts may be 7 ft. deep. Drift ice is found along both coasts in the north and appears as late as July. The west coast conditions are somewhat moderated by a branch of the Kuro Siwo coming up the Gulf of Tartary, though cold, dense fogs are as prevalent here as in the east.

Fauna and Flora.—The north of the island, and the higher land is bleak tundra and much of the island is forested, coniferous trees prevailing on the mountains; amongst them is found the Kurilian bamboo. The coniferous passes into mixed deciduous in the river valleys, and there is a dense undergrowth of wild rose, berry-bearing plants and spiraea. The soil is unfavourable to agriculture and the vegetative period is at most 100 days, so that, with the exception of a few cereals, potatoes and vegetables grown on a patch of alluvial soil round Klyuch in the more sheltered central part, cultivation does not exist.

Bears, squirrels, pole-cat, ermine, sable, otter, glutton, marten, fox, elk and musk-deer are hunted and trapped. The bird life is varied and includes circumpolar and subtropical types, as well as those characteristic of the east of Asiatic Russia. Vipers, mosquitoes, horse- and sand-flies are pests. Fishing is the most common occupation and fish is almost the sole diet of many natives; vast quantities are exported to Japan for manure. Whales are numerous in the southern seas and the bêche-de-mer or trepang is caught for export.

Population.—The native tribes include Gilyaks, Oroke and Tungus, with Ainus in the Japanese part; for a description of the tribes of the Russian part see FAR EASTERN AREA. The Russians first settled on the island in 1857, and from 1875 to 1905 owned the whole of it. They established five penal settlements, to which convicts of the worst type were sent and afterwards liberated in the region, a policy from which much social disorder resulted; the penal settlement was abolished in 1907. The population in the Russian part in 1926 was about 12,000 and included many Japanese and Koreans. The estimated population of S. Sakhalin in 1938 was 339,357.

Industries.—During their occupation of the island up to 1925, the Japanese markedly developed the coal mining industry; and after their evacuation of the northern half of the island they continued to work both coal and oil concessions by agreement with the soviet government. Iron and gold also exist and amber is cast up on the eastern shores. The Japanese also developed the timber industry of the district, which is, however, at present not prosperous (see FAR EASTERN AREA).

There are railways in the Japanese part, but none in the Russian, except short lines linking the Alexandrovsk coal mines with the sea.

Steamers run from Vladivostok and Nikolaevsk-on-Amur to the chief town, Alexandrovsk (q.v.), from the end of April to October. Between October and December and from mid-March to April, there is no communication except by telegraph. Between these dates dog sledges cross the frozen sea from Nikolaevsk to Alexandrovsk. The island was under Chinese dominion till the 19th century. Martin Gerritz de Vries in the 17th century, La Pérouse (1787), Krusenstern (1805) visited it, but thought it a peninsula.

A Japanese, Mamiya Rinzo, discovered the Strait of Tartary and the Russian navigator Nevelskoi in 1849 established it as possible for navigation.

See N. B. Arkhipov, *The Far Eastern Area* (1926); P. I. Polevol, *Sakhalin* (1914).

SAKI, the name of a group of tropical American monkeys. The sakis form the genus *Pithecia*, which also includes the Uakaris (q.v.). They are characterized by their long, bushy and non-prehensile tails, distinct whiskers and beard, and the elongated hair on the crown of the head, which may either radiate from a point in the centre, or be divided by a median parting. They are very delicate animals and normally silent (see PRIMATES).

SAKTISM. The worship of *Sakti*, or female energy, is believed to be derived from lower cults prevalent in northeast Bengal and Assam. The principal Sakti shrine is situated at Kamakhya (? the fulfilment of lust) on the summit of a hill

two miles west of Gauhati. In Indian speculation the male principle is often regarded as quiescent, while the female principle is active and creative, a view which it may be noted is found in the physiological ideas of the Ba Ilia, who hold that the male element is an inert creature but upon the female depend all the generative functions (*Ha-speaking Peoples*, 1920, vol. i. p. 227). A close connection exists with Tantrism, the ritual for which includes the *pancamakara*, the five elements, beginning with *m*, *madya*, *mamsa*, *matnya*, *mudra*, *maithuna* (wine, meat, fish, parched grain, copulation). Apart from this, caste restrictions are minimized, girl widows may remarry, women are honoured.

The most popular Sakti worship relates to Durga and Kali and there is ample evidence that human sacrifice is in theory an essential element of the ritual.

See Sir C. Eliot, *Hinduism and Buddhism* (1922).

SAL (*Shorea robusta*), a valuable timber tree the wood of which resembles teak. Large forests of sal occur in India, where the tree is widely planted and officially protected. The genus *Shorea* (family Dipterocarpaceae) contains about 90 species found in India, Ceylon and thence eastward to the Philippines.

SALA, GEORGE AUGUSTUS HENRY (1828-1895), English journalist, was born in London, on Nov. 24, 1828. He was educated in Paris and London. In his earlier years he did odd jobs in scene-painting and book illustration. He wrote articles and stories for Charles Dickens in *Household Words* and *All the Year Round*, and in 1856 Dickens sent him to Russia as a special correspondent. Sala engaged in many journalistic enterprises, but he is best known for his journalism on the *Daily Telegraph*, with which he became connected in 1857. For that paper he did his most characteristic work, whether as a foreign correspondent in all parts of the world, or as a writer of leaders or special articles. In 1892, when his reputation was at its height, he started a weekly paper called *Sala's Journal*, but it was a disastrous failure; and in 1895 he had to sell his library of 13,000 volumes. Lord Rosebery gave him a civil list pension of £100 a year. He died at Brighton on Dec. 8, 1895.

See *The Life and Adventures of George Augustus Sala*, written by himself (2 vols., 1895).

SALAD, a preparation of fresh or cooked vegetables or other ingredients, eaten cold, and served with a dressing of which oil, vinegar and salt are essential ingredients. The word comes from Med. Lat. *salata*, salted, pickled, *salare*, to sprinkle with salt.

Salads are prepared from raw green leaves and stems such as lettuces, watercress and endive, but many varieties are also made from fresh fruits and cold cooked vegetables. Cold fish, poultry, game, meat and eggs, may likewise be included.

The preparation of lettuce, endive, watercress, small cress and corn salad needs care. For salad green leaves are best when young and should be gathered early before the sun is up and kept in a cool place until needed. Soaking in cold water for ½ hour before use makes them crisp. Each leaf should be separated and washed thoroughly. Watercress needs special care in cleansing, and small cress should have the black seed cases removed and should be kept in small bunches. After cleansing, the plants should be well drained in a salad basket, on a cloth on a sieve, or in a colander, or they can be shaken lightly in a cloth. The leaves may well be broken with the fingers or cut with a fruit knife; a steel knife must never be used or both colour and flavour will be spoilt. Chives, radishes, tomatoes and celery, cabbage, cucumbers and onion are in this class, as they are used raw. Chives may be chopped or whole; radishes cut in slices or whole; celery used in pieces or shredded, when it curls and makes a pretty garnish; tomatoes cut in slices or quarters; cucumbers in slices, cubes or shreds, cabbage shredded, green peppers shredded; chopped or sliced canned pimiento is much used, as cubes or shredded.

Among fruits used for salads are bananas cut in slices, apples cut in cubes, oranges in slices or in natural divisions, pineapples and pears in cubes, cherries and plums, stoned, whole or in halves, grapefruit in sections, kumquats whole and shredded, grapes (seeded). Cold cooked vegetables useful in salads are also numerous, e.g., peas, beans, carrots, turnips, potatoes, artichokes, beet-

root and cauliflower buds, asparagus tips, brussels sprouts, spinach or other greens, okra, whole-boiled onions. Care must be taken when cooking these, as if overcooked they will break up and become too soft; they may be cut in cubes, shreds or slices. Occasionally raw grated carrot is used.

Salad Dressings.—(1) The simple French dressing of oil and vinegar, seasoned with pepper, salt, mustard and sugar. This may be further flavoured with chopped tarragon, chervil, parsley, shallot, onion or chives. This dressing is used for green salads and for fruit and vegetable salads when served with poultry and cold meats. Cubes of apple with a French dressing are delicious with cold meat. Use at least twice as much oil as vinegar, seasoning to taste. Mix all in a basin and pour over the salad, mixing thoroughly; or mix from the oil and vinegar cruets directly on to the prepared salad, pouring the oil over the leaves first, for the vinegar is apt to make them flabby and it runs off them, whereas the oil coats them and then holds the vinegar; mix thoroughly.

(2) Mayonnaise (see also SAUCE). This dressing is used when a salad is to be served as a separate course, e.g., salmon mayonnaise, and for the more elaborate salads.

Garnishes.—Hard-boiled egg in slices or yolk of egg rubbed through a wire sieve and the white chopped, the two being placed in alternate groups; beetroot in fancy shapes, cucumber crimped and cut in slices, celery shredded and made to curl by keeping in cold water 30 minutes before use, the small heart of a lettuce, bunches of mustard and cress.

For fruit salad, a syrup flavoured with lemon, liqueurs or wine is made, and to this fruits of all descriptions are added.

(E. G. C.)

SALADE, SALLET or SALET, a headpiece introduced in the early 15th century replacing the heavy helmet. Its essential features were its smooth rounded surface, like an inverted bowl, and its long projecting neck guard. Usually there was no movable vizor, but the front fixed part covered most of the face, a slit being left for the eyes. (See HELMET.)

SALADIN (Arab. *Salah ud-Din*, "Honour of the Faith") (1138-1193), first Ayyubite sultan of Egypt, was born at Tekrit in 1138. The brilliance of his career was made possible only by the condition of the east in the 12th century. Such authority as remained to the orthodox caliph of Baghdad (see CALIPHATE) or to the heretical Fatimides (q.v.) of Cairo was exercised by their viziers. The Seljuk empire had, after 1104, been divided and subdivided among Turkish atabegs. The Latin kingdom of Jerusalem had existed since 1098 only because it was a united force in the midst of disintegration. Gradually, however, Christian enthusiasm had aroused a counter enthusiasm among the Moslems. Zengi, atabeg of Mosul, had inaugurated the sacred war by his campaigns in Syria (1135-46). Nureddin, his son, had continued his work by further conquests in Syria and Damascus, by the organization of his conquered lands and by "publishing everywhere the Holy War."

The opportunity of Saladin lay therefore in the fact that his lifetime covers the period when there was a conscious demand for political union in the defense of the Mohammedan faith. By race Saladin was a Kurd of Armenia. His father, Ayyub (Job), and his uncle Shirghu, sons of a certain Shadhy of Ajdaksan near Dawin, were both generals in Zengi's army. In 1139 Ayyub received Baalbek from Zengi; in 1146 he moved, on Zengi's death, to the court of Damascus. In 1154 his influence secured Damascus to Nureddin and he was made governor. Saladin was therefore educated in the most famous centre of Moslem learning, and represented the best traditions of Moslem culture.

His career falls into three parts: the conquest of Egypt, 1164-74, the annexation of Syria and Mesopotamia, 1174-86; and lastly the destruction of the Latin kingdom and subsequent campaigns against the Christians, 1187-92. The conquest of Egypt was essential to Nureddin. It was a menace to his empire on the south, the occasional ally of the Franks and the home of the unorthodox caliphs. His pretext was the plea of an exiled vizier, and Shirghu was ordered to Egypt in 1164, taking Saladin as his lieutenant. The Christians under King Amalric I of Jerusalem immediately intervened; and the four expeditions which ensued in 1164, 1167,

1168 and 1169 were duels between Christians and Saracens. They resulted in heavy Christian losses, the death of Shirghu and the appointment of Saladin as vizier with the title of al-Malik al-Nasir. His relations toward the Fatimite caliph were marked by extraordinary tact, and on his death in 1171 Saladin was powerful enough to substitute the name of the orthodox caliph in all Egyptian mosques. The Mohammedan religion was thus united against Christianity. To Nureddin he was invariably submissive, but from the vigour which he employed in adding to the fortifications of Cairo and the haste with which he retreated from an attack on Montréal (1171) and Krak (Kerak, 1173) it is clear that he feared his lord's jealousy.

In 1174 Nureddin died, and the period of Saladin's conquests in Syria began. Nureddin's vassals rebelled against his youthful heir, as-Salih, and Saladin came north, nominally to his assistance. In 1174 he entered Damascus, Emesa and Hamah; in 1175 Baalbek and the towns round Aleppo.

The next step was political independence. He suppressed the name of as-Salih in prayers and on the coinage and was formally recognized by the caliph in 1175. In 1176 he defeated an invasion by Saif ud-Din of Mosul and reached an agreement with as-Salih and also with the Assassins. In 1177 he returned by Damascus to Cairo, which he enriched with colleges, a citadel and an aqueduct. From 1177 to 1180 he made war on the Christians from Egypt, and in 1180 he imposed terms of peace on the sultan of Konia. From 1181 to 1183 he was chiefly occupied in Syria. In 1183 he induced the atabeg Imad ud-Din to exchange Aleppo for the insignificant Sinjar and in 1186 he received the homage of the atabeg of Mosul. The last independent vassal was thus subdued and the Latin kingdom enclosed on every side by a hostile empire.

In 1187 a four years' truce was broken by the brilliant brigand Raynald of Châtillon, and thus began Saladin's third period of conquest. In May a small body of Templars and Hospitaliers was cut to pieces at Tiberias, and on July 4 Saladin inflicted a crushing defeat upon the united Christian army at Hittin. He then overran Palestine, on Sept. 20 besieged Jerusalem and on Oct. 2, after chivalrous clemency to the Christian inhabitants, crowned his victories by entering and purifying the Holy City. In the kingdom only Tyre was left to the Christians. Probably Saladin made his worst strategic error in neglecting to conquer it before winter. The Christians had thus a stronghold whence their remnant marched to attack Acre in June 1189. Saladin immediately surrounded the Christian army and began the famous siege.

Saladin's lack of a fleet enabled the Christians to receive reinforcements and thus to recover from defeat by land. On June 8, 1191, Richard of England arrived, and on July 12 Acre capitulated without Saladin's permission. Richard followed up his victory by an admirably ordered march down the coast to Jaffa and a great victory at Arsuf (q.v.).

During 1191 and 1192 there were four small campaigns in southern Palestine when Richard circled round Beitauba and Ascalon with Jerusalem as objective. In Jan. 1192 he acknowledged his impotence by renouncing Jerusalem to fortify Ascalon. Negotiations for peace accompanied these demonstrations, which showed that Saladin was master of the situation. Though in July Richard secured two brilliant victories at Jaffa, the treaty made on Sept. 2 was a triumph for Saladin. Only the coast line was left to the Latin kingdom, with a free passage to Jerusalem; and Ascalon was demolished. The union of the Mohammedan east had beyond question dealt the death blow to the Latin kingdom. Richard returned to Europe, and Saladin returned to Damascus, where on March 4, 1193, after a few days' illness, he died. He was buried in Damascus and mourned by the whole east. (See CRUSADES.)

The character of Saladin and of his work is singularly vivid. In many ways he was a typical Mohammedan, fiercely hostile toward the unbelievers who had occupied Syria, though tolerant to his own Christian subjects, intensely devout and regular in prayers and fasting. He showed the pride of race in the declaration that "God reserved this triumph for the Ayyubites before all others." His generosity and hospitality were proved in his gifts to Richard and his treatment of captives. He had the oriental's power of endurance, alternating with violent and emotional courage. Other vir-

ble fittings and contains several fine pictures of the Neapolitan school, especially the Conception by J. Ribera (1585-1656) over the altar. The convent of the Espíritu Santo has a good door by A. Berruguete (c. 1480-1561). Many of the private houses are untouched examples of the domestic architecture of the times in which they were built.

See B. Dorado, *Compendio histórico de la ciudad de Salamanca* (Salamanca, 1863); M. Villar y Macías, *Historia de Salamanca* (3 vols., Salamanca, 1887); H. Rashdall, *Universities of Europe in the Middle Ages*, vol. II, pt. 1 (London, 1895); E. Espartero, *Historia pragmática e interna de la Universidad de Salamanca* (2 vols., Salamanca, 1914-17). (C.) Battle of Salamanca, 1812. (For the operations which preceded this battle see PENINSULAR WAR.) On July 22, 1812, the Allied army under Wellington (about 46,000 with 60 guns) was drawn up south of Salamanca, the left resting on the river Tormes, with a division under Packenham on the north bank of Cabrerizos. Wellington's object was to cover Salamanca and guard his communications through Ciudad Rodrigo with Portugal. The French under Marshal Marmont (about 42,000 with 70 guns) were collecting toward Wellington's right, stretching southward from Calvariza de Ariba. The country generally is undulating.

Until the morning of the battle it had been uncertain whether Marmont wished to reach Salamanca by the right or left bank of the Tormes, or to gain the Ciudad Rodrigo road, but Wellington now felt that the latter was his real objective. At daylight there was a rush by both armies for the two commanding hills of the Arapiles; the Allies gained the northern (since termed the "English"), and the French the southern (since termed the "French") Arapiles. While Marmont was closing up his forces, a complete change of position was carried out by Wellington. Packenham was directed to march through Salamanca, crossing the Tormes, and move under cover to a wood near Aldea Tejada, while Wellington took up a line under cover of a ridge between Arapiles and Aldea Tejada. By noon his old right had become his left, and he was nearer to the Ciudad Rodrigo road, flanking Marmont should he move toward it.

It was not Wellington's wish (*Despatches*, July 21, 1812) to fight a battle "unless under very advantageous circumstances." He knew that large reinforcements were nearing the French, and, having determined to fall back toward Portugal, he began to pass his baggage along the Ciudad Rodrigo road. Marmont, about 2 p.m., seeing the dust of his baggage column, ignorant of its true position, and anxious to intercept his retreat, ordered two divisions under Maucune to push westward, while he himself attacked Arapiles. Maucune moved off, flanked by some cavalry and 50 guns, leaving a gap between him and the rest of the French. Wellington instantly took advantage of this. Directing Packenham to attack the head of the leading French division, and a Portuguese brigade (Pack) to occupy the enemy by assaulting the south (or French) Arapiles, he prepared to bear down in strength upon Maucune's right flank. The French attack upon Arapiles was after hard fighting repulsed; and, at about 5 p.m., Maucune's force, when in confusion from the force attack of Packenham and Wellington in front and flank and suffering severely, was suddenly trampled down "with a terrible clamour and disturbance" (Napier) by an irresistible charge of cavalry under Sir Stapleton Cotton. This counterstroke decided the battle, Marmont's left wing was being completely broken. The French made a gallant but fruitless effort to retrieve the day, and repulsed Pack's attack upon the French Arapiles; but, as the light waned, Clause, Marmont being wounded, drew off the French army toward Alba de Tormes and retired to Valladolid. Both armies lost heavily, the Allies about 6,000, the French some 15,000 men, 12 guns, 5 eagles and several standards. The rout would have been even more thorough had not the castle and ford at Alba de Tormes been evacu-

ated by its Spanish garrison without Wellington's knowledge. Salamanca was a brilliant victory, and followed by the capture of Madrid, it severely shook the French domination in Spain. (C. W. Ro.)

SALAMANCA, a city of Cataquango county, New York, U.S.A., 63 mi. S. by E. of Buffalo, on both sides of the Allegheny river. It is on federal highway 219 and state highways 17 and 18. It is served by the Erie, the Baltimore and Ohio and the Pennsylvania railways and by interurban trolleys and motorbuses lines. Pop. 1950, 8,850. Salamanca is on both sides of the river, at an altitude of 1,390 ft., with wooded hills on the horizon. It lies in the Allegheny Indian Reservation, and all land is held under a 99-year lease, authorized by congress in 1892. It is within a few miles of the Allegheny State park of 65,000 ac.

Industries consist of railroad shops and terminals, furniture factories, tannery, plastic moulding, worsted yarns, print rolls, hat blocks and milk-gathering plants. It was first settled in 1855 and called Hemlock. It was later named after a Spanish banker who was a large stockholder in the first railroad built in the county in 1862.

SALAMANDER, properly the term for the tailed amphibians constituting the order Caudata. The group includes eight families of very diverse form, the majority of which are exclusively North American. See AMPHIBIA.

In Europe the term may refer principally to the genus *Salamandra*, which is restricted to the western parts of the Palaearctic region. The fire salamander, *S. salamandra*, is the well-known black and yellow creature inhabiting central Europe and northwest Africa, and southwest Asia; the black salamander, *S. atra*, is restricted to the Alps. These salamanders, far from being able to withstand the action of fire, as was believed by the ancients, are found only in damp places. They often emerge in great numbers in misty weather or after thunderstorms. Although harmless to man, the large glands on their smooth, shiny bodies secrete a milky poison, which protects them from many enemies. The bright coloration of *S. salamandra* may therefore have a warning function.

THE EUROPEAN FIRE SALAMANDER, AFTER BREHM

The two well-known European species pair on land, the male clasping the female at the arms, and the impregnation is internal. Long after pairing the female gives birth to living young. *S. salamandra*, which lives at low altitudes (up to 3,000 ft.), deposits her young, 10 to 50 in number, in the water, in springs or cool rivulets. These young at birth are similar to small newt larvae, and provided with external gills. *S. atra*, on the other hand, inhabits more hilly regions, up to 9,000 ft. Such altitudes not being, as a rule, suitable for larval life in the water, the young are retained in the uterus until after metamorphosis. Only two young, rarely three or four, are born, and may measure as much as 50 mm. at birth, the mother measuring only 120. The fertilized eggs are large and numerous, as in *S. salamandra*, but only one develops in each uterus, the embryo being nourished on the other eggs, the embryos of which break down into a soupy "vitelline mass." The embryo passes through three stages—(1) still enclosed within

the egg membrane and living on its own yolk; (2) free, within the vitelline mass, which is swallowed by the mouth; (3) there is no more vitelline mass, but the embryo develops long external gills, which serve for a nutritive exchange through the maternal uterus, these gills functioning in the same way as the chorionic villi of the mammalian embryo's placenta. Embryos, in the second stage, if artificially released from the uterus, are able to live in water, but the uterine gills soon wither and are shed and are replaced by other gills similar to those in the larva of *S. salamandra*. In *S. salamandra* without access to water, the development of the embryos becomes closely similar to that of *S. atra*.

SALAMIS, an island of Greece in the Saronic Gulf of the Aegean Sea, extending along the coasts of Attica and Megaris, and enclosing the Bay of Eleusis between two narrow straits on the W. and S. Its area is 36 sq.m., its greatest length in any direction 10 m.; its extremely irregular shape gives rise to the modern popular name Κουλλούρι, i.e., baker's crescent. In Homer Salamis was the home of the Aeginetan prince Telamon and his sons Ajax and Teucer, and this tradition is confirmed by the position of the ancient capital of the island opposite Aegina. It subsequently passed into the hands of the Megarians, but was wrested from them about 600 B.C. by the Athenians under Solon (q.v.) and definitely awarded to Athens by Sparta's arbitration. Though Attic tradition claimed Salamis as an ancient possession the island was not strictly Athenian territory; a 6th-century inscription shows that it was treated either as a cleruchy or as a privileged foreign dependency. The town of Salamis was removed to an inlet of the east coast opposite Attica. In 480 Salamis became the base of the allied Greek fleet after the retreat from Artemisium, while the Persians took their station along the Attic coast off Phalerum. Through the stratagem of the Athenian Themistocles the Greeks were enclosed in the straits by the enemy, who had wheeled by night across the entrance of the east channel and detached a squadron to block the west outlet. The Greeks had thus no resource but to fight, while the Persians could not utilize their superior numbers, and as they advanced into the narrow neck of the east strait were thrown into confusion. The allies, among whom the Athenians and Aeginetans were conspicuous, seized this opportunity to make a vigorous attack which probably broke the enemy's line. After waging a losing fight for several hours the Persians retreated with a loss of 200 sail and of an entire corps landed on the islet of Psyttaleia in the channel; the Greeks lost only 40 ships out of more than 300. During the Peloponnesian War Salamis served as a repository for the country stock of Attica. About 350 Salamis obtained the right of issuing copper coins. In 328 Cassander placed in it a Macedonian garrison which was finally withdrawn through the advocacy of the Achaean statesman Aratus (232). The Athenians thereupon supplanted the inhabitants by a cleruchy of their own citizens. By the 2nd century A.D. the settlement had fallen into decay. In modern times Salamis, which is chiefly peopled by Albanians, has regained importance through the transference of the naval arsenal to Ambelaki near the site of the ancient capital. Excavations in this region have revealed large numbers of late Mycenaean tombs.

SALAMIS, the principal city of ancient Cyprus, situated on the east coast north of the river Pedias (Pedieus). It had a good harbour, well situated for commerce with Phoenicia, Egypt and Cilicia, which was replaced in mediaeval times by Famagusta

(q.v.), and is wholly silted now. Its trade was mainly in corn, wine and oil from the midland plain, and in salt from the neighbouring lagoons. Traditionally, Salamis was founded after the Trojan War (c. 1180 B.C.) by Teucer from the island Salamis, off Attica, but there was a Mycenaean colony somewhat earlier.

A king Kisu of Silna (Salamis) is mentioned in a list of tributaries of Assur-bani-pal of Assyria in 668 B.C., and Assyrian influence is seen in terra-cotta figures from a shrine excavated in 1890-1891. Salamis seems to have been the principal Hellenic power in the island. The revolts against Persia in 500 B.C., 386-380 B.C. and 352 B.C. were led respectively by its kings Onesilas, Evagoras (q.v.) and Phrygagoras. In 306 B.C. Demetrius Poliorcetes won a great naval victory here over Ptolemy I. of Egypt. Under Egyptian and Roman administration Salamis flourished greatly, though the seat of government was at New Paphos (see PAPHOS). But it was greatly damaged in the Jewish revolt of A.D. 116-117; suffered repeatedly from earthquakes, and was wholly rebuilt by Constantius II. (A.D. 337-361) under the name Constantia. There was a large Jewish colony, and a Christian community was founded by Paul and Barnabas in A.D. 45-46. Barnabas was himself a Cypriote, and his reputed tomb, discovered in A.D. 477, is still shown near the monastery of Ail Barnaba. St. Epiphanius was archbishop A.D. 367-402. The Greek city was destroyed by the Arabs under the Caliph Moawiya in 647; Christian survivors migrated to the neighbouring Ammochostos (see FAMAGUSTA).

Myres, *Archaeologia*, lxxvi. 259-278 ("Prison of St. Catherine"); E. Oberhammer in *Pauli-Wissowa* (s.v.). (J. L. Myr.)

SAL AMMONIAC or **AMMONIUM CHLORIDE**, the earliest known salt of ammonia (q.v.), was formerly much used in dyeing and metallurgical operations.

The name *Hammoniacus sal* (from ἄμμος sand) occurs in Pliny, who relates that it was applied to a kind of fossil salt found below the sand, in a district of Cyrenaica. The general opinion is, that the sal ammoniac of the ancients was the same as that of the moderns; but the imperfect description of Pliny is far from being conclusive. The native sal ammoniac of Bucharia, described by Model and Karsten, and analysed by M. H. Klaproth, has no resemblance to the salt described by Pliny. The same remark applies to the sal ammoniac of volcanoes. Dioscorides, in mentioning sal ammoniac, makes use of a phrase quite irreconcilable with the description of Pliny, and applicable rather to rock-salt than to our sal ammoniac. Sal ammoniac, he says, is peculiarly prized if it can be easily split into rectangular fragments. Finally, we have no proof whatever that sal ammoniac occurs near the temple of Jupiter Ammon, or in any part of Cyrenaica, so it is improbable that the name is derived from Ammon, and it seems that the term sal ammoniac was applied as indefinitely by the ancients as most of their other chemical terms. In any case there can be no doubt that it was well known to the alchemists as early as the 13th century.

Egypt is the country where sal ammoniac was first manufactured, and thence Europe for many years was supplied with it. This commerce was first carried on by the Venetians, and afterwards by the Dutch. In 1716 C. J. Geoffroy read a paper to the French Academy, showing that sal ammoniac must be formed by sublimation; but his opinion was opposed so violently by W. Homberg and N. Lemery, that the paper was not printed. In 1719 D. Lemaire, the French consul at Cairo, sent the Academy an account of the mode of manufacturing sal ammoniac in Egypt. The salt, it appeared, was obtained by simple sublimation from soot. In the year 1760 Linnaeus communicated to the Royal Society a correct detail of the whole process, which he had received from Dr. F. Hasselquist, who had travelled in that country as a naturalist. The dung of black cattle, horses, sheep, goats, etc., which contains sal ammoniac ready formed, is collected during the first four months of the year, when the animals feed on the spring grass, a kind of clover. It is dried, and sold to the common

people as fuel. The soot from this fuel is carefully collected and sold to the sal ammoniac makers, who work only during the months of March and April, for it is only at that season of the year that the dung is fit for their purpose.

The composition of this salt (NH_4Cl) seems to have been first discovered by J. P. Tournefort in 1700. The experiments of C. J. Geoffroy in 1716 and 1723 were still more decisive, and those of H. L. Duhamel de Monceau, in 1735, left no doubt upon the subject. Thomson first deduced its composition synthetically from his observation that when hydrochloric acid gas and ammonia gas are brought in contact with each other, they always combine in equal volumes.

The first attempt to manufacture sal ammoniac in Europe was made, about the beginning of the 18th century, by Goodwin, a London chemist, who appears to have used the mother lye of common salt and putrid urine as ingredients. The first successful manufacture of sal ammoniac in Great Britain was established in Edinburgh about the year 1760. It was first manufactured in France about the same time by A. Baumé. It is now obtained from the ammoniacal liquor of gas works by distilling the liquor with milk of lime and passing the ammonia so obtained into hydrochloric acid. The solution of ammonium chloride so obtained is evaporated and the crude ammonium chloride purified by sublimation.

The salt volatilizes (mostly in the form of a mixed vapour of the two components, which reunite on cooling), and condenses in the dome in the form of a characteristically fibrous and tough crust.

Sal ammoniac (ammonium chloride, British and United States pharmacopoeias) as used in medicine is a white crystalline odourless powder having a saline taste. It is soluble in 3 parts of cold water and in 50 parts of 90% alcohol. It is incompatible with carbonates of the alkalis. The dose is 5 to 20 gr. Ammonium chloride has a different action and therapeutic use from the rest of the ammonium salts. It possesses only slight influence over the heart and respiration, but it has a specific effect on mucous membranes as the elimination of the drug takes place largely through the lungs, where it aids in loosening bronchial secretions. This action renders it of the utmost value in bronchitis and pneumonia with associated bronchitis.

The drug may be given in a mixture with glycerine or liquorice to cover the disagreeable taste or it may be used in a spray by means of an atomizer. Though ammonium chloride has irritant properties which may disorder the stomach, yet if its mucous membrane be depressed and atonic the drug may improve its condition, and it has been used with success in gastric and intestinal catarrhs of a subacute type and is given in doses of 10 grains half an hour before meals in painful dyspepsia due to hyperacidity.

The drug is also an intestinal and hepatic stimulant and a feeble diuretic and diaphoretic, and has been considered a specific in some forms of neuralgia.

See AMMONIA

SALANDRA, ANTONIO (1853-1931), Italian statesman, was born at Troia, Puglia, in 1853. He first entered parliament as member for Lucera, and from the beginning of his political career was a Liberal of the right wing. When Sidney Sonnino became treasury minister in the Crispi cabinet of 1893, Salandra was chosen under-secretary in that department. He was minister of finance in the first Sonnino cabinet of 1906 and treasury minister in the second (1909-10). When, in March 1914, Giolitti resigned, Salandra was called upon to form the new cabinet, and in June he had to face a revolutionary outbreak in the Marches and Romagna.

Salandra was premier on the outbreak of World War I, and it was the Salandra cabinet which took the momentous decision of proclaiming Italy's neutrality, in spite of the existence of the Triple Alliance, because Austria-Hungary had violated art. 7 of the Triple Alliance by declaring war on Serbia without a previous agreement with Italy.

In May 1915 Salandra assumed the still greater responsibility of bringing Italy into the war on the side of the Allies. On re-

signing office in June 1916, in consequence of the Austrian offensive in the Trentino, he continued to support both the Boselli and the Orlando cabinets. During the disturbed period from 1919 to 1922 Salandra upheld the principles of orthodox Liberalism, and opposed the policy of the various cabinets who truckled to the extremists. He succeeded Tittoni as Italian delegate on the League of Nations Council and Assembly, and represented the Italian thesis in the Italo-Greek conflict arising from the massacre of the Tellini mission in Epirus in Aug. 1923. The Fascist movement was supported from the first by Salandra, but he did not join the Fascist party, and when he felt that Fascism was incompatible with the old Liberal tradition, especially after Mussolini's speech of Jan. 3, 1925, he withdrew his support, without, however, abandoning the Chamber. Subsequently his opposition became considerably attenuated, and in 1928 on the proposal of Mussolini, he was created a senator. Salandra died Dec. 19, 1931.

See on Salandra's war policy two books of his, written or compiled in the last nine years of his life: *I Discorsi della Guerra* (1922) and *La Neutralità italiana del 1914, ricordi e pensieri* (1928).

SALARIA, VIA, an ancient highroad of Italy, which ran from Rome by Reate and Asculum to Castrum Truentinum (Porto d'Ascoli) on the Adriatic coast, a distance of 151 mi. Its first portion was the route by which the Sabines came to fetch salt from the marshes at the mouth of the Tiber. Of its course through the Apennines considerable remains exist.

See T. Ashby in *Papers of the British School at Rome*, iii, 3-38.

SALAR JUNG, SIR (1829-1883), Indian statesman of Hyderabad, born in 1829, descendant of a family of officials under the Adil Shahi kings of Bijapur, then under the Delhi emperors and lastly under the Nizams. Sir Salar Jung's personal name was Mir Turab Ali; he was styled by native officials of Hyderabad the Mukhtar ul-Mulk, and commonly known as the Nawab Sahib. He succeeded his uncle Suraj ul-Mulk as prime minister of Hyderabad in 1853. Salar Jung disciplined Arab mercenaries, the more valuable part of the Nizam's army, and employed them against the rapacious nobles and bands of robbers who had annihilated the trade of the country. He then constituted courts of justice at Hyderabad, organized the police force, constructed and repaired irrigation works, and established schools. On the outbreak of the Mutiny he supported the British, and although unable to hinder an attack on the residency, he warned the British minister that it was in contemplation. The attack was repulsed; the Hyderabad contingent remained loyal, and their loyalty served to ensure the tranquillity of the Deccan. Salar Jung took advantage of the preoccupation of the British government with the Mutiny to push his reforms more boldly, and when the Calcutta authorities were again at liberty to consider the condition of affairs his work had been carried far towards completion. During the lifetime of the Nizam, Afzulu'd-dowla, Salar Jung was considerably hampered by his master's jealous supervision. When Mir Mahbub Ali, however, succeeded his father in 1869, Salar Jung, at the instance of the British government, was associated in the regency with the principal noble of the state, the Shamsu ul-Umara or Amir Kabir, and enjoyed an increased authority. In 1876 he visited England with the object of obtaining the restoration of Berar. Although he was unsuccessful, his personal merits met with full recognition. He died of cholera at Hyderabad on the 8th of February 1883.

See *Memoirs of Sir Salar Jung*, by his private secretary, Syed Hossain Bilgrami, 1883.

SALDANHA BAY, an inlet on the south-western coast of South Africa, 63 m. by sea N. by W. of Cape Town, forming a land-locked harbour. The northern part of the inlet is known as Hoetjes Bay. It has accommodation for a large fleet with deep water close inshore, but the arid nature of the country caused it to be neglected. From Kalabas Kraal on the Cape Town-Clanwilliam railway, a narrow gauge line runs via Hopefield to Hoetjes Bay—126 m. from Cape Town.

Saldanha Bay is so named after Antonio de Saldanha, captain in Albuquerque's fleet which visited South Africa in 1503.

SALDERN, FRIEDRICH CHRISTOPH VON (1719-1785), Prussian soldier and military writer, entered the army in

1735, and was transferred to the Guards in 1739. As one of Frederick's aides-de-camp he was the first to discover the approach of Neipperg's Austrians at Mollwitz. He commanded a guard battalion at Leuthen, again distinguished himself at Hochkirch and was promoted major-general. In 1760 at Liegnitz Frederick gave him four hours in which to collect, arrange and despatch the spoils of the battle, 6,000 prisoners, 100 wagons, 82 guns and 5,000 muskets. His complete success made him a marked man even in Frederick's army. At Torgau, Saldern and Mölendorf (q.v.) with their brigades converted a lost battle into a great victory by their desperate assault on the Siptitz heights. The manoeuvring skill, as well as the iron resolution, of the attack, has excited the wonder of modern critics, and after Torgau Saldern was accounted the "complete general of infantry alive" (Caryle). In the following winter, however, being ordered by Frederick to sack Huhertsburg, Saldern refused on the ground of conscience. Nothing was left for him but to retire, but after the peace the general was at once made inspector of the troops at Magdeburg. In 1766 he became lieutenant-general. Saldern was a pedant of the most pronounced type. In one of his works he discussed at great length the question between 76 and 75 paces to the minute as the proper cadence of infantry. "Saldern-tactics" contributed powerfully to the disaster of Jena in 1806. His works included *Taktik der Infanterie* (Dresden, 1784) and *Taktische Grundsätze* (Dresden, 1786), and were the basis of the British "Dundas" drill-book.

See Klüster, *Charakterzüge des Generalleutenants von Saldern* (1792).

SALE, GEORGE (c. 1697–1736), English Orientalist, was the son of a London merchant. In 1720 he was admitted a student of the Inner Temple, but subsequently practised as a solicitor. Having studied Arabic for some time in England, he became, in 1726, one of the correctors of the Arabic version of the New Testament, begun in 1720 by the Society for Promoting Christian Knowledge, and subsequently took the principal part in the work. He made an extremely paraphrastic, but, for his time, admirable English translation of the Koran (1734 and often reprinted), and had a European reputation as an Orientalist. He died on Nov. 13, 1736.

SALE, SIR ROBERT HENRY (1782–1845), British soldier, entered the 36th Foot in 1795, and went to India in 1798, as a lieutenant of the 12th Foot. He served in the operations against Tipposah, against the raja of Travancore (1808–09) and in the expedition to Mauritius (1810). After some years he became major in the 13th, with which regiment he was for the rest of his life associated. In the Burmese War he led the 13th in all the actions up to the capture of Rangoon, in one of which he killed the enemy's leader in single combat. In the concluding operations of the war, being now lieutenant-colonel, he commanded a brigade, and at Malown (1826) he was severely wounded. In 1838, on the outbreak of the Afghan War, Sale was assigned to the command of the 1st Bengal brigade of the army assembling on the Indus. His column arrived at Kandahar in April 1839, and in May it occupied the Herat plain. The Kandahar force next set out on its march to Kabul, and a month later Ghazni was stormed, Sale in person leading the storming column and distinguishing himself in single combat. The place was well provisioned, and on its supplies the army finished its march to Kabul easily. He was left, as second-in-command, with the army of occupation, and in the interval between the two wars conducted several small campaigns ending with the action of Parwan which led directly to the surrender of Dost Mohammed.

By this time the army had settled down to the quiet life of cantonments, and Lady Sale and her daughter came to Kabul. But the policy of the Indian Government in stopping the subsidy to the frontier tribes roused them into hostility, and Sale's brigade received orders to clear the line of communication to Peshawar. After severe fighting Sale entered Jalalabad on Nov. 12, 1841. Ten days previously he had received news of the murder of Sir Alexander Burnes, along with orders to return with all speed to Kabul. These orders he, for various reasons, decided to ignore; suppressing his personal desire to return to protect his wife and family, he gave orders to push on, and on occupying Jalalabad at once set about making the old and half-ruined fortress fit to stand

a siege. There followed a close and severe investment. At last Pollock and the relieving army appeared, only to find that the garrison had on April 7, 1842, relieved itself by a brilliant and completely successful attack on Akbar's lines. Pollock and Sale after a time took the offensive, and after the victory of Haft Kotal, Sale's division encamped at Kabul again.

At the end of the war Sale received the thanks of parliament. In 1845, as quartermaster-general to Sir H. Gough's army, Sale again took the field at Moodkee (Mudki) he was mortally wounded, and he died on Dec. 21, 1845. His wife, who shared with him the dangers and hardships of the Afghan war, was amongst Akbar's captives. Amongst the few possessions she was able to keep from Afghan plunderers was her diary (*Journal of the Distress in Afghanistan*, London, 1843).

See Gleig, *Sale's Brigade in Afghanistan* (London, 1846); Kaye, *Lives of Indian Officers* (London, 1867); W. Sale, *Defence of Jellalabad* (London, 1846); Regimental History of the 13th Light Infantry.

SALE, a town of Tanjil county, Victoria, Australia, the principal centre in the agricultural Gippsland district, on the river Thomson, 127½ mi. by rail E.S.E. of Melbourne. Pop. (1933), 4,262. It is the seat of the Anglican bishop of Gippsland, and contains the cathedral of the Roman Catholic bishop of Sale. Sale is the head of the Gippsland lakes navigation, the shipping being brought from the lakes to the town by canal. The chief Australian district for beet sugar is at Maffra nearby.

SALE, a municipal borough in the Altrincham parliamentary division, Cheshire, England, 5 mi S.W. of Manchester, on the L.M.S.R. and G.W.R. Pop. (1938) 37,480. Area, 5.67 sq.mi. The borough, created in 1935, is mainly residential. Several industries are carried on and provision has been made for further development. Market gardening to supply Manchester is extensive.

SALE (SAL), a seaport on the Atlantic coast of Morocco, on the north side of the Bu Ragreg, opposite Rabat (q.v.). Salé, inhabited by a native bourgeoisie, has many Moslem sanctuaries, mosques, *zauous*, *medersas* and tombs of saints. In the middle ages, it was the most important merchant port and entrepôt of the west coast. In the 17th century it became an independent republic, a great centre of corsairs. Various French and English expeditions tried, without much success, to put an end to it. Pop. (1936) 31,823, of which 1,090 were Europeans and 30,733 natives; (1944) 53,819, including 2,868 Europeans, 3,173 Jews, 47,778 natives.

SALEM, a city and district of British India, in the Madras presidency. The city is on both banks of the river Tirumunni, 3 mi. from a station on the Madras railway, 206 mi. S.W. of Madras city. Pop. (1941) 129,702. There is a considerable weaving industry. Its situation in a green valley between the Shevaroy and Jarugumalai hills is picturesque.

The DISTRICT OF SALEM has an area of 7,073 sq.mi. Except towards the south it is hilly, with extensive plains lying between the several ranges. It consists of three distinct tracts, formerly known as the Talaghat, the Baramahal and the Balaghat. The Talaghat is situated below the Eastern Ghats on the level of the Carnatic generally; the Baramahal includes the whole face of the Ghats and a wide piece of country at their base; and the Balaghat is situated above the Ghats on the tableland of Mysore.

The western part of the district is mountainous. Among the chief ranges are the Shevaroy, the Kalrayans, the Melagiris, the Kollimalais, the Pachamalais and the Yelagiris. The population in 1941 was 2,866,226. The principal crops are millets, rice, pulses, mangoes, and oil-seeds. Coffee is grown on the Shevaroy hills. The chief irrigation work is the Barur tank system. The Madras railway runs through the district, with two narrow-gauge branches. The chief industry is cotton-weaving, and magnesite and steatite are worked, and there are iron and steel works. The district was acquired partly by the treaty of peace with Tippos Sultan in 1792 and partly by the partition treaty of Mysore in 1799.

SALEM, a city of Massachusetts, U.S.A., on the coast, 15 mi. N.E. of Boston; a port of entry, one of the county seats of Essex county and a city of great historical interest. It is served by the Boston and Maine railroad.

Pop. (1920) 41,842; (1940) 41,213 by federal census. The city's area of 8.5 sq.mi. comprises a peninsula projecting toward the

northeast between Marblehead and Beverly, Winter Island (connected with the neck of the peninsula by a causeway) and some territory on the mainland.

The commerce of Salem's harbour is largely from coal and oil. Its manufactures include chemicals, cotton goods, shoes, leather, cany, valves, mattresses, incandescent bulbs, fluorescent tubes and radio tubes. Salem is the seat of a state teachers college (1854).

The assessed valuation of property for 1940 was \$53,975,000. Salem is one of the oldest cities in New England and has preserved an unusual number of historic and literary landmarks. In the centre of the city is the common (8 ac.). On a bluff projecting into South river is the old Burying point, set aside in 1637, with stones dating back to 1673; and in Broad street is another old burial ground, laid out in 1655. The famous Indian (or Crowninshield's) wharf became a coal pocket. The custom house (described by Nathaniel Hawthorne in the introduction to *The Scarlet Letter*) was built in 1818-19; the oldest of the three courthouses, which has great monolithic Corinthian columns, in 1839-41; the city hall, in 1837.

There are many old dwellings built by shipowners before the Revolution. Many are of the gambrel type, and they are rich in beautiful doorways, doorheads and other fine architectural details. The Salem Maritime national historic site comprises Derby wharf, the customhouse and three other buildings. Among the houses of special interest are the birthplace of Nathaniel Hawthorne (built before 1692); the "house of the seven gables," in use as a social settlement; the "witch house," where Jonathan Corwin is said to have held preliminary examinations in the witchcraft trials. The Essex Institute (1848) and the Peabody museum (in the East Indian Marine hall, built in 1824) contain rich collections relating to colonial life.

Salem was founded in 1626 by Roger Conant (1593-1679) as a commercial venture, partly agricultural and partly to provide a wintering-place for the Banks fishermen. The name was probably chosen in allusion to Psalm lxxvi, 2. In 1628 a patent for the territory was granted by the New England council to the Dorchester Company, which promptly sent out a small colony under John Endecott as governor. This patent was superseded in 1629 by the charter for the Colony of Massachusetts Bay. Endecott continued as governor until the arrival (1630) of John Winthrop, who soon moved the seat of government to Charlestown and then to Boston. In 1639 the first Congregational Church in America was organized in Salem, and Roger Williams (q.v.) was one of its first pastors. In 1686 the people of Salem, guarding against the danger of being dispossessed by a new charter, secured a deed to their land from the Indians for £20. Salem village (then part of Salem, but now in Danvers) was the centre of the witchcraft delusion of 1692. Beginning with accusations by ten young girls that Tituba, the West Indian slave of the Rev. Samuel Parris, and two old women had bewitched them, the hysteria spread rapidly, and within four months hundreds were arrested and tried, 19 hanged, and one pressed to death for refusing to plead. The reaction came quickly, and in May 1693 Governor Phelps ordered the release of all prisoners held on the charge of witchcraft. Salem was an important port after 1670, especially in the India trade, and Salem privateers were conspicuous in the Seven Years' War, during the Revolution (when 158 of them took 445 prizes), and in the War of 1812. The first provincial assembly of Massachusetts met in Salem in 1774. On Feb. 20, 1775, at the North bridge, the first armed resistance of the Revolution was offered by the men of the town to royal troops sent to search for hidden cannon. Marblehead was set off from Salem in 1649, Beverly in 1668 and Danvers in 1752. Salem was chartered as a city in 1836. It was the birthplace of Nathaniel Hawthorne, William H. Prescott, Nathaniel Bowditch, Jones Vary and William Wetmore Story.

SALEM, a city of southwestern New Jersey, U.S., the county seat of Salem county; 38 mi. S.W. of Philadelphia, on the Salem river, 2 mi. from its confluence with the Delaware. It is served by the Pennsylvania-Reading Seashore railroad and motorbus lines. The vicinity abounds in small river craft for pleasure. Pop. (1950) 9,050; (1940) 8,618. It is the trade centre for a rich

agricultural region and has important manufactures, including floor coverings, canned food, canning machinery and glass. The public library was established in 1804; the county offices occupy the old Johnson house, built in 1804; and in the Friends' burial ground (set aside in 1676) is an oak tree 88 ft. high, with a spread of 1 ac., a survivor of the original forest. In Finn's Point national cemetery, 4 mi. N. of Salem, are buried about 2,460 Confederate soldiers, who died while prisoners of war at Ft. Delaware, on an island in the Delaware river near the mouth of the Salem. Salem is the oldest permanent English settlement along the Delaware. It was founded in 1675 by John Fenwick, an English Quaker, who bought from the Indians the land now embraced in Salem and Cumberland counties, and selected the site of the present city for his settlement, naming it Salem because of its peaceful aspect. In 1682 he submitted to the authority of the proprietors of West Jersey. Salem was incorporated as a town in 1695 and as a city in 1858.

SALEM, a city of Columbiana county, Ohio, U.S., 67 mi. S.E. of Cleveland; served by the Pennsylvania railway. The population was 12,754 in 1950 and was 12,301 in 1940 by the federal census.

Salem is in a fertile agricultural region, where coal and natural gas are plentiful, and has important manufactures (including pumps, furnaces, machinery, bathroom fixtures, chinaware, automobile bodies and various other articles). Salem was settled by Friends in 1805, incorporated as a town in 1830, as a village in 1852 and as a city in 1887. It was a "station" on the underground railroad and the headquarters of the Western Anti-Slavery society, which published there *The Anti-Slavery Bugle*.

SALEM, the capital city of Oregon, U.S., and county seat of Marion county; on the Willamette river, 51 mi. S.S.W. of Portland. It is on federal highway 99E and is served by the Southern Pacific and the Oregon Electric railways and by motor coach lines. Pop. (1950) 43,140; 1940 federal census 30,908. In the heart of the Willamette valley, Salem is surrounded by rich farm land producing fruits, berries, nuts, hops, mint, mushrooms and seed; it is the only region in the United States where long-fibre flax is raised. Manufacturing industries include fruit, berry and vegetable canneries, a paper mill, large sawmills, also sash and door factories, woolen mills, ironworks and two linen mills. All but two of the state institutions are in or near the city, and at Chemawa, 5 mi. N., is a government school for Indians. On an 18-ac. campus in the heart of the city is Willamette university (Methodist Episcopal; 1842), an outgrowth of the mission work of the Methodist Episcopal church begun in the vicinity by Jason Lee in 1834. Around the mission and the school grew up a settlement which in 1853 was chartered as a city and in 1860 became the capital of the state.

SALEM, a town of southwestern Virginia, U.S., the county seat of Roanoke county; on the Roanoke river and federal highway 11, 6 mi. W. of Roanoke. It is served by the Norfolk and Western and the Virginian railways. Pop. 6,823 in 1950 and 5,737 in 1940 by the federal census. Salem lies about 1,000 ft. above sea level, in the beautiful region between the Blue Ridge and the Allegheny mountains. It is the seat of Roanoke college, coeducational (Lutheran; 1842), and of two orphanages (Baptist and Lutheran) and has a variety of manufacturing plants. The town was laid out in 1802, incorporated in 1806 and became the county seat in 1838. Since 1922 Salem has had a council-manager form of government.

SALE OF GOODS. The law of sale is usually treated as a branch of the law of contract, because sale is effected by contract. Thus Pothier entitles his classical treatise on the subject, *Traité du contrat de vente*. But a completed contract of sale is something more. It is a contract plus a transfer of property. By an agreement to sell *in personam* is created; by a sale of *ius in rem* is transferred. The essence of sale is the transfer of property for a price. If there be no agreement for a price, express or implied, the transaction is of the nature of a gift. So, too, if commodity be exchanged for commodity, the transaction is called barter (q.v.) and not sale, and the rules relating to sales do not apply in their entirety. Again, a contract of sale must

contemplate an absolute transfer of the property in the thing sold or agreed to be sold. A mortgage may be in the form of a conditional sale, but English law regards the substance and not the form of the transaction. If in substance the object of the transaction is to secure the repayment of a debt, and not to transfer the absolute property in the thing sold, the law at once annexes to the transaction the complex consequences which attach to a mortgage. So, too, it is not always easy to distinguish a contract for the sale of an article from a contract for the supply of work and materials. If a man orders a set of false teeth from a dentist the contract is one of sale, but if he employs a dentist to stop one of his teeth with gold the contract is for the supply of work and materials. The distinction is of practical importance, because very different rules of law apply to the two classes of contract. The property which may be the subject of sale may be either movable or immovable, tangible or intangible. The present article relates only to the sale of goods—that is to say, tangible movable property.

The Code of 1893.—In 1847, when Justice Story wrote his work on the sale of personal property, the law of sale was still in process of development. Many rules were still unsettled, especially the rules relating to implied conditions and warranties. But for several years the main principles have been well settled. In 1891 the subject seemed ripe for codification, and Lord Herschell introduced a codifying bill which two years later passed into law as the Sale of Goods Act, 1893.

Sale is a consensual contract. The parties to the contract may supplement it with any stipulations or conditions they may see fit to agree to. The code in no wise seeks to fetter this discretion. It lays down a few positive rules—such, for instance, as that which reproduces the 17th section of the Statute of Frauds. But the main object of the act is to provide clear rules for those cases where the parties have either formed no intention or have failed to express it. When parties enter into a contract they contemplate its smooth performance, and they seldom provide for contingencies which may interrupt that performance—such as the insolvency of the buyer or the destruction of the thing sold before it is delivered. It is the province of the code to provide for these contingencies, leaving the parties free to modify by express stipulation the provisions imparted by law. When the code was in contemplation the case of Scotland gave rise to difficulty. Scottish law varies widely from English. To speak broadly, the Scottish law of sale differs from the English by adhering to the rules of Roman law, while the English common law has worked out rules of its own. The Codifying bill of 1891 applied only to England, but on the advice of Lord Watson it was extended to Scotland. As the English and Irish laws of sale were the same, the case of Ireland gave rise to no difficulty, and the act now applies to the whole of Great Britain. As regards England and Ireland, very little change in the law has been effected. As regards Scotland, the process of assimilation has been carried further, but this has not been completed. In a few cases the Scottish rule has been saved or re-enacted, in a few other cases it has been modified, while on other points, where the laws were dissimilar, the English rules have been adopted.

The act is divided into six parts, the first dealing with the formation of the contract. The 1st section, which may be regarded as the keystone of the act, is in the following terms: "A contract of sale of goods is a contract whereby the seller transfers or agrees to transfer the property in goods to the buyer for a money consideration called the price. A contract of sale may be absolute or conditional. When under a contract of sale the property in the goods is transferred from the seller to the buyer the contract is called a 'sale,' but when the transfer of the property in the goods is to take place at a future time or subject to some condition thereafter to be fulfilled the contract is called an 'agreement to sell.' An agreement to sell becomes a sale when the time elapses or the conditions are fulfilled subject to which the property in the goods is to be transferred." This section clearly enunciates the consensual nature of the contract, and this is confirmed by sec. 55, which provides that "where any right, duty or liability would arise under a contract of sale by impli-

cation of law," it may be negated or varied by express agreement, or by the course of dealing between the parties, or by usage, if the usage be such as to bind both parties to the contract. The next question is who can sell and buy. The act is framed on the plan that if the law of contract were codified, this act would form a chapter in the code. The question of capacity is therefore referred to the general law, but a special provision is inserted (sec. 2) relating to the supply of necessities to infants and other persons who are incompetent to contract. Though an infant cannot contract he must live, and he can only get goods by paying for them. The law, therefore, provides that he is liable to pay a reasonable price for necessities supplied to him, and it defines necessities as "goods suitable to the condition in life of such minor or other person, and to his actual requirements at the time of the sale and delivery."

The 4th section of the act reproduces the famous 17th section of the Statute of Frauds, which was an act "for the prevention of frauds and perjuries." The object of that statute was to prevent people from setting up hocus contracts of sale by requiring material evidence of the contract. The section provides that "a contract for the sale of any goods of the value of £10 or upwards shall not be enforceable by action unless the buyer shall accept part of the goods so sold, and actually receive the same, or give something in earnest to bind the contract, or in part payment, or unless some note or memorandum in writing of the contract be made and signed by the party to be charged, or his agent in that behalf." It is a much-disputed question whether this enactment has brought about good or harm. It has defeated many an honest claim, though it may have prevented many a dishonest one from being put forward. When judges and juries have been satisfied of the *bona fides* of a contract which does not appear to satisfy the statute, they have done their best to get round it. Every expression in the section has been the subject of numerous judicial decisions, which run into almost impossible refinements, and illustrate the maxim that hard cases make bad law. It is to be noted that Scotland is excluded from the operation of sec. 4. The Statute of Frauds has never been applied to Scotland, and Scotsmen appear never to have felt the want of it.

As regards the subject-matter of the contract, the act provides that it may consist either of existing goods or "future goods"—that is to say, goods to be manufactured or acquired by the seller after the making of the contract (sec. 5). Suppose that a man goes into a gunsmith's shop and says, "This gun suits me, and if you will make or get me another like it I will buy the pair." This is a good contract, and no question as to its validity would be likely to occur to the lay mind. But lawyers have seriously raised the question, whether there could be a valid contract of sale when the subject-matter of the contract was not in existence at the time when the contract was made. The price is an essential element in a contract of sale. It may be either fixed by the contract itself, or left to be determined in some manner thereby agreed upon, e.g., by the award of a third party. But there are many cases in which the parties intend to effect a sale, and yet say nothing about the price. Suppose that a man goes into an hotel and orders dinner without asking the price. How is it to be fixed? The law steps in and says that, in the absence of any agreement, a reasonable price must be paid (sec. 8). This prevents extortion on the part of the seller, and unreasonableness or fraud on the part of the buyer.

Warranty.—The next question dealt with is the difficult one of conditions and warranties (secs. 10 and 11). The parties may insert what stipulations they like in a contract of sale, but the law has to interpret them. The term "warranty" has a peculiar and technical meaning in the law of sale. It denotes a stipulation which the law regards as collateral to the main purpose of the contract. A breach, therefore, does not entitle the buyer to reject the goods, but only to claim damages. Suppose that a man buys a particular horse, which is warranted quiet to ride and drive. If the horse turns out to be vicious, the buyer's only remedy is to claim damages, unless he has expressly reserved a right to return it. But if, instead of buying a particular horse, a

man applies to a dealer to supply him with a quiet horse, and the dealer supplies him with a vicious one, the stipulation is a condition. The buyer can either return the horse, or keep it and claim damages. Of course the right of rejection must be exercised within a reasonable time. In Scotland no distinction has been drawn between conditions and warranties, and the act preserves the Scottish rule by providing that, in Scotland, "failure by the seller to perform any material part of a contract of sale" entitles the buyer either to reject the goods within a reasonable time after delivery, or to retain them and claim compensation (sec. 11 [2]). In England it is a very common trick for the buyer to keep the goods, and then set up in reduction of the price that they are of inferior quality to what was ordered. To discourage this practice in Scotland the act provides that, in that country, the court may require the buyer who alleges a breach of contract to bring the agreed price into court pending a decision of the case (sec. 59). It seems a pity that this sensible rule was not extended to England.

In early English law *caveat emptor* was the general rule, and it was one well suited to primitive times. Men either bought their goods in the open market-place, or from their neighbours, and buyer and seller contracted on a footing of equality. Now the complexity of modern commerce, the division of labour and the increase of technical skill, have altogether altered the state of affairs. The buyer is more and more driven to rely on the honesty, skill and judgment of the seller or manufacturer. Modern law has recognized this, and protects the buyer by implying various conditions and warranties in contracts of sale, which may be summarized as follows: First, there is an implied undertaking on the part of the seller that he has a right to sell the goods (sec. 12). Secondly, if goods be ordered by description, they must correspond with that description (sec. 13). Thirdly, there is the case of manufacturers or sellers who deal in particular classes of goods. They naturally have better means of judging of their merchandise than the outside public, and the buyer is entitled within limits to rely on their skill or judgment. A tea merchant or grocer knows more about tea than his customers can, and so does a gunsmith about guns. In such cases, if the buyer makes known to the seller the particular purpose for which the goods are required, there is an implied condition that the goods are reasonably fit for it, and if no particular purpose be indicated there is an implied condition that the goods supplied are of merchantable quality (sec. 14). Fourthly, in the case of a sale by sample, there is "an implied condition that the bulk shall correspond with the sample in quality," and that the buyer shall have a reasonable opportunity of comparing the bulk with the sample (sec. 15).

Effects of Contract.—The main object of sale is the transfer of ownership from seller to buyer, and it is often both a difficult and an important matter to determine the precise moment at which the change of ownership is effected. According to Roman law, which is still the foundation of most European systems, the property in a thing sold did not pass until delivery to the buyer. English law has adopted the principle that the property passes at such time as the parties intend it to pass. Express stipulations as to the time when the property is to pass are very rare. The intention of the parties has to be gathered from their conduct. A long train of judicial decisions has worked out a series of rules for determining the presumed intention of the parties, and these rules are embodied in secs. 16 to 20 of the act. The first rule is a negative one. In the case of unascertained goods, i.e., goods defined by description only, and not specifically identified, "no property in the goods is transferred to the buyer unless and until the goods are ascertained." If a man orders ten tons of scrap iron from a dealer, it is obvious that the dealer can fulfil his contract by delivering any ten tons of scrap that he may select, and that until the ten tons have been set apart, no question of change of ownership can arise. But when a specific article is bought, or when goods ordered by description are appropriated to the contract, the passing of the property is a question of intention. Delivery to the buyer is strong evidence of intention to change the ownership, but it is not conclusive. Goods may be

delivered to the buyer on approval, or for sale or return. Delivery to a carrier for the buyer operates in the main as a delivery to the buyer, but the seller may deliver to the carrier, and yet reserve to himself a right of disposal. On the other hand, when there is a sale of a specific article, which is in a fit state for delivery, the property in the article *prima facie* passes at once, even though delivery be delayed. When the contract is for the sale of unascertained goods, which are ordered by description, the property in the goods passes to the buyer, when, with the express or implied consent of the parties, goods of the required description are "unconditionally appropriated to the contract." It is perhaps to be regretted that the codifying act did not adopt the test of delivery, but it was thought better to adhere to the familiar phraseology of the cases. Section 20 deals with the transfer of risk from seller to buyer, and lays down the *prima facie* rule that "the goods remain at the seller's risk until the property therein is transferred to the buyer, but when the property therein is transferred to the buyer, the goods are at the buyer's risk whether delivery has been made or not." *Res perit domino* is therefore the maxim of English, as well as of Roman law.

Title.—In the vast majority of cases people only sell what they have a right to sell, but the law has to make provision for cases where a man sells goods which he is not entitled to sell. An agent may misconceive or exceed his authority. Stolen goods may be passed from buyer to buyer. Then comes the question, Which of two innocent parties is to suffer? Is the original owner to be permanently deprived of his property, or is the loss to fall on the innocent purchaser? Roman law threw the loss on the buyer, *Nemo plus iuris in alium transferre potest quam ipse habet*. French law, in deference to modern commerce, protects the innocent purchaser and throws the loss on the original owner. "En fait de meubles, possession vaut titre" (*Code civil*, art. 1,599). English law is a compromise between these opposing theories. It adopts the Roman rule as its guiding principle, but qualifies it with certain exceptions, which cover perhaps the majority of the actual cases which occur (secs. 21 to 26). In the first place, the provisions of the Factors Act, 1889 (extended to Scotland by 53 and 54 Vict. c. 40), are preserved. That act validates sales and other dispositions of goods by mercantile agents acting within the apparent scope of their authority, and also protects innocent purchasers who obtain goods from sellers left in possession, or from intending buyers who have got possession of the goods while negotiations are pending. In most cases a contract induced by fraud is voidable only, and not void, and the act provides, accordingly, that a voidable contract of sale shall not be voided to the prejudice of an innocent purchaser. The ancient privilege of market overt (*i.e.*, "open market") is preserved intact (sec. 22). The section does not apply to Scotland, nor to the law relating to the sale of horses which is contained in two old statutes, 2 and 3 Phil. and Mar. c. 7, and 31 Eliz. c. 12. The minute regulations of those statutes are never complied with, so their practical effect is to take horses out of the category of things which can be sold in market overt. The privilege of market overt applies only to markets by prescription, and does not attach to newly-created markets. The operation of the custom is therefore fitful and capricious. For example, every shop in the City of London is within the custom, but the custom does not extend to the greater London outside. If then a man buys a stolen watch in Fleet street, he may get a good title to it, but he cannot do so if he buys it a few doors off in the Strand. There is, however, a qualification of the rights acquired by purchase even in market overt. When goods have been stolen and the thief is prosecuted to conviction, the property in the goods thereupon reverts in the original owner, and he is entitled to get them back either by a summary order of the convicting court or by action. This rule dates back to the statute 21 Hen. VIII. c. 11. It was probably intended rather to encourage prosecutions in the interests of public justice than to protect people whose goods were stolen.

Having dealt with the effects of sale, first, as between seller and buyer, and, secondly, as between the buyer and third parties,

the act proceeds to determine what, in the absence of convention, are the reciprocal rights and duties of the parties in the performance of their contract (secs. 27 to 37). "It is the duty of the seller to deliver the goods and of the buyer to accept and pay for them in accordance with the terms of the contract of sale" (sec. 27). In ordinary cases the seller's duty to deliver the goods is satisfied if he puts them at the disposal of the buyer at the place of sale. The normal contract of sale is represented by a cash sale in a shop. The buyer pays the price and takes away the goods ("Unless otherwise agreed, delivery of the goods and payment of the price are concurrent conditions" (sec. 27). But agreement, express or implied, may create infinite variations on the normal contract. It is to be noted that when goods are sent to the buyer which he is entitled to reject, and does reject, he is not bound to send them back to the seller. It is sufficient if he intimates to the seller his refusal to accept them (sec. 36).

Remedies of Buyer and Seller.—The ultimate sanction of a contract is the legal remedy for its breach. Seller and buyer have each their appropriate remedies. If the property in the goods has passed to the buyer, or if, under the contract, "the price is payable on a day certain irrespective of delivery," the seller's remedy for breach of the contract is an action for the price (sec. 49). In other cases his remedy is an action for damages for non-acceptance. In the case of ordinary goods of commerce the measure of damages is the difference between the contract price and the market or current price at the time when the goods ought to have been accepted. The convenient market-price rule is subordinate to the general principle that "the measure of damages is the estimated loss directly and naturally resulting in the ordinary course of events from the buyer's breach of contract" (sec. 56). Similar considerations apply to the buyer's right of action for non-delivery of the goods (sec. 51). In exceptional circumstances the remedy of specific performance is available to the buyer (sec. 52). Thus the court might order the specific delivery of an autograph letter of an otherwise unrecorded signatory of the Declaration of Independence. The seller's rights are further protected by the rules as to lien and stoppage *in transitu* (secs. 38 to 48).

The sixth and last part of the act is supplemental, and is mainly concerned with drafting explanations, but sec. 58 contains some rules for regulating sales by auction. The practice known as a "knock-out" has since been struck at by the Auctions (Bidding Agreements) Act, 1927, by which it is declared illegal and punishable.

The act of 1893 has been adopted in substance by very many of the colonial possessions, and has been followed in the main by the American Sales Act (U.S.A.). (M.D.C.)

C.I.F. Contracts.—These are in a class by themselves. The law governing them is mostly of recent growth and, nearly all of it, case law. They are contracts for the sale of sea-borne goods where the price quoted covers cost, insurance and freight. Hence the name. But the distinguishing characteristic of these sales is this: Performance is effected by tender of the documents in place of the delivery of the actual goods. Indeed, in the business world they are often referred to as sales of documents. By their means the goods are often sold many times over while still afloat; even though the ship be sunk or the goods perish no loss need fall upon the buyer, because he is protected under the policy of insurance effected on the goods or the bill of lading under which they are carried.

The documents are naturally the focus of attention. The seller must tender to the buyer the invoice, the bill of lading and the policy of insurance. On this point the requirements of the English courts are strict. By bill of lading is meant a bill or document attesting that the goods have been loaded on board, not that a shipping company is under contract to carry the goods on a named or subsequent ship. In the United States the practice may be different and the courts there may recognize "received for shipment" bills of lading and similar documents which circulate freely enough in the commercial world. Similarly with the policy of insurance. English law requires the tender of a policy. In the United States certificates of insurance and even more informal

records of the contract of insurance are in recognized use. In this respect perhaps English law lags a little behind commercial practice, for certainly these certificates are a great convenience and by special agreement can be regularly employed. But in criticizing the law as it stands it must not be forgotten that other interests besides those of buyer and seller are affected; the banker and underwriter have to be taken into account. The banker for his part has up till now resolutely set his face against the so-called "bill of lading" which gives no certain information as to the whereabouts of the goods.

When the documents are tendered the buyer must be ready and willing to pay the price. He is not entitled to withhold payment until he has had an opportunity of examining the goods. The term "net cash" in a c.i.f. contract means cash against documents. The property passes, if any one general rule can be laid down on the subject, when the documents are tendered. But on this as on other aspects of the sale there is a growing body of law to which it is very difficult to do justice in a general statement. Some of the topics are not altogether free from difficulty. Moreover, though it is a form of contract in use the world over, the law governing it is by no means as uniform as could be wished. Accordingly it has been suggested, though the suggestion has a greater measure of support on the Continent where it originated than in either England or the United States, that attempts should be made to secure uniformity along the lines of the York-Antwerp rules. More doubtless will be heard of the proposal as time goes on. (H. Got.)

UNITED STATES

The English law, as stated above, gives even in its details a picture of the American law. There is, to be sure, no market overt in the United States; and the American Factors' Acts are not only less broad in scope than the English, but, even with their narrower scope, are found only in a handful of States. Their policy should be compared with that of the statutes requiring filing or recording of chattel mortgages (*see BILL OF SALE*) and of conditional sales (*see INSTALLMENT PURCHASE*). Where found, they commonly permit a consignee of goods, whose business also includes selling on his own account, to make an effective pledge of his principal's goods to secure his own debt; but the American law extends such powers to the "intending purchaser" who has secured possession only in a few specific cases, such as (in many States) instalment purchase. It should also be noted that the rule that risk follows title has an exception where title is withheld—as in the instalment purchase—only for securing payment of the price.

The chief divergence of American sales law from that described above has to do with warranties; *i.e.*, the nature of the seller's obligation with reference to the kind and quality of goods sold. The facts which will place some obligation on the seller with reference to quality are substantially the same in both countries. But in the United States, if the seller has undertaken any obligation in this respect, the buyer will, in the majority of States, be entitled not only to damages (the English "warranty") but also (at his election) to return the goods and recover the price (the English "condition"). This rule as indicated, is not universal. The American common law was in some conflict and confusion on the point, and the Uniform Sales Act, incorporating the view just stated, has not been adopted as yet (1928) in 20 of the States.

The long controversy over the buyer's power to return defective goods indicates the extent to which the law of warranty has been a creature of mercantile law, designated to settle disputes about goods between merchants. Of recent years, however, the law of warranty has been put to another striking social use: that of allocating the risks incident, in a highly industrialized society, to the unavoidable use of goods manufactured by persons with whom the user has no direct contact, who may be a "corporation" located in a distant place, whose methods the user has neither skill nor opportunity to know—but whose efficiency he is forced by the nature of the market to rely upon. Injury in those cases results from a tack or a piece of glass concealed in cake or a can of beans, from the explosion of an automatic water-heater, or from the breaking of an automobile wheel. In such cases return of the goods is not in

question, but only the allocation of the damage suffered. The device of an action for negligence has recently been extended for this purpose; but it seems to be limited to personal injury, as opposed to property damage; and it is obviously ineffective in the many States in which the burden rests on the injured plaintiff of proving the manufacturer negligent in regard to the particular defective article. There is some tendency to shift the burden to the manufacturer where the article is one, which, if negligently made, would be dangerous; i.e. to make an injury due to defect raise a presumption of negligence in manufacture. Under this rule the remedy "for negligence" is effective—so effective indeed, as apparently to have given rise to a considerable volume of fraudulent claims. The remedy in negligence, too, may well be extended to any injured purchaser.

But the remedy for the same injury by way of the law of warranty seems in almost all States to be limited to the specific purchaser against his specific seller; it has been held to extend neither to his wife, his child, his employee nor his guest. Nor, under most decisions, will it run against the manufacturer if the plaintiff bought the article not directly from him, but from an intervening dealer. On the other hand, wherever remedy in warranty is available, it requires no proof of negligence at all: the seller is held to guarantee against dangerous defects in the article. It is clear the situation is one in which the courts are groping toward satisfying a definite social need, and yet one in which the traditional legal devices are only with delay and distortion capable of being made to fill the need.

Documents of Title.—One feature of American law in which wide changes have been worked in recent years requires mention. The old rule that no man might convey goods which he did not own imposes on buyers either a noticeable risk (of having any goods which have been improperly sold to them recovered by their true owners) or a degree of investigation incompatible with rapid turnover. Especially dangerous and impracticable is this in the case of bankers advancing money on the security of goods in warehouse or in transit; a banker's margin of profit is too low to make losses readily compensable, and enquiry into title is in general outside his competence. A practice therefore grew up, in the case of goods in warehouse, of accepting the warehouseman's receipt for the goods, if fair on its face, as full evidence of title to the goods, and of dealing with the receipt as with the goods themselves. The same practice has developed, even earlier, with reference to bills of lading, i.e., carriers' receipts for goods entrusted to their care.

This mercantile custom has now received full warrant at law, in America, in all 38 States which have adopted the Uniform Sales Act (beginning in 1906); also, as to warehouse receipts, in the 43 States which have enacted the Uniform Warehouse Receipts Act (beginning in 1906); in more than half the States, as to bills of lading, and in all bills of lading arising out of interstate shipments, by the adoption of the Uniform Bills of Lading Act by Congress and many State legislatures (beginning in 1909). Sharp distinction is taken under these acts between straight or *non-negotiable* documents, which do not contain a promise to deliver to the order of named person, and which can transfer only such rights as the transferor possesses; and on the other hand, *order* or negotiable documents, which do carry a promise to deliver to the order of a named person, and which in general carry to a *bona fide* purchaser (or pledgee) for value all the rights apparent on their face, even though the transferor may have lacked such rights. The English law is to the same effect, and even expressly extends the same rules to policies of marine insurance drawn in proper form. All the American uniform acts named above are the work of Prof. Samuel Williston, whose credit in this connection is as great as that of Chalmers in England, and whose text on sales (see *The Law of Sales*, 2nd ed., 1924) promises to remain for a generation the authoritative work on the subject.

SALEP, a drug extensively used in oriental countries as a nerve restorative and fattener, and also much prescribed in paralytic affections. It is not used in European medicine. It consists of the tuberous roots of various species of *Orchis* and *Eulophia*, which are decorticated, washed, heated until horny in appearance, and then dried. Its most important constituent is a mucilaginous substance which it yields with cold water to the extent of 48%.

SALERNO (known in Roman and mediaeval times as Salernum), a small seaport, archiepiscopal see and capital of a province of the same name, about 30 mi. S.E. of Naples, Italy, finely situated at the foot of an amphitheatre of hills. Pop. (1936) 41,925 (town), 67,009 (commune). The modern town is of little commercial importance, but as a sea base and communications centre was bombed by the Allies in World War II.

The site was of some strategic significance under the Roman Republic and Empire, but the town was of only secondary importance until mediaeval times. It was dismantled by Charlemagne in the 9th century. Later it became the fortified capital of an independent principality and the rival of Benevento. During the 9th and 10th centuries it was frequently attacked by the Saracens. It was taken in 1076 by the Normans under Robert Guiscard. In 1194 it was sacked by Henry VI, and its development ceased. Salerno revived somewhat in the early 13th century, under Frederick II. (1194-1250), but soon fell into decay. The historic interest of Salerno centres round its medical school, the foundation of which is ascribed to the legendary "four masters"—a Latin, a Greek, a Jew and a Saracen. The legend represents the syncretic cultural influences under which the school arose. In the 10th and 11th centuries the place was a health resort. Under Norman rule the medical element became organized and was profoundly influenced by the work of Constantine the African (d. 1087, *q.v.*), secretary to Robert Guiscard who translated medical works from Arabic into Latin. A contemporary who translated medical works from Greek was Alfano, archbishop of Salerno. A Jewish element was early in evidence. Under Frederick II. lectures in Hebrew were given at Naples, and one of the most important Latin translators from the Arabic, the Jew, Faraj ben Salim (d. c. 1290), worked at Salerno. The decline of the school dates from 1224, when Frederick II. instituted a university at Naples. The very well known doggerel Latin verses on the preservation of health, known as the *Regimen Sanitatis Salerni*, have been translated into almost every European language. They are addressed to an apocryphal "King of England," usually supposed to be Robert of Normandy, but there is no doubt that the verses are mostly of the 14th century. They are probably, in the main, the work of Arnald of Villanova (1235-1313).

The school is regarded as the earliest university in Europe. It became, in the later middle ages, a place of bogus degrees but survived till 1811, when it was closed by Napoleon.

BIBLIOGRAPHY.—F. Hartmann, *Die Literatur von Früh- und Hochsalerno* (Leipzig, 1918), and C. Singer, *Essays on the History of Medicine, presented to K. Sudhoff* (Oxford, 1924), contain bibliographies. The legends of Salerno are disposed of by C. Singer in *From Magic to Science* (1928), and the Arabic and Hebrew Salernitan relationships are discussed by him in *The Legacy of Israel* (Oxford, 1927). The work of Alfano is printed by C. Burkhard, *Nemesii Episcopi Praemon Physicon . . . Alfano Salerni in Latium translatum* (Leipzig, 1917). The records of the University of Salerno are collected by H. Rashdrid, *The Universities of the Middle Ages*, 3 vols. (Oxford, 1895). An important document, recording the physicians at Salerno, is C. A. Garufi, *Necrologio del Liber Confraternum di S. Matteo di Salerno* (1921), discussed by P. Capparoni, *Magistri Salernitani noscitur cogniti* (London, 1921). The last edition of the *Scola Salernitana* is by F. R. Packard and F. H. Garrison, *The School of*

Salernum Regimen Sanitatis Salernitanum (1920).

(C. Sr., X.)

SALESBURY or SALISBURY, WILLIAM (c. 1530-c. 1600), Welsh scholar, was a native of Denbighshire, being the son of Foulke Salesbury, who belonged to a family said to be descended from a certain Adam of Salzbürg, a member of the ducal house of Bavaria, who came to England in the 12th century. Salesbury was educated at Oxford, where he accepted the Protestant faith, but he passed most of his life at Llannerf, working at his literary undertakings. The greatest Welsh scholar of his time, Salesbury was acquainted with nine languages, including Latin, Greek and Hebrew, and was learned in philology and botany. He died about 1600. About 1546 he edited a collection of Welsh proverbs (*Oll synau'r pen kembero*), probably the first book printed in Welsh, and in 1547 his *Dictionary in English and Welshe* was published (facsimile edition, 1877). In 1563 the English parliament ordered the Welsh bishops to arrange for the translation of the Scriptures and the Book of Common Prayer into Welsh. The New Testament was assigned to Salesbury, who had previously translated parts of it. He received assistance from Richard Davies, bishop of St. Davids, and also from Thomas Huet, or Hewett (d. 1591), but he himself did the greater part of the work. The translation was made from the Greek, but Latin versions were consulted, and in Oct. 1567 the New Testament was published in Welsh for the first time. This translation never became very popular, but it served as the basis for the new one made by Bishop William Morgan (c. 1547-1604).

Salesbury and Davies continued to work together, translating various writings into Welsh, until about 1576 when the literary partnership was broken. After this event, Salesbury, although continuing his studies, produced nothing of importance.

SALESMANSHIP. Like other skills, salesmanship is based on a body of knowledge that approaches a science; but a mere knowledge of the principles involved is not sufficient to make a person a good salesman. He must be able to apply these principles with an efficiency gained only by practice. Certain native abilities are helpful, but most of the needed skills can be acquired by any normal person willing to study and practise diligently.

The salesman is a concomitant of the industrial era wherein most goods are manufactured for exchange rather than for use by the maker. The maker himself employs salesmen to sell his product to the middleman, the middleman uses salesmen to sell to other middlemen or to consumers, while some manufacturers sell directly to the final buyers. The production of goods on a large scale usually involves the problem of finding buyers for those goods, because it is cheaper for the salesman to contact several buyers than for each of those buyers to contact several manufacturers. Thus the salesman performs an economic function, imparting to the product time utility, place utility or possession utility. The buyer is willing to pay for these utilities for the same reason that he pays for the form utility imparted by the manufacturers.

In addition the salesman often brings to his customer a fund of helpful suggestions relating to the use of his product or its resale at a profit, thereby still further meriting the payment he receives for his work. With this recognition of the importance of the salesman's work came a marked improvement in his economic and social status.

There are many types of selling and just as many types of salesmen, each of which should be fitted by endowment and training for his particular task. This need for varied abilities makes it possible for nearly anyone to find some sort of congenial sales work. At one extreme is the sales engineer who requires considerable academic training before he receives his specialized education from the company whose product and services he sells. This man must be intelligent and possess a better-than-average personality. At the other extreme may be classed the clerk in a chain store whose duties embrace little more than making change and wrapping parcels. Little education or product knowledge is demanded, and personality traits are not of so great importance.

Between these extremes are found salesmen and saleswomen whose jobs vary widely as to type of employer (manufacturer, wholesaler, retailer), type of product sold (tangible or intangible,

specialty or staple), complexity (some jobs are simple while others involve the performance of many functions), personality preferred (some selling demands aggressiveness while other sales jobs are best handled by persons of the type termed by psychologists as "submissive"), repetitive or pioneering (some salesmen call on the same customers at frequent intervals while others are always calling on new prospective buyers), seeking out customers (retail store salesmen wait for customers to walk in while insurance salesmen must seek out their customers), physical vigour required (some selling work is light and easy while other jobs demand great strength and stamina), general difficulty (the greater the difficulties to be surmounted, the higher the rewards to the salesman who can surmount them).

Most salesmen work as part of an organization, not as individual entrepreneurs. This is true whether they work for a manufacturer, wholesaler, retailer or as a door-to-door salesman. An organization implies management of the individuals in that organization, and the head of the sales organization or department is usually called the sales manager.

In a large manufacturing establishment this department may embrace hundreds or even thousands of individuals, and it is divided and subdivided by geographical divisions, by products sold, by type of prospects called on, or by the functions performed by the salesmen. Over each division of the organization is placed a minor sales manager responsible for sales in his jurisdiction and responsible to the man immediately above him in the chain of command.

The management of a sales organization is subject to the same principles that govern management anywhere. Management is management, but the methods used by the sales manager will vary with the manager himself and with the type of salesmen under him. Here are the same extremes as those seen in the political world—the extreme of dictatorship on the one hand and, on the other, a considerable degree of democracy marked by a two-way flow of ideas between the sales manager and salesmen and by a large amount of self-management exercised by the salesmen. The higher the type of salesman involved, the greater the degree of self-government granted him; the lower type of salesman requires more detailed supervision.

The sales manager gives careful attention to such problems as analysis of the market, estimating potential sales, fixing quotas for each territory and salesman, analysis of the product sold, determination of marketing policies, selection of salesmen, their training, assignment to proper duties, their supervision in the field, analysis of their jobs, methods of compensation, stimulation to optimum effort, adequate reports from salesmen, conferences with individual salesmen or with groups varying in size up to a general convention, pensions and retirement programs, and dealings with unions in which his salesmen may hold membership.

In selecting new salesmen the sales manager employs personal interviews, credentials and references, and various psychological tests to determine aptitudes, attitudes and pertinent personality traits. Such tests may forecast with accuracy the testee's probable success, but they have not supplanted the judgment of the manager, based on personal appraisal of the applicant.

After the new salesman is hired, he is usually put through a course of training that may vary from a few days to a couple of years in length, depending on the complexity of the product or service to be sold and on the difficulties in selling it. This training may be accomplished through classroom instruction; trips through or actual work in the factory; accompanying experienced salesmen and watching them operate; coaching in the field by persons trained for such work; or correspondence courses in which the young salesman must study printed lessons and pass examinations on them. Careful training greatly increases the productivity of salesmen.

Assignment of salesmen to various duties is based on an analysis of the jobs to determine precisely each salesman's duties. A proper job analysis enables the sales manager to choose for each job a man who, as nearly as possible, will fit that job. The result is happier, more efficient salesmen, and a lower rate of turnover.

in the sales force

Most salesmen, like other workers, require some supervision. This may be done in large organizations by men whose status is similar to that of factory foremen, each of whom supervises the work of a group of salesmen. In retail stores the department head or proprietor does this.

Salesmen are paid in a wide variety of ways ranging from a straight time wage or salary to a straight commission on volume of sales. In choosing or devising a method of compensation the sales manager seeks one that will accomplish these objectives: attract the type of salesman he wants, keep him working happily, pay him for doing what the sales manager wants him to do, offer him an incentive to put forth his best efforts, and not be too complicated to understand or too costly to operate. The time wage gives the sales manager the greatest degree of control, the commission offers the strongest selling incentive to the salesman. A combination is often worked out to afford the salesman some feeling of security based on a fixed salary or drawing account on which he can depend even when his sales fall below normal. To this may be added payments or bonuses based on volume of sales, number of new customers, collections made by salesmen, opening of new accounts, etc. Some companies have tried profit-sharing plans for paying their salesmen, but these are hard to compute and the salesman is likely to feel that profits depend too much on others' efforts. Above all, any system of compensation must appeal to the salesman as being equitable.

To stimulate salesmen to greater effort, resort may be had to contests, with attractive prizes for the winning salesmen. Bulletins and house organs are also used to develop and maintain enthusiasm. Salesmen are usually expected to make daily reports on their activities, these reports being used by the sales manager as a basis for determining policies and helping the salesmen who need help.

Unions among salesmen are relatively rare in the United States, although in some fields the movement had made progress by mid-20th century. Pensions likewise gained in popularity, although many salesmen feel quite competent to make their own provisions against old age.

In learning to be a salesman, a person must master three areas of knowledge. He must learn all he can about the product or service he is to sell; he must study himself and strive to develop a good selling personality; and he must study prospective buyers or prospects so that he may learn what objectives each is seeking and what desires each is trying to satisfy. Only when he has learned this can the salesman intelligently and helpfully demonstrate how his proposition will meet those needs.

The salesman thus becomes a practical psychologist, specializing in motivation. He learns to recognize such buying motives as greed, the urge to feel important, love of family, physical comfort or pleasure, knowledge, imitation, romance, health, caution, love of beauty, and the desire for security. He adapts his presentation to the individual prospect, making it appeal to whichever buying motives dominate that prospect at that time.

To make a sale, the salesman must carry the prospect through five mental stages, viz., attention to the salesman and his proposition, interest in that proposition, desire to possess it, confidence that it will be as represented by the salesman, and finally, action or the decision to buy.

To accomplish this, the salesman himself must often take certain definite steps. The first may be to locate his prospect, a task of vital importance to many specialty salesmen, although one seldom performed by the store salesman. To discover logical prospects the salesman functions as a detective, utilizing many sources of information.

His next step is termed the preapproach or the gathering of information about the prospect—information pertinent to his task. This will include, among other items, the question of which buying motives are most likely to appeal to the prospect; but it embraces also such matters as ability to buy, actual need for the proposition, hobbies, preferences and prejudices in many lines. The preapproach continues even after the salesman and prospect face each other.

Perhaps the next step is the winning of the interview or a chance to tell his story—sometimes a challenging sales project in itself.

Then comes the actual demonstration of his proposition, which is a dual task—to awaken in the prospect's mind a feeling of need and to show how the salesman's proposition meets that need. He utilizes logical reasoning and emotional appeals, usually relying more heavily on the latter; he listens attentively at proper times and displays tact in other ways; he avoids argument; he speaks the prospect's language; he dramatizes his points; he follows a more or less standardized sales talk to insure its completeness and effectiveness; he treats competition firmly but fairly; he meets a variety of objections and questions raised by the prospect, being careful to give them due weight and to avoid becoming involved in a debate; he takes the prospect through the successive mental stages of buying, making certain that he has taken each step before urging him to take the next one.

Finally, the salesman attempts to gain the buying decision or to close the sale. If he is a skilled salesman he has injected into his canvass a number of intimations that the prospect has decided to buy, such suggestions being known as "trial closes." The prospect's reaction informs the salesman as to whether he can safely proceed with the real closing effort. Also, he watches the prospect closely to detect signs of rising interest.

In closing, most salesmen use such proved techniques as obtaining a series of affirmative replies to various questions that lead or add up to the final decision; getting a decision on a minor point as size of order, date of delivery, terms, or colour desired; summarizing the talking points previously made; simply asking for the order. He strives to avoid creating an atmosphere of tension. Rather, he seeks to convey the impression that consummating a sale is nothing out of the ordinary for either buyer or salesman. He makes the final decision seem like merely one more in a series of decisions.

After he obtains the order, the salesman strives to take his departure with dignity and poise, leaving the door open for future sales. And finally, he will follow through on the sale to assure himself that the buyer is thoroughly pleased with his purchase. The truly professional salesman always remembers that his ultimate success depends upon the service he renders the buyer.

SALES TAX. The term "sales tax" ordinarily refers to the general sales tax, which is a levy on the sale of a wide variety of goods and services. Although some writers use the term to refer also to taxes on the sale of particular commodities, these taxes are more commonly called selective sales taxes or excises.

There are several varieties of general sales taxes. Some apply to the sale of a commodity each time it changes hands; these are commonly called turnover, or transactions, taxes. Sales taxes of the single-stage type apply to the sale of a commodity only once as it passes through production and distribution channels and into the hands of consumers.

The single-stage sales tax may take one of three possible forms, depending upon the level of production or distribution at which it is levied. A manufacturers' sales tax, such as that employed in Canada, applies to sales by manufacturers, except sales of materials and parts for use in the further manufacturing of other articles. A wholesale sales tax, as levied by Australia, applies to sales of finished articles to retailers. The retail sales tax, in wide use by the states in the United States, generally applies to sales of finished products at retail.

The sales tax, in its more rudimentary forms, is an old tax. Sales of specific commodities, as well as of commodities in general, were taxed in ancient and medieval times. The general sales tax became an important element in national revenue systems in

the difficult period immediately following World War I. Most of the European nations, with the notable exception of Great Britain, adopted the sales tax during the years 1919-23. Canada also enacted a sales tax during this period. Subsequently some of the leading South American countries incorporated the sales tax into their revenue systems. Australia introduced its sales tax in 1930 primarily as a source of revenue to offset declines in customs receipts caused by the depression. The British Purchase tax, levied at the wholesale level, was enacted in 1940 as a World War II fiscal measure.

The federal government in the United States has never imposed a general sales tax although congress at various times of fiscal emergency has given consideration to such a tax. The sales tax movement in the United States has been associated primarily with the fiscal difficulties of the states arising out of the depression. Thirty-one of the 48 states have employed general sales taxes, but at the end of the year 1944 only 23 of the laws were in effect. A few cities of the United States, the most important of which are New York and New Orleans, impose general sales taxes.

Appraisal of the sales tax as a fiscal measure raises many controversial issues. Those who favour it emphasize primarily the revenue-producing possibilities and ease of payment of the tax. Those who oppose it do so chiefly on the ground that it is regressive, that is, that the smaller an individual's income, the larger the proportion he spends on taxed articles and, hence, the heavier his burden in relation to his income. Exemption of so-called necessities for purposes of reducing regressivity of the sales tax has been found to decrease its yield significantly and to raise difficult administrative problems.

SALEYER (Dutch, *Salejar*), a group of 73 islands belonging to the government of Celebes and its dependencies in the Netherlands Indies. They include Saleyer, Tambalangan, Pulasi and Bahuluwung; between 5° 36' and 2° 25' S. and 119° 30' and 121° 30' E. The main island, Saleyer, is more than 50 mi long and 8 mi. at its widest point; area, 248 sq.mi. The strata of the island are all sedimentary rocks; everywhere, except in the north and northwest, covered by a fertile soil. The watershed is a chain running throughout the island from north to south. The population, in 1930, mainly a mixture of Macassars, Buginese and natives of Luwu and Buton, was 76,501, Saleyer being one of the most thickly populated parts of the division of Celebes. Trepan, tortoise shell, copra, coconut oil and salt are exported.

Conquered by Japan in 1942, the islands were surrendered to Australia Sept 1945.

SALFORD, city; municipal, county and parliamentary borough, Lancashire, England; 189 mi. N.W. of London Pop (1938) 199,400. Area, county borough, 8.1 sq.mi. Salford also gives its name to the hundred of southwest Lancashire in which Manchester is situated. The parliamentary and municipal boundaries of Salford are identical. The parliamentary borough returns three members. The borough, composed of three townships identical with the ancient manors of Salford, Pendleton and Broughton, is for the most part separated from Manchester by the river Irwell. The Irwell valley, largely occupied by factories, separates the higher ground of Broughton from that of Pendleton. The main railway station is Exchange station, on the London Midland Region railway route, which is in Salford, but has its main approach in Manchester. Salford is well served with canals, chiefly the Manchester ship canal. Salford has been to some extent overshadowed by Manchester, and the two boroughs, in spite of their separate government, are so closely connected as to be one great urban area. Broughton and Pendleton have each a separate town hall.

Salford is the seat of extensive cotton, iron, chemical and allied

industries, large engineering and electrical instrument factories as well as works for the manufacture of furniture, rubber goods, mackintoshes, etc. Salford forms part of the port of Manchester and the largest docks on the Manchester ship canal are in Salford. It contains a number of valuable coal mines and the deepest workings in Britain are at Pendleton. Salford was not incorporated until 1844, when it became a county borough. It was raised to the status of city in 1926.

Within the present borough areas there have been found neolithic implements and British urns, as well as Roman coins. In 1851 traces of a Roman road were still visible.

Domesday Book mentions Salford as held by Edward the Confessor and as having a forest three leagues long and the same broad. At the Conquest it was part of the domain granted to Roger of Poitou, but it reverted to the crown in 1102.

After successively belonging to the earls of Chester and of Derby, it passed to Edward Crouchback, earl of Lancaster. It was erected into a duchy and county palatine in 1353, and when the house of Lancaster succeeded to the throne their Lancashire possessions were kept separate. Salford and Pendleton remained part of the ancient duchy of Lancaster, belonging to the English crown.

In 1331 Ranulf de Blundeville, earl of Chester, granted a charter constituting Salford a "free borough." But the government notwithstanding was essentially manorial and not municipal.

In the civil wars between Charles I and parliament, Salford was royalist, and the unsuccessful siege of Manchester was conducted from its side of the Irwell.

Its later history is mainly identical with the history of Manchester (*q.v.*).

SALICACEAE, a family of dioecious trees or shrubs consisting of two genera, the flowers borne in characteristic catkins. The family is essentially characteristic of the north temperate zone of both hemispheres, but *Salix* also extends into the arctic and tropical regions. *Populus*, known as poplar (*q.v.*), conservatively estimated to have about 18 species in 1900, had more than 100 additional species proposed in the succeeding half century. *Salix*, known as willow (*q.v.*), has in excess of 3,000 described species, but many of these are probably only forms or varieties and others are hybrids. (See also *OSTER*) (E. D. Mf.).

SALICETI, ANTOINE CHRISTOPHE (1757-1806), French revolutionary, was born at Saliceto, Corsica, on Aug. 26, 1757. He was elected to the states general in 1789, and later to the convention. He was sent on a mission to repress counter-revolutionary plots in Corsica and Provence. His friendship with Robespierre led to his denunciation on the 9th Thermidor, but he was saved by the amnesty of the year IV. He organized the army of Italy and held various offices under the consulate and the empire. He died at Naples on Dec. 23, 1809.

SALICIN, SALICINURX, the bitter principle of willowbark, $C_{12}H_{18}O_8$, found in most species of *Salix* and *Populus*.

Salicin is prepared from a decoction of the bark by first precipitating the tannin by milk of lime, then evaporating the filtrate to a soft extract and dissolving out the salicin by alcohol. As met with in commerce it is usually in the form of glossy white scales or needles. It is neutral, bitter, odourless, unaltered by exposure to the air, soluble in about 30 parts of water and 80 parts of alcohol at the ordinary temperature, and in 0.7 of boiling water or in 2 parts of boiling alcohol, and more freely in alkaline liquids. It is also soluble in acetic acid without alteration, but is insoluble in chloroform and benzol. Salicin is used in medicine for the same purposes as salicylic acid (*q.v.*), but is much less effective.

SALIC LAW and Other Frankish Laws. The Salic law is one of those early mediaeval Frankish laws which, with other early Germanic laws, are known collectively as *leges germanorum*. It originated with the Salian Franks. The Salic law has come down to us in numerous mss. and divers forms. The most ancient form, represented by Latin ms. no. 4404 in the Bibliothèque Nationale, consists of 65 chapters. The second form has the same 65 chapters, but contains interpolated provisions. The third text consists of 99 chapters. The fourth version, as amended by Charlemagne, consists of 70 chapters with the Latinity corrected

and without the glosses. The last version, published by B. J. Herold at Basel in 1557 is founded on the second recension.

The law is a compilation, the various chapters were composed at different periods, and we do not possess the original form of the compilation. Even the most ancient text, that in 65 chapters, contains passages which a comparison with the later texts shows to be interpolations. The scale of judicial fines is given in the *denarius* ("which makes so many *solidi*"), and it is known that the monetary system of the *solidus* did not appear until the Merovingian period. Even in its earliest form the law contains no trace of paganism—a significant fact when we consider how closely law and religion are related in their origins. The Romans are clearly indicated in the law as subjects, but as not yet forming part of the army, which consists solely of the *antrustions*, i.e., Frankish warriors of the king's bodyguard. As yet the law is not impregnated with the Christian spirit; this absence of both Christian and Pagan elements is due to the fact that many of the Franks were still heathens, although their king had been converted to Christianity. (For contrary opinion see Franz Beyerle in the *Zeitschrift der Savigny-Stiftung*, xlv, 216 seq.) Christian enactments were introduced gradually into the later versions. Finally, we find capitularies of the kings immediately following Clovis being gradually incorporated in the text of the law—e.g., the *Pactum pro tenore pacis* of Childebert I and Clotaire I (511–558), and the *Edictum Chilperici* (561–584), chapter iii of which cites and emends the *Salic law*.

The law as originally compiled underwent modifications of varying importance before it took the form known to us in Latin ms. No. 4404, to which the edict of Childebert I and Clotaire I is already appended. Finally, Charlemagne, who took a keen interest in the ancient documents, had the law emended, the operation consisting in eliminating the Malberg glosses, which were no longer intelligible, correcting the Latin of the ancient text, omitting a certain number of interpolated chapters, and adding others which had obtained general sanction.

The *Salic law* is not a political law; it is in no way concerned with the succession to the throne of France, and it is absolutely false to suppose that it was the *Salic law* that was invoked in 1316 and 1322 to exclude the daughters of Louis X and Philip V from the succession to the throne. The *Salic law* is pre-eminently a penal code, which shows the amount of fines for various offenses and crimes, and contains, besides, some civil law enactments, such as the famous chapter on succession to private property (de *alode*), which declares that daughters cannot inherit land.

Of the numerous editions of the *Salic law* only the principal ones can be mentioned: J. M. Pardessus, *Loi salique* (Paris, 1843), 8 texts, A. Holder, *Lex Salica* (1879 seq.), reproductions of all the mss. with all the abbreviations; H. Gelfken, *Lex Salica* (Leipzig, 1898), the text in 65 chapters, with commentary paragraph by paragraph, and appendix of *addimenta*; and the edition undertaken by Bruno Krusch for the *Mon. Germ. hist.* For further information see E. Mayer-Homburg, *Die fränkischen Volksrechte und das Reichsrecht* (1912); Cl. v. Schwerin, in the *Neues Archiv*, xl, 581 seq.; Bruno Krusch, in the *Neues Archiv*, xl, 497 seq., and in the *Nachrichten der Gesellschaft der Wissenschaften zu Göttingen* (1916), 683 seq.; E. Heymann and others, in the *Neues Archiv*, xli, 375 seq., 419 seq.; Franz Beyerle, in the *Zeitschrift der Savigny-Stiftung*, xlv, 216 seq.

The *Lex Ripuaria* was the law of the Riparian Franks, whose centre was Cologne. We have no ancient mss. of the law of the Riparians; the 35 mss. we possess, as well as those now lost which served as the basis of the old editions, do not go back beyond the time of Charlemagne.

On analysis, the law of the Riparians, which contains 89 chapters, falls into three heterogeneous divisions. Chapters i–xxviii consist of a scale of compositions; but, although the fines are calculated, not on the unit of 15 *solidi*, as in the *Salic law*, but on that of 28 *solidi*, it is clear that this part is already influenced by the *Salic law*. Chapters xxx–lvi are taken directly from the *Salic law*; the provisions follow the same arrangement; the unit of the compositions is 15 *solidi*; but capitularies are interpolated relating to the enfranchisement and sale of immovable property. Chapters lvi–lxxxix consist of provisions of various kinds, some taken from lost capitularies and from the *Salic law*, and others of unknown origin.

There is an edition of the text of the Riparian law in *Mon. Germ. hist. Leges* (1883), v. 185 seq. by R. Sohm, who also brought out a separate edition in 1885 for the use of schools. For further information see the prefaces to Sohm's editions; H. Brunner, *Deutsche Rechtsgeschichte* (2nd ed., Leipzig, 1906), I, 442; Bruno Krusch, *Die Lex Bajuvariorum, mit zwei Anhängen: Lex Alamannorum und Lex*

Ribuaria (1924) 333 seq. and *Neue Forschungen über die drei oberdeutschen Leges: Bajuvariorum, Alamannorum, Ribuaria* (1927) 141 seq.; Franz Beyerle, in the *Zeitschrift der Savigny-Stiftung*, xlviii, 264 seq.

Lastly, we possess a judicial text in 42 paragraphs, which bears the title of *Notitia vel commemoratio de illa ewa (law), quae se ad Amorem habet*. This was in use in the district along the Yssel formerly called Hamaland. The name Hamaland is unquestionably derived from the Frankish tribe of the Chamavi, and the document is often called *Lex Francorum Chamavorum*.

There is an edition of this text by R. Sohm in *Mon. Germ. hist. Leges*, v. 269, and another appended to the same writer's school edition of the *Lex Ribuaria*. Also Fustel de Coulanges, *Nouvelles Recherches sur quelques problèmes d'histoire* (1891).

(C. F. K. A. Eck.)

SALICYLIC ACID, employed in many medicinal preparations and in food preservation because of its powerful antiseptic properties, is *ortho*-hydroxybenzoic acid, $\text{HO.C}_6\text{H}_4.\text{CO}_2\text{H}$. It also finds considerable use in the manufacture of dyestuffs. (See DYES, SYNTHETIC.) It crystallizes from hot water in prismatic needles melting at $156^\circ\text{--}159^\circ\text{C}$, and when carefully heated it sublimes without decomposition, this sublimation being sometimes applied as a method of purification. Salicylic acid and salicylaldehyde occur in the oils from various species of *Spiraea*, whereas methyl salicylate, a colourless oil boiling at 222°C , is the main constituent of oil of wintergreen from *Gaultheria procumbens* and *G. fragrantissima*. Salicylic acid was first obtained by R. Piria (1838) on treating salicylaldehyde with potassium hydroxide and until 1874 was mainly obtained by the hydrolysis of methyl salicylate.

It is now manufactured from phenol (*q.v.*) by processes based on H. Kolbe's celebrated synthesis of the acid discovered in 1859, and on R. Schmidt's improvement whereby sodium phenoxide (or phenolate), $\text{C}_6\text{H}_5\text{ONa}$, is converted into sodium phenylcarbonate, $\text{C}_6\text{H}_5\text{O.CO}_2\text{Na}$, and the latter salt heated under pressure until transformed completely into sodium salicylate, $\text{HO.C}_6\text{H}_4.\text{CO}_2\text{Na}$.

Preparation.—Pure phenol is converted by concentrated aqueous sodium hydroxide into sodium phenoxide and this salt is dried carefully and pulverized in a strong steel vessel (autoclave) capable of withstanding considerable pressure. The anhydrous sodium phenoxide powder is then saturated under pressure (200 lb. per square inch) with carbon dioxide and heated in the autoclave at $120^\circ\text{--}140^\circ\text{C}$. The resulting sodium salicylate is dissolved in water, decolorized with stannous salts or with zinc and charcoal and then acidified with mineral acid, when salicylic acid is precipitated, collected and washed with cold water.

For dye making, the precipitated acid is sufficiently pure, but for preservative and medicinal purposes further purification is effected either by distillation in superheated steam or by sublimation.

Since salicylic acid is 35 times more soluble in hot than in cold water (100 parts of water at 15°C . dissolve 0.225 part of salicylic acid), it may be readily crystallized from this solvent or from alcohol in which it dissolves more freely (1 part in 2.5 parts of 90% alcohol).

Salicylic acid in aqueous solution develops a violet coloration with ferric chloride, and with bromine water it gives tribromophenol bromide, $\text{C}_6\text{H}_2\text{Br}_3\text{OBr}$. Sodium in boiling methyl alcohol reduces it to *n*-pimelic acid, $\text{CO}_2\text{H}(\text{CH}_2)_4\text{CO}_2\text{H}$. When heated at $195^\circ\text{--}220^\circ\text{C}$, it decomposes, yielding phenol and carbon dioxide, but also giving phenyl salicylate, $\text{HO.C}_6\text{H}_4.\text{CO}_2\text{C}_6\text{H}_5$ (salo). This drug, also prepared by the action at 125°C . of phosphorus oxychloride or carbonyl chloride on a mixture of sodium phenoxide and salicylate, crystallizes from alcohol in rhombic plates melting at 42°C . and it boils at $173^\circ\text{C}/12\text{ mm}$. Acetylsalicylic acid (see ASPIRIN), prepared by the action of acetyl chloride on salicylic acid or its sodium salt, crystallizes in colourless needles and melts at 132°C . (with decomposition).

Applications of Salicylic Acid and Salicylates.—Salicylic acid has a strong inhibitory influence on the growth of microorganisms, and retards the action of unorganized ferments and of the ferments of alcoholic and acetic fermentations. It has a widespread employment as a preservative of foods and beverages in concentrations of 0.5–6 parts per 1,000. It is thus used in

jams and other fruit preparations, in glues and albuminoid substances, and also in milk, beer and wine. The use of salicylic acid as a food preservative was, however, condemned by a commission of the U.S. government in 1904.

Applied externally as an antiseptic and antipruritic to wounds and parasitic skin diseases, salicylic acid is less irritating than phenol, but may in strong solution have a destructive action on the horny layer of the epidermis. It is employed to remove corns and warts and in the treatment of lupus. It is a constituent of dental preparations and mouth washes.

For internal use, salicylic acid has been almost completely replaced by its sodium salt (sodii salicylas, official dose 0.6 to 2.09 g.) and its acetyl derivative (aspirin), which are less irritant to the mucous membrane of the stomach.

Methyl salicylate is now made synthetically from salicylic acid and methyl alcohol. It is used as a flavour for foods, beverages, tooth paste, etc.

Salicylic acid is the basis of numerous drugs and therapeutic agents, and in addition to the above-mentioned there are also salipyrin, salophen, diuretin and many others.

The greater proportion of salicylic acid is, however, employed in the manufacture of such azo-dyes as alizarin yellow (khaki yellow), chrysamine, anthracene brown, cloth brown, cotton yellow, diamine yellow N, anthracene yellow, etc. Large quantities serve for the preparation of 5-aminosalicylic acid which is an intermediate in the production of the important wool dye, diamond black.

SALIDA, a city of Chaffee county, Colo., U.S., on the Arkansas river, federal highways 50 and 285, and the Rio Grande railroad, 140 mi. S.W. of Denver. The population was 4,516 in 1950 and was 4,969 in 1940 by federal census.

The city lies at an altitude of 7,050 ft. in a basin almost surrounded by mountains rising to heights of more than 14,000 ft. It is headquarters for the San Isabel National forest. There is some granite quarried in the county, and a granite shed is in Salida, where there are also repair shops for the railroad, a creosoting plant, a coal-screening plant, large stockyards and a large rainbow trout commercial fish hatchery.

Salida (so-called because the city stands at the outlet of the upper Arkansas basin) was settled and incorporated in 1880, when the Rio Grande railroad began service to the community.

SALIERI, ANTONIO (1750-1825), Italian composer, was born at Legnano, It., on Aug. 19, 1750. In 1766 he was taken to Vienna, Aus., by F. L. Gassmann, who introduced him to the emperor Joseph. His first opera, *Le Donne letterate*, was produced at the Burg-Theater in 1770. Others followed in rapid succession, and his *Armida* (1771) was a triumphal success. On Gassmann's death in 1774, he became Kapellmeister and, on the death of Bonno in 1788, Hofkapellmeister. He held his offices for 50 years, though he made frequent visits to Italy and Paris, and composed music for many European theatres. His chief d'oeuvre was *Tarare*, later called *Azar, re d'Ormus* (1787), a work which was preferred by the Viennese public to Wolfgang Mozart's *Don Giovanni*. His last opera was *Die Neger*, produced in 1804. After this he devoted himself to the composition of church music, for which he had a very decided talent. Salieri lived on friendly terms with F. J. Haydn, but was a bitter enemy to Mozart, though the wild suggestion that he actually poisoned him (albeit made the basis of Nicolas Rimsky-Korsakov's *Mosart und Salieri*) has long been scouted. He retired from office on his full salary in 1824, and died at Vienna on May 7, 1825.

Salieri gave lessons in composition to M. Cherubini and to Ludwig van Beethoven, who dedicated to him his three sonatas for pianoforte and violin, op. 12.

See also Albert von Hermann, *Antonio Salieri, eine Studie* (1897); J. F. Eder von Mosel, *Über das Leben und die Werke des Antonio Salieri* (Vienna, 1827).

SALII ("dancers"). An ancient priesthood at Rome, consist-

ing of two colleges, each of 12 members, the Salii Palatini and the Salii Collini or Agonenses, connected respectively with the worship of Mars on the Palatine and the Quirinus on the *collis Quirinalis*. They wore armour of an ancient pattern, probably the old war dress of the Italians, and in particular, carried shields called *ancilia*, shaped somewhat like the figure 8. These they carried in procession on certain days of the year, in March (Mars's month) and October (end of the campaigning season under early conditions), singing a very ancient hymn or hymns (*axamenta*, in honour of all the gods, and separate hymns to single deities, called by their names). They were assisted by women similarly dressed and called *saliae virginis*; these were hired for the occasion in historical times. The whole performance was accompanied with dancing.

All this suggests a war dance, and can easily be paralleled from the customs of uncivilized peoples. But the matter is complicated by a statement of Johannes Lydus, a late and untrustworthy author, that on March 15 a man clad in goatskins and called Mamurius was driven out with rods. This person Lydus identifies with Mamurius Veturius, said to have been the smith who made the *ancilia* after a pattern fallen from heaven. (See Joannes Lydus, *De Mensibus*, p. 105, 19 Wünsch.) But the name may mean "old Mars," hence it has been plausibly conjectured that the ritual is at least in part connected with vegetation, the "old Mars" or worn-out spirit of fertility being yearly driven away. As, however, we have no proof that the Salii were connected with this ceremony, it is open to us to suppose, with Georg Wissowa, that it is a mere coincidence of date, and that the name of the skin-clad figure was a popular one only, made up from the unintelligible words *mamuri veturi* in the Saliar hymn.

The balance of evidence certainly is in favour of supposing the ritual of the Salii to have been purely war magic, in its origin at least. There were also Salii at Tibur, of whom nothing is known (Servius on *Aen.* viii, 285).

SALINA, a city near the centre of Kansas, U.S., on the Smoky Hill river and federal highways 40 and 81; the county seat of Saline county. It is served by the Missouri Pacific, the Rock Island, the Santa Fe and the Union Pacific railways. Pop. (1950) 26,141; 21,073 in 1940 by the federal census. It is the seat of Kansas Wesleyan university (Methodist Episcopal; established 1886) and Marymount college (Catholic, for girls).

The city operates under a commission-manager form of government. It has a city plan, zoning regulations, parks, a municipal band and swimming pool, and an assessed valuation (1950) of \$32,500,000.

Salina has a large wholesale and retail trade and varied manufactures. The annual volume of wholesale and retail trade is about \$100,000,000. Flour milling is the chief industry. The city was founded in 1858 and chartered in 1870. The first railway (the Union Pacific) came through in 1867. The first flour mill (still in operation and using the original water turbines) was built in 1868.

SALINA CRUZ, southernmost port of Mexico on the Pacific coast in the state of Oaxaca at the southern terminus of the transisthmian railway across Tehuantepec. The population in 1940 was 4,614. In the north-western part of the bay, Salina Cruz lies at the mouth of the Tehuantepec river, and is divided into a free port and a fiscal port. Opened for business in 1907, its costly artificial harbour decayed and silted after the opening of the Panama Canal cut off its traffic. It was reopened in 1936 after extensive dredging.

Lying in a hot, semiarid area, Salina Cruz is chiefly a transshipment point for petroleum products from Minatitlan on the north to supply the western parts of Mexico. It also exports coffee from Chiapas to the United States. (Hb.-C.)

SALINAS, a city of western California, U.S., 9 mi. from Monterey bay, in the Salinas River valley, between the Gabilan and the Santa Lucia mountains; the county seat of Monterey

county. It is on federal highway 101 and is served by the Southern Pacific railway. Pop. 13,895 in 1930 and 11,586 in 1940 by federal census. The Salinas valley is one of the richest agricultural regions in the United States, producing especially lettuce, broccoli, celery, artichokes, sugar beets, dry beans, bulbs and seeds.

The California rodeo is held there annually. Four miles from Salinas is Ft. Ord. Salinas was settled in 1858; became the county seat in 1872, in place of Monterey; and was incorporated as a city in 1874.

SALISBURY, JAMES EDWARD HUBERT GASCOYNE-CECIL, 4TH MARQUESS OF (1861-1947), British politician, eldest son of the 3rd marquis (see SALISBURY, ROBERT A. T. G.-C.), was educated at Eton and University college, Oxford. He entered parliament in 1885 and succeeded to the peerage in 1903. He served in the South African War, and on his return entered the ministry, joining the cabinet in 1903. In the crisis over the Parliament bill he threw in his lot with the "Die-hards." He did not join either coalition government during World War I, but was critical of both, taking an independent line. He gradually came to assume the informal leadership of the conservative opposition first in the house of lords and afterward in the party generally. In a speech on Oct. 16, 1922, he categorically demanded the freedom of the party. Three days later the policy was accepted at the Carlton Club meeting. He was lord president in the council in Bonar Law's cabinet and in Stanley Baldwin's first cabinet. In Baldwin's second cabinet he was lord privy seal, and from Curzon's death in 1925 until 1929 was leader of the house of lords. He was created K.G. in 1927. He died on April 4, 1947.

SALISBURY, ROBERT ARTHUR TALBOT GASCOYNE-CECIL, 3RD MARQUESS OF (1830-1903), British statesman, second son of James, and marquis, by his first wife, Frances Mary Gascoyne, was born at Hatfield on Feb. 3, 1830. Lord Robert Cecil, as he then was, was educated at Eton and Christ Church, Oxford. His health was delicate and after leaving Oxford, he spent nearly two years at sea on a voyage round the world, visiting Cape Colony, Australia, Tasmania and New Zealand. On his return home he stood for parliament and on Aug. 22, 1853, was returned unopposed as member for the borough of Stamford in Lincolnshire. In the same year he was elected to a fellowship of All Souls.

He married in July 1857, the eldest daughter of Sir Edward Hall Alderson, Baron of the Court of Exchequer, a man of notable parts who at Cambridge had earned the rare distinction of being both Senior Wrangler, Senior Classic and Smith's prizeman. His daughter inherited his abilities but there was very little money, and to add to his income Lord Robert joined the staff of the *Saturday Review* which had been lately founded by his brother-in-law, Mr. Alexander Beresford-Hope, this being, so far as is known, his only contribution to pure journalism. Most of his writing was done for the *Quarterly Review*, whose articles were then exclusively anonymous. The literary quality and vigorous lucidity of his style secured him a welcome in its pages, and of the 24 numbers which appeared between the years 1860 and 1866 there were only three which did not contain an article from his pen. Six of these have since been republished in volume form—three of them biographical essays on Pitt and Castlereagh and three dealing with foreign questions. These were uncompromisingly denunciatory of Lord John Russell's policy and to the study required for an effective presentation of his case may probably be traced his first knowledge of and interest in foreign affairs.

In the House of Commons.—Speeches on the same subjects, and notably one or two in 1864 on the abandonment of Denmark at the time of Germany's annexation of Schleswig-Holstein, placed him for the first time by general consent in the front rank of parliamentary debaters. When Lord Russell's Government was defeated over Mr. Gladstone's Reform bill in 1866, it was a foregone conclusion that he should be among those invited to join Lord Derby's cabinet. His eldest brother had died in 1865 and it was as Lord Cranborne that, in July 1866, he took office as secretary of State for India.

He only held it for seven months. The story of that ministry

is well known. In the summer of 1866 the Tory party, assisted by a secession of anti-democratic Liberals, defeated Mr. Gladstone's Reform bill as tending dangerously in the direction of household suffrage. In the summer of 1867, the same party passed a Reform bill which established household suffrage. Lord Cranborne, with two other members of the Cabinet, Lord Carnarvon and General Peel, resigned on Feb. 9, two days before the bill's introduction. The breach was embittered by the tactics which the two leaders employed towards their junior colleagues. They kept them in the dark till within a week or two of the bill's production; offered reassurance in the shape of counter-checks and limitations which were changed with every meeting of the cabinet—and were in fact all abandoned in the course of the bill's passage through parliament—and allowed them no opportunity for considered argument. Their belief that there had been a deliberate attempt to hustle them into a consent which it was known that they would not have given freely, estranged them personally from Disraeli for many years afterwards. When the parliamentary fight was over Lord Cranborne accepted the constitutional change as an accomplished fact which it behoved every good citizen to make the best of, and it was the offence against public morality of which he held his party and its leaders to have been guilty that became the theme of an article called "The Conservative Surrender" which appeared that October in the *Quarterly Review*. Its quality and its easily divined authorship procured it a sensational reception. Seven editions of the number which contained it had to be issued in order to meet the demand for it.

On April 12, 1868, his father died and his House of Commons career came to an end. During the six years which followed (1868-1874), Lord Salisbury joined actively from below the gangway in the warfare which his late colleagues waged against Mr. Gladstone's legislation. In 1870 he was chosen chancellor of Oxford university in succession to Lord Derby,—an indication of the reputation which his attitude in '67 had won for him among the more serious representatives of the party outside Parliament. It was a distinction which he always peculiarly prized. When, after the defeat of the Liberals in 1874, Disraeli undertook the formation of his second ministry, almost his first step was to invite the return of this alienated colleague. Under actual conditions there could be no risk of a repetition of his earlier experience, and after a few days of painful hesitation, he accepted. On Feb. 17 he resumed control of the Government of India where a disastrous famine claimed all his energies. By a curious chance a similar visitation had synchronised with his previous brief tenure of office, and he had left behind him a high reputation for success in dealing with it.

The first two years of this ministry were uneventful—except in connection with an ecclesiastical measure—the Public Worship Act, introduced in 1874 by Archbishop Tait. Lord Salisbury and his chief took opposite sides upon it, and the momentary clashing of their swords in debate excited some quite unfounded anticipations of ministerial rupture. But in 1876 a crisis arose in the southeast of Europe, one of whose incidental results was to fix permanently Lord Salisbury's destiny in public life.

The Eastern Question.—Two or three of the European provinces of the Turkish Empire had revolted against its misgovernment; there had been a voluminous interchange of notes and protocols among the signatory Powers of the Treaty of Paris; the already autonomous principality of Serbia had taken up arms in support of its co-religionists; and finally the Russian tsar had mobilised his army and declared that, if the rest of Europe did not act, he would. A conference of the Great Powers had thereupon been called to meet at Constantinople in December, to draw up a scheme of reforms and, by securing the Porte's acceptance of it, avert the threatened war.

The repercussion of these events in England had been peculiarly characterized. The insurrection in Bulgaria had been suppressed by Turkish irregular troops with incidents of great savagery. Misled by the optimism of the British embassy at Constantinople, the prime minister—now become Lord Beaconsfield—had poured scorn upon the first newspaper reports of these outrages, and in the impassioned agitation which Gladstone initiated on the

subject throughout the country, the Tory Government became an object for almost equal denunciation with the Turkish sultan. Salisbury resented the agitation, but was himself admittedly sympathetic with the cause of the insurgent Christians and had privately urged his colleagues to dissociate England once and for all from the incriminated cause of Turkish ineptitude. His views were known or divined and when Beaconsfield invited him to serve as plenipotentiary to the Constantinople Conference, the appointment helped to quiet the prevailing excitement and was received with general acclamation. At first all went smoothly at the Conference; there was no difficulty in obtaining unanimous agreement among the Christian Powers as to the reforms to be recommended. But there success stopped. The Turkish envoys rejected all proposals, and were deaf to every argument. Salisbury would have tried that of force, but his colleagues refused, and on Jan. 20, 1877, the conference broke up and Russia was left to carry out her originally proclaimed purpose.

She declared war on April 24. Throughout the remainder of that year counsels in the British cabinet were divided. The prime minister and Cairns advocated prompt intervention; Salisbury and Carnarvon opposed a resolute veto to any action which the Turks could construe into acquiescence in their defiance of Europe; and Derby, the foreign secretary, supported them with impartial loyalty. Agreement between the warring groups was obtained for a declaration of neutrality, balanced by a warning addressed to Russia that no attempt on Constantinople itself would be tolerated.

The change of issues foreshadowed in this document materialized in the new year and with it a change in cabinet grouping. The Turkish defence, at first resolute and successful, suddenly collapsed and when the Russian troops in rapid advance appeared upon the threshold of the forbidden city Lord Salisbury was foremost in urging that men-of-war should be sent up to the Bosphorus for its protection. On this decision being taken (Jan. 23), Derby and Carnarvon resigned, though the former was subsequently persuaded to withdraw his resignation.

An armistice was agreed upon and a treaty of peace, negotiated between the two belligerents, was signed at San Stefano on March 3. It provided for a huge Slav State under Russian protection stretching right across the Balkans and completely isolating Constantinople. Russia announced that at the approaching conference of the Signatory Powers required under treaty law to legalize the settlement she would admit discussion on those parts only of the new treaty which were "of European interest." The other Powers hesitated to enforce their rights but England declared that unless the treaty were submitted in its entirety she must decline to participate in the congress; Russia again refused, the summoning of the congress was indefinitely postponed, and when the British cabinet met on March 27 it was to face an imminent probability of war. They called out the Reserves and telegraphed orders for a contingent of Indian troops to be at once embarked for the Mediterranean. Lord Derby resigned the same evening and Lord Salisbury, who had taken a leading part in these decisions, was appointed foreign secretary the following day.

He signalized his accession to control by a despatch whose contents were telegraphed on April 1 to every capital and which became famous as the Salisbury Circular. Its object was to show that the Treaty of San Stefano, by reducing the Turkish Empire to vassalage, would constitute a greater menace to the interests of other Powers than would have arisen from its frank dismemberment in Russia's favour. It was by the treaty as a whole that this result would be achieved and it was as a whole therefore that it must be submitted to the judgment of Europe. This document, by the lucidity of its style and argument, the impression of resolution which it conveyed and the subtly indirect appeals which it contained to the interests or sentiments of the different neutral nations, effected an immediate revolution in the international position. Hesitation disappeared; the rest of Europe ranged itself on the side of the British contention and Russia could do no other than submit.

But danger was not over with the removal of obstacles to the

meeting of the Powers. In present conditions a failure of agreement at the Congress itself must precipitate a general war and Salisbury refused to risk that possibility. He entered into private communication with Russia and satisfied himself that the provisions which either side regarded as vital were capable of adjustment. On May 31st a secret agreement was signed between him and the Russian ambassador binding both Powers not to push dispute on these provisions to the point of rupture at the Congress. Russia's price for this adjustment was her retention of her Asiatic conquests, and to counteract the effect of these Salisbury co-incidentally arranged a convention with Turkey. Under this, in consideration of her ceding Cyprus to England and entering into an engagement of administrative reform in Asia Minor, England guaranteed her Asiatic frontier against further aggression.

These preparations having been effected, the Congress, summoned by Prince Bismarck, met at Berlin on June 13. Lord Beaconsfield and Lord Salisbury attended it, and a month later a treaty was signed there by the seven great Powers. It secured all the objects for which England had contended, and when the two plenipotentiaries returned to London Beaconsfield was able to announce that they had brought back "Peace with Honour."

In Opposition.—At the general election of 1880, the Conservative party was heavily defeated. Lord Beaconsfield died the following spring, and Lord Salisbury succeeded him as leader in the House of Lords, sharing with Sir Stafford Northcote in the leadership of the party as a whole. During this period of opposition and in the election campaign which closed it, he spoke continually on public platforms and developed gifts for attracting and holding mass meetings of working men which hitherto had had little opportunity for display.

In home affairs his attitude was distinguished alike from that of the Tory Democrats of that day and that of the more old-fashioned Toryism. He made no attempt, like the former, to clothe his views in radical or democratic phraseology, but on the other hand he was disdainful of privilege and frankly indifferent to tradition. That the confidence begotten of economic stability and respect for individual rights was of supreme importance to the class whose welfare depends on full and well-paid employment; that theorists and phrasemakers are the enemy, always and everywhere; above all, that unity and mutual trust are the indispensable foundation for all moral and all material welfare in a nation,—were the recurrent texts from which he spoke. But he demurred to the title of Conservative: "There is much . . . which it is highly undesirable to conserve." He identified himself strongly with the movement for housing reform and in speaking to a bill promoted by a Royal Commission of which he had been a member, he shocked the rigid individualists of his own and the opposite party by his warm advocacy of State expenditure in dealing with the evils of overcrowding.

In 1884 Gladstone introduced a bill for enfranchising two million agricultural voters and divorced it from the large rearrangement of seats which such an unequally distributed addition to the electorate would require. Salisbury saw in this procedure an intention of manipulating the constituencies in a party sense and invited the House of Lords to compel an appeal to the country on the question by refusing to pass one bill without the other. They did so and a tempestuous campaign of protest against their action followed. It was responded to by a similar campaign in their favour, in which Salisbury took a prominent part. The recurrent climax of his speeches was a challenge to the Government to dissolve parliament and so obtain the verdict of the electors on the issue. Through the Queen's mediation the controversy was closed by Gladstone's giving the required guarantee of impartiality in the Redistribution bill by inviting Salisbury and Sir Stafford Northcote to assist in drawing it up.

On June 8, 1885, the Liberals, disorganized by Sudanese disaster, allowed their Government to be defeated on a Budget vote and Mr. Gladstone resigned. The passage of the Franchise Act had made a dissolution impossible until the new registers were completed in November, and there were patent reasons why Salisbury, whom the Queen summoned, should refuse to take office. It would lose for his party all the advantage of attack in the

approaching elections, and it would place on it the invidious responsibility of governing Ireland without the Crimes act, whose necessity it had urged and which was due to expire that summer. But the state of affairs abroad which the Queen revealed to him decided Salisbury upon acceptance. England was at that moment without friends or authority in Europe; perennial antagonists—Russia and Austria—France and Germany—had been negotiating reconciliation at her expense; if present conditions were suffered to continue it seemed to him that any catastrophe was possible. He kissed hands as prime minister and foreign secretary on June 24.

First Ministry.—His tenure of office this time was too short for the testing of any policy, but he achieved one sensational success. That September, the southern Bulgarians, who had been left under Turkish rule by the Treaty of Berlin, revolted and proclaimed union with their northern brethren. These and their Prince, Alexander of Battenberg, had in the intervening seven years quarrelled hopelessly with their Russian patron and Russia was now foremost in vindication of the treaty and insistence upon an immediate reversal of the achieved union. A conference of the Powers was called and the rest of the Continent rallied to the Russian demand. Salisbury alone refused. Now that the union had become an accomplished fact, he declared, the Bulgarians would never willingly surrender it and to force surrender, as the Imperial Governments proposed, by means of a Turkish military "execution," was unthinkable. For weeks he was argued with, pressed, obfuscated for stultifying the united authority of Europe. He refused to give in and on Nov. 25 the conference broke up. Meanwhile Serbia, outraged at the accretion of territory illicitly secured by her neighbour, had invaded Bulgaria. Her unexpected and crushing defeat by Prince Alexander converted the great Powers to a depressed recognition of the facts upon which Salisbury had insisted. In December he was appealed to for help in discovering some face-saving compromise and the sultan was induced to come to a direct agreement with Prince Alexander, in which the union was recognized. The Treaty Powers had only to acquiesce, while the continental press turned round and congratulated the British minister upon the presence and firmness which had saved Europe from a disastrous blunder.

Before this settlement was finally consummated Salisbury had left office. The general election in November had resulted in giving the Irish party the casting vote in the House of Commons. In December Gladstone had announced his adhesion to Home Rule and Salisbury's ministry was defeated on an amendment to the address on Jan. 26, 1886. Gladstone introduced his Home Rule bill which, with the assistance of 90 dissident Liberals, was rejected, on June 8. Parliament was dissolved; the Unionists gained a decisive victory though not one giving a majority to the Conservatives independently of their allies. On July 20, the Queen sent for Salisbury who, with her leave, pressed Hartington to take the premiership in his stead. But the Liberal-Unionist chief refused, promising independent support, and Lord Salisbury formed his second Government which remained in power for six years,—1886-92.

Government of 1886-92.—The worst difficulty which it had to encounter was at starting. Lord Randolph Churchill, who was the second man in the ministry and leader in the House of Commons, found himself unable to work with his colleagues, and resigned at the end of the year. The most popular platform speaker in the party, he was at that time without a rival on his own front bench, and the break up of the Government was anticipated. Salisbury again offered to widen its support by retiring in Hartington's favour, and Hartington again refused. But he advised his lieutenant, Goschen, to join the cabinet, which in the end suffered no permanent injury by Lord Randolph's defection. Salisbury, who at the outset had surrendered the foreign office to Lord Idlesleigh, now resumed its direction (Jan. 1887).

England was no longer in the position of dangerous isolation which she had occupied when he took office in 1885. The initiatory approaches which he had then made to the German chancellor had re-established friendly relations between them, and his successful obstinacy about Bulgaria had presented England to Europe as a power that had to be reckoned with. In '86, circum-

stances all combined to draw her towards the grouping of Central European Powers,—Germany, Austria and Italy as against the Russo-French combination. Russia had been alienated by her resistance to the coercion of Bulgaria, while across the Channel France's growing resentment at her continued presence in Egypt had operated in the same direction. But in 1887 there was an interval of hesitation. Salisbury was repelled by the German chancellor's methods. Throughout the preceding autumn and winter he had been ceaselessly resisting the chancellor's efforts to induce an Anglo-Russian war and so shift the Bulgarian quarrel from Austrian to English shoulders. The menacing pressure with which the chancellor visited any crossing of his wishes by a friendly Power had been a constant source of irritation. Salisbury's wish for a wider choice in friendships expressed itself that spring in a new departure in Egyptian policy. He offered to Turkey—as the suzerain power—an engagement to evacuate Egypt in three years if the conditions for her security permitted and with a right of re-entry reserved. After prolonged negotiation the sultan agreed to sign a convention to that effect (May 22, 1887). But France rejected the proffered compromise with indignation, and under threats of violence from her and Russia the sultan withdrew his consent, and refused ratification. The attempt, though it failed in its main object in a reconciliation with France, was not fruitless. It freed England from further solicitations and intrigues on the score of Egypt. She had made her offer and it had been rejected. Thenceforward, as Lord Salisbury soon made abundantly clear, she would consult only her own judgment as to the period of her occupation.

But France's inactivity was decisive in determining England's continental friendships for the next ten years. Lord Salisbury declined to give them the character of alliances. In response to insistent requests from the Austrian and Italian Governments, backed by a private letter of strong appeal from the German chancellor (Nov. 22), he that autumn signed an engagement (the Tripartite Agreement, Dec. 10, 1887), to join with them in resisting any future coercion of Turkey on the part of Russia. The chancellor's letter hinted at a more general and binding adhesion to the Triple Alliance and it was followed by other suggestions to the same effect. These were ignored or evaded and more definite proposals met with more definite refusals. In the spring of 1887, Italy had asked for a defensive alliance specifically directed against France and in Jan. 1889 Germany invited a similar compact. Salisbury's answer on both occasions was that an undertaking to fight on an unwarlike issue was contrary to the traditions of English policy and was impossible for a Constitutional Government.

To maintain this refusal of the only thing that constituted an alliance in Continental eyes without falling into the pit of national isolation was a difficult problem for diplomacy. Salisbury's large success in solving it during the period of his ministry was due in the main to his avoidance of exaggerated claims and his readiness not only to acquiesce in but actively to assist those of other countries wherever they were in any way admissible. Thus the detachment which must otherwise have become a source of jealousy and suspicion was, time and again, presented in a guise attractive to the needs of other nations. England never occupied a position of greater authority in Europe than during this time, and after Bismarck's retirement in 1890 Salisbury's became the dominating figure among European statesmen.

The white invasion of Africa which signalled that decade afforded opportunity for a marked display of his capacity for international co-operation. It was a movement unique in history for the rapidity, and, it may be added, the human benefit of its achievement. But behind the influx of explorers, missionaries and traders of all nations, had now come their Governments, whose claims—undefined and illimitable—were, by the end of the eighties, advancing to inevitable conflict. England, whether by earlier occupation or the present activity of her adventurers, was a competitor in every region, north, south, east and west, and Lord Salisbury accepted the initiative to bring order out of chaos which was thus marked out for him. He engaged in negotiations, delimitations, arbitrations, and struck the best bargains he could

for his own clients compatible with an instructed sympathy with their rivals' requirements. With an eye for a future still eight years distant he averted encroachment upon the Nile valley up to the river's source, though no Englishman had as yet set foot south of Wady Halfa, and placated French enmity beforehand by a large complaisance in the west and north-west of the continent. He reasoned suavely with Italy's aspirations and sharply with Portugal's baseless obstruction to the northward advance of Cecil Rhodes' South Africans; and when England's and Germany's irreducible requirements proved incompatible, threw Heligoland into the scales in security of a peaceful settlement (June 1890). When he left office the main outlines of actual occupation and prospective "spheres of influence" had been drawn without the serious chilling of a single international relationship.

The elections of 1892 resulted in a victory for the Liberal party though with a small and unharmonious majority. Gladstone passed a bill for Home Rule and one for Welsh Disestablishment through the House of Commons in successive sessions, but the evident want of enthusiasm in the country for either measure encouraged Salisbury, in accordance with the principle on which he acted in this connection, to invite their rejection by the House of Lords. The place of the Lords in the Constitution was to secure an appeal to the electorate but they could only wisely assert it against the House of Commons when there were sound reasons to believe that the electorate agreed with them. On this occasion his judgment proved amply justified. Parliament was dissolved in '93 and the verdict of the constituencies ratified the Lords' action by a substantial majority. Lord Salisbury again became prime minister and foreign secretary while the Liberal Unionist leaders established the fusion of the two sections of the party by joining his cabinet.

Third Ministry.—This was in many ways the least satisfactory of Lord Salisbury's four tenures of the foreign office. Since he was last in office the German emperor had quarrelled with England over Far East politics, and never afterwards paid more than lip service to the old friendship. The breach with France was not yet healed, and, though Lord Salisbury's personal authority remained and the influence of his initiative, England was isolated in European sympathy throughout this period. He found diplomacy once more absorbed in the Near East problem as the result of a peculiarly atrocious outbreak of Turkish cruelty and misgovernment in Armenia. After falling in a private proposal to Germany to join in some drastic enterprise—its details are not known—for the dismemberment or subjugation of Turkey, he appealed in 1896 to the Christian Powers as a whole to take combined action for enforcing reform on the Porte. They agreed and accepted his initiative. The "Concert of Europe" succeeded both in this matter and in a subsequent crisis in Crete, in averting the ever-present danger of a breach in the "armed truce" on the continent. But as regarded the lot of the unhappy Armenians it proved a sore disappointment to its author—Russia, who, in the strange whirligig of time, had become the champion of Turkish independences, vetoing, with German support, any form of coercion at Constantinople.

In the summer of 1895 a long-drawn-out frontier dispute between British Guiana and Venezuela achieved sudden importance through the action of the American Government which, with a view to hastening a conclusion, addressed a singularly discourteous despatch to that of England, claiming rights of dictation rather than intervention. Lord Salisbury, after some delay, replied with a reasoned demurrer to such a development of the Monroe doctrine. President Cleveland responded in a fierce speech, foreshadowing ultimatums, and was applauded by his public in a wild outbreak of anglo-phobic jingoism. Lord Salisbury declined the quarrel, and some months later, when feelings had cooled, tacitly conceded America's claim to intervene and agreed to defer the whole question to neutral arbitration, whose verdict substantially conceded the British case. (Oct. 1899.)

In the winter of '97-'98 a stir of anger was roused in England by Russia's illegal seizure from China of two ports—Port Arthur and Talienwan—which were supposed to secure domination over Peking, and Lord Salisbury was much censured for passing the

aggression by with no more than a diplomatic protest. Events elsewhere called urgently for complaisance. The culminating crisis of the long quarrel with France over Egypt was imminent and Lord Salisbury held that its peaceful issue would depend on her finding no militant encouragement from sympathetic outsiders when the moment came. Colonel Marchand had been for more than three years making his way through the forests of Central Africa with instructions to assert a French claim upon the upper waters of the Nile before England had established an effective occupation there. He succeeded in fact in arriving that July at Fashoda a few weeks before General Kitchener reached it, steaming hurriedly up the river from the battle of Omdurman. But the news of the planting of the French flag and that of its removal reached Paris concurrently and with it a telegram from Lord Salisbury announcing the British occupation of the post and warning the French Government and people in the clearest terms that no compromise on England's claim upon the Nile valley was possible. Popular passion, dangerously excited for a few days, was thus compelled in the first moment of its ebullition to face the gravity of the decision to be taken and in the end it suffered its Government, discouragingly advised thereto by its Russian ally, to follow counsels of peace. The episode thus safely passed through proved, in spite of the resentment which it aroused at the time, the close of the quarrel that had so long kept the two nations apart. The resentment was artificially prolonged by the general unpopularity in which England was submerged through the South African war the following year, but when in 1901 that had passed by, the way was left open for the automatic operation of the forces which three years later resulted in the conclusion of the Entente.

The successful conduct of this crisis was Lord Salisbury's last diplomatic achievement of any note. He surrendered the foreign office in Nov. 1900, and the prime ministership in July 1902—only deferring this final retirement to avoid the embarrassment of a change before peace had been concluded in South Africa. He died a year later on Aug. 22, 1903, his wife having predeceased him in Nov. 1899.

He was singularly happy in his domestic life, taking little pleasure in society outside his home, though his wit, literary culture and gift of language made him a brilliant companion in conversation. Science was his main interest outside his profession and he was also widely read in history and theology. He was a strong Churchman and a convinced and devout Christian, his religious faith constituting the fundamental inspiration of his life.

Pulling, *Life and Speeches of the Marquis of Salisbury* (1885); S. H. Jones, *Life and Times of the Marquis of Salisbury* (4 vols., 1898-99); G. G. Cecil, *Life of Robert, Marquis of Salisbury* (1921).

SALISBURY, ROBERT CECIL, 1ST EARL OF (c. 1565-1612), English lord treasurer, the exact year of whose birth is unrecorded, was the youngest son of William Cecil, 1st Lord Burghley, and of his second wife Mildred Cooke, of Gidea Hall in Essex. He was educated in his father's house and at Cambridge University. In 1584 he was sent to France, and was returned the same year to parliament, and again in 1586, as member for Westminster. In 1588 he accompanied Lord Derby in his mission to the Netherlands to negotiate peace with Spain, and sat in the parliament of 1588, and in the assemblies of 1593, 1597 and 1601 for Hertfordshire. About 1589 he appears to have entered upon the duties of secretary of state, though he did not receive the official appointment till 1596. In 1591 he was knighted, and sworn of the privy council. In 1597 he was made chancellor of the duchy of Lancaster, and in 1598 despatched on a mission to Henry IV. of France to prevent the impending alliance between that country and Spain. The next year he succeeded his father as master of the court of wards.

On Lord Burghley's death on Aug. 4, both Essex and Bacon desired to succeed him in the supreme direction of affairs, but the queen preferred the son of her last great minister. At this period began Cecil's secret correspondence with James in Scot-

land. Hitherto Cecil's enemies had persuaded James that the secretary was unfavourable to his claims to the English throne. An understanding was now effected by which Cecil was able to assure James of his succession, ensure his own power and pre-eminence in the new reign against Sir Walter Raleigh and other competitors, and secure the tranquillity of the last years of Elizabeth, the conditions demanded by him being that all attempts of James to obtain parliamentary recognition of his title should cease, that an absolute respect should be paid to the queen's feelings, and that the communications should remain secret.

Owing to Cecil's action, James took possession of the throne without opposition on the death of Elizabeth in 1603. Cecil was continued in his office, was created Baron Cecil of Essendine in Rutlandshire (1603), Viscount Cranborne (1604) and earl of Salisbury (1605). He was elected chancellor of the University of Cambridge in 1601, and obtained the Garter in 1606. Meanwhile Cecil's success had completed the discontent of Raleigh, who, exasperated at his dismissal from the captaincy of the guard, became involved—whether innocently or not is uncertain—in the treasonable conspiracy known as the "Bye Plot." Cecil took a leading part in his trial in July 1603, and, though probably convinced of his guilt, endeavoured to ensure him a fair trial and rebuked the attorney-general, Sir Edward Coke, for his harshness towards the prisoner. In 1608 the office of lord treasurer was added to Salisbury's other appointments, and the whole conduct of public affairs was placed solely in his hands. His real policy is not always easy to distinguish, for the king constantly interfered, and Cecil was often merely a follower, simulating approval of schemes opposed to his real judgment.

In foreign affairs Salisbury made it his aim to preserve the balance of power between France and Spain, and to secure the independence of the Netherlands from either state. He also hoped, like his father, to make England the head of the Protestant alliance abroad; and his last energies were expended in effecting the marriage in 1612 of the princess Elizabeth, James's daughter, with the Elector Palatine. He was in favour of peace, preoccupied with the state of the finances at home and the decreasing revenue, and, though sharing Raleigh's dislike of Spain, was instrumental in making the treaty with that power in 1604. In 1611 he disapproved of the proposed marriage between the prince of Wales and the Infanta. His bias against Spain and his fidelity to the national interests render, therefore, his acceptance of a pension from Spain a surprising incident in his career. At the conclusion of the peace in 1604 the sum Cecil received was £1,000, which was raised the following year to £1,500; while in 1609 he demanded an augmentation and to be paid for each piece of information separately.

As lord treasurer Salisbury showed considerable financial ability. In 1608 he imposed new duties on articles of luxury and those of foreign manufacture which competed with English goods, while lowering the dues on currants and tobacco. By this measure, and by a more careful collection, the ordinary income was raised to £460,000, while £700,000 was paid off the debt, leaving at the beginning of 1610 the sum of £300,000. But the minister's efforts were nullified by the extravagances of James, who continued to exceed his income. Salisbury erred, as the sequel was to show, in forcing the king's legal right to levy impositions against the remonstrances of the parliament. In the "great contract," the scheme now put forward by Salisbury for settling the finances, his lack of political wisdom was still more apparent. The Commons were to guarantee a fixed annual subsidy, on condition of the abandonment of impositions and of the redress of grievances by the king. An unworthy and undignified system of higgling and haggling was initiated between the crown and the parliament.

Salisbury had always been averse to prosecution for religion, and he made the offer in October 1607 that if the pope would excommunicate those that rebelled against the king and oblige them to defend him against invasion, the fines for recusancy would be remitted and they would be allowed to keep priests in their houses. This was a fair measure of toleration. But his attitude to the Nonconformists was identical with that after-

wards maintained by Laud; he maintained that "unity in belief cannot be preserved unless it is to be found in worship."

Elizabeth and James found security in Salisbury's calm good sense, safe, orderly official mind and practical experience of business, of which there was no guarantee in the restlessness of Essex, the enterprise of Raleigh or the speculation of Bacon. On the other hand, he was neither guided nor inspired by any great principle or ideal, he contributed nothing towards the settlement of the great national problems, and he precipitated by his ill-advised action the struggle between crown and parliament.

Lord Salisbury died on May 24, 1612, at the parsonage house at Marlborough. During his long political career he had amassed a large fortune, besides inheriting a considerable portion of Lord Burghley's landed estate. In 1607 he exchanged, at the king's request, his estate of Theobalds in Hertfordshire for Hatfield. Here he built the magnificent house of which he himself conceived the plans and the design, but which he did not live to inhabit, its completion almost coinciding with his death. In person and figure he was in strange contrast with his rivals at court, being diminutive in stature, ill-formed and weak in health. Elizabeth styled him her pygmy; his enemies delighted in vilifying his "wry neck," "crooked back" and "splay foot." He married Elizabeth, daughter of William Brooke, 5th Baron Cobham, by whom, besides one daughter, he had William (1591-1668), his successor as earl.

No complete life of Robert Cecil has been attempted, but the materials for it are very extensive, including *Hist. MSS. Comm. Series, Marquis of Salisbury's MSS.* (superseding former reports in the series), from which MSS. selections were published in 1740 by S. Haynes, by Wm. Murdin in 1750, by John Bruce, in *The Correspondence of King James VI. with Sir Robert Cecil*, in 1861 (Camden Society), and by Ed. Lodge, in *Illustrations of English History*, in 1838. Some of his writings are printed in the *Harleian Miscellanies* and the *Somers Tracts*.

SALISBURY, THOMAS DE MONTACUTE, 4TH EARL OR (1388-1428), was son of John, the third earl, who was executed in 1400 as a supporter of Richard II. Thomas was granted part of his father's estates and summoned to parliament in 1409, though not fully restored till 1421. He was present throughout the campaign of Agincourt in 1415, and at the naval engagement before Harfleur in 1416, and in 1417-18. During the spring of 1419 he held an independent command, capturing Fécamp, Honfleur and other towns, was appointed lieutenant-general of Normandy, and created earl of Perche. In 1420 he was in chief command in Maine, and defeated the Maréchal de Rieux near Le Mans. When Henry V. went home next year Salisbury remained in France as the chief lieutenant of Thomas, duke of Clarence. The duke, through his own rashness, was defeated at Baugé on March 21, 1421. Salisbury came up with the archers too late to retrieve the day, but recovered the bodies of the dead, and by a skilful retreat averted further disaster. He soon gathered a fresh force, and in June was able to report to the king "this part of your land stood in good plight never so well as now." (*Foedera*, x. 131.) Salisbury's success in Maine marked him out as John of Bedford's chief lieutenant in the war after Henry's death. In 1423 he was appointed governor of Champagne, and by his dash and vigour secured one of the chief victories of the war at Cravant on July 30. Subsequent operations completed the conquest of Champagne, and left Salisbury free to join Bedford at Verneuil. There his "judgment and valour" won the day. During the next three years Salisbury was employed on the Norman border and in Maine. After a year's visit to England he returned to the chief command in the field in July, 1428. Against the judgment of Bedford he determined to make Orleans his principal objective, and began the siege on Oct. 12; whilst surveying the city from a window in Tourelles he was wounded by a cannon-shot, and died on Nov. 3, 1428. Salisbury was the most skilful soldier on the English side after the death of Henry V. He was a patron of John Lydgate, who presented to him his book *The Pilgrim* (now Harley ms. 4826, with a miniature of Salisbury, engraved in Strutt's *Regal Antiquities*). By his first wife Eleanor Holand, daughter of Thomas, earl of Kent, Salisbury had an only daughter Alice, in her own right countess of Salisbury, who married Richard

Neville, and was mother of Warwick the King-maker. His second wife, Alice, was granddaughter of Geoffrey Chaucer, and after his death married William de la Pole, duke of Suffolk.

The chief accounts of Salisbury's campaigns are to be found in the *Gesta Henrici Quinti*, edited by B. Williams for the Eng. Hist. Soc. (London, 1850) in the *Vita Henrici Quinti* (erroneously attributed to Thomas of Elmham), edited by T. Hearne (Oxford, 1727); the *Chronique* of E. de Monstrelet, edited by L. D. d'Arcey (Paris, 1857-1862); the *Chroniques* of Jehan de Waurin, edited by W. and E. L. C. F. Hardy (London, 1864-1891); and the *Chronique de la Pucelle* of G. Cousinot, edited by Vallet de Virville (Paris, 1859). For modern accounts see Sir J. H. Ramsey, *Leicester and York* (Oxford, 1892); and C. Oman, *Political History of England, 1377-1485* (London, 1906).

SALISBURY, WILLIAM LONGSWORD (or **LONGESPÉE**), 3RD EARL OF (d. 1226), was an illegitimate son of Henry II, who granted him the estates of Appleby, Lincolnshire (1188). In 1198 he received from Richard I the hand of Isabella, or Ela (d. 1261), daughter and heiress of William, earl of Salisbury, and was granted this title with the lands of the earldom. He was received with favour by King John, who appointed him sheriff of Wiltshire in 1200, and subsequently gave him many important military and diplomatic posts, thus retaining his allegiance during the period of excommunication. In 1213 Salisbury was sent in command of a fleet to attack Philip of France, and, by his successful action at Damme, he foiled the projected invasion of England; but in the following year he was captured by the French and was only exchanged after prolonged negotiations. On his return to England he supported John in opposition to the baronial party, but feeling that the king's cause was hopeless, he surrendered to Louis on his arrival in England.

After the death of John, however, Salisbury deserted the French side in 1217, supported Herbert de Burgh and the young king, Henry III, and was appointed sheriff of Lincoln. It is asserted by Matthew Parker that he took part in the siege of Damietta (1219), but the evidence in support of this is scanty. It is known, however, that he supported the excommunication of William of Aumale in 1221; that he assisted in the war on the Welsh marches (1224); and that in 1225 he accompanied the expedition to Gascony. On the return voyage he was wrecked on the isle of Ré, and the hardships which he suffered probably hastened his death, which occurred on March 7, 1226, at Salisbury.

SALISBURY, a city and municipal borough, and the county town of Wiltshire, England, 23 mi. W. of Winchester, with stations on the Southern and Great Western railways. Pop. (1931) 26,456; (est. 1938) 28,260. Area 4.4 sq. mi. The city lies in the valley at the junction of the rivers Avon, Wylye, Nadder and Bourne. The cathedral stands out above the city, which is partly laid out in squares called the "Chequers." To the north rises the bare upland of Salisbury plain. The neighbourhood of Salisbury was one of the most important areas in prehistoric England. It seems to have been a meeting place of early cultures, e.g., of the people who made beakers and the people who built megaliths; 6 mi. N. is Stonehenge (q.v.). The Blackmoor museum in the city has exhibits of almost every age from the neighbourhood. Most intimately associated, however, with the origins of Salisbury is the great prehistoric fortress of Old Sarum. It is about 2 mi. N. of the present city. The great mound has a fosse and earthenwork, while the summit is hollowed out like a crater and its rim surmounted by a rampart. It was an important site in Romano-British times and especially in the period immediately preceding the arrival of the Romans. It was known to the Romans as *Sorbidunum*. In 552 it was taken by Cenric, who named it *Saearesbyrig* ("dry town") and it became the home of the kings of Wessex. Alfred strengthened the castle, and it was selected by Edgar as a place of national assembly to devise means of checking the Danes. About 1075 Old Sarum became the seat of a bishopric. Osmond, the second bishop, compiled a missal which forms the groundwork of the celebrated "Sarum Use." The "Sarum Breviary" was printed at Venice in 1483, and upon this, the most widely prevalent of English liturgies, the prayer books of Edward VI were mainly based. Osmond also built a cathedral, in the form of a plain cross. The garrison and priests, confined within a small space, were a perpetual feud; and after a licence

had been granted by Pope Honorius III, it was decided to move down into the fertile Avon valley. In 1102 Bishop Roger Poore obtained a comprehensive charter from Henry I. With the building of New Sarum in the 13th century and the transference to it of the see, Old Sarum lapsed to the crown. By the 16th century it was in ruins, and in 1608 it was ordered that the town walls should be demolished.

The new city, under the name of New Sarum (New Saresbury, Salisbury) immediately began to spring up close around the cathedral. A charter of Henry III creating it a free city in 1227 recites the removal from Old Sarum, the king's ratification and his laying the foundation stone of the church. In 1611 the city obtained a charter of incorporation from James I under the title of "mayor and commonalty" of the city of New Sarum.

The cathedral church of St. Mary is a beautiful example of Early English architecture, begun and completed, save its spire and a few details, within one brief period (1220-1266). There is a tradition that Elias de Derham, canon of the cathedral (d. 1245), was the principal architect. The building is 475 ft. in extreme length, the length of the nave being 250 ft. 6 in., the choir 151 ft., and the lady chapel 68 ft. 6 in. The width of the nave is 51 ft. and the height 84 ft. The spire, the highest in England, measures 404 ft. (For plan, see *GOTHIC ARCHITECTURE: Gothic Architecture in England*.) The cathedral consists of a nave of ten bays, with aisles and a lofty north porch, main transepts with eastern aisles, choir with aisles, lesser transepts, presbytery and lady chapel. The two upper stories of the tower and the spire above are early Decorated. The west front, the last portion of the original building completed, bears in its rich ornamentation signs of the transition to the Decorated style. The perfect uniformity of the building is no less remarkable within than without. The frequent use of Purbeck marble for shafts contrasts with the delicate gray freestone which is the principal building material. An unhappy restoration of the cathedral (1782-1791) destroyed many magnificent stained-glass windows which had escaped the Reformation, and also removed two perpendicular chapels and the detached belfry which stood to the northwest of the cathedral. The lady chapel is the earliest part of the original building. The cloisters, south of the church, were built directly after its completion. The fine octagonal chapter-house is of the time of Edward I with a series of contemporary sculptures. The library contains many valuable mss. and ancient printed books. The diocese covers all Dorsetshire, except four parishes, the greater part of Wiltshire, and eight parishes in whole or in part in Southampton, two each in Berkshire and Devonshire and one in Somersetshire. There are three ancient parish churches: St. Martin's, with square tower and spire, and possessing a Norman font and Early English portions in the choir; St. Thomas's (of Cantebury), founded in 1240 as a chapel to the cathedral, and rebuilt in the 15th century; and St. Edmund's, founded as the collegiate church of secular canons in 1268, but later rebuilt in the Perpendicular period. The residence of the college of secular priests is occupied by the ecclesiastical college of St. Edmund's, founded in 1873. St. John's chapel, founded by Bishop Robert Bingham in the 13th century, is occupied by a dwelling house. There is a chapel attached to the St. Nicholas hospital. The poultry cross, or high cross, an open hexagon with six arches and a central pillar, was erected by Lord Montacute before 1335. Among remaining specimens of ancient domestic architecture are the banquet hall of John Halle, wool merchant, built about 1470 and since 1930 used as a cinema; and Audley house (16th century), repaired in 1881 as a diocesan church house. Salisbury returned two members to parliament until 1885 when the number was reduced to one. Since 1918 it has been in the Salisbury division of the county.

SALISBURY, capital of Southern Rhodesia, Africa. Pop. (1936) 32,846, including 11,392 whites and 20,177 natives. Altitude 4,865 ft. It was founded in 1890, is well laid out, has good shops, and an excellent water supply. The distance by rail to Capetown is 1,659 mi., and to Beira 374 mi. It is the centre of a gold-producing area.

SALISBURY, a city of southeastern Maryland, U.S.A., at the head of navigation on the Wicomico river: the county seat

of Wicomico county. It is on federal highways 13 and 50 and is served by the Pennsylvania, and (for freight) the Baltimore and Eastern railways.

Pop. (1950) 15,141; in 1940 it was 13,313. It is the wholesale distributing centre for the "eastern shore" of Maryland south of Delaware.

Salisbury was founded in 1732, organized as a town in 1812, incorporated in 1854 and chartered as a city in 1880.

Lumber, building materials, leather goods and wearing apparel are manufactured there. Agricultural products include cantaloupes, strawberries and cucumbers. There are also nurseries and sea food and meat packing plants. In 1925 the State Teacher's College of Salisbury was established.

SALISBURY, a city of North Carolina, U.S., the county seat of Rowan county; 120 mi. W.S.W. of Raleigh, near the Yadkin river. It is on federal highways 29, 52 and 70, and is served by the Southern and the Yadkin railways.

Pop. (1950) 20,102; in 1940, 19,037 by federal census. It is an industrial and commercial centre in the rich Piedmont section of the state, and is the seat of Catawba college (Reformed church; opened in 1851 at Newton and moved to Salisbury in 1923) and Livingstone college for Negroes (1882). The community has cotton mills, car shops and various other manufacturing plants. It is the site of a veterans administration neuropsychiatric hospital.

There are granite quarries and iron deposits in the vicinity. The city operates under a council-manager form of government. Salisbury was incorporated as a town in 1755, and as a city in 1770. During the Civil War it was the seat of a Confederate military prison. On April 12, 1865, a cavalry engagement near by resulted in the capture of 1,364 Confederate soldiers. There is a national cemetery there, containing 12,186 graves.

SALISH. This tribe, popularly known as Flathead, has given name to the Salishan family of Indians, all speaking cognate dialects, in British Columbia and north-western United States. None of the Salishan tribes were agricultural or matrilineal; those on the coast practised potlatch festivals, accumulated wealth, held slaves and lived in plank houses like the other coastal tribes of the area. Inland, arts and customs were simpler. The principal groups or tribes are: 1, Interior Salish, comprising the Shuswap, Lilloet, Thompson or Nitlakyapamuk, Okanagan in British Columbia, and the Flathead or Salish proper, Kalispel, Coeur d'Alène, Spokane, Methow in the United States; 2, Coast Salish, in order from north to south: Bellaçola of Dean's Inlet, Comox, Cowichan of Vancouver island, Nanaimo, Squawmish, Lummi, Snohomish, Snoqualmie (Seattle), Puyallup, Nisquallie, Cowlitz, Skokomish, Songish, Clallam of Strait of Juan de Fuca, Quinault, Chehalis, and, south of Columbia river, Tillamook called also Nehalem.

In 1909 the total population was 28,600, somewhat more than half being respectively in the interior and in Canada. The original number was perhaps three times as great.

SALITE (from Sala, Sweden, its original locality), a variety of monoclinic pyroxene (q.v.).

SALIVAN, a group of tribes of South American Indians, usually regarded as constituting an independent linguistic stock. The Salivas, from whom the stock gets its name, lived originally along the western side of the Orinoco and for some distance west along its tributaries, from above the mouth of the Vichada to the Sinarucu.

They were a peaceful, docile folk, who, being attacked by the Caribs in the latter part of the 17th century, withdrew westward up the Meta and Vichada toward their heads. In the main a hunting and fishing people, they had no maize and but little manioc.

Like some of the neighbouring groups, they were accustomed to exhume the bones of the dead after a year or so, burn and reduce them to powder and then drink this, mixed with their fermented beer.

See J. Cassani, *Historia de la provincia de la compañía de Jesús del Nuevo Reino de Granada* (Madrid, 1741).

SALLUST [GAIUS SALLUSTIUS CRISPUS] (86–34 B.C.), Roman historian, belonging to a well-known plebeian family, was

born at Amiternum in the country of the Sabines. After an ill-spent youth he entered public life, and was elected tribune of the people in 52. From the first he was a decided partisan of Caesar, to whom he owed such political advancement as he attained. In 50 he was removed from the senate by the censor Appius Claudius Pulcher, restored in 49 and became quaestor. In 46 he was praetor, and accompanied Caesar in his African campaign, which ended in the decisive defeat of the remains of the Pompeian party at Thapsus. He was then made governor of Numidia, where he was oppressive and extortionate. On his return to Rome he purchased and laid out in great splendour the famous gardens on the Quirinal known as the *Horti Sallustiani*. He now retired from public life.

His account of the Catiline conspiracy (*De coniuratione Catilinae* or *Bellum Catilinarianum*) and of the Jugurthine War (*Bellum Jugurthinum*) have come down to us complete, together with fragments of his larger and most important work (*Historiae*), a history of Rome from 78–67, intended as a continuation of L. Cornelius Sisenna's work. In the *Catiline Conspiracy* Sallust adopts the usually accepted view of Catiline, and describes him as the deliberate foe of law, order and morality, without attempting to give any adequate explanation of his views and intentions. Catiline, it must be remembered, had supported the party of Sulla, to which Sallust was opposed. He is careful to clear Caesar of complicity and on the whole he is not unfair towards Cicero.

His *Jugurthine War*, again, though a valuable and interesting monograph, is not a satisfactory performance. Here, as in the *Catiline*, he dwells upon the feebleness of the senate and aristocracy, too often in a tiresome, moralizing vein, but as a military history the work is unsatisfactory in the matter of geographical and chronological details, though vivid in its depiction of character and scenery. The extant fragments of the *Historiae* (some discovered in 1886) are enough to show the political partisan, who took a keen pleasure in describing the reaction against the dictator's policy and legislation after his death. Two letters (*Duae epistolae de republica ordinanda*), and an attack upon Cicero (*Invektiva* or *Declamatio in Ciceronem*), frequently attributed to Sallust, are probably the work of a rhetorician of the first century A.D., also the author of a counter-invektive by Cicero.

Editions and translations in various languages are numerous. Editio princeps (1470); (text and notes) F. Jacobs, H. Witz (1894); G. Long, revised by J. G. Frazer, with chief fragments of *Historiae* (1884); English translation by A. W. Pollard (1882); (text and tr.) J. C. Rolfe (Loeb library, 1911). There are many separate editions of the *Catiline* and *Jugurthine*, chiefly for school use. The fragments have been edited by F. Kritz (1853) and B. Maurenbrecher (1891–93); and there is an Italian translation (with notes) of the supposititious letters by G. Vittori (1897).

SALMASIUS, CLAUDIUS, the Latinized name of CLAUDE SAUMAISE (1588–1653), French classical scholar, born at Semur-en-Auxois in Burgundy on April 15, 1588. He was educated at Paris and Heidelberg, where he went over to Protestantism. In 1609 he brought out an edition of Florus. He then returned to Burgundy, and qualified for the succession to his father's post, which he eventually lost on account of his religion. In 1620 he published Casaubon's notes on the *Augustan History*, with copious additions of his own. In 1623 he married Anne Mercier, a Protestant lady of a distinguished family. In 1629 Salmasius produced his *magnum opus* as a critic, his commentary on Solinus's *Polihistor*, or rather on Pliny, to whom Solinus is indebted for the most important part of his work. Salmasius learned Arabic to qualify himself for the botanical part of his task. In 1631 he went as professor to Leiden, where he composed for Frederick of Nassau his *De Re Militari Romanorum*, not published till 1657. He was persistently attacked by a clique led by Daniel Heinsius. His *De primatu Papae* (1645) excited a warm controversy in France.

In November 1649 appeared his *Defensio regia pro Carolo I.* It does not appear who influenced him to write it but Charles II. defrayed the expense of printing, and presented the author with £100. The first edition was anonymous, but the author was universally known. This celebrated work, in our day principally famous for the reply it provoked from Milton (1651) even

in its own time added little to the reputation of the author. His reply to Milton, which he left unfinished at his death, and which was published by his son in 1660, is insipid as well as abusive. Salmasius died on Sept. 3, 1653.

As a commentator and critic, Salmasius is entitled to high rank. His notes on the *Augustan History* and *Solinus* display not only massive erudition but massive good sense as well; his perception of the meaning of his author is commonly very acute, and his emendations are frequently felicitous.

The life of Salmasius was written by Philibert de la Mare, but never printed; it was used by Papillon, whose account of Salmasius in his *Bibliothèque des auteurs de Bourgogne* (Dijon, 1745), is by far the best extant, and contains an exhaustive list of his works, both printed and in ms. There is an *éloge* by A. Clément prefixed to his edition of Salmasius' *Letters* (Leiden, 1656), and another by C. B. Monsot, in his own *Letters* (Dijon, 1656). See also E. Haag, *La France protestante* (ix, 149-173); and, for the *Defensio regia*, D. Masson's *Life of Milton*.

SALMERÓN, NICOLÁS (1838-1908), Spanish statesman, born at Alhama la Seca, Almería, April 10, 1838. Professor of literature and philosophy at Madrid, he co-operated with Castelar on *La Democracia* and in 1865 was a member of the directing committee of the Republican party. Imprisoned as a suspect in 1867, he was elected to the Cortes in 1871 and on the resignation of Amadeo (Feb. 11, 1873) was naturally marked out to be the leader of the party which sought to establish a republic in Spain. He succeeded Pi y Margall in the presidency of the republic on July 18, 1873, but resigned (Sept. 7), when he found that the generals insisted on executing rebels taken in arms. His successor, Castelar, was compelled to restore order by drastic means. Salmerón took part in the attack made on him in the Cortes on Jan. 3, 1874, and went into exile until recalled by Sagasta in 1881. In 1886 he was elected to the Cortes as Progressive deputy for Madrid. He died at Pau, Sept. 21, 1908.

SALMON, THOMAS WILLIAM (1876-1927), U.S. physician and psychiatrist, was born in Lansingburg, N.Y., on Jan. 6, 1876. He was educated in the public schools and at the Lansingburg academy. In 1899 he took his degree in medicine at the Albany Medical college and then entered private practice for a short time. Two years later he was appointed to the Willard State hospital where he made one of the earliest studies of the role of humans as disease carriers. In 1903 he was commissioned in the U.S. public health service. There he developed an interest in the medical problems of some maritime patients. As a result, he suggested and provided the plans for a hospital ship for deep sea fishermen which later materialized to excellent advantage. In 1905 he was asked to undertake an assignment in conjunction with the immigration office at Ellis Island. New York state authorities had become alarmed at the prevalence of foreign born among patients admitted to state hospitals, and plans were made for more careful scrutiny of immigrants on their arrival. Under Salmon's direction, a psychiatric service was incorporated into the regular medical department at Ellis Island which proved invaluable in weeding out the insane and defective and provided a more humane and scientific reception of helpless immigrants. By this time, his publications on the subject were well known and respected and when the federal immigration law was in process of revision, his aid was requested at congressional hearings. Much of his advice was incorporated into the new law. In 1915 he resigned from the public health service to become medical director of the newly formed National Committee for Public Hygiene. In this capacity, he gave practical guidance toward the extension of hygiene knowledge and the applications of psychiatry to public welfare. The second most outstanding achievement of his career was his role in establishing neuropsychiatric services for the armed forces during World War I. For this and related activities, he was awarded the D.S.M. After the war, he provided plans for model hospitals to care for mentally disabled veterans. In 1921 he resigned from the national committee to become professor of psychiatry at Columbia university, where he virtually established that field of study on an independent basis. Salmon edited the volume on neuropsychiatry in the *Medical History of the World War*. He died on Aug. 13, 1927.

SALMONIDAE. The family Salmonidae, as understood in modern ichthyology, consists of three principal groups of fishes, which herein will be referred to as the salmon, the trouts and the charrs. Formerly the lake herrings or ciscoes and the whitefishes, also, were included. However, the last-mentioned groups, having larger scales and a skull that differs in structure, now are quite generally assigned to a separate family called Coregonidae.

The Salmonidae have robust, somewhat-rounded, muscular bodies. The skeleton is bony, and the fins have soft rays only. The lower pair of fins, the ventrals, are attached to the abdomen, far behind the upper pair, the pectoral fins. A fleshy fin, without rays, is situated on the back behind the larger dorsal fin, and the caudal fin usually is more or less concave or forked. The entire body, exclusive of the head, is covered with small smooth-edged scales, of which more than a hundred are present along the middle of the side.

These fishes are more or less midway in zoological classification between the sharks with their primitive cartilaginous skeleton and the higher fishes such as the basses and cods with a complex bony frame. In colour the Salmonidae are greatly specialized, however, since many of them rival the most brilliant productions of the tropical seas.

Nearly all the members of the family live in the northern part of the northern hemisphere and are largely restricted to coastwise waters, neighbouring islands and the inland waters of North America, Europe and Asia. Only a few have spread naturally beyond this range, as in the Atlas Mountains of northern Africa. However, several species have been widely distributed and have become well established far beyond their natural range by the help of man.

Virtually all Salmonidae make some sort of migration to spawn. Those that live habitually in fresh water may ascend the stream they occupy only a short distance; inhabitants of lakes migrate somewhat farther as they ascend the streams; while those species that live chiefly in the sea make long migrations, to and in freshwater rivers, some of which are exceedingly great as shown subsequently. Salmonidae are carnivorous, and normally feed on live bait. Fish, crustaceans and many insects are included in the diet.

The Salmon (genus *Oncorhynchus*).—The name, salmon, when used herein as a group name is restricted to the several species of the Pacific belonging to the genus *Oncorhynchus*. This is done, notwithstanding that the name salmon no doubt was used for the anadromous species of the genus *Salmo* long before it came into use for the members of the genus *Oncorhynchus*. This procedure seems necessary because no other common English name is available for *Oncorhynchus*, whereas most of the species of the genus *Salmo* have long been known as trout. Therefore, the common Atlantic salmon, and its relatives, will be discussed in this article under the general group name, "trouts."

The salmon, as defined in the preceding paragraph, differ externally from the trouts and charrs in the size of the anal fin. In the salmon this fin is longer than it is high and has 13 or more developed rays, whereas in the trouts and charrs it is higher than it is long and has fewer than 12 developed rays.

Five commercially important species of salmon of the genus *Oncorhynchus* occur on the Pacific coast of the United States and northward to Alaska, and to northern Asia, with a few more that are restricted to Japan and vicinity. These fishes are the source of the large annual pack of canned salmon shipped to virtually all parts of the world, and constituting a familiar article of diet to many millions of people. The catch for the United States, Canada and Alaska ran up to the impressive total of approximately 825,145,000 lb. in 1941. Of this amount the United States contributed about 86,455,700 lb., Canada 193,664,200 lb., and Alaska 545,024,370 lb.

Of the five important species of salmon, the Chinook or king salmon, *Oncorhynchus tshawytscha*, grows the largest, occasionally attaining a weight of 70 to 100 lb., though the average weight probably does not exceed 20 lb. However, only about 5.5% of the total catch for the United States, Canada and Alaska for 1941 consisted of this species, the smallest amount yielded by any one species.

The chum or dog salmon, *Oncorhynchus keta*, although much smaller than the king salmon, generally weighing only about 7-10 lb., contributed about 18% to the catch of 1941. The silver salmon, *Oncorhynchus kisutch*, attaining an average weight of about 5 to 8 lb., furnished about 21%; the sockeye or blueback, *Oncorhynchus nerka*, which also reaches a weight of about 5 to 8 lb., yielded about 26%; and the pink or humpback salmon, *Oncorhynchus gorbuscha*, averaging only about 3-5 lb. in weight, furnished about 29% of the 1941 catch. Therefore, the smallest of the five species exceeded every other species in the quantity supplied.

It is evident from the foregoing statistics that by far the greater part of the catch of salmon came from Alaska in 1941, as has been the case for many years. The catch in the United States has declined more or less gradually. For example, in 1928 it amounted to 131,792,900 lb., in 1934 to 106,691,900 lb. and in 1941 to 86,455,700 lb. Assuming that the efforts devoted to fishing remained about the same, the decline is impressive. The depletion is not so great as it is for the Atlantic salmon, *Salmo salar*, on the coast of the United States, as will be shown subsequently. Yet it is evident that the decline is serious. How to overcome the obstacles occasioned by industrial developments, especially the high dams built across salmon streams, awaits a satisfactory solution.

The salmon as well as some of the trouts, are anadromous. That is, they migrate from the sea to fresh-water streams to spawn. Some of the species ascend streams to their headwaters, whereas others spawn in the lower stretches of rivers. The king salmon goes to the headwaters. It has been found in the upper Yukon river, 3,000 mi. or so from the sea. The pink salmon, on the other hand, commonly spawns only a few miles above salt water.

The fish come in from the sea in fine condition. Upon entering fresh water they cease feeding, and sometimes they wear themselves out completely trying to reach proper places to deposit their eggs. They will ascend rapids and falls, often jumping vertically several times their own length in passing difficult places. By the time they have spawned they often are terribly emaciated, and have broken and ragged fins. However, whether worn out or still in fair condition the fish die after spawning. It is not known that a salmon has lived to spawn more than once.

When the fish reach the spawning ground, which it is believed is more or less in the selfsame spot where these mature males and females themselves were hatched, the female with body, tail and fins prepares a trough-shaped depression in gravel or sand. The eggs are deposited in the "nest" thus prepared, and are fertilized at the same time by the male. Upon completion of this process the female covers the eggs with the excavated or other material, which is the final act in the life cycle. She, as well as the male, now appear to have lost interest in life. They drift downstream more or less with the current, and as already indicated they soon die.

The relatively large eggs, $\frac{1}{4}$ in. or more in diameter, may hatch in 60 days, though the incubation period may be prolonged several days by a drop in the temperature of a degree or two and shortened several days by a similar increase in temperature.

The newly hatched fish with their tremendously large yolk sac are quite helpless. They remain hidden among pebbles on the spawning ground until the yolk is absorbed. At that stage in life the young fish begin to swim about and to seek food. After remaining in fresh water from a few months to perhaps a year or more they descend the streams and enter salt water. When once in salt water the fish grow rapidly.

Sometime between the ages of two to seven years the fish have matured. Sexual products have developed, and the urge to spawn causes them to re-enter the fresh-water streams they descended to fulfil their final mission in life, in the same vicinity where their ancestors completed their life cycle.

The Trouts (genus *Salmo*).—The trouts are among the most difficult fishes to classify. Indeed, scarcely two ichthyologists agree as to the number of species that should be recognized. What one authority regards a valid species another may recognize as

only subspecifically distinct, or only as a variety or race. The reasons for the confusion are the irregularities in the anatomical structures, the great variation in colour and the confusing irregularities in habits. Regardless of these difficulties, some generally accepted species exist, but a reasonable and logical interpretation of the group as a whole is missing. The problem may now be virtually impossible of satisfactory solution, because of the near extinction of certain forms of restricted distribution. Furthermore, through fish culture seemingly fertile hybrids have been produced, and various forms have been distributed and have become intermixed with native species.

The Atlantic salmon, *Salmo salar*, is one of the well-known and generally recognized species of the genus. It occurs on both sides of the North Atlantic and ranges well within the Arctic circle. In Europe it occurs as far south as the Bay of Biscay, and in North America to Cape Cod and formerly to the Hudson river. It has many near relatives that live habitually in fresh-water lakes and streams.

Salmo salar has been greatly reduced in abundance in some parts of its range. In New England it may be listed among the "vanishing animals." This depletion is in part the result of over-fishing, but the construction of dams across rivers without providing "fish ladders," and the pollution of streams have constituted a far greater menace. Whether the streams formerly occupied can again be made suitable and the fish restored is an unsolved problem. Neither is it known whether the fish can be brought back in commercial numbers in those rivers that are still frequented to a limited extent.

The life history of *Salmo salar* is better known than that of any other species of the family, and therefore is described herein in some detail. In general, it is similar to that of the Pacific salmon. It also ascends rivers to spawn, but unlike the Pacific salmon it does not habitually die after spawning. To the contrary, an Atlantic salmon may live to spawn three or four times. The migration upstream starts in the autumn and occurs from October to February. *Salmo salar*, like the Pacific salmon, does not feed while in fresh water en route to its spawning ground. In the meantime the sexual products are developed at the expense of the other tissues. This causes the flesh, which was red and fat when the fish left the sea, to become pale and watery. In the breeding male the jaws become prolonged during migration; the lower one becomes curved upward, or even acquires a hook, and the teeth grow large. The silvery colour becomes replaced by a dull gray in the female, while the male acquires irregular dark and reddish spots on the body.

The eggs, as in the Pacific salmon, are deposited in shallow excavations made in sand or gravel by the female and covered by her after spawning is finished. The eggs are 6 or 7 mm., or fully $\frac{1}{4}$ in. in diameter, and incubation extends over a period of about 5 months.

The newly hatched fish is 15-18 mm., or about $\frac{1}{2}$ in. long. It is quite helpless at first and lies hidden among the pebbles until the big yolk sac it retains at hatching is absorbed. When the yolk is all gone the fish is an inch or more long. It then swims actively and begins its search for food. The little fish, known as a "parr," soon becomes brilliant in colour, and has 10 or 11 dark cross bars, alternating with bright red spots.

The parr live in fresh water a variable length of time, according to the locality and factors not well understood. Most of the fish migrate to the sea principally in the spring and early summer, at the age of two years, when they have attained a length of about six inches. However, some linger in fresh water, especially in northern localities, three, four, five or even six years.

When the young fish approach tidewater they lose the bars and spots, and become silvery for their sojourn in the sea. These fish, now known as "smolts," stay in or near the mouths of rivers and in estuaries for some time, although by fall they have disappeared. Little is known of their movements during the first winter in the sea. It is certain, however, that they grow rapidly on the abundant diet in the ocean, for when they reappear on the coast the following spring they are 16 in. and more in length, and weigh 1½-7 lb. or, rarely, even more. The fish, now known as

"grilse," are distinguishable from older fish by the slender body, smaller head, more deeply forked caudal and by the more numerous spots on the body, which at this stage in life are bluish rather than black.

A few individuals, especially males, may spawn during the grilse stage, but the great majority remain in the sea. Many fish spawn after living in the ocean two years, while others do not make a return migration for three, four or even five years. As it is improbable that any Atlantic salmon lives more than eight or nine years, it follows that the individuals that spawn three or four times, as stated elsewhere, are the ones that reproduce early in life, and not the ones that remain at sea four or five years and spawn for the first time at the age of about six or seven years.

A tremendously large size for a trout is attained by the Atlantic salmon. An individual weighing 83 lb. has been reported from England. None even approaching such a weight has been found in America where a 50-lb. fish is a rarity. Large individuals are not necessarily very old, as they probably are fish that remained on rich feeding grounds in the sea without spawning. As the fish while en route to the spawning grounds do not feed, they become emaciated, and growth is greatly retarded. In general, the individuals that begin spawning early in life and spawn every year do not grow large, whereas those that spawn for the first time late in life, and perhaps spawn only once, reach a large size.

Landlocked Salmon (*Salmo* sp.).—It already has been stated that the Atlantic salmon has many near relatives that habitually live in fresh water. The nearest of all are the landlocked forms. The lake dwellers received this name from the belief long held that their ancestors, *Salmo salar*, in some way became shut off from the sea and were obliged to remain in fresh water. It seems more probable in the light of present knowledge that some young *Salmo salar* found certain lakes, which they reached while migrating toward the sea, a sufficiently agreeable substitute for the ocean to remain there voluntarily and permanently. Thus, landlocked salmon seems to be a misnomer, and "lake salmon" has been suggested as a substitute.

Under the influence of the new environment in the lakes the progeny in the course of time diverged sufficiently from the parent stock, *Salmo salar*, to become recognized as distinct species. In fact, several species have been named, but in this case as in others general agreement as to their validity is lacking. Therefore, no attempt to list the species herein has been made.

Colonies of landlocked salmon exist in New England, eastern Canada and in Europe. While these fish spend most of their lives in lakes, they retain the migratory instinct of their ancestors and ascend rivers to spawn. In general, landlocked salmon run smaller than the Atlantic salmon, though individuals weighing 20 lb. and more have been reported. They are protected and reserved for sport, only, in the United States.

Numerous other species of *Salmo* occur in the fresh waters of North America, and of Europe, and a few are found in the mountains of northern Africa. The fresh-water trouts are especially difficult to classify. Among them are the brown trout, *Salmo trutta*, and the Loch Laven trout, *Salmo leuvenis*, of Europe, which have long been subjects of fish culture and have been widely distributed artificially.

In western North America there are numerous closely related species of *Salmo*, which J. O. Snyder regarded as belonging to two main groups. These he called "rainbow series" and the "cut-throat series." The same investigator, after many years of study, came to the conclusion that the steelhead trout, long held to be a distinct species somewhat intermediate of the rainbow and cut-throat trouts, is not entitled to specific rank. Professor Snyder said, "A steelhead is a sea migrant of the particular species inhabiting the stream, and in our waters (California) it may be either a cut-throat steelhead or a rainbow steelhead, and there is no occasion to apply a Linnaean binomial name to a steelhead as such." (John O. Snyder, "The Trouts of California," *Calif. Fish and Game*, vol. 26, no. 2, April 1940, Dept. Nat. Resources, State of California.)

The steelhead trout offers another illustration of the extreme

difficulties met in classifying trouts. It is also an illustration of the diversity of habits, since it shows that some rainbow and cut-throat trouts retain the migratory instinct of distant ancestors and continue to migrate to the sea, whereas others remain in fresh water throughout life.

The rainbow and cut-throat trouts are extensively cultivated in America, where they also are protected and reserved for sport. There are many records of rainbow and cut-throat trouts weighing 20 lb. and more, but the average size is much smaller.

Chars (genus *Salvelinus*).—Many species of char occur in Europe and the cold regions of the north, the range extending far into the Arctic circle. Some of the species continue to live in salt water, like all the ancestors of the living species no doubt did. However, others have become chiefly or wholly restricted to fresh water. Certain species that live in fresh water in the southern part of their range throughout life will enter salt water if they inhabit streams adjacent to cold seas. *Salvelinus fontinalis*, known in the United States as the "eastern brook trout," for example, ranges southward into Georgia, but it enters the sea only from Cape Cod northward. Even there only a part of the population of any one river "run down" to the sea. The ones that enter salt water are called "sea trout." These fish are not to be confused, however, with the sea trout of the southern shores of the U.S. which are not *Salmonidae*, but are members of the croaker family, *Sciaenidae*.

The chars, that is, the species of the genus *Salvelinus*, generally are distinguishable from the trouts of the genus *Salmo* by the smaller scales, which are so minute as to be hardly visible in some species, and usually they may also be distinguished by the colour, since the chars have reddish spots, whereas the trouts have dark ones. However, for certain identification it is necessary to examine the teeth on the roof of the mouth. In *Salvelinus* teeth are present in a group on the anterior part of the vomer only, whereas in *Salmo* the teeth extend back on the vomer in a double zigzag series.

The chars generally are valued as food and game fishes. Thus, the eastern brook trout in America is extensively cultivated, and has been distributed by man far beyond its natural range, and is protected as a game fish. However, there is a disliked member, the "Dolly Varden trout," *Salvelinus malma*, which occurs in the Pacific coast states of the U.S. and ranges northward to Alaska, Kamchatka, U.S.S.R., and to Japan. The Dolly Varden is highly predatory, destructive of salmon eggs and young salmon and is not regarded as a good game fish.

Chars generally do not run large in size, often attaining a length of only about 10-12 in., though some individuals of those species that run down to the sea may attain a length of about 24 in.

The Great Lakes Trout (*Cristivomer namaycush*).—This fish, as its name indicates, lives in the Great Lakes of North America, and in other deep lakes northward and beyond to the Arctic circle. It does not belong to one of the major groups of *Salmonidae* named at the beginning of this article, though its relationship is with the trouts, genus *Salmo*. It is readily distinguished, however, as it lacks bright colours, and has pale yellow or grayish spots rather than dark ones. Further, its tail is more deeply forked. Although it does not belong to one of the major groups of *Salmonidae*, it is important enough to require at least brief mention. It is among the largest of the entire family. A maximum weight of 90 lb. has been reported. Certainly a weight of 50 to 80 lb. is occasionally attained, though the average weight of the fish that reach the markets is less than 10 lb. While the Great Lakes trout is chiefly a commercial fish, it is also a game fish of importance. The annual catch for the Great Lakes is around 10,000,000 lb. (S. F. Hb.)

SALMON-BERRY (*Rubus spectabilis*), a vigorous North American shrub of the raspberry genus, native from California to Alaska and eastward to Idaho, bearing rose-coloured flowers and large salmon-coloured edible berries. The name is applied also to the thimble-berry (*R. parviflorus*), of similar range but extending farther eastward, with white flowers and red scarcely edible fruit.

SALMONEUS, in Greek mythology, son of Aeolus (king of Magnesia, in Thessaly, looked upon as the mythic ancestor of the Aeolian race), grandson of Hellen and brother of Sisyphus. He removed to Elis, where he built the town of Salmone, and became ruler of the country. His subjects were ordered to worship him under the name of Zeus; he built a bridge of bronze, over which he drove at full speed in his chariot to imitate thunder, the effect being heightened by dried skins and cauldrons trailing behind, while torches were thrown into the air to represent lightning. At last Zeus smote him with his thunderbolt, and destroyed the town (Apollodorus I, 89; Hyginus, *Fab.*, 60, 61; Strabo viii, p. 356; Manilius, *Astronom.*, 5, 91; Virgil, *Aen.*, vi, 585). This is a confused recollection of some old rite of weather magic. At Crannon in Thessaly there was a bronze chariot, which in time of drought was shaken and prayers offered for rain (Antigonus of Carystus, *Historiae mirabiles*, 15).

Fraser, *Golden Bough*, see index s.v.; another interpretation in S. Reinach, *Cultes, Mythes et Religions*, II, 186.

SALOME, the name of one of the women present at the crucifixion of Jesus (Mk. xv, 40) and at the sepulchre (xvi, 1). The name is derived from Heb. *shalôm*, "peace." Comparison with Matt. xxvii, 56, suggests that she was the wife of Zebedee. The name was borne by some of the Herod family also, notably by the daughter of Herodias by her first husband, the disinherited Herod Philip. She is probably the "damsel" (whose name is not given) mentioned in connection with the death of John the Baptist (Matt. xiv, 3-6; Mk. vi, 17-22). She afterward married her uncle, Herod Philip the Tetrarch. The rendering in Mk. vi, 22 adopted by Hort, however, assumes that the girl daughter was Herod Antipas' own daughter, also called Herodias.

See Josephus, *Ant. XVIII* v, 4; *Jewish War*, I, xxx, 1; Justin, *Dial.* 49; Schürer, *The Jewish People in the Time of Jesus Christ*.

SALOMON, ALICE (1873-1948), German social worker and educator, was born in Berlin, of Jewish parentage, in 1873. She was one of the first women granted a Ph.D. degree from the University of Berlin (1906), where her doctoral thesis concerned the inequality of pay between men and women doing equivalent work. Although she attended a general university, her experience there convinced her that training for social work ought properly to be received in special schools. She originated the first regular training course in this field (1899), which grew into the first German social work school, and was president of the school until her retirement in 1925. She was also president of the Federation of German Schools for Social Work and thus trained and influenced the next generation of social workers. Throughout this period, she was active in international feminist work and studied social conditions outside Germany.

During World War I, she organized the German women's voluntary work. After 1918, she remained aloof from political activities, convinced that social workers served their community best if unaffiliated. In 1932 she received a medal for special service to the state, by unanimous consent of the Prussian cabinet. At the same time, the University of Berlin gave her an honorary M.D. degree, and the social work school founded by her was renamed the Alice Salomon school. In 1937 she was exiled from Nazi Germany and went to the U.S., where she continued her work as a lecturer. She died Aug. 30, 1948, in New York City.

SALOMON, HAYM (1740-1785), early American financier and patriot of Jewish-Portuguese origin, was born in Lissa, Poland in 1740. He went to America following some revolutionary activities in defense of Polish liberty.

When he arrived in New York, he established himself as a commission merchant, and his personality and keen discernment

soon made him a successful financier. During the American Revolutionary War, Salomon was with the patriotic party known as "Sons of Liberty." Within a short time he was made financial agent of the French government, for which services he accepted no commission. His ability and patriotic activities brought him to the attention of Robert Morris, who assigned him to the office of the superintendent of finance, where he handled all the bills of exchange.

Among his many other contributions to the colonies, Salomon subscribed heavily to government loans, endorsed notes, gave generously to soldiers and statesmen, and equipped several military units with his own money. He was made interpreter during the war, and was permitted to go into the British lines, but on two occasions was thrown into prison. He escaped, but suffered ill health from exposure, which later led to his death.

While living in Philadelphia (1778-85), Salomon initiated a measure in behalf of Jewry in the state of Pennsylvania which later resulted in more liberal conditions of employment for them. At that time, persons seeking to qualify for civic employment in Pennsylvania were required to take an oath affirming their belief in the New as well as the Old Testaments. Salomon presented a petition to the Council of Censors on Dec. 23, 1783, in which he requested the removal of this condition, so that public service might not be closed to orthodox Jews. Later, the constitution of the state was so amended.

Salomon died in Philadelphia, Pa., on Jan. 6, 1785.

SALON (-de-Provence), a town of southeastern France, in the department of Bouches-du-Rhône, 40 mi. N.N.W. of Marseilles by rail. Pop. (1936) 9,047. Salon is situated on the eastern border of the plain of Crau and on the irrigation canal of Craponne. The church of St. Laurent is 14th century, and the church of St. Michel (12th century) has a fine Romanesque portal. The central part of the town preserves a gateway of the 15th century and the remains of fortifications. There are remains of Roman walls near Salon, and in the *hôtel-de-ville* (17th century) there is a milestone of the 4th century.

The town carries on trade in olive oil and soap. Olives are grown in the district, and there is a trade in them.

SALONIKA (sah-lôn'-kə, popularly sâ-lôn'-kə) or **THESSALONIKE**, as the name was officially fixed in August 1937, the capital of Greek Macedonia, and one of the principal seaports of southeastern Europe. Pop. (1928, last census before World War II) 236,524, including some 50,000 Sephardic Jews, whose ancestors fled thither in the 16th century from Spain and Portugal; their language is a corrupt form of Spanish, called *Ladino* (i.e., Latin).

Salonika lies on the west side of the Chalcidic peninsula, at the head of the Gulf of Salonika (*Sinus Thermaicus*), on a fine bay whose southern edge is formed by the Kalamara heights, while its northern and western side is the broad alluvial plain produced by the Vardar and Vistritza rivers.

Antiquities.—The Via Egnatia of the Romans (Grand Rue du Vardar) traverses the city from east to west, between the Vardar gate and the Kalamara gate. Excavations there have revealed the Hellenistic *agora* near the present prefecture. Two Roman triumphal arches used to span the Via Egnatia. The arch near the Vardar gate—a massive stone structure probably erected towards the end of the 1st century A.D., was destroyed in 1867 to furnish material for repairing the city walls; an imperfect inscription from it is preserved in the British museum. The other arch, assigned to the reign of Galerius (A.D. 305-311), is built of brick and partly faced with sculptured marble.

The ecclesiastical architecture of Salonika was once remarkable for its specimens of early Christian (Byzantine) origin and style, with well-preserved mural decorations. St. Sophia (Aya Sofia), formerly the cathedral, probably erected in the 6th century by Justinian's architect Anthemius, was converted into a mosque in 1589. The nave, forming a Greek cross, is surmounted by a

hemispherical dome covered with a rich mosaic representing the Ascension. St. Demetrius, which was probably older than the time of Justinian, consisted of a long nave and two side aisles, each terminating eastward in an atrium the full height of the nave, in a style not known to occur in any other church. This church was destroyed by the great fire of 1917. It is partly repaired but mainly ruinous. St. George's, conjecturally assigned to the reign of Constantine (d. 337), is circular in plan, measuring internally 80 ft. in diameter. The external wall is 18 ft. thick, and at the angles of an inscribed octagon are chapels formed in the thickness of the wall, and roofed with wagon-headed vaults visible on the exterior; the eastern chapel, however, is enlarged and developed into a bema and apse projecting beyond the circle, and the western and southern chapels constitute the two entrances of the building. The dome is covered throughout its entire surface of 800 sq. yd. with what is the largest work in ancient mosaic still extant, representing a series of fourteen saints standing in the act of adoration in front of temples and colonnades. The Eski Juma, or Old Mosque, is another interesting basilica, evidently later than Constantine, with side aisles and an apse without side chapels.

Salonika is the see of an Orthodox Greek archbishop. Each religious community has its own schools and places of worship, among the most important being the Jewish high-school, the Jesuit college, a high-school founded in 1860 and supported by the Jewish Mission of the Established Church of Scotland, a German school, dating from 1887, and a college for boys and a secondary school for girls, both managed by the French *Mission Laïque* and subsidized after 1905 by the French government.

Railways, Harbour and Commerce.—Salonika is the principal Aegean seaport of the Balkan Peninsula, the centre of the import trade of all Macedonia, and the natural port of shipment for the products of an even larger area. It is the terminus of four railways. One line goes north to Nish in Serbia, where it meets the main line (Paris-Vienna-Constantinople) of the Oriental railways; another, after following the same route as far as Üsküb in Macedonia, branches off to Mitrovitza in Albania. A third line extends westward from Salonika to Monastir. A fourth, the Constantinople junction railway to Constantinople, was partly dismantled and put out of use in 1921, but re-organized later. It now runs via Séres and Kavalla and joins the main line at Kuleli Burgas.

The new harbour, which was opened to navigation in Dec. 1901, allows the direct transhipment of all merchandise whatever may be the direction of the wind, which was previously apt to render shipping operations difficult. The harbour works consist of a breakwater 1,835 ft. long, with 28 ft. of water on its landward side for a width of 492 ft. Opposite the breakwater is a quay 1,475 ft. long, which was widened in 1903-07 to a breadth of 306 ft.; at each end of the quay a pier 656 ft. long projects into the sea. Between the extremities of these two piers and those of the breakwater are the two entrances to the harbour. Salonika exports grain, flour, bran, silk cocoons, chrome, manganese, iron, hides and skins, cattle and sheep, wool, eggs, opium, tobacco and fennel. Other industries are cotton-spinning, brewing, tanning, iron-founding, and the manufacture of bricks, tiles, soap, flour, ironmongery and ice. The spirit called *mastic* or *raki* is largely produced.

Province of Macedonia, of which Salonika is the capital, is rich in minerals, including chrome, manganese, zinc, antimony, iron, argentiferous lead, arsenic and lignite, but some of these are unworked. The chief agricultural products are grain, rice, beans, cotton, opium and poppy seed, sesame, fennel, red pepper; there is also some trade in timber, live stock, skins, furs, wool and silk cocoons. Apart from the industries carried on in the capital, there are manufactures of wine, liqueurs, sesame oil, cloth, macaroni and soap. The principal towns, Séres, Vodena and Kavalla, are described in separate articles; Tikvesh is the centre of an agricultural region, Karaferia a manufacturing town, and Drama one of the centres of tobacco cultivation. The total population of Macedonia is in the neighbourhood of 1,500,000. This total includes the large number of refugees who were settled

here after 1922. The Greeks form about 90% of the population; there are no Muslims except those of Albanian origin. Bulgarians number about 77,000, being about 5% of the total.

History.—Thessalonika was built on the site of the older Greek city of Therma, so called in allusion to the hot-springs of the neighbourhood. It was founded in 315 B.C. by Cassander, who gave it the name of his wife, a sister of Alexander the Great. It was a military and commercial station on a main line of communication between Rome and the East, and had reached its zenith before the seat of empire was transferred to Constantinople. It became famous in connection with the early history of Christianity through the two epistles addressed by St. Paul to the community which he founded here; and in the later defence of the ancient civilization against the barbarian invasions it played a considerable part. In A.D. 390, 7,000 citizens who had been guilty of insurrection were massacred in the hippodrome by command of Theodosius. Constantine repaired the port, and probably enriched the town with some of its buildings. During the iconoclastic reigns of terror it stood on the defensive, and succeeded in saving the artistic treasures of its churches; in the 9th century Joseph, one of its bishops, died in chains for his defence of image-worship. In the 7th century the Macedonian Slavs strove, but failed, to capture the city. It was the attempt made to transfer the whole Bulgarian trade to Thessalonika that in the close of the 9th century caused the invasion of the empire by Simeon of Bulgaria. In 904 the Saracens from the Cyrenaica took the place by storm, and the inhabitants to the number of 22,000 were sold as slaves throughout the countries of the Mediterranean. In 1185 the Normans of Sicily took Thessalonika after a ten days' siege, and perpetrated endless barbarities, of which Eustathius, then bishop of the see, has left an account. In 1204 Baldwin, conqueror of Constantinople, conferred the kingdom of Thessalonika on Boniface, marquis of Montferrat; but in 1222 Theodore, despot of Epirus, one of the natural enemies of the new kingdom, took the city and had himself crowned there by the patriarch of Macedonian Bulgaria. On the death of Demetrius, who had been supported in his endeavour to recover his father's throne by Pope Honorius III., the empty title of king of Salonika was adopted by several claimants. In 1266 the house of Burgundy received a grant of the titular kingdom from Baldwin II. when he was titular emperor, and it was sold by Eudes IV. to Philip of Tarentum, titular emperor of Romania, in 1320. The Venetians to whom the city was transferred by one of the Palaeologi, were in power when Murad II. appeared and on May 1st, 1430, in spite of the desperate resistance of the inhabitants, took the city, which had thrice previously been in the hands of the Turks. They cut to pieces the body of St. Demetrius, the patron saint of Salonika, who had been the Roman proconsul of Greece under Maximian and was martyred in A.D. 306. In 1576 the French and German consuls at Salonika were murdered by the Turkish populace. On Sept. 4, 1890, more than 2,000 houses were destroyed by fire in the south-eastern quarters of the city. During the early years of the 20th century Salonika was the headquarters of the Committee of Union and Progress, the central organization of the Young Turkey Party, which carried out the constitutional revolution of 1908. Before this event the weakness of Turkey had encouraged the belief that Salonika would ultimately pass under the control of Austria-Hungary or one of the Balkan States, and this belief gave rise to many political intrigues which helped to delay the solution of the Macedonian question.

When the first Balkan War broke out in 1912, Salonika surrendered to the Greeks on the festival of its patron, St. Demetrius, Nov. 8, after 482 years of Turkish occupation. King George I. proceeded to what was now the second largest city of his kingdom, but was assassinated there on March 18, 1913, by a Greek, named Schinasi.

The Treaty of London of May 30, 1913, assigned Salonika to Greece, and the battle of Kilikis in the second Balkan War of that year prevented the Bulgarians from approaching it. Salonika was becoming more and more Hellenized when World War I brought it into prominence as the base of the Allied

operations in the Near East. (See SALONIKA CAMPAIGNS 1915-18.)

In 1916 a Venizelist revolution against King Constantine broke out there, and on Oct. 9 E. Venizelos arrived and formed a provisional government, which the Allies recognized, and to which Lord Granville was accredited as British representative. This government declared war on Nov. 23 against Bulgaria and Germany. On Aug. 18, 1917, a great fire destroyed a large part of the city, including the church of St. Demetrius. After the war an arrangement was made by which Yugoslavia should have a "Serbian Zone" in the harbour. After the proclamation of the Greek republic, Salonika often had a decisive voice in politics, and the large immigration of Greek refugees from Asia Minor further Hellenized the country round it. Salonika again figured prominently in World War II.

German forces driving southward from Bulgaria captured the city April 9, 1941, only three days after their initial assault on Greece. By so doing they cut off all Thrace from the rest of Greece and split Macedonia in two.

See General Sarraill, *Mon Commandement en Orient, 1916-18* (1920); P. Rusal, *La Ville Convoitée, Salonique* (1914); *Greek Refugee Settlement* (League of Nations, Geneva, 1926).

SALONIKA CAMPAIGNS 1915-18. Under the heading SERBIAN CAMPAIGNS the collapse and subjugation of Serbia in 1915 is related in this work. The present article describes the campaigns in Salonika which formed the sequel to this Allied disaster.

I. OBJECTS OF THE EXPEDITION

Although undertaken for political objects—to bring relief to a hard-pressed ally and to check the influence of Germany in the Balkans—the Salonika campaigns were ultimately crowned by the first decisive military success of the World War. For on the Macedonian front the continent-wide trench barriers of the Central Powers were first breached beyond repair, and there too was knocked away the first national prop—Bulgaria—of the Germanic alliance. To disentangle cause from effect is difficult where moral, military and economic threads are so closely interwoven as in the years 1914-18, yet the fact at least stands out that the overthrow of Bulgaria began the series of national capitulations which ended with that of Germany on Nov. 11, 1918.

If Salonika was for several years an unproductive field of military effort, an infringement of the law of economy of force, which in some measure justified the German gibe that it was their largest concentration camp—"an enemy army, prisoner of itself"—the historian, when weighing his verdict, must throw the counterpoise of 1918 into the scales. And not this only, for it must be remembered that the Allied occupation of the Salonika front made possible the rebuilding of the Serbian army—from the ragged and disorganized survivors of the 1915 winter retreat through Albania to the well-equipped and irresistible force which broke through the Vardar front in Sept. 1918. On the credit side also must be set the fact that the Salonika expedition prevented the danger that Greece might become a submarine base for the Central Powers, one which would have lain in deadly proximity to the British artery of communication with the East via the Suez Canal. And again, that the Allied force contained the bulk of the Bulgarian army—although it is perhaps doubtful whether these would have placed their services at Germany's disposal for any front more remote from their homeland.

Although the Salonika expedition was the immediate outcome of the Serbian debacle of Sept.-Oct. 1915, the idea had an earlier origin. For Salonika was not only the one feasible channel of Allied communication with and supply to Serbia, but that front offered a possible strategic flank for attack once the trench line on the western front had been welded into a seemingly impenetrable barrier. As far back as 1914, British and French naval missions, with guns, had been sent to support the Serbians, and they had also been supplied with munitions by the Salonika route. The question, too, had been mooted of a larger employment of military force in that theatre, but British commitments at Gallipoli led to this project being shelved—until the Bulgarian mobilization for war on the side of the Central Powers.

Throughout the summer of 1915 the two warring coalitions had been bidding for intervention on the part of the Bulgarians, and in this diplomatic bargaining the Entente suffered a moral and a material handicap—the first, their obvious failure at the Dardanelles; the second, Serbia's reluctance to concede any part of Bulgarian Macedonia, which she had seized as her share of the spoils of the second Balkan war of 1913. As this was the one prize on which the Bulgarians had set their heart, and as Austria had nothing to deter her from offering territory that belonged to her enemy—Serbia—the Entente offers failed to attract Bulgaria. Her intervention on the opposite side meant that free communication could be easily established between Germany and Turkey, and as a consequence that the Entente forces on the Gallipoli peninsula were imminently menaced.

II. THE RETREAT TO SALONIKA

Faced with this critical situation, the French and British Governments decided, albeit tardily, to succour Serbia with an expeditionary force.

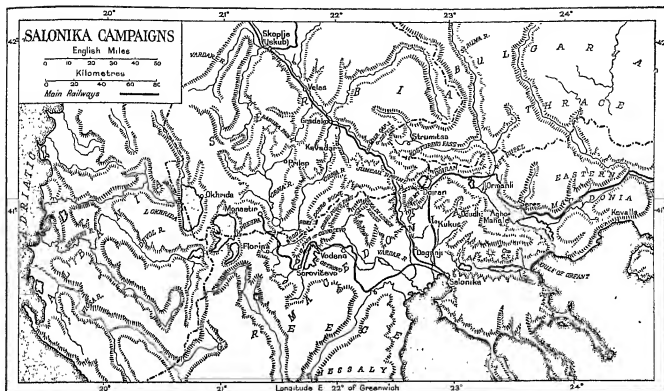

In this the French Government took the lead and nominated as commander Gen Sarraill, the former chief of the III. Army in the Verdun sector. Sarraill's political activities had earned him the distrust of the military authorities; but the same factor, through his influence with the parties of the Left, made it difficult to ignore him completely. His removal by Joffre from the III. Army command placed the Government in a temporary dilemma, and they eagerly seized the opportunity of placating Sarraill and his political supporters by appointing him to a conveniently distant theatre of war.

While the constitution of Sarraill's force was still under discussion, the Bulgarian mobilization on Sept. 22 forced the hands of the Entente Governments. A hurried order was sent for the dispatch to Salonika of contingents from Gallipoli, preliminary to the arrival of reinforcements from France. Preceded by staff officers, the British 10th and French 156th Divs began to disembark at Salonika on Oct. 5, and they were followed by the French 57th Division. On the same day, however, the Greek promise of aid to Serbia, made by M. Venizelos, was repudiated by King Constantine, and the Venizelist Government fell—to be replaced by that of M. Zaimis, which took neutrality as its keynote. This reacted at once not only on the Franco-British plan but on their operations. The Greek officials, civil and military, at Salonika did their best, or worst, to obstruct the disembarkation of the Allied contingents.

To increase the confusion, the intended concentration point was several times changed by successive orders from Paris until, on Sarraill's arrival on Oct. 12, he decided, in view of his slender resources and the doubtful attitude of the Greek army in his rear, to concentrate no further forward than the Demir Kapu (Demir Kapija) defile. The limited object was to protect the railway and to ease the pressure on the Serbian forces to the north by repelling a Bulgarian advance from Strumitsa (Strumica)—which would sever that line and so the Serbian line of retreat. Meanwhile, the British troops under Gen. Mahon began moving up to Doiran, in echelon behind the right of the French.

On Oct. 14 the vanguard of the French troops came into action at Strumitsa station (in Serbia), driving back a Bulgarian reconnaissance, and on Oct. 17, in response to Serbian urgings, a brigade was sent forward beyond the Demir Kapu defile as far as Krivolak. Reinforced by the arrival of the French 122nd Div. Sarraill began, on Nov. 3, an offensive northward to facilitate the Serbian retreat. But the seizure of the Babuna pass by the Bulgarians closed the channel of southward retreat for the main Serbian army, and finally shattered the hope that the Serbians might fall back on the relieving force, as was the advice of their allies.

Sarraill was thus faced with a difficult problem. On the one hand the gallant French efforts to break through toward the Babuna had failed and they were forced on the defensive, and, on the other, he received news of the Serbian decision to retreat westward through Albania toward the Adriatic. With his small force thus isolated he took the only possible decision—to fall

MAP SHOWING THE TERRAIN OF THE SALONIKA CAMPAIGNS IN 1915-1918. NATIONAL BOUNDARIES ARE INDICATED BY THE BROKEN LINE

back towards Salonika. This decision raised further problems. Were they to hold on there, or evacuate Greek soil altogether? With the disappearance of Serbia beneath the enemy flood, the Entente Powers could no longer claim that they were at Salonika merely to use a line of communication to which Serbia was by treaty entitled. The other justification, that they had come at the request of the Greek Government was now nullified by the downfall of Venizelos. Considerations of prestige and their desire to use Salonika as a base for diplomatic operations in the Balkans led the Entente Governments to remain, but without any clear policy as to the future.

Even with the decision to retreat taken, the Franco-British forces were not "out of the wood." The withdrawal had to be made down a single-track railway, through a country without roads—converted by the autumn rains into a swamp—and in face of a pursuing enemy. The retreat was made by echelons, in four stages, and only by a narrow margin did the French frustrate Bulgarian efforts to outflank and cut their retreat, first at the Demir Kapu defile, and again at Strumitsa station. The British, too, on the right were heavily attacked, and any weakening of their line at this critical juncture might have been fatal to the extrication of the Allied forces from the noose into which they had been pushed.

Fortunately, once the Greek frontier was regained the pursuit halted—mainly because the Germans were reluctant to undertake further commitments in the Balkans to the detriment of their strength in other theatres. Falkenhayn held that the Macedonian operations should be left to the Bulgarians, but this policy overlooked the fact that the Greeks, however friendly to the Germans, would have resented any invasion of their territory by the Bulgarians. Thus by Dec. 12 the retreating forces were safely out of reach of their pursuers, facing them across the frontier. After pausing for a few days on a line stretching roughly from Sorovichevo to Lake Doiran, the withdrawal was resumed, and by Dec. 18 the forces of Sarraill and Mahon were back in the vicinity of Salonika. Covering this base an entrenched line was constructed, on an 80m. arc stretching from the mouth of the Vardar through Doganli to the Gulf of Orfano, and occupied early in the new year.

Allied Reinforcements.—The delay in the expected en-

emy offensive enabled the Entente force to receive reinforcements, not only French and British but Serbian, for the remnant of their army, after resting and being re-equipped at Corfu, was brought round to Salonika. From April onwards the stream steadily swelled until by July their strength on the Salonika front reached a total of 152,000, divided into three armies of two divisions each. The French had four divisions. The British had been raised to five divisions (10th, 22nd, 26th, 27th, 28th), and later a sixth (60th), organized in two army corps; in May Lieut.-Gen. G. F. (later Sir George) Milne took over command as general officer commanding the British Salonika Force. The total allied force was thus a little over 300,000 men. Opposing it early in 1916 were the Bulgarian I. and II. Armies and the German XI. Army—a total of some 280,000 men—aligned on a front from Lake Okhrida on the west to the point where the Struma enters Bulgaria on the east. But from March onwards the drain on the German forces at Verdun led Falkenhayn to withdraw the German troops, all but one division; by 1918 the XI. Army, though German in name and in staff, contained only one complete German battalion.

On the Entente side the reaction of Verdun took the form of orders from Joffre to Sarraill to pin down the enemy on his front, in order if possible to prevent Falkenhayn drawing upon the forces there. Accordingly the French moved out west of the Vardar towards Vodenia, and the British advanced north to Kukus. This advance, although it lengthened the front to be defended and the lines of communication, was of essential value for the security of the Allied force, for the entrenched position at Salonika itself was dominated from the mountains east of the town, and might become untenable if these heights were occupied by the enemy. But in how small degree the Allied advance fixed the Germans can be gauged from the previous paragraph, and Sarraill, who had been placed under Joffre's supreme command in Dec., received instructions not only to operate with greatly increased vigor on the Salonika front but also to prepare and organize a definite offensive to be launched simultaneously with the anticipated entry of Rumania into the war.

Meantime the situation was complicated by a Greek incident; until 1918 politics were to play a larger part in the Salonika theatre than war. The neutral Greek forces, five corps, were

distributed throughout the region, in theory to guard the frontier; and such a situation, while Gilbertian in its absurdity to the distant observer, was a source of serious anxiety to the Franco-British forces on the spot. Feeling that they would be safer without such dubious protection, they brought diplomatic pressure to bear on the Greek Government for the withdrawal of the Greek forces from Macedonia and their demobilization. Reluctantly the Greeks complied, but while the Allies occupied certain of their forts the Bulgarians seized the opportunity to cross the frontier, and appeared before Rupel, which commanded the Struma gate into the Macedonian plain. The Greek commander thereupon handed over the fort to them (May 26).

This unfriendly act bared the eastern flank of the Entente army, and gave the whole of Eastern Macedonia into the hands of the enemy. To meet the danger the British occupied the Struma line in force. Further, the Entente Governments instituted an economic blockade of the Greek coast, sent a brigade to Athens, and by the ultimatum of June 21 enforced the demobilization of the Greek army and the resignation of the Government. As it proved, however, the seizure of Rupel and Eastern Macedonia did not develop into a general offensive by the German-Bulgarian forces.

Handicaps of the Allies' Army.—While these external troubles with Greece beset the Entente Powers, they were far from the sum of the handicaps which hindered effective action by the Salonika force. The idea of an offensive was constantly discussed between the French and British Governments, as also between Joffre and Sarraïl; but, apart from reluctance to provide adequate forces, it depended on too many contingencies, in particular the uncertain and often postponed intervention of Rumania. Furthermore the internal troubles of the Salonika force were notorious. Sarraïl had the title of "Commander-in-chief of the Allied Armies in the Orient," and with him Cordonnier commanded the French forces; but his status was a nebulous one. Not only was the British commander to all intents independent, but also the Italian—a detachment arrived from Italy in Aug. 1916.

Apart from the defect that Sarraïl's orders were issued from French headquarters without consultation with the other Allied Powers, Sarraïl's own personality was not such as to weld this loose understanding into an effective co-operation. In a heterogeneous force, composed of French, British, Italians, Serbians and Russians, it was hardly a recommendation that the chief commander should be known not to have the confidence of his own supreme command, and that even the suspicion should exist that he was conducting operations with one eye on the political game at home. The British, by polite but firm insistence on their independence, maintained tranquil relations; wrangles and disputes between the other Allied commands were continual, and the majority were unfortunately attributable to the policy or tactlessness of Sarraïl.

While the Allied leaders were debating ways and means, the opposing armies moved, on Aug. 17, to forestall and dislocate the Allied offensive, which they judged would synchronize with Rumania's intervention. The Bulgarians made their effort on the two wings. The eastern wing from Rupel drove back the French cavalry on the east of the Struma, and pressed down towards its mouth. But they dissipated their force by detaching part to seize the coastal strip of Kavalla, and the stout resistance of the British prevented them forcing the river line. On the western wing the position was more critical, for the Bulgarian advance from the Monastir area drove the Serbs out of Florina and reached Lake Ostrovo before they were ultimately held.

III. THE FIRST AND SECOND ALLIED OFFENSIVES

These reverses caused a further change in Sarraïl's plan for the Allied offensive; the forces east of the Vardar were merely to contain the enemy, while those west of the Vardar carried out the offensive. Thus to all intents it became no more than a counter-offensive to restore the impaired situation in this sector. To release additional French troops the British extended their line west from Doiran to the Vardar; Sarraïl was thus enabled to form an offensive group (of 2½ French divisions, one Serbian

division and a Russian brigade) under Cordonnier, in addition to the Serbian striking force of four divisions.

On Sept. 10 various British detachments crossed the river Struma in raids at six points in order to divert the enemy's attention, and on Sept. 11 the real attack developed west of the Vardar. The Serbs, skilled mountain fighters and inspired by the closeness of their native soil, made good progress, and on Sept. 14 gained the pass of Gornjevo, breaking through the hostile front. But the Cordonnier group was slower, partly because of transport difficulties and Cordonnier's own inclination for the secure methodical advances he had practised successfully in France. As a result, however, the Bulgarians, broken by the Serbs at Gornjevo, were able to fall back across Cordonnier's front and re-establish their lines on the Brod, Sarraïl, incensed, ordered fresh attacks by both groups, which were repulsed with heavy loss—as Cordonnier, protesting, had prophesied.

Between Sept. 30 and Oct. 8 the British XVI. Corps (Briggs) advanced its front to the line Agho Mahale-Omanli, as a fixing move, coincidentally with a fresh attack on the main front by the French and Serbs from Kaimakçalan westward. The pressure of the Serbs turned the Bulgars left and forced a further slight withdrawal, but a Franco-Russian attack on Oct. 6 failed. Cordonnier urged the idea of a wider turning manoeuvre, but Sarraïl, in the mistaken belief that a Bulgarian collapse was imminent, ordered a fresh blow on Oct. 14. This was a costly failure and led to a violent scene between Sarraïl and his subordinate. Cordonnier left for home a few days later. This internal friction caused a temporary breakdown of action, and the Serbs were left to fight unsupported, until Sarraïl took the step of putting the whole attacking force under the Serbian Gen. Michich—a man of real military genius and with the knack of inspiring not only Serbian but other national forces.

Michich attacked in the Crna bend on Nov. 12 while, to aid this offensive, Milne's troops made local attacks and raids as a diversion on the Struma. Despite rain and snow the Serbs pressed on, turning successive positions, with the French, Russians and an Italian brigade on their left. Monastir was out-flanked and on Nov. 19 was found evacuated—the first important Serbian town to be regained. For a moment there was a real opportunity of exploitation, as the Bulgarians were in full retreat towards Prilep; but the immediate attacking forces were tired and hungry, and Sarraïl suspended the advance—to the annoyance of the Serbs, who, in default of receiving fresh reserves, tried to press on unsupported until exhaustion stopped them.

By this time the Rumanian collapse, under pressure of the convergent German and Bulgarian attacks, was clear, and on Dec. 11 Sarraïl received instructions to consolidate a defensive line embracing as much of the regained territory as possible. This line stretched from Lake Prespe—just north of Monastir—north slopes of Kaimakçalan—to the Vardar, and thence by Doiran to the Struma and down to the sea. Its worst feature was that the commanding heights were held almost everywhere by the enemy. This front was to remain practically unchanged until Sept. 1918.

Reorganization.—Apart from the incident of a threatening Greek concentration in Thessaly—settled by a fresh ultimatum—the winter months of 1916-17 passed quickly, and the opportunity was taken to reorganize and regroup the forces. From the Gulf of Orfani to the Vardar the front was held solidly by the British, owing to Milne's insistence, but on the rest of the front Sarraïl followed his usual plan of interspersing detachments of the various nationalities—presumably on the principle "*divide et impera*." Whatever its personal advantages it was hardly conducive to prompt and effective action. Reinforcements had now brought the French up to a strength of eight divisions, while there were six Serbian and 1½ Italian divisions—making with the British 2½ divisions, plus two Russian brigades. The total Allied strength was approximately 600,000, while the Greek National Defence, or Venizelist army, was in process of formation. This concentration afforded adequate reserves for a resolute offensive in the spring.

Confronting the Allies were still the nominal German XI.

Army, and Bulgarian I. and II. Armies, comprising the equivalent of one German and 13 Bulgarian divisions,¹ of which practically half faced the British. Apart from the II. Army, these forces were under a German Commander-in-chief, Gen. Von Scholtz. On their side no large move was considered, partly because the Bulgarians had already achieved their principal territorial aims, and merely desired to hold tight, while the Germans were satisfied with immobilizing so large an Allied force at no expenditure to themselves.

For the 1917 campaign Sarraïl's scheme was for a preliminary flanking move on the extreme west, between Lakes Ohrida and Prespa, to shake the enemy's hold in the Monastir area; following this was to be the main fixing attack by the British on the Doiran front; then the French, Russians and Italians in the south-west of the Crna bend were to advance; and finally the Serbs were to strike the decisive blow to the west again.

The preliminary move began on March 12 and was soon suspended, achieving little apart from a creditable French local success on a spur west of Monastir. Then came the British turn—to attack the key position formed by the Dub and lesser ridges which commanded the passage between Lake Doiran and the Vardar. Milne had rejected an alternative proposal of Sarraïl's that he should attack to gain Seres, which while attractive as a political advertisement had no military value, and being dominated by the hills behind would have been difficult to hold. After a two days' artillery preparation, in vile weather, the British infantry advanced to the assault, on a two-division front (22nd and 26th), at 9.45 P.M. on April 24, the late hour being to gain surprise and protection. On the left the enemy's first position was gained and held, but in the centre and right the difficulties of the Jumeaux ravine and the strength of the resistance foiled the attackers.

Worst of all, their sacrifice was in vain and their "fixing" rôle rendered abortive because the attack west of the Vardar was postponed by Sarraïl, ostensibly for climatic reasons. Not until May 9 did the other attacks develop. Sarraïl had rejected the Italian proposal for a flanking manoeuvre, in preference for a frontal blow, and this, made by the French and Italians, was a costly failure. The Serbian attack was even less effectual, in fact hardly developed, partly owing to internal political troubles then rife and partly to their want of confidence in the higher direction and in the genuineness of its intention to support their efforts. Once more the British, on the night of May 8, had delivered a fixing attack, and once more their heavy sacrifice had been purposeless. The offensive was definitely closed down by Sarraïl on May 24.

The Bulgarians, content with the prestige of this successful repulse, attempted no counter-stroke, and as the Allied forces were neither in the mood nor the condition for further efforts, the front relapsed into stagnation for the rest of the year. The only minor incidents were a successful local advance in Sept. by the French on the extreme left, west of Lake Ohrida, and Milne's withdrawal of his right from the marshy valley to the foot-hills west of the Struma, a precaution to lessen the danger of malaria and dysentery. The focus of interest again became political—common action was taken to settle the simmering menace and intrigues of Greece. In June, Allied troops invaded Thessaly, but the abdication of King Constantine was forced without fighting, and the Venizelist Government returned to power. The consequent reinforcement of the Allies by the Greek army came as a prospective counterpoise to the contemplated withdrawal of two British divisions in Sept. for the projected offensive in Palestine.

Sarraïl Superseded.—At the end of 1917 the new Clemenceau ministry recalled Sarraïl, in response to the renewed requests of the British and Italian Governments, which were supported by Foch. His successor was Gen. Guillaumat, who had distinguished himself as an army commander on the Verdun front. His first aim was to restore confidence and cohesion in the Allied forces at Salonika, while hastening the reorganization

and training of the Greek army. His second, to think out and prepare the plan for a fresh offensive, adopting in its main outlines one which Gen. Michich had suggested in 1916. But to obtain the sanction of the Allied Governments was more difficult, obsessed as they were with the threatened German offensive in France, and in any case dubious of the effectiveness of any major operation in Macedonia. While biding his time, however, Guillaumat seized the opportunity to "blood" his new Greek troops in an ably planned *coup de main* against the Srka di Legen ridge. Supported by a powerful concentration of French artillery it was completely successful, and Guillaumat withdrew the attackers into reserve before any possible counterstroke might dilute the moral tonic. On the main front there were no other incidents of note between Jan. and Sept. 1918; but away on the Adriatic coast, in Albania, Ferrero's Italian XVI. Corps, aided by a French division, advanced in July from the Viosa to the line of the Semeni and Devol rivers; an Austrian counter-offensive late in Aug. regained most of the lost ground.

In July also, Gen. Guillaumat, his task of reorganization completed, was summoned back to France, to be entrusted with the defence of the capital in view of the critical situation caused by the German offensives. A man who put first not his own interests, nor even those of France, but his duty to the Allied forces as a whole, his military ability had won the respect, as his character had won the esteem, of the multifarious contingents. He was succeeded by Gen. Franchet d'Espèrey, who, if perhaps not possessing the exceptional tact and supra-national outlook of Guillaumat, was yet an able strategist, and well able to maintain allied co-operation. He adopted and put the finishing touches to Guillaumat's offensive plan, while the latter utilized his position at the centre of policy to gain sanction for its execution. Winning over M. Clemenceau, he then went to London and Rome on the same mission, and at last on Sept. 11 Franchet d'Espèrey was authorized to attack—if there was still little confidence in its success.

IV. THE DEFEAT OF BULGARIA

The military situation on the eve of the offensive was numerically little changed. The Bulgarians had a ration strength of some 700,000 and a rifle strength of 200,000—divided into the same three armies. The Allies had a ration strength of about 574,000 and a rifle strength of 157,000, although against the inferiority of numbers they could put a slight preponderance in artillery and a heavy one in aircraft. But the real defect on the enemy's side was the first underlying war-weariness of the Bulgarians and their dissatisfaction with their German directors; and secondly the divided command by which the so-called German XI. Army and the Bulgarian I. Army—from Doiran westwards—were under Von Scholtz, while the Bulgarian II. Army and the coastal detachments were under the Bulgarian commander-in-chief, Gen. Gekoff.

For the new offensive Franchet d'Espèrey's plan was first to strike a concentrated blow with a Franco-Serb group under Michich on a narrow front of seven miles along the Sokol-Dobro Polje range, aiming at a tactical break-through and a subsequent expansion of the breach to gain and clear the triangle formed by the Crna and the Vardar. This would menace the enemy's communications on both flanks, and the offensive would then be taken up in turn by the other forces along the front. The initial objectives were relatively modest, for the possibility of a strategic break-through, ending in the overthrow of the enemy armies, was no more than an idea in the commander's mind.

The immense difficulties of the terrain and the scantiness of reserves made even this limited aim far from certain of success. But Franchet d'Espèrey's plan, made possible by the wholehearted co-operation of the other Allied commanders, was an admirable fulfilment of the principle of concentration. On the vital sector six Serbian and two French divisions with 600 guns—more than a third of the total artillery strength in Macedonia—were concentrated against one Bulgarian division, and to do this the other sectors were almost stripped of their artillery.

The offensive began on Sept. 1, as the British 27th Div. made

¹ A Bulgarian division had almost twice the infantry strength of a French or German division.

a feint attack in the Vardar valley to divert the enemy's attention, and on the night of Sept. 14 a heavy bombardment was begun on the real front of attack. Next morning at 5:30 a.m. the French divisions assaulted and after hard fighting gained the Dobro Polje ridge, the Sokol also falling by the evening—opening a path for the Serbian divisions of the I Army, hitherto in reserve, to be pushed through. At the same time the Serbian II Army advanced to the attack. By nightfall on Sept. 16 a penetration of 5 mi. had been made.

The Serbian troops now wonderfully inspired by success and the *sight* of their homeland swept forward with such *élan* that by the night of Sept. 17 they were 20 mi. forward, and the breach had been expanded to 25 mi. by Greek and French divisions on the flank. After the initial clash resistance was feeble, partly because the mountains hampered the lateral movement of reserves. By Sept. 19 the left wing of the attackers had reached across the Crna, while the right wing was rolling up the front eastward toward the Vardar, and between the two wings the Serbian cavalry had penetrated to Kavadarci in the apex of the Crna-Vardar triangle. Meanwhile on Sept. 18 Milne's troops attacked on the whole front from the Vardar to Lake Doiran in order to prevent the Bulgarians withdrawing troops to dam the breach west of the Vardar. Facing the British were the pick of the Bulgarian troops and also the strongest fortified positions, so that although they penetrated the enemy's lines along most of the front, it was little wonder that lack of reserves and artillery compelled them to yield up the larger part of their gains. But they had fulfilled their mission of pinning down the enemy including the reserves during these critical days, Sept. 18 and 19, and by Sept. 21 the whole of the enemy's front west of the Vardar had collapsed under the convergent pressure of the exploiting Serbs and of the French on their flanks.

By the afternoon of the same day the collapse had extended to the Doiran-Vardar front, and the British aeroplanes spread considerable havoc among the troops of the Bulgarian VI Army falling back through the narrow Kosturno pass. Similarly, on the extreme west, facing Prilep, the Italians joined in the advance. From now on the advance became a strategic pursuit, now fast, now slow, in which successive rear-guard resistances of the enemy were outflanked. On Sept. 23 the Serbian spearhead reached Grdsko, and Veles three days later. Seizing their opportunity, a French cavalry brigade under Gen. Jounot-Gambetta made a dash for Skopje (Üsküb), and seized this vital centre of communications, the key to the whole front, on Sept. 29. This definitely separated the XI Army from the remainder of the Bulgarian forces, forcing them on divergent lines of retreat. To the southeast the British had already invaded Bulgaria itself, taking Strumica on Sept. 26. That night a Bulgarian staff officer arrived at British headquarters to ask for an armistice, and three days later the Bulgarians capitulated, accepting the Allied terms unreservedly. The first national prop of the Central Alliance had fallen. While the reconquest of Serbia proceeded rapidly, a mixed striking force was rapidly organized under Milne's command to advance through Thrace on Constantinople, and had pressed as far as the Maritsa, seizing the bridgeheads, when Turkey—its force in Syria already annihilated by Allenby—surrendered on Oct. 30. (See *World War I: Bibliography*.)

SALSETTE ("sixty-six villages"), a large island in British India, north of Bombay city, forming a part of Thana district. Area 246 sq. mi. It is connected with Bombay Island and also with the mainland by bridge and causeway. In various parts of the island are ruins of Portuguese churches, convents and villas, while the cave temples of Kanheri form a subject of interest. There are 109 Buddhist caves, which date from the end of the 2nd century A.D. Salsette is crossed by two lines of railway, and the island is encircled by a motor road of 50 mi. The island was taken from the Portuguese by the Maharrattas in 1739 and from

them by the British in 1774; it was formally annexed to the East India company's dominions in 1782. There is another Salsette in the Portuguese settlement of Goa.

SALSIFY or **SALSIFY**, *Tragopogon porrifolius*, sometimes called oyster plant or vegetable oyster, a hardy biennial with long, cylindrical, fleshy, esculent roots, which, when properly cooked, are extremely delicate and wholesome; it occurs in meadows and pastures in the Mediterranean region and in Britain is confined to the south of England, but is not native. The leaves are linear-lanceolate. The second season a handsome purplish flower is borne atop a stalk 2-4 ft. high; the mature seed head appears much like that of an enlarged dandelion. Salsify requires a free, rich, deep soil, which should be trenched in autumn, the manure used being placed at two spades' depth from the surface. The first crop should be sown in March and the main crop in April, in rows a foot from each other, the plants being afterward thinned to 8 in. apart. In November the whitish roots should be taken up and stored in sand for immediate use, others being secured in a similar way during intervals of mild weather. Salsify is widely naturalized as a wayside weed in the United States and Canada. In the United States, salsify is widely grown in home gardens but is of little importance as a market vegetable. It is sown about the average date of last frost in the spring, in rows about 1½ ft. apart and thinned to 3-4 in. apart. It requires the entire growing season to develop. Roots may be harvested and stored in a moist cellar or dug as needed through the winter. The roots are not damaged by freezing of the soil but must not be allowed to freeze after harvest. (V. R. B.)

SALSOMAGGIORE, a town of Emilia, Italy, in the province of Parma, 6 mi. southwest of Fidentia by steam tramway. Pop. (1936) 7,751; village; 15,259, commune. It is a popular wateringplace. The water is strongly saline and is also used for inhalation. The wells are, some of them, over 2,000 ft. deep and yield illuminating gas and oil as well as water.

SALT, SIR TITUS, BART., 1869 (1803-1876), English manufacturer, was born on Sept. 20, 1803, at Morley, Yorkshire. His success in introducing the coarse Russian wool (*domsko*) into English worsted manufacture, due to special machinery of his own devising, gave his firm a great impetus. In 1836 he solved the difficulties of working alpaca (*g.v.*) wool, created an enormous industry in the production of the staple goods for which that name was retained and became one of the richest manufacturers in Bradford. In 1853 he opened, a few miles out of the city on the Aire, the extensive works and model manufacturing town of Saltaire. He died on Sept. 20, 1876.

SALT. In chemistry the term salt is applied generically to any compound formed by substituting the hydrogen of an acid by a metal or a group of elements acting as a metal. (See ACIDS AND BASES.) Common salt, or, simply, salt, is the name given to the varied natural and industrial forms of sodium chloride, NaCl. Pure sodium chloride may be made by passing dry hydrogen chloride gas into a saturated solution of the salt whereupon the purified salt is deposited as a colourless crystalline powder. It crystallizes in the cubic system, usually as cubes (see below under *Rock Salt*). The melting point is 804° C., which is a bright red heat. Vaporization begins near this temperature. It dissolves easily in cold water and a little more readily in hot water; 100 parts by weight of water dissolve 35.87 parts of salt at 20° C., 39.18 parts at 100° C. and 39.8 parts at 109.7° C., the boiling point of the saturated solution. If a saturated solution in water be cooled to -10° C. a crystalline hydrate, NaCl·2H₂O, separates. (See HYDRATE.) Solution of salt in water is accompanied by reduction of temperature. 36 parts of salt in dissolving in 100 parts of water at 12.6° C. will lower the temperature to 10.1° C. If the same proportion of salt and snow be intimately mixed the temperature falls to -21.5° C.

Salt occurs in the sea, in natural brines and in the crystalline form, as rock salt. Its most abundant source is the ocean. Assuming that each gallon of sea water contains 0.2547 lb. of salt, and allowing an average density of 2.24 for rock salt, it has been computed that if dried up the entire ocean would yield no less than 4,500,000 cubic miles of rock salt or about 14½ times the bulk of

the entire continent of Europe above high-water mark. Natural brines having commercial importance are those of Austria; France; Germany; of Kharaghoda and Kuda in India; of Michigan, New York state, Ohio, Pennsylvania, West Virginia and the salt lake of Utah in the United States; and of the Dead sea. In Great Britain salt brines are met with in Cheshire, Worcestershire, Lancashire and Yorkshire, and have been found by deep boring in Derbyshire, Staffordshire and Midlothian. Salt in brines is nearly always accompanied by the chlorides and sulphates of potassium, calcium and magnesium; in many cases carbonates and the valuable element bromine are present. Sea water contains on the average about 3.33% of solids, but the concentration of salts varies from about 2.9% in the polar seas to 3.55% and upward at the equator. Enclosed seas such as the Mediterranean and Red seas contain a higher proportion of salt than the open ocean at the same latitude (See OCEAN AND OCEANOGRAPHY.) From Dittmar's analyses of sea water taken during the "Challenger" expedition, the average composition of the solids in sea water may be considered to be: sodium chloride 2.60%, magnesium chloride 0.31%, magnesium sulphate 0.22%, calcium sulphate 0.12%, potassium chloride 0.07% and magnesium bromide 0.007%. The mixed salt obtained by evaporation of sea water has, however, the following composition irrespective of the source of the sea water: sodium chloride 77.84%, magnesium chloride 9.44%, magnesium sulphate 6.57%, calcium sulphate 3.44%, potassium chloride 2.11%, magnesium bromide 0.22% and some calcium carbonate.

Natural Brines.—The Dead sea, which covers an area of about 340 sq. mi., contains approximately 11,000,000,000 tons of salt, and the River Jordan, which contains only 35 parts of salt per 100,000 of water, adds each year 850,000 tons of salt to this total. The composition of Dead sea water is given in the following table (although the salts exist as ions in solution and are so analyzed, it is customary to express the analyses in terms of compounds):

Dead Sea Waters	Surface water	Deep water (250 ft.)
Specific gravity	1.161	1.235
Sodium chloride	6.1%	7.40%
Potassium chloride	0.85%	1.25%
Magnesium bromide	0.38%	0.01%
Magnesium chloride	0.46%	13.15%
Calcium chloride	2.65%	3.82%
Calcium sulphate	0.11%	0.05%
Total solids	19.51%	26.66%

The concentration of salts in the Dead sea increases to a depth of about 250 feet, after which it remains practically constant. At this depth and below it is a concentrated solution, which, indeed, is supersaturated when pumped up, for a slight deposition of salt takes place owing to diminished pressure. Noteworthy features of Dead sea water are its relative freedom from sulphates and the high proportions of potassium and bromine. These facts, coupled with the circumstance that atmospheric conditions in Palestine are favourable to solar evaporation for about eight months of the year, indicate that the production of salt, potassium and even bromine is feasible in the Dead sea area, the process as regards salt and potash being similar to that described below under *Manufacture*. The brines at Kharaghoda resemble sea water in the character of their dissolved salts, but are much more concentrated and in some cases practically saturated as shown by analysis no. 2.

Kharaghoda Brines	1	2
Specific gravity	1.134	1.220
Sodium chloride	13.15%	14.32%
Potassium chloride	0.26%	0.75%
Magnesium bromide	0.05%	0.11%
Magnesium chloride	1.02%	9.48%
Magnesium sulphate	1.16%	0.85%
Calcium sulphate	0.31%	0.05%
Calcium carbonate	0.01%	0.02%
Total solids	17.07%	26.13%

The following table gives the composition of some concentrated natural brines used for the production of salt in various countries.

Concentrated Natural Brine	Droitwich	Winniford	Syracuse, N.Y.	St. Charles, Mich.	Artemesia, Saxony	Friedrichshall, Württemberg
%	%	%	%	%	%	%
Sodium chloride	24.07	25.46	21.71	22.81	25.37	25.40
Sodium sulphate	0.26					
Potassium chloride					0.12	
Potassium sulphate					0.29	
Magnesium bromide				0.26		
Magnesium chloride	0.05	0.21	0.14	4.01	0.13	
Calcium chloride	0.37	0.45	0.50	0.20	0.40	0.44
Calcium sulphate			0.10	0.77		
Total solids	25.63	26.11	22.54	28.10	26.50	25.54

Certain natural brines occurring in England and the United States are of interest, not only from the economic point of view, but also because they contain salts not usually found in brines, such as the chlorides of barium and strontium; when salt is produced from such brines special methods of manufacture are adopted. In Great Britain these brines were found at great depth in boreholes in Derbyshire, Staffordshire and Midlothian during the search for petroleum wells. In the U.S. they occur in the Ohio valley district of West Virginia and in Ohio, at depths ranging from 1,100 ft. to 1,600 ft.

	Remshaw, Derbyshire	West Calder, Scotland	Pomeroy, Ohio	Malden, W. Virginia
Depth (feet)	3,708	3,010		
Specific gravity	1.127	1.061	1.075	1.061
Sodium chloride	10.38%	6.50%	7.67%	6.01%
Potassium chloride	0.03%	0.04%	0.05%	0.05%
Magnesium bromide	0.11%	0.55%	0.37%	0.56%
Magnesium chloride	0.34%	1.34%	1.36%	1.19%
Calcium chloride	4.23%	0.10%	0.10%	0.07%
Strontium chloride	0.12%	0.10%	0.10%	0.07%
Barium chloride	0.14%	0.07%	0.04%	0.07%
Total solids	15.75%	8.49%	9.06%	8.15%

It has been suggested that those brines which are characterized by the absence of carbonates and sulphates have been produced by a natural process akin to the "Permutit" process for softening water. (J. J. F.; A. G. F.; X.)

ROCK SALT

Rock salt is crystalline halite (sodium chloride) occurring in the form of rock masses and beds. It has a wide geographic distribution and occurs abundantly in rocks of all ages. Because of its great solubility in water it occurs under extremely thick cover in humid regions, but lies close to the surface in arid regions.

All important rock-salt deposits originated from the evaporation of sea water at some time during the geologic past. Some 77% of the mineral matter in normal sea water is sodium chloride. Upon evaporation of about nine-tenths of the volume of sea water, rock salt is precipitated. The precipitation of rock salt overlaps the precipitation of calcium sulphate (gypsum and anhydrite) on the one hand and potassium and magnesium salts on the other. Thus these compounds commonly occur with rock salt. Deposits are found in beds from a few feet to many hundreds of feet thick. In age these beds are distributed through much of geologic time from the Cambrian through the Mesozoic.

Since it is necessary to evaporate a large quantity of sea water to deposit a small amount of salt, it is thought that many extremely thick rock-salt beds were deposited in partly enclosed arms of the seas in which evaporation was greater than inflow of fresher water. The supply of water was continually renewed by inflowing currents while a barrier on the sea floor at the entrance to the basin prevented the outflow of the concentrated saline water so that the salts were deposited in thick beds on the basin floor.

Such bedded salt deposits occur in the lower Cambrian of the Punjab Salt range in Pakistan and in Iran, but are little exploited. The Silurian and Devonian rocks of the northeastern United States and Ontario in Canada contain important rock-salt deposits which are extensively worked for industrial and domestic use. The Carboniferous of Nova Scotia contains extensive rock-salt deposits which are utilized in eastern Canada and northeastern United

States. The Pennsylvanian (Carboniferous) of Colorado and Utah contains large amounts of unexploited rock salt.

The rocks of Permian age contain some of the largest rock-salt deposits in the world. The most important are the Zechstein deposits of Germany, long exploited not only for their common salt but for their potassium content. The salt deposits of the sub-Carpathian region extending from Poland through Hungary and Rumania may be of this age. In the Donetz basin and the Volga region of European U.S.S.R. are extremely important deposits of Permian rock salt. In the United States enormous thicknesses of rock salt underlie much of the Permian basin extending from Kansas to western Texas.

The Triassic of England contains important rock-salt deposits which have been worked for many years. In the Tyrol the Triassic strata also contain important salt deposits. In the province of Szechwan, China, rock salt occurs in beds of Triassic age and has been exploited through salt wells for more than 2,000 years.

Another type of rock-salt deposit which is economically important is the salt dome. This deposit has been forced up by earth pressure from great depths in the form of plugs of roughly circular shape a few yards to a mile across. The domes appear to be a development of folding, in which the salt is forced up through other rocks, because of its great plasticity under high pressure, from depths as great as 20,000 ft. Such salt domes are abundant along the Gulf coast of southern United States and extend into the east Texas basin and northern Louisiana. Many domes occur at shallow depths and are extensively mined to supply the southern United States. Similar domes in the sub-Carpathian region of Europe have been worked since ancient times. The north German plain has many domes, extensively worked, which are thought to have originated below 6,000 feet.

Rock salt may be exploited by usual mining methods. Another method of exploitation is by drilling wells into the salt strata, pumping water down them to dissolve the salt and treating the returning brine in a manner similar to the treatment of natural brines. It is difficult to arrive at any estimate of the relative importance of rock-salt production as compared with production of other types of salt since most available statistics make no distinction between natural and artificial brines. However, practically all important salt production for industrial uses is from rock salt deposits. The United States and Europe are leaders in exploitation of rock salt deposits. However, South American countries rapidly developed their deposits, with Brazil ranking as the largest producer outside United States and Europe. (J. M. Hs.)

Manufacture.—At one time almost all of the salt used in commerce was produced from the evaporation of sea water, and sea salt still is a staple commodity in many maritime countries, especially where the climate is dry and the summer of long duration. At mid-century, commercial salt was manufactured (1) from rock salt and (2) from sea water and other natural and artificial brines. Most of the artificial brines are obtained by pumping water into wells drilled into underground salt beds and pumping up the solution which results when this water dissolves salt from the deposit. In addition to the ordinary uses of crystalline salts, much is used directly in the form of brine in industrial countries.

Manufacture from Rock Salt.—The beds of rock salt are mined or quarried by the usual excavation methods, depending upon the depths and thicknesses of the deposits and upon local conditions. In some cases the mined rock salt is dissolved and salt manufactured by treatment of the brine as described below. This treatment affords opportunities for purification of the salt. Where the rock salt is of high degree of purity, as in the United States and in Galicia, the salt is ground, sieved and marketed with no further treatment. The mined salt in large lumps is first crushed, then more finely ground and screened to separate the various size grades; the oversize material going back to the mill and the acceptable sizes being packed for market, usually by bagging. A disadvantage of such salt is the tendency to revert to hard masses in storage. In Germany rock salt is treated in similar fashion, except that the larger fragments of impurities such as anhydrite and gypsum are hand picked from the coarsely crushed rock salt. Less pure German rock salt is purified by fusion, either alone or with sodium carbonate and silica or with chalk and saltpetre (sodium nitrate). In some cases, the fused mass is "blown" with air to burn away carbonaceous material, leaving a clear melt which crystallizes on cooling. After separation from the slag by concussion, the salt is ground and sieved. Alternately, an impure salt is leached with a saturated solution of pure salt in dilute hydrochloric acid whereby impurities such as gypsum, magnesium salts and iron oxide are dissolved. The treated salt is filtered, washed with a saturated solution of pure salt, dried,

ground and graded for market.

Manufacture from Brines.—When an aqueous solution of several salts is evaporated, the salts separate, each as it reaches its point of saturation in the solution. The solubilities of the salts in the complex solution will, in general, be similar to but not the same as the solubilities for the same salts in water. In the case of sea water and many brines the order of deposition is calcium carbonate, calcium sulphate, sodium chloride, magnesium sulphate, carnallite (potassium magnesium chloride) and magnesium chloride. These salts are not, however, deposited within sharply defined limits of concentration. As each salt reaches its own point of saturation it deposits along with all the other salts which have reached their own saturation points. Therefore each salt deposited is contaminated by some of the other salts and by the residual brine. Further, the relative solubilities are altered by temperature and hence in solar evaporation the difference in temperature between day and night and also the seasonal temperature changes affect the character of the salt deposited. The art of the salt maker is to produce grades of salt suitable for the particular use to which it is to be put.

Salt is produced by solar evaporation from sea water in France, Portugal, Spain, Italy, India, the U.S.S.R. and the United States—in fact, in nearly all maritime countries. The processes generally adopted are similar in principle, although details of evaporating pans and of manufacturing plants vary with local conditions. A preliminary concentration is usually carried out by allowing the brine to flow through a series of channels to concentration ponds constructed of wood, puddled clay or concrete. The areas of the ponds vary from 280 sq ft to 50 ac. in different countries. The solution is concentrated first to a specific gravity of about 1.21. At this stage, suspended impurities (sand and clay) and the less soluble salts (calcium carbonate or chalk and calcium sulphate) are removed. The clear concentrated brine is now run successively into a series of crystallizing pans, usually three, where the salt is deposited. The total area of the crystallizing pans is approximately one-tenth of that of the evaporating pans. In the first crystallizing pan the brine is concentrated to a specific gravity of 1.25 and here the best grade of salt is produced. The specific gravity of the mother liquor increases slowly during crystallization of the salt because of the increasing concentration of the other salts. The mother liquor reaches a specific gravity of 1.26 in the second pan where a second grade of salt is obtained. In the third pan a specific gravity of 1.275 is obtained and here the lowest grade of salt is deposited. The final mother liquor, termed "bitterns," is used in some countries (e.g., France, India and the United States) for the manufacture of potash, bromine, Epsom salts (magnesium sulphate) and magnesium chloride.

The salt in each crystallizing pan is raked into rows and allowed to drain for several days, is then piled into bins, drained again, lifted from the pans and finally dried. As a tax is levied on salt by weight in most European countries, it is obviously an advantage to trade in the dried material. The salt from the first pan is frequently used locally as table salt, that from the second pan may go into the fish, refrigeration and other purposes. Typical compositions of the salts thus produced are given in the following table.

	Grade I	Grade II	Grade III
	%	%	%
Sodium chloride	98.0	95.0	91.0
Calcium sulphate	1.0	0.0	0.4
Magnesium sulphate	0.1	0.5	1.0
Magnesium chloride	0.2	0.5	1.3
Insoluble matter		trace	0.1
Water (moisture)	2.6	3.7	
	100.0	100.0	100.0

In England, Germany, most of the eastern part of the United States and other places where it is impractical to manufacture salt by means of solar heat, the brines are concentrated and evaporated by artificial heat. Formerly the brine was concentrated in open pans over fire. More recently steam-jacketed vessels were used, but now the larger part of the salt produced in the colder countries is manufactured in multiple-effect vacuum evaporators and an important quantity is made in open crystallizers or grainers which produce a type of crystal preferred for use in some of the food industries. The brine, natural or artificial, is first pumped into settling tanks, where calcium and magnesium compounds may be removed by chemical treatment, usually lime and sodium hydroxide are used. After settling and filtration, the brine is delivered to the grainier, which is a long open trough with steam coils. The brine is fed into the grainier at approximately the same rate as that at which evaporation is taking place and at a temperature only slightly below that of the brine in the grainier. The residue of brine or bitterns may be removed only or less often or may be withdrawn continuously. The evaporation occurs at the surface of the liquid and the crystals originate there. They remain at the surface, held up by the surface tension of the brine. The crystal grows at the top edges, becoming a small inverted hollow pyramid or hopper. Eventually the hopper sinks and ceases to grow. When the crystals are recovered the salt is largely in the form of flakes, whence the name "flake salt." When multiple-effect evaporators are used, the vacuum in

each vessel is adjusted so that the vapour from the first vessel is sufficiently hot to boil the brine in the second; the vapour from the second supplying the heat to operate the third vessel or effect. The brine is usually sent through the stages or effects in succession, although in the case of salt manufacture, fresh brine may be fed to each stage if desired. In a triple-effect system, vacuums of 15 in., 25 in. and 27 in. of mercury have been found efficient. With open pans, one ton of coal will produce about two to two and one-half tons of salt, whereas it will yield five to six tons of salt with an efficient triple-effect plant.

In France and Germany weak brines which could not profitably be used for saltmaking with the aid of artificial heat are first concentrated by a natural process. The brine is pumped to the top of a towerlike structure of scaffolding enclosing brush wood and is distributed by means of a spray over the top of the brushwood. Exposure to the air as the brine trickles down rapidly concentrates it and the process is continued until the brine is sufficiently strong to be used in ordinary concentration pans.

The brines at Pomeroy, O., containing notable quantities of the salt barium chloride, were formerly concentrated in steam-jacketed vessels without treatment to remove this salt, but it is now customary to remove barium by addition of "salt cake" (crude sodium sulphate) followed by sedimentation or filtration or both to separate the precipitated barium sulphate. By this procedure barium chloride content of the salt is reduced to negligible quantities.

Saltmaking and salt mining seem to be healthful occupations, occasional slight soreness of the eyes being the only ailment; whereas exposure to the atmosphere about open grainers seems to confer some degree of immunity against colds, rheumatism, neuralgia and similar troubles.

Uses.—The best-known use of sodium chloride is as table salt. For this service, a fine-grained salt of high purity is used. To ensure that it will remain free-flowing when exposed to the atmosphere, small quantities of sodium carbonate or trisodium phosphate sufficient to combine with such hygroscopic impurities as calcium and magnesium chlorides are added. Usually potassium iodide is added in small quantity to overcome any possible iodine deficiency of the consumer. Common salt used for various manufacturing purposes may be coarser in grain than table salt. Salt is used universally as a condiment and preservative. It is employed in meat packing and fish curing, in the dairy and pickle industries, for salting cattle and curing hides and as a brine for refrigeration. It is indispensable to the manufacture of sodium carbonate (washing soda), sodium bicarbonate (baking soda), sodium hydroxide (caustic soda), hydrochloric acid, bleaching powder, chlorine and many other heavy and fine chemicals. The glass and soap industries are dependent upon it and it is used also in the glaze and enamel trades. As a flux, it enters into metallurgical processes and has been used in the manufacture of cement to aid in the recovery of potash as a by-product.

The grading of salt is complex and varies in different countries. In the United States, the main grades are: dry solar fine-milled, dry solar kiln-dried, granulated, "southern granulated," high-grade, high-grade granulated, packer's, medium, special medium, rock (of various grades), table and kosher. These grade names refer to purity, method of manufacture and grain size; and while they are generally descriptive, they cannot always be taken literally.

The production of salt is one of the world's most widely distributed mineral industries. Outputs of salt vary with the population and industrial activity of the country in question. Heavily populated countries like India and China require the major part of their production for food uses only; the United States on the other hand requires several times as much salt for industrial purposes as is consumed in food. A great many countries contribute to total world production of salt; but the output of the United States far exceeds all others, amounting at mid-century to approximately 14,600,000 short tons annually. Other leading salt producing countries and their approximate annual output in short tons at mid-century were, United Kingdom (3,297,000), China (2,267,000), India (2,215,000), France (1,700,000), Germany (1,600,000) and Italy (100,000). (R. H. Rn.)

Ancient History and Religious Symbolism.—Salt must have been quite unattainable to primitive man in many parts of the world. Thus the *Odyssey* (xi, 222 et seq.) speaks of islanders who did not know the sea and used no salt with their food. In some parts of America, and even of India (among the Todas), salt was first introduced by Europeans; and there are still parts of central Africa where its use is a luxury confined to the rich. Indeed, where men live mainly on milk and flesh, consuming the latter raw or roasted, so that its salts are not lost, it is not necessary to add sodium chloride, and thus we understand how the Numidian nomads in the time of Sallust and the Bedouins of Hadramut at the present day never eat salt with their food. On the other hand, a cereal or vegetable diet calls for a supplement of salt, and so does both man and beast.

The habitual use of salt is intimately connected with the advance from nomadic to agricultural life; i.e., with precisely that step in civilization which had most influence on the cults of almost all ancient nations. The gods were worshipped as the givers of the kindly fruits of the earth, and, as all over the world "bread and salt" go together in common use and common phrase, salt was habitually associated with offerings, at least with all offerings which consisted in whole or in part of cereal elements. This practice obtained among the Greeks and

Romans and among the Semitic peoples (Lev. ii, 13).

As covenants were ordinarily made over a sacrificial meal, in which salt was a necessary element, the expression "a covenant of salt" (Numb. xviii, 19) is easily understood; it is probable, moreover, that the preservative qualities of salt made it a peculiarly fitting symbol of an enduring compact, and influenced the choice of this particular element of the covenant meal as that which sealed an obligation to fidelity. Hence the Greek phrase *ἀλάτιον καὶ ἀνιδρωτὸν* was applied to the Arab tribes

(Mar'avi viii, 398). In like manner the ancient trade between the Aegean and the coasts of southern Russia was largely dependent on the salt pans at the mouth of the Dnieper and on the salt fish brought from this district (Herod. iv, 53; Dio Chrys. p. 437). The vast salt mines of northern India were worked before the time of Alexander (Strabo v, 2, 6; xv, 1, 30). The economic importance of salt is further indicated by the prevalence down to the present day of salt taxes or of government monopolies. In oriental systems of taxation high imposts on salt are seldom lacking and are often carried out oppressively with the result that the article is apt to reach the consumer in an impure state largely mixed with earth. "The salt which has lost its savour" (Matt. v, 13) is simply the earthy residuum of such an impure salt (See the sodium chloride has been washed out).

Cakes of salt have been used as money, e.g., in Abyssinia and elsewhere in Africa, and in Tibet and adjoining parts. (See the testimony of Marco Polo and Sir Henry Yule's note on analogous customs down to our own time, in his translation of Polo ii, 48 et seq. The same work gives interesting details as to the importance of salt in the financial system of the Mongol emperors, ii, 200 et seq.)

In the Roman army an allowance of salt was made to officers and men, from which in Imperial times this *salarium* was converted into an allowance of money for salt. (X.)

SALTA, a northwestern province of Argentina. An official decree of Sept. 23, 1943, awarded to Salta the departments of San Antonio de los Cobres and Pastos Grandes, both in the former territory of Los Andes. The province is bounded on the west by Chile. Area, after these boundary changes, 97,579 sq. mi.; pop (1914 census) 140,927, (1947 est.) 288,205. In terms of its present boundaries the western part of the province lies in the Andean highlands and is characterized by lofty chains of mountains (sierras) and high, intermont basins or *saltars*. The sandy and rock-strewn volcanic soils support a sparse cover of stunted plants and hard grasses. The climate is arid and cold, although extreme diurnal variations in temperature are common. Streams are numerous but small, and nearly all drain into the *saltars*, where their waters are rapidly evaporated. In the valleys of the central and eastern parts of the province the vegetation is exuberant, with thick forests of valuable woods. The eastern plain is well watered and hot, with precipitation and temperatures decreasing westward with increasing altitudes. The capital of the province is Salta (q.v.).

The chief rail communications of the province are provided by the Belgrano railway, with connections to all of the principal parts of Argentina and to Bolivia, and across the Andes to Antofagasta, Chile. The excellent natural forage in the province has long made livestock raising a lucrative enterprise. Since colonial times Salta has supplied the markets of northern Chile with cattle,

formerly driven on the hoof across the Andes, and when prices are sufficiently high to offset transportation costs, the animals are in demand in the markets of the east coast. Sheep raising is also important. Although a great variety of crops is planted, tobacco (considered the best in the country) and sugar cane lead in commercial importance. The province also produces appreciable quantities of timber and minerals, and ordinarily ranks third among the Argentine states in the production of petroleum. Other minerals include gold, silver, copper, marble and lead.

(R. W. RO.; X.)

SALTA, a city of Argentina and capital of a province of the same name, in the picturesque and historic valley of Lerma, 1,007 mi. by rail N.N.W. of Buenos Aires. Population (1947 est.) 60,000. Salta was founded in 1582 (under the name of San Felipe de Lerma) by Hernando de Lerma, governor of Tucumán. In 1813, during the War of Independence, the Spanish forces under General Pío Tristán, after suffering a decisive defeat at Salta, were obliged to capitulate to Gen. Manuel Belgrano. Salta, 3,895 ft. above sea level, is the centre of a rich mineral and timber region. Mean monthly temperatures range from 53° F. in June to 72° F. in January; average annual rainfall is 28 in., with a distinct dry season from May to October.

A colonial city that has preserved and perpetuated colonial architecture and traditions, Salta holds many attractions for tourists and offers exceptional hotel accommodations and travel facilities.

SALTASH, municipal borough, Bodmin parliamentary division, Cornwall, Eng., 5 mi N.W. of Plymouth, on the Western region railway. Pop (1951) 7,924. Area 9.8 sq mi. It is on the wooded shore of the Tamar estuary, on the lower part of which lies the port and naval station of Plymouth. Local communications are maintained by river steamers. At Saltash the Royal Albert bridge (1857-59) carries the railway across the estuary. The church of St. Nicholas and St. Faith has an early Norman tower. The church of St. Stephen retains its ornate Norman font.

Saltash (Esse, 1207; Ash, 1302; Assheburgh, 1392) belonged to the manor of Trematon and at the Domesday survey was held by Reginald de Valletort. Reginald's descendant and namesake granted a charter to Saltash about 1190. This charter was confirmed in the fifth year of Richard II. Roger de Valletort gave the borough of Saltash to the earl of Cornwall. Thenceforth the earls and subsequently the dukes of Cornwall were the lords of Saltash. The privilege of parliamentary representation was conferred by Edward VI. In 1584 Queen Elizabeth I granted a charter of incorporation to Saltash. This was superseded by another in 1683 but the modern charter was adopted in 1886. In 1852 Saltash was deprived of its two members.

SALT-BUSH, the name given especially in Australia to plants of the genus *Atriplex* (family Chenopodiaceae), which inhabit arid saline soils, notably to *A. halimoides* and *A. nummularia*, which are cultivated for forage. *A. semibaccata*, also native to Australia, is grown as a forage plant in California, where it is known as Australian salt-bush. (See GREASEWOOD.)

SALT DOMES. Generically the term salt dome is used commonly to include all salt structure; i.e., any anticlinal type structure containing a core of rock salt which has been formed in part or whole by the growth of the core. Specifically the term should be restricted to the special and perhaps mature type of salt structure having a circular or quasircular plane section, such as the piercement domes of the Texas-Louisiana coastal plain.

When a block of strata including a bed of rock salt (the mother bed) is subjected to any of the geologic forces which normally produce folding or faulting, the resulting structures are likely to be sharper and substantially different from those formed under similar conditions with salt absent. Rock salt is plastic and will flow under sufficient pressure differentials. It is also generally of lower specific gravity than the strata with which it is associated (the country rock), particularly at depth, and thus is relatively buoyant. Under great enough pressure differentials the salt will flow in the folded beds and the structure of the overlying strata will be accentuated over that of the underlying strata. Furthermore, any structural disturbance of the originally level-lying, salt-

containing formations, or even erosional redistributions of their overburden, is likely to result in disturbance of isostatic equilibrium. Under great enough inequality of load the salt may even breach the overlying beds, thus forming a piercement structure or dome, the diapir fold of Mrazec. In form and mechanics of formation the specific salt dome much resembles a volcanic plug, the salt occupying the position and being structurally almost the functional equivalent of the igneous magma. The salt core, once isostatic equilibrium has been sufficiently disturbed, becomes the active structure-building element. We are dealing with the intrusion of a magma, if one may borrow the word, of sedimentary and evaporite origin. The analogy is valid since salt has been known to form even horizontal intrusions or sills. Aside from the intrusion of igneous rocks the only other geologic processes which resemble genetically the formation of salt structures are the formation of structures by the flow of highly plastic clays or shales. Examples of such structures are formed by the *argille scagliose* of Italy, the *pug* of New Zealand or of mixtures of highly plastic clays and shales with gypsum and perhaps salt such as occur in the Lower Fars of southwestern Iran.

Origin.—The origin of salt structures has long been the subject of speculation, often of great controversy, and is covered by voluminous literature. The German and Rumanian structures were first studied in detail. European geologists early formulated the theory, which came to be generally accepted, that the structures are formed by the flow of originally bedded salt under pressure. Students of American domes were slow to recognize the genetic kinship with European structures. The first vague speculations regarded the domes as having been Cretaceous outliers in Tertiary seas. Robert T. Hill, in the early part of the 20th century, considered that the salt and cap-rock cores of the domes were precipitated from solution by circulating waters. This theory, elaborated and modified by N. M. Fenneman and Gilbert D. Harris, suggested that the little understood force supposed to be exerted by growing crystals was sufficient to account for the uplift of the overlying and contiguous sedimentary rocks. For a time it received wide acceptance. Volcanic forces were suggested from time to time either to explain uplift, provide a source for the solutions or, through heat, to account for the plasticity of the salt. Later, U.S. geologists came to accept generally the theory of intrusive origin.

Formation.—There are at least three distinct positive and important steps in the formation of salt structure: (1) the deposition of a series of sedimentary rocks, including the mother bed of salt and overlying sediments; (2) the initiation of salt flow through the subjection of the mother bed of salt to sufficient pressure differentials. E. De Golyer and others believed that the initial flow is practically always the result of folding or faulting and that it is rarely, if ever, the result of isostatic adjustment; (3) flow of salt. This must continue to the extent necessary to satisfy the pressure differentials established by folding or unequal loading. The salt flow of many structures may be caused entirely by forces established by compressive folding. De Golyer believed, however, that in most domes the quantitatively important flow is the result of isostatic adjustment. A flow of the lighter plastic salt results from the pressure on the mother bed of the heavier sediments overlying the flanks of the structure.

Once the original condition of equilibrium, which should exist in a flat-lying series of bedded rocks, has been disturbed by folding or faulting or once a salt structure has started to grow as a result of compressive forces, new stresses upon the mother salt become effective as a result of differential loading. Since salt is lighter generally than the sediments with which it is associated, particularly at depth, such differential loading stresses become effective in minute degree with even the smallest disturbance of the bed of mother salt, always assuming no disturbance of surface conditions, either by erosion or deposition. With substantial disturbance of the original equilibrium in the mother salt either through folding, faulting, tilting or flow of salt, such stresses alone may become of sufficient magnitude to cause the flow of the salt to continue. If we assume the simple case of a salt anticline caused by compressive folding and buried under thousands of

feet of younger sediments with low resistance texture, such as probably occur in the North German plain and in the Gulf coastal plain of the United States, it is probable that the extra loading will cause the salt to breach the crest of its anticline and flow upward, assuming a tubelike form as a matter of least skin friction. As a unit volume of salt displaces a unit volume of the heavier overlying sediments, the difference between the load on the mother salt and the overburden on the upward-flowing salt (the compelling stress) should increase, and growth should continue at an accelerated rate until the mother bed of salt is exhausted, cut off by the formation of a rim syncline or until a condition of equilibrium in load is approached. Growth may stop before the salt reaches the surface, as in most Texas and Louisiana domes; it may continue until it reaches the surface and is removed by erosion, as in many Rumanian structures, or it may form great mountains with salt glaciers flowing down their sides, as in the Iranian deserts. Most salt domes are believed to root deeply; e.g., those of Iran and Texas-Louisiana at 20,000–25,000 ft. Flow induced by differential loading is believed to be the chief reason for their continued growth. De Golyer believes, however, that growth is seldom if ever initiated by such forces. It is noteworthy that, even with the almost perfectly fluid system of L. L. Nettleton's striking device for demonstrating mechanically the effectiveness of such forces in dome formation, it was necessary to apply an outside force to destroy the normal condition of equilibrium and thus initiate the flow of the lighter fluid into the overlying heavier one.

Cap Rock.—A salt structure may or may not include cap rock, the *gysshus* of the Germans. It is a phenomenon best developed or best known and studied in the Texas-Louisiana domes, where the cap rock was explored for oil and sulphur. It consists usually of a tip or thimble of anhydrite over and in direct contact with the generally flat top of the salt core. The anhydrite cap grades upward by alteration into the gypsum cap which is generally overlain by a limestone or calcite cap. The thickness of the entire cap rock when present varies from a few feet or inches to a thickness of 1,000 ft. or more, as in the sulphur and Lake Calcasieu domes of Louisiana. Cap rock often contains other sulphates, sulphites and carbonates but in minor amounts. It also includes, rarely, blocks of limestone, shale and sandstones, apparently plucked from the formations through which the plug has passed. Sulphur is of common occurrence in the limestone and gypsum cap rocks.

The principal theories of origin of cap rock are: (1) that it is a shield of anhydrite, primarily a part of the normal salt series, carried upward to its present position by the growth of the core and that the limestone and gypsum caps result from alteration of the anhydrite; (2) the more generally accepted theory that the anhydrite, known to occur disseminated through the salt, freed through solution of the salt by circulating water, has been concentrated at the periphery of the salt core, has been compacted or recrystallized into massive anhydrite and may or may not have been altered into gypsum, limestone, sulphur, etc. Schistose structure is of common occurrence in the anhydrite cap. Cap rock is also of common occurrence in the German and Isthmus of Tehuantepec structures but is rarely found in the Iranian, Rumanian and Colorado-Utah structures. Most European students adhere to the theory of residual origin.

Distribution.—Salt structures and salt domes, formerly regarded as unusual, with continued prospecting and study are known to be of fairly common occurrence. There are three and possibly four regions of salt basins in the North American continent where these structures are known to occur. The best explored region is that of coastal Texas, Louisiana and Mississippi, an area extending northward to include the so-called interior domes of northeast Texas, northwest Louisiana and continuing into Arkansas. This area may extend southward into northeastern Mexico. There is also a salt-structure basin in the northern coastal plain of the Isthmus of Tehuantepec, states of Veracruz and Tabasco, Mexico. Another notable occurrence is the group of bold structures of the Paradox basin of southeastern Utah and southwestern Colorado. There appears to be a salt dome at Malagash, N.S.

In South America salt domes or structures are known only in the highlands near Bogotá, Colombia, and in the Amazon region of Peru.

The best-known European occurrences are in the Hanover district and its extensions, the Magdeburg-Halberstadt basin, the eastern part of the north German plain and adjoining areas in the Netherlands and throughout most of Denmark. They are also known in Spain and in southern France. Numerous salt structures occur in Rumania, along the outer margins of the Carpathian arc and in the Transylvanian basin. Salt structures are of abundant occurrence in the Emba basin, just northeast of the Caspian sea. They have been found also in the Ukraine, and salt occurrences in arctic Siberia appear to be of salt-dome type.

The faulted anticlines of the Kohat region of Pakistan may be salt structures and possibly the Punjab Salt range is the result, in some part at least, of the flowage of salt.

Salt structures are also known to occur in Algeria and Tunisia, northern Africa, near the Dead sea in Palestine and along the Gulf of Suez in Egypt.

The most spectacular known occurrence of salt domes is that of southwestern Iran, extending through the many islands of the southern half of the Persian gulf to the margins of the Arabian peninsula. In most of the known domes of this arid region the salt core comes to the surface. This may result in any type of topographic expression from a deep hollow where the salt has been dissolved away and where the more resistant country rocks still form a rim several thousand feet high to that of a simple, bold circular hill of salt standing 1,000 ft. or so above the surrounding plain. A number of the domes have glacierlike plumes of salt extending down for three or four miles from the outcrop of the core. Salt domes occur also on the Iranian plateau and at least one dome occurs in southern Iraq, near the Kuwait border. There is also a group of little and vaguely known salt structures in the Hadramut of Arabia and there are believed to be salt structures within the southern end of the Red sea gaben.

Many important mineral deposits occur in salt structures or salt domes. The limestone cap rock or the limestone brought to the surface by the formation of the structure has been burned for lime at many places, and common salt is mined from the cores of many of the structures. Beds of potassium are mined from the salt complex of many of the German domes, and the extremely important sulphur deposits of the Texas and Louisiana coastal plain are found in the cap rock of salt domes. The oil deposits of the same region, of the Isthmus of Tehuantepec region of Mexico, of the outer Carpathian arc and the Transylvanian basin of Rumania, of the north German coastal plain, extending into the Netherlands, and of the Emba basin in the U.S.S.R. are found in traps resulting from the formation of salt structures or salt domes. Some of the oil is found in cap rock where present but most of it comes from overlying sands arched into simple or faulted anticlines by the intrusion of the salt nucleus and in sands tilted by the intrusion of the salt core and dipping away from it.

(E. L. DE.)

SALTILLO, capital city of the Mexican state of Coahuila. Pop. (est. 1950) 70,000; altitude 5,244 ft. Served by National Railways of Mexico, Saltillo is linked by highways to Eagle Pass, Tex. (286 mi.) via the steel and coal centres of Monclova and Sabinas, and to the other branches of the Pan-American highway passing southward through Monterrey and Torón.

Saltillo is at the northern edge of the great central plateau of Mexico. Its cool, dry, healthful climate made it a summer resort, with facilities for golfing, hunting and swimming. Founded in 1586, Saltillo retains few of its colonial buildings beyond an impressive cathedral and is chiefly significant as an active commercial and manufacturing centre and communications hub. It has an annual fair of importance and manufactures cotton and woolen fabrics, knitted goods and flour. Its blankets or serapes have for centuries been considered among Mexico's finest and many are collector's items. Coal seams near by are exploited on a small scale, though the chief reserves lie in the Sabinas basin and are estimated at perhaps 830,000,000 metric tons. (Ho. C.)

SALT LAKE CITY, the capital city of Utah, U.S., and

the county seat of Salt Lake county, on the Jordan river, 11 mi. E. of Great Salt Lake, at the foot of the Wasatch mountains, about equally distant from Denver, Colo., Los Angeles and San Francisco, Calif., and Spokane, Wash. It is on federal highways 40, 50 and 97, has a modern municipal airport and is the concentration and distribution point for air mail between the Pacific coast and the east; and is served by the Denver and Rio Grande Western, the Union Pacific, the Western Pacific and several electric railways, and by commercial airlines. The population was 182,121 in 1950; it was 149,934 in 1940; and in 1930 it was 120,267.

Physical Aspect and Buildings.—Salt Lake City is the largest city between the Rockies and the coast, and is the headquarters of the Church of Jesus Christ of Latter-Day Saints (Mormons), by whom it was founded and who are still the largest single element in the population. It has an area of 53.87 sq.mi., an altitude of 4,555 ft., and is almost surrounded by mountain peaks, some of which reach a height of 12,000 ft. The site was chosen by Brigham Young (q.v.), and the basic plan of the city was determined by the original survey under his direction, which laid it out in ten-acre blocks, separated by streets 132 ft. wide. In one of these blocks (Temple square, originally the centre of the community) stand the great Mormon temple which no "gentile" may enter, built of gray granite (1853-93) with walls six feet thick and six piers, the highest (220 ft.) surmounted by a copper statue of the angel Moroni; the tabernacle (a low building seating 10,000, with a turtle-shaped aluminum-covered roof unsupported by pillars or beams) where recitals are given daily on the magnificent organ (11,000 pipes); the assembly hall, also of granite, seating 2,500; a bureau of information and a museum of pioneer relics; the first house built in Utah (enclosed in a protecting shelter); monuments to Joseph Smith and his brother Hyrum; and a monument to the sea gulls which at a critical hour of the early colony's history saved the crops and other vegetation from destruction by grasshoppers. In the adjoining block are the administration building of the church; the Genealogical Society building; Eagle gate, formerly the entrance to Brigham Young's estate; the Beehive house and the Lion house, two of his residences. The state capitol (a fine colonnaded building of marble and Utah granite, completed in 1916) stands half a mile northeast of Temple square, at the head of State street (a long, straight thoroughfare) on an eminence commanding the entire valley and backed by the mountains.

East of it is Memory Grove, a park created in honour of the veterans of World War I, at the entrance to City Creek canyon. On the east edge of the city is the campus of the University of Utah (established by the provisional government of the state of Deseret, 1850).

Beyond the university is Fort Douglas, an installation utilized mostly for the civilian components of the armed forces (army and air national guard, reserve components of army, navy and marine corps, and R.O.T.C. instructor personnel. During World War II it was headquarters for the 9th service command. At the entrance to Emigration canyon, east of the military reservation, is a point (marked by This Is The Place monument) where Brigham Young looked down over the valley and said he recognized the site that had been shown to him in a vision.

The state prison is located at the point of the mountain, south of the city, in Salt Lake county. Saltair, 15 mi. W. of the city, is a popular pleasure resort on the lake (in which it is impossible to sink, on account of the large amount [about 27%] of salt in the water).

Churches and Schools.—Of the 152 churches, about 60% are Mormon chapels, and the rest (including a Roman Catholic cathedral) represent most of the faiths and denominations commonly found in U.S. cities. The public-school system comprises 32 elementary, nine junior high and three senior high schools, and a part-time school for boys and girls who go to work before the age of 18. There are several private schools; Westminster college (Presbyterian, established 1875); and various hospitals and charitable institutions. Interest in music, the dance and the drama was fostered from the beginning by Brigham Young. The Tabernacle choir (500 voices) is one of the best choruses in the United States, and the Salt Lake theatre (one of the foremost in

design and appointments when it was built in 1862) had a brilliant history. Salt Lake City ranked second among the large cities of the country in the proportion of children and young people attending school and in literacy.

The general death rate and the infant mortality are among the lowest in the country. In 1911 the city adopted a commission form of government. The assessed valuation of Salt Lake county property for 1950 was \$233,567,780.

Commerce and Industry.—Salt Lake City is the commercial, financial and industrial centre of the state of Utah and of a large additional part of the intermountain territory. It is the seat of the fourth branch (established 1918) of the Federal Reserve Bank of San Francisco, serving 31 counties in Idaho and four in Nevada besides the entire state of Utah. Debts to accounts in the local banking institutions amounted in 1949 to \$7,700,003,055. Manufacturing expanded rapidly during World War II. Many national firms established branch factories or distributing offices there, to supply the natural trade territory of the city (500,000 sq.mi.), and many local industries have extended their markets to cover the country. Among the leading industries are slaughtering and meat packing, printing and publishing, the refining of oil, the smelting of silver, lead and copper, and the manufacture of best sugar, candy, flour and radio equipment.

Receipts at the stockyards totalled 1,493,374 head in 1949, of which the local packing plants used 245,688 head. There is an oil refinery with a capacity of 25,000 bbl. of crude per day, producing all types of petroleum products. The suburb of Murray, 7 mi. S. (population in 1950, 9,005), is a great smelting centre.

History.—The history of the city is bound up with that of the Mormons (q.v.) and of the state (see UTAH). On July 22, 1847, an advance party of Mormons, led by Orson Pratt and Erastus Snow, in search of a place where they might "colonize in peace and safety," entered the Salt Lake valley. On July 24, Brigham Young arrived and approved the site, and on July 28 he chose the spot for the temple. Ploughing and planting were begun forthwith; the hard sun-baked earth was flooded by building a dam in City Creek canyon; and an irrigation system was devised. The city was named the City of the Great Salt Lake, and was so called until 1868. Before the end of 1847 the main body of the people arrived. A theocratic government was set up, with a bishop in charge of each of the 19 wards into which the community was divided. The settlers were U.S. citizens squatting on foreign soil, for the region at that time belonged to Mexico, and they were practically beyond the reach of any civil government, as their leaders had desired. This isolation was of brief duration. The treaty of Guadalupe-Hidalgo, at the close of the Mexican War, transferred the region to the United States, and after the discovery of gold in California, the city was overrun with caravans of treasure seekers. Many of the colonists deserted to join the stream of prospectors, notwithstanding the attitude of their leader, who opposed the exploitation of mineral wealth (even in Utah) and whose ideal was a community of farmers, merchants and manufacturers. Those who stayed at home grew rich as out-fitters.

There was a considerable immigration from Europe in the early years, especially from England, where the Mormon missions were very successful. By 1850 the city had a population of 6,000.

Salt Lake City was chartered in 1851 by the territorial legislature of Utah. After the Civil War the non-Mormon population steadily increased, and there was a long period of conflict between the opposing elements, as well as officially between the Mormon church and the U.S. government over the practice of polygamy and other matters of dispute (see MORMONS), all of which happily is now long past.

SALTO, third city of Uruguay and capital of a department of the same name. Pop. (1950 est.) 48,000. It lies on the Uruguay river opposite the Argentine town of Concordia, 365 mi. by rail from Montevideo and 221 mi. by water from Buenos Aires.

The province of Salto covers 4,866 sq.mi., with a pop. of 99,754 (1941 est.) or 20.5 per square mile, slightly less than the average for the country, which was (1941) 20.3. It is a rolling prairie land, devoted very largely to the raising of high-grade cattle with some

farms and vineyards about the principal towns.

SALTON SEA or **SALTON SINK**, a depression in the Imperial Valley, Calif., whose water surface is 248.7 ft. below sea level. Its drainage area of about 7,500 sq. mi. is mainly desert land and consequently the sink used normally to be dry, though at times the rate of inflow exceeded that of evaporation sufficiently to form a temporary lake. In 1905 during the construction of irrigation works in the valley, the Colorado river left its channel and flooded the sink to a maximum depth of 79 ft. with a surface area of about 330,000 ac. When the river was finally brought back to its proper course the water in the sink began to subside. After 1920 this tendency ceased, and, fed chiefly by the irrigation ditches of the region, the sea became fairly constant at a level of about 37 ft. at its deepest point.

SALTPETRE: see **NITRIC ACID** and **NITRATES**.

SALT RANGE, a hill system in the West Punjab and North-West Frontier Province of Pakistan, deriving its name from its extensive deposits of rock salt. The range commences in Jhelum district, in the lofty hill of Chel (3,701 ft.), on the right bank of the river Jhelum, traverses Shapur district, crosses the Indus in Mianwali district, thence a southern branch forms the boundary between Bannu and Dera Ismail Khan until it finally merges in the Waziristan system of mountains. The salt range contains the great mines of Mayo, Warcha and Kalabagh, which supply the wants of all northern India and Pakistan. Coal of an inferior quality is also found.

SALTYKOV, MICHAEL EVGRAFOVICH (1826-1889), Russian satirist who wrote under the pseudonym of Nicolay Evgrafovich Stchedrin, was born in the province of Tula, Jan. 15 (27), 1826. In 1848 he published *Zaputennoye Dyelo* ("A Complicated Affair"), which led to his banishment to Vyatka, where he spent eight years as a minor government official. The clever picture of Russian provincial officials in his *Gubernskie Otcherki* ("Provincial Sketches") resulted from this experience. After an interval given to writing he was appointed deputy governor, first of Ryazan and then of Tver. On his return to St. Petersburg in 1864 he was appointed president of the local boards of taxation successively at Penza, Tula and Ryazan. In 1868 he finally left the civil service. His principal works are: *Poshekhonskaya Starina* ("The Old Times of Poshekhonsk"), *Istoria odnogo Goroda* ("The History of a Town"), A Satirical History of Russia; *Messieurs et Mesdames Pompadours*; and *Messieurs Golovlofs*. He died in St. Petersburg on April 30 (May 12), 1889.

SALUS, an ancient Roman goddess of safety (from defeat, etc.). In 302 B.C. a temple on the Quirinal was dedicated to Salus (Liv. x, 1). Salus being identified with Hygieia (q.v.). See *Wissowa, Relig. u. Kultus*, p. 131.

SALUTATIONS or **GREETINGS**, the customary forms of kindly or respectful address, especially on meeting or parting or on occasions of ceremonious approach. Etymologically *salutation* (Lat. *salutatio*, "wishing health") refers only to words spoken.

Embraces.—Forms of salutation frequent among savages and barbarians may persist almost unchanged in civilized custom. The habit of affectionate clasping or embracing is seen at the meetings of the Andaman Islanders and Australian blacks, or where the Fuegians in friendly salute hug "like the grip of a bear." This natural gesture appears in old Semitic and Aryan custom.

Rubbing Noses.—The salute by smelling or sniffing (often called by travellers "rubbing noses") belongs to Polynesians, Malays, Burmese and other Indo-Chinese, Mongols, etc., extending thence eastward to the Eskimo and westward to Lapland.

Kissing.—The kiss, the salute by tasting, appears constantly in Semitic and Aryan antiquity. Herodotus describes the Persians of his time as kissing one another—if equals on the mouth, if one was somewhat inferior on the cheek (Herod. i, 134). In Greece, in the classic period, it became customary to kiss the hand, breast or knee of a superior. In Rome the kisses of inferiors became a burdensome civility (Martial xii, 59). The early Christians made it the sign of fellowship: "greet all the brethren with an holy kiss." Of more ceremonial form is the kiss of peace given to the newly baptized and in the celebration

of the Eucharist, which is retained by the Greek church. After a time, by ecclesiastical regulations, men were only allowed to kiss men, and women women, and eventually in the Roman Catholic Church the ceremonial kiss at the communion was only exchanged by the ministers, a relic or cross called an *osculatorium* or *pax* being carried to the people to be kissed. While the kiss has thus been adopted as a religious rite, its original social use has continued. Among men, however, it has become less effusive. Court ceremonial keeps up the kiss on the cheek between sovereigns and the kissing of the hand by subjects. When these osculations cease to be performed they are still talked to by way of politeness: Austrians say, "*Kuss d' Hand!*" and Spaniards, "*Beso a Vd. las manos!*" ("I kiss your hand!") Stroking, petting and other caresses have been turned to use as salutations.

Weeping.—Weeping for joy is sometimes affected as a salutation. Highly ceremonious weeping is performed by several rude races when, meeting after absence, they renew the lamentations over those friends who have died in the meantime. Among the Australian natives, the male nearest of kin presses his breast to the newcomer's, and the nearest female relative, with piteous lamentations, embraces his knees with one arm, while with the other she scratches her face till the blood drops. Obviously this is mourning. So, too, the New Zealand *tangi* is performed at the reception of a distinguished visitor, whether he has really dead friends to mourn or not. Weeping, as A. R. Brown has shown, is for the Andamanese a rite for the revival of sentiments that have lain dormant, the renewal of interrupted social relations and for the recognition of a change in personal relations.

Cowering.—Cowering or crouching is a natural gesture of fear or inability to resist. Its extreme form is lying prostrate, face to the ground. In barbaric society, as soon as distinctions are marked between master and slave, chief and commoner, these tokens of submission become salutations. The sculptures of Egypt and Assyria show the lowly prostrations of the ancient east, while in Dahomey or Siam subjects crawl before the king. A later stage is to suggest, but not actually perform, the prostration, as the Arab bends his hand to the ground and puts it to his lips or forehead, or the Tongan would touch the sole of a chief's foot, thus symbolically placing himself under his feet.

Kneeling.—Kneeling prevails in the middle stages of culture, as in the ceremonial of China; Hebrew custom sets it rather apart as an act of homage to a deity; mediaeval Europe distinguishes between kneeling in worship on both knees and on one knee only in homage.

Bowing.—Bowing, as a salute of reverence, appears in its extreme in oriental custom, as among the ancient Israelites: "bowed himself to the ground seven times." The Chinese according to the degree of respect implied bow kneeling or standing. The bowing salutation, varying in Europe from something less than the Eastern salaam down to the slightest inclination of the head, is given mutually. Uncovering is a common mode of salutation, originally a sign of disarming or defencelessness or destitution in the presence of a superior. Taking off the hat by men has for ages been the accepted mode in the western world. Some eastern nations are apt to see disrespect in baring the head, but insist on the feet being uncovered. Europeans have been called on to conform to a native custom by taking off their shoes to enter the royal presence. In Burma it is respectful to squat in the presence of a superior; elsewhere the inferior should stand.

Handshaking.—Grasping hands appears in antiquity as a legal act symbolic of the parties joining in compact, peace or friendship. In marriage, the hand grasp was part of the ancient Hindu ceremony, as was the "dextrarum iunctio" in Rome, which passed on into the Christian rite and became a mere salutation.

Words of Greeting.—As to words of salutation, even among the lower races certain ordinary phrases have passed into formal greetings. Many formulas express difference of rank and consequent respect, as where the Basuto salute their chiefs with "*Tama swata!*" (i.e., "Greeting, wild beast!"). Congo negroes returning from a journey salute their wives with an affectionate

"*Okoro*" but they, meekly kneeling round him, may not repeat the word, but must say "*Kal ka*!" Among cultured nations, salutations are apt to be expressions of peace and goodwill. Such formulas run on from age to age, and the latter may be traced on Jo the Muslim greeting, "*Salām 'alaikum*" ("The peace be on you"), to which the reply is "*Wa-alaiakum as-salām*" ("And on you be the peace," *sc.* "of God!"). This greeting is a password among fellow believers, for it may not be used by or to an infidel. The Babylonian form, "O king, live for ever!" (Dan. iii, 9), represents a series of phrases, which continue still in the "*Vivat rex*!" ("Long live the king!"). The Greeks said, "Be joyful!" both at meeting and parting. The Romans applied "*Salve*" ("Be in health!") especially at meeting, and "*Vale*" ("Be well!") at parting. In the modern civilized world, everywhere, the old inquiry after health appears, the "How do you do?" becoming so formal as often to be said on both sides, without either waiting for an answer. Hardly less wide in range is the set of phrases "Good day!" "Good night!" etc., varying according to the hour and translated into every language of Christendom. Among other European phrases, some correspond to our "Welcome!" and "Farewell!" while the religious element is exemplified by our "Good-bye!" ("God be with you!") and French "*Adieu*!" Such half-meaningless forms of salutation serve the purpose of keeping up social intercourse.

SALUZZO, a city and episcopal see of Piedmont, It., in the province of Cuneo, 42 mi. S. of Turin by rail, 1,296 ft. above sea level. Pop. (1936) 10,443, town; 15,938, commune. The upper town preserves some part of the fortifications which protected it when, previous to the plague of 1630, the city had about 50,000 inhabitants. The old castle of the marquises of Saluzzo (the line runs 1142-1548) now serves as a prison. Besides the Gothic cathedral (1480-1511), with the tombs of the marquises, the churches of San Giovanni (formerly San Domenico), San Bernardo and the Casa Cavazza, now the municipal museum, are noteworthy. Railways run to Cuneo and Airasca (the latter on the Turin-Pinerolo line).

Henry IV restored the marquise to Charles Emmanuel I of Savoy at the peace of Lyons in 1601.

SALVADOR, EL (sometimes incorrectly called San Salvador from its capital city), the smallest and most densely populated republic of Central America and probably the most intensively cultivated country in Latin America. It is bounded on the north and east by Honduras, on the south by the Pacific ocean and on the west and northwest by Guatemala. It is the only republic of Central America which has no Atlantic seaboard. The republic is 140 mi. long from east to west and 60 mi. wide; its greatest length is about 160 mi. Its area is 13,176 sq.mi. (34,126 sq.km.).

Physical Features.—The chief physical features of El Salvador are the two mountain chains, largely independent of the central Cordillera of Central America, which cross the country and the rich river valleys (chiefly that of the Río Lempa). The mountains are accented by a series of volcanic cones, some of ancient and some of recent origin, which cross the country from east to west. Most of the area of the country is comprised in the plateau, about 2,000 ft. high, between the mountain chains, the region in which the coffee of El Salvador is cultivated, and in which are situated the volcanoes. The Río Lempa rises in Guatemala, crosses a corner of Honduras, and entering El Salvador near Citale, flows east, forming its famously rich and beautiful valley, turns south at the base of the volcano Siguatepeque and enters the Pacific at 80° 40' W. The Lempa is the only river of importance, and although it can be navigated for portions of its course, is little used. The Río San Miguel drains the country between the Bay of Fonseca and the Lempa valley. The volcanoes are clustered into more or less well-defined groups, and in some of these, beautiful crater lakes are found; the largest of these, Lake Ilopango, has been used as a landing place for seaplanes. The most important volcanic groups are, from west to east: the Izalco group, including Izalco (thrown up in 1770), Marcelino, Santa Ana (8,300 ft.), Naranjos, Agüita, San Juan de Dios, Apacana, Tamajaso and Lagunita; the San Salvador group, 30 mi. east, the

chief cone of which is San Salvador; Cojutepeque to the north-east, the San Vicente group farther east, marked by San Vicente volcano and Lake Ilopango; and the San Miguel group, to the southeast, including notable landmarks like San Miguel (7,120 ft.), Chinameca, Buenapa, Usulután, Tecapa and Taburete. Two other volcanoes, Caguateguete and Sociedad, in the northeastern portion of the country, lie in the Cordillera and are not to be taken as part of the El Salvador groups proper. Many of these volcanoes are in eruption, and San Miguel has had violent outbursts in recent years.

Climate.—Because El Salvador is locked in as it is by the Cordillera which marks its boundaries with Guatemala and Honduras, it has an almost temperate climate on the tableland and along the mountain slopes, which are intensively cultivated for coffee, often to the very summits of the hills or volcanoes. The lowland is often hot and sultry when the winds are not blowing. The recognized seasons are the wet and the dry, the wet season, from May to October, being confusingly called "winter" in El Salvador, the dry season, from November to April, "summer." Winds and thunderstorms mark the middle of the wet season, in July and August, and in September and October the rains are almost continuous, but moderate. Following the August storms, there is a brief dry spell, the "dog days," *veranillo* or "little summer," when crops are planted and preparations made for obtaining the greatest productivity from the soil. In the earlier days, there was a tradition that no revolution could be fought during the *veranillo*, as both armies insisted on returning home to attend to their planting. For general geology see CENTRAL AMERICA: Geology.

History.—El Salvador was conquered by Pedro de Alvarado, Cortes' lieutenant, who invaded the present republic in 1524 and early the next year met and defeated the Indians and captured their capital, Cuscatlan, placing the rule of the new region under the captain generalcy of Guatemala. El Salvador declared its independence from Spain with the other countries of Central America on Sept. 15, 1821, and its history was that of Central America during the early period. Its independent career was marked by numerous revolutions and wars against other Central American countries. Through World War I, apparently following Mexico's example, El Salvador remained neutral, and later requested the United States to explain a reference in the Versailles treaty to the Monroe Doctrine.

What was hailed as El Salvador's first free election in almost 20 years was held in Jan. 1931 when Arturo Araya was chosen president. Economic distress, however, combined with the general surge of reform spirit throughout Latin America, led in December to the government's overthrow and the elevation of Gen. Maximiliano Hernández Martínez to the presidency. Although the United States and a number of other American republics at first refused to recognize the Hernández Martínez regime, the general remained in power for more than a decade, and until 1944 Salvadoran politics were meaningful only as they related to his essentially authoritarian government.

General Hernández Martínez was at length deposed in 1944. The disorders were precipitated in February, when the subservient national assembly voted to extend the general's presidential term until Dec. 31, 1949. This action brought a storm of protest, and on April 2, 1944, an abortive rebellion was launched by Arturo Romero and Gen. Tito Calvo. Once the ill-fated uprising was suppressed, President Hernández Martínez ordered the execution of General Calvo and other army officers who had been involved in the affair. The executions gave rise to renewed protests. On May 5 the university students organized a demonstration which, joined by other elements of the population, became an effective general strike by May 8, when Hernández Martínez, pointing out that it was impossible to "shoot everybody," at length resigned from the presidency and went into exile.

Salvadoran politics, however, remained turbulent and unstable. Gen. Andrés B. Menéndez succeeded Hernández Martínez as president, but Menéndez himself was overthrown five months later in a military uprising successfully led by Col. Osmin Aguirre y Salinas. The Aguirre coup served primarily to complicate the situation; his

political opponents coalesced around the leadership of former supreme court chief Miguel Tomás Molina, who established a government-in-exile in Honduras. The two rival regimes co-existed until March 1, 1945, when Gen Salvador Castañeda Castro was inaugurated as president and the government-in-exile was abandoned.

Castañeda Castro had been the only candidate in a presidential election held under outgoing President Aguirre's direction on Jan. 14-16. Installed in the presidency, Castañeda Castro sponsored the writing of the constitution of 1945. In 1948, he attempted to extend his term of office. This move produced a military uprising against him, and he was deposed on Dec. 14. The revolutionists formed a governing junta composed of three army officers and two civilians. This group provided for a presidential election to be held in 1950, at which time Lieut. Col. Oscar Osorio, one of the members of the junta, emerged as president. A new constitution was proclaimed later that year.

Population.—According to the 1950 census of the Americas, El Salvador had a population of 1,855,917. A large proportion of the people live on farms, and the number of landowners includes a large percentage of small landowners; these small farmers raise coffee and sugar which is milled in larger properties or *centrales*, which buy the crop or prepare it for the market on a percentage basis. The chief cities are San Salvador, the capital, 161,951; Santa Ana, 51,702; Nueva San Salvador (Santa Tecla), 18,313; San Miguel, 26,702; Sonsonate, 17,949; Cojutepeque, 10,015; Ahuachapán, 10,294; San Vicente, 10,950. The principal ports are Acajutla (2,018) and La Unión (7,890).

The people of El Salvador are made up of white, chiefly Spanish, stock (about 10%); mixed blood, Spanish and Indian (about 50%) and Indian (40%). There are very few Negroes. The rulers are chiefly of the white group, and this strain is jealously guarded; the large coffee planters are whites of Spanish colonial origin, there being some foreigners. The Indians of El Salvador constitute an important element of the population, being industrious, efficient and commanding, as a class, higher wages on the plantations than the mixed bloods of similar social groups; Indian villages are still largely segregated by their own choice, but they have their own little coffee farms and work at wages, with their families, for the white owners of the larger estates.

Government.—The constitution adopted in 1950 provided for division of the government into executive, legislative and judicial branches. The legislative body is a unicameral congress which meets in regular session twice a year. Voting is obligatory for every male citizen of 18 years or over, but this provision is not enforced. The president is elected by popular vote for a term of four years, and is ineligible to succeed himself. In the event of death, disability or removal of the president, an *ad interim* president is elected by the cabinet, chief justice and congress. A new election must then be held within six months, and the new president's four-year term begins the following Jan. 1. The president has a cabinet, the members of which may attend sessions of congress and answer questions submitted there. The judiciary is composed of a supreme court, two courts of third instance and several of first and second instance. The supreme court is made up of a chief justice and six judges from the court of third instance.

Defense.—The defensive forces consist of the permanent army, limited to 3,000 men, a militia and a national guard.

Education and Religion.—In 1945 there were 1,519 primary schools with 3,701 teachers and 100,000 students, 50 secondary schools with 6,982 students, and one university with 835 students. Provision was made in the 1947 budget for the expenditure of the equivalent of about \$8,000,000 U.S. for educational purposes. The Roman Catholic religion prevails, although there is freedom of worship. The church is headed by an archbishop at San Salvador and bishops at Santa Ana and San Miguel.

Industry and Agriculture.—El Salvador is chiefly an agricultural state and produces coffee, sugar and specialties in quantities which make it an important factor, in proportion to its size, in world markets. Coffee is the chief crop, production amounting to 89,605 metric tons in 1950 and providing more than 80% of the

export value. Sugar is ordinarily second in production. Maize, which is shipped to neighbouring Central American countries, including Costa Rica and Nicaragua, is third. Beans are a similar food crop, and some wheat is also exported. Of the specialties, balsam of Peru and indigo are the chief, and both are important. Balsam (*g.u.*), a healing drug, is produced solely in El Salvador, the nismom coming down from early Spanish days, when Peru was best known.

There is some mining, about 200 mining establishments being listed as in operation; gold production in 1949 was 28,103 troy ounces; silver, 447,851 troy ounces.

Commerce and Trade.—With 80% to 90% of all exports made up by coffee, El Salvador's prosperity is dependent upon the size of her coffee crop and the world price. Before World War II the heavy overproduction of this commodity had affected the country's economy. Nevertheless, in terms of U.S. dollars, the value of foreign trade increased. Exports in 1950 totalled \$69,502,000 and imports \$47,231,000. About three-quarters of the trade is ordinarily with the United States.

Communications.—The interior is well supplied with railways and with highways. The El Salvador railway was opened in 1882, and the international railways finished their line to La Unión in 1922 and connected up with the Guatemala line in 1929. There is also a short railway from San Salvador to Acajutla, on the Pacific coast.

El Salvador was perhaps the most active of all Central American countries in constructing its portion of the Inter-American highway, completing its portion in the early 1940s. In 1950 the total highway mileage was 1,693, of which 934 mi. were all-weather roads.

Finance.—The monetary unit is the colón, stabilized at 40 cents U.S. The public debt on Dec. 31, 1950, was \$10,381,805, all external. Ordinary government expenditure in 1950 was \$35,395,579; ordinary revenue, \$35,347,019. The 1951 budget was estimated to balance at approximately \$44,000,000.

(L. W. BE.; C. I. B.)

SALVADOR or **BAHIA**, the oldest city of Brazil, for 250 years the capital of the country and now the capital of the state of Bahia, was founded by Thomé de Souza in 1549. Lat. 13° S. and long. 30° 31' W. Pop. (1950) 395,993. A picturesque and bluff-formed peninsula extending southward, ranging from slightly above sea level to 250 ft., separates Todos os Santos bay, a deep body of water 25 mi. long and 30 mi. wide, from the Atlantic ocean. Salvador is situated on the inner side of the peninsula, facing west.

The mean temperature is 78° F. and the annual rainfall is 52 in. Having outgrown its original bay-level site, the city today extends well over higher levels. Lower and upper sections are connected by elevators and by graded and winding roads. Narrow streets, principally old business structures and some residences, warehouses, commercial activity, new docks and shipping services typify the lower city. On upper levels there are new parks, modern streets and boulevards, fine residences, flower gardens, modern shops, hotels, schools, theatres, churches. Electric car lines radiate to suburbs. A railway to Jazeiro, 350 mi., connects with steamer service on the São Francisco river; also there is rail connection to Lençóis, Toca da Onça and the state of Sergipe, all of which provide outlets for agricultural products via Salvador. During the period 1900 to 1920 and again from 1940 to the census of 1950 the population of Salvador showed a substantial increase of about 30%. Most marked advances of later years were the extension of paved streets, modern business houses, further extension of electricity for domestic purposes and numerous civic improvements. Cia Brasileira de Energia operates streets, telephones and power services. Port improvements were begun as early as 1909, but made only fair progress. Ships dock (instead of anchoring in the bay) and cargo is efficiently transferred to and from ships. There are numerous extensive warehouses and mechanical energy is replacing physical labour in

handling cargo. Exports from the port include cacao, hides, tobacco, coffee, sugar, rubber, diamonds, castor oil beans and hard woods. The total of exports for the years 1947 to 1949 amounted to an average of 218,000 metric tons annually. Manufactured goods imported during the same period of years ranged from 167,800 to 217,000 tons per year. A considerable number of industrial plants are engaged in manufacture of less complicated commodities. The Brazilian government maintains a dockyard at Salvador; a second one is operated by a British corporation. There is a coaling station with Welsh and other fuels on hand. Smaller vessels are built here and ship repairing occupies the attention of skilled mechanics and many labourers. The good financial condition of the state of Bahia reacted favourably on the city's progress.

Salvador is an important refining centre of petroleum, considerable amounts of oil having been discovered in the neighbourhood of the city. (R. D'E)

SALVAGE, includes a service rendered voluntarily by a person by saving life or property from peril, and also the reward for such service and in certain cases the thing saved, as from fire on land. Usually the word is employed in reference to salvage at sea, which has two divisions: (1) civil salvage, (2) military salvage.

Civil Salvage.—This is defined in English law as such a service as may become the ground of a reward in an admiralty court, and arises from the preservation of life or property from dangers of the sea. The jurisdiction to give it is an admiralty jurisdiction. But the right to reward was recognized in the courts of common law before the admiralty court became, as it now is, a part of the High Court of Justice, *e.g.*, by enforcing a possessory lien of the salvor over the salvaged property. The origin of the rule has been traced to the doctrine of Roman law that "spontaneous services" in the protection of lives and property should be rewarded. But that doctrine has not found a place in English law, except as part of the maritime law administered in the court of admiralty. Thus services on land, as in rescuing lives or houses or goods from fire, do not entitle the person rendering those services to reward, unless he has acted under some contract or employment. But at sea or in a harbour or dock the right to reward springs from the service itself if it has been rendered to a ship, or her passengers, crew or cargo, or to property which has been thrown or washed out of her.

The right to salvage for saving lives from ships is the creation of modern statutes. Formerly the admiralty court treated the fact that lives had been saved as enhancing the merit of a salvage of property by the same salvors, where the two could be connected; and so indirectly gave life salvage. And this is still the position in cases where the Merchant Shipping Act of 1894 does not apply. This act (s. 544) applies to all cases in which the "services are rendered wholly or in part within British waters in saving life from any British or foreign vessel, or elsewhere in saving life from any British vessel." Also (s. 545) it can be applied, by Order in Council, to life salvage from ships of any foreign country whose Government "is willing that salvage should be awarded by British courts for services rendered in saving life from ships belonging to that country where the ship is beyond the limits of British jurisdiction." By s. 544 life salvage is made payable "by the owner of the vessel, cargo or apparel saved"; and is to be paid in priority to all other claims for salvage. Where the value of the vessel, cargo and apparel saved is insufficient to pay the life salvage, the Board of Trade may in their discretion make up the deficiency, in whole or in part, out of the Mercantile Marine Fund. The effect of the act is to impose a common responsibility upon the owners of ship and cargo to the extent of their property saved. Whatever is saved becomes a fund out of which life salvors may be rewarded, and to which they are entitled in priority to other salvors. By the Maritime Convention Act 1911 a master who does not render assistance to any person in danger of being lost at sea is guilty of a misdemeanour.

This limitation of the reward to the amount of the property salvaged also applies in the case of salvage of property. The ordi-

nary remedy of the salvor is against the property itself by proceedings *in rem*, to enforce the maritime lien given him by the law upon that property. This enables him to arrest the property, if within the jurisdiction, into whose hands soever it may have come; and, if necessary, the court will order a sale, and payment of his claim out of the proceeds. The salvor has also a remedy *in personam* against the owners or others interested in the property saved; but it seems that this right depends upon property having been saved, and having come to the owner's hands. The amount which can be awarded is limited by the value of that property.

In order to create a right to salvage lives or property saved must have been in danger—either in immediate peril, or in a position of "difficulty and reasonable apprehension." Danger to the salvor is not essential, though it enhances his claim to reward. Again, the service must have helped towards saving the lives or property. Ineffectual efforts, however strenuous and meritorious, do not give rise to a claim. But the service need not be completely successful. If it has contributed to an ultimate rescue it will be rewarded, though that may have been accomplished by others. And as we have seen, there must have been ultimate success. Some of the property involved in the adventure must have been saved. And its value, or the fund realized by its sale, limits the total of the awards to all the salvors. Cases, of course, occur in which services at sea are employed by ships in danger: as where a steamer with a broken propeller shaft employs another steamer to tow her; or where a vessel which has lost her anchors employs another to procure anchors for her from shore. In such cases the conditions of reward above set out may not apply. Reward may be payable, notwithstanding entire failure or success, by the express or implied terms of the employment. But such a reward is not truly "salvage."

Services that are rendered in the performance of a duty do not bestow a claim to salvage. Thus the crew cannot (while still the crew) be salvors of the ship or cargo; nor can the passengers, unless they have voluntarily stayed on the ship for the purpose of saving her. Nor can a pilot employed as such be salvor, unless he has boarded a vessel in such exceptional circumstances that his doing so for pilotage fees could not reasonably be expected; or unless the circumstances of the service, entered upon as pilotage, have so changed as to alter its character. Again, the owners and crew of a tug employed to tow a ship cannot claim salvage for rescuing her from danger which may arise during towage, unless circumstances have supervened which were not contemplated, and are such as to require extraordinary aid from the tug, or to expose her to extraordinary risk. Officers and crew of a ship of the royal navy may, with consent of the Admiralty, recover salvage when they have rendered services outside the protection which their ship ought to afford. No claim, however, can be made in respect of the ship herself, except she be specially equipped with salvage plant.

The reward depends first, on the degree of the danger to the property saved, on its value, and on the effect of the services rendered; next, on the risks run by the salvors, the length and severity of their efforts, the enterprise and skill displayed, and on the value and efficiency of the vessel or apparatus they have used, and the risks to which they have exposed her. Negligent or improper conduct of the salvors will cause a diminution or total disallowance of the award.

In apportioning the award given for a salvage service among the owners, master and crew of the vessel by means of which it has been rendered, the special circumstances of each case have to be considered. In nearly all cases a large portion goes to the owners, and as in recent times the value and efficiency of ships (especially of steamships) have increased, so the proportion of the whole usually awarded to the owners has also increased. In an ordinary case of salvage by a steamship towing a distressed ship into safety, the share of the owners has often been about three-fourths; of the remainder the master usually gets about one-third, and the officers and crew divide the rest in proportion to their ratings. But where the salvaging ship has sustained special damage in the service, or her owners have been put to loss by it, that is taken into considera-

tion. On the other hand, where special personal services have been rendered by members of the crew they are specially rewarded.

An agreement as to the salvage to be paid is sometimes made at the time the assistance is given. When made fairly the court will act upon it, though it may turn out to be a bad bargain for one or other of the parties. But if the facts were not correctly apprehended by one or both, or if the position was one of such difficulty that those salvaged had no real option as to accepting the salvor's terms, the court will set the agreement aside.

The award of salvage is generally made in one sum against ship, freight and cargo; and those interests contribute to the amount in proportion to the value saved. Each is liable to the salvors for his own share, and for no more. If, however, the shipowner pays the cargo's share, he has a lien upon it for the amount. (T. G. C.)

Military Salvage.—This is such a service as may become ground for a reward in a prize court for the rescue of property from the enemy in time of war. It involves the determination of two questions: first, whether the property is to be restored to its original owner or condemned as prize to the recaptor; and second, what amount of salvage, if any, is to accompany restitution. The first question depends upon the law of nations, which may be taken to be that where a ship has been carried by an enemy *infra praesidia*, and especially after a sentence of condemnation, the title of the original owner is divested, and does not revert upon recapture by third parties. In such a case, therefore, *ius gentium* restitution cannot be claimed. The municipal law of civilized countries, however, does not encourage subjects to "make reprisals upon one another," and laws are generally found, as in England, which as between subjects of that particular State provide for restitution irrespective of any change in the title to the subject matter which may have occurred. But (speaking henceforth of England) in cases which do not fall strictly within these acts, the old maritime law, which was in unison with the general law of nations, is applied by the courts. Moreover, the English Prize Acts do not apply to foreign owners of recaptured prizes, and therefore no award can be made against them unless in accordance with the law of nations. In practice the courts have acted upon the "rule of reciprocity" where recaptures have been made of the property of formal allies, dealing with them as the allied State would have dealt with English property. If a neutral vessel is recaptured restitution is always ordered, unless the vessel is in peril of condemnation or destruction. An exception to the rule of restitution as between British subjects is made in the case of a British ship which has been "set forth as a ship of war" by the captor, and subsequently retaken by a British ship. Such a ship is not liable to restoration, but is the prize of the recaptor. This exception, the object of which is to encourage the capture of armed ships, dates from 1793, previous acts having provided for restitution upon payment of a moiety as salvage. The condition of setting forth as a ship of war is satisfied, where under a fair semblance of authority, which is not disproved, the ship "has been used in the operations of war, and constituted a part of the naval force of the enemy."

The right to salvage and the amount which will be allowed are also questions of the *ius gentium*, though usually governed by municipal law. In England the first statutory recognition of the right occurs in 1648, when an act of the Commonwealth provided that British vessels captured by an enemy and retaken by British ships shall be restored upon payment of one-eighth of the value of the property in lieu of salvage, or one-half in the case of a prize "set forth as a ship of war." Since the first act, and down to the act of 1805 inclusive, a distinction has always been drawn between a recapture effected by one of the royal ships of war and a recapture by a privateer or other vessel. In the former case the allowance has always been one-eighth, in the latter it varied, but was usually one-sixth. In the act of 1692 a clause gave salvage to a privateer, rising in amount from one-eighth to one-half according to the number of hours the prize had been in the enemy's possession, but this clause has disappeared since 1756. There is no provision in the present act for the payment of salvage, except in case of recapture by one of His Majesty's ships, but it seems beyond question that recaptors are entitled at law to salvage, although they may hold no commission

from the Crown. Similarly, salvage is awarded in the case of recapture from pirates or from a mutinous crew. In the case of royal ships the act of 1864 allows one-eighth salvage, which in cases of "special difficulty or danger" the court may increase to an amount not exceeding a quarter. (M. Br.)

UNITED STATES

Mariners are not under any legal obligation to render salvage services to property in peril at sea. Salvage awards are granted by the maritime law in order to encourage them to undertake the peril and responsibility of performing such services. However, the duty of master mariners to render assistance to every person in peril at sea has been laid down by statute in the leading maritime countries (see Salvage Act of Aug. 1, 1912, c. 268, s. 2; *Comp. Stat. s. 7,991*). Under American law, failure of a master of a vessel to fulfil this duty renders him liable to a penalty not exceeding \$1,000, or imprisonment not exceeding two years, or both. The reward for life salvage is not so definitely provided for in American law as in England. By the Act of Aug. 1, 1912 (c. 268, s. 3; *Comp. Stat. s. 7,992*), salvors of human life may recover an award for such service only where a salvage award is made with respect to a salvaged vessel, her cargo and accessories. Salvors of life receive no award unless property is saved. A private vessel may take off the crew and passengers of a sinking liner, but unless some property is saved, no claim for salvage award will lie. But the property saved need not be saved by the salvors of human life. And if any property is saved, it matters not by whom, the salvage award on that property which, as will be hereafter remarked, usually does not exceed half of its salvaged value, is the fund from which the award for life salvage must be drawn (*The Admiral Evans*, 286 Fed. Rep. 442). It is provided by statute that with the exception of ships of war, or vessels appropriated exclusively to public service, salvors of human life who have taken part in the services are entitled to a fair share of the remuneration awarded to the salvors of the vessel, her cargo and accessories (Salvage Act of Aug. 1, 1912, c. 268, s. 3; *Comp. Stat. s. 7,992*).

The Government may claim salvage for services rendered by its public vessels. By the Act of July 1, 1918 (Stat. L. 40, p. 705, c. 114), the secretary of the navy is authorized to cause vessels under his control, adapted to the purpose, to afford salvage service to private or public vessels in distress, and to determine and collect reasonable compensation therefor when such salvage service is rendered by a vessel especially equipped for the purpose, or by a tug. The implication which might be drawn from the statute that, where the service is rendered by a public vessel not specially equipped for salvage service, such as a man-of-war or a transport, the Government may not demand and collect a salvage award, has been rejected by the courts. The Government has sued for and been allowed salvage award for salvage services rendered to a British merchant vessel by a merchant vessel owned by the U.S. Shipping Board and operated as a munitions ship for Government account (*The Impoco*, 287 Fed. 400). In the case of salvage services rendered by any merchant vessel owned or operated by the United States or the U.S. Emergency Fleet Corporation (now U.S. Merchant Fleet Corporation), it is provided by s. 10 of the Act of March 9, 1920 (Suits in Admiralty Act c. 95; *Comp. Stat. s. 1,952*), that the United States and the crew of any such vessel shall have the right to collect and sue for salvage services rendered, and any moneys recovered therefrom by the United States for its own benefit, shall be paid into the U.S. Treasury, to the credit of the department of the Government, or of the U.S. Shipping Board, or of the Emergency (Merchant) Fleet Corporation having control of the possession or operation of the vessel.

Salvage Award.—By statute, the master and crew of the salvaging vessel, in rendering services to another vessel of common ownership, are entitled to salvage award (Salvage Act of Aug. 1, 1912, c. 268, s. 1; *Comp. Stat. s. 7,990*). In the absence of request by the distressed vessel, salvage services, to merit an award, must be rendered directly to the salvaged property. It has been held that where a dry-dock is on fire and tugs extinguish

the flames, if a vessel in the dry-dock does not request such services and has other means of protecting itself, no salvage award may be claimed from it. The services were rendered directly to the dry-dock and perhaps incidentally benefited the vessel lying in it, but no salvage award may be claimed from the vessel (*Merritt and Chapman D. & W. Co. v. United States* [The *Leviathan*], 274 U.S. 511). So, also, where vessels are moored alongside a river quay, services rendered by tugs in extinguishing a fire on one of the vessels do not give rise to a salvage claim against the vessels near by, unless the vessels against which the claim is made requested the salvors to perform the services (*The City of Atlanta*, 56 Fed. 252). In the same circumstances, however, if the salvors devote their attention to the other vessels and tow them away from the burning vessel, then salvage award may be claimed from them. It is not essential that there should be direct contact between the structure, gear or personnel of the salving vessel and the vessel saved. A word of warning to a vessel heading for a shoal, which enables her to avoid destruction, is a salvage service (*South American S.S. Co. v. Atlantic Towing Co.*, 22 F. [2d] 16). Likewise, a vessel which stands by another in distress, even though she does nothing else, is entitled to salvage award (*The Sapiro*, 5 F. [2d] 56; *The Manchester Brigade*, 276 Fed. 470).

It often happens that while the services are rendered under the apprehension of grave peril, the result shows that the vessel was not in danger at all or at least not to the extent anticipated. In such case it has been held that it is the apprehended danger which fixes the value of the services and controls the amount of the award. The owner of the salved property will not be heard to argue that subsequent developments showed that the salvage was unnecessary or that the risks taken by the salvors were less in fact than they appeared at the time the services were rendered (*The Louther Castle*, 195 Fed. 604). But see *The Sapiro*, 5 F. [2d] 56, holding that the master of the distressed ship exaggerated the plight of his vessel. Apparently it is the peril reasonably apprehended which controls.

Success is of the essence of a salvage service. But if a salvor undertakes a salvage service and is ready and able to carry it to completion, he cannot be summarily dismissed on the arrival of other assistance and thus deprived of salvage award. If a salvor is dismissed after he has contributed to the ultimate success of the operation and is ready and able to continue, he is entitled to share in the salvage award. Cases frequently arise where salvors are relieved by other vessels belonging to the same ownership as that of the distressed vessel. It has been held that the first salvors are entitled to share in the salvage award (*The Annie Lord*, 251 Fed. 157; *The Manchester Brigade*, 276 Fed. 470). However, a salved vessel need not retain incompetent salvors and is free to obtain whatever assistance is available. Whether or not the first set of salvors are entitled to share in the award depends on what they did and what they were able to do (*The Santa Rosa*, 295 Fed. 350).

Claims for Salvage.—In making demands for salvage, and in exacting security under process in rem against the salved property, salvors must be careful not to be exorbitant in their demands. The amount of salvage award is entirely discretionary with the court. A grasping attitude on the part of salvors will often work against their claim for salvage. Indeed it may cause the court to dismiss their claim entirely where their conduct is of such character as to destroy whatever merit there may have been in the service (*The Gypsy Queen*, 284 Fed. 607). The salved interests must also show the proper attitude. Owners of salved ships should make reasonable offers of award, or else the court may penalize them for putting the salvors to the expense of litigation (*The Western Star*, 157 Fed. 489). Interest on the amount of the award may be allowed, in the discretion of the court (*The Naiwa*, 3 F. [2d] 381).

Where salvors are negligent in the performance of the service, or in care of the property after deliverance from the peril, the owner of the salved property may urge the fact against them in reduction of salvage award or as a complete defence to the claim (*The Henry Steers, Jr.*, 110 Fed. 578; *The Bremen*, 111 Fed.

228; *The Ragnarok*, 158 Fed. 694; *Albury v. Cargo Ex. Lugano*, 215 Fed. 963; *The F. Q. Barstow*, 257 Fed. 395).

Salvage awards, in the view of the United States maritime law, while having as their purpose the encouragement of salvage service, must be fixed in such amounts as not to deprive the owner of the property saved of all benefit of the service.

Amount of Award.—This depends, in each case, on the facts. The courts frequently advert to awards made in similar cases, but precedents serve only as a guide. They have no controlling force (*The Buckingham*, 284 Fed. 917). The appellate courts will not disturb the award made by the trial judge unless there appears to be such a clear abuse of discretion as to amount to an error of law (*The Bay of Naples*, 48 Fed. 737; *The Kia Ora*, 352 Fed. 507; *The Naiwa*, 3 F. [2d] 381; *The Santa Rosa*, 5 F. [2d] 478; *The Zaca*, 7 F. [2d] 69). A classic definition of the elements to be considered by a court in fixing salvage award was given by the U.S. Supreme Court in *The Blackwall*, 10 Wall. 1, 14:—

"(1.) The labour expended by the salvors in rendering the salvage service. (2.) The promptitude, skill, and energy displayed in rendering the service and saving the property. (3.) The value of the property employed by the salvors in rendering the service, and the danger to which such property was exposed. (4.) The risk incurred by the salvors in securing the property from the impending peril. (5.) The value of the property saved. (6.) The degree of danger from which the property was rescued."

It is, therefore, apparent that the amount of award in the various classes of salvage can not be readily classified because of the highly variable factors which enter into them. The following cases, grouped according to the nature of the service, will give some idea of the amounts of salvage awards. Towage on high seas: *The Varzin*, 180 Fed. 892; *The Meldersheim*, 249 Fed. 776; *The Western Pride*, 274 Fed. 920; *The Katrina Luckenbach*, 61 Ct. Cls. 632. Releasing stranded vessels: *The St. Paul*, 82 Fed. 104; *The Kia Ora*, 352 Fed. 507; *The Santa Rosa*, 295 Fed. 350. Extinguishing fire on vessels: *The F. Q. Barstow*, 257 Fed. 393; *The Huttonwood*, 262 Fed. 452; *The Zaca*, 7 F. [2d] 69; *The Florence Luckenbach*, 9 F. [2d] 1,008. Towing vessels away from burning vessels or pier: *The Geo. W. Elzey*, 250 Fed. 602; *The West Mount*, 277 Fed. 168; *The Thorwald Halvorsen*, 281 Fed. 506; *The Magnetic*, 293 Fed. 94; *The Santa Barbara*, 299 Fed. 152.

Where the salved vessel has been abandoned by her master and crew and is therefore derelict, the salvage awards run much higher than otherwise. The ancient rule was that the salvage award amounted to a moiety of the salved value. While this rule is no longer regarded as controlling, there are a few cases of derelict salvage awards which even exceed 50% (*The Edwards*, 12 Fed. 508; *The Flower City*, 16 Fed. 866; *The Bay of Naples*, 48 Fed. 737; *The Myrtle Tunnel*, 146 Fed. 324; *The Flora Rodgers*, 152 Fed. 286).

Division of Award.—The division of salvage award between the owner of the salving vessel and the master, officers and crew is subject to the circumstances of each case. Where a vessel is towed from her position of distress at sea to a port of refuge, or where a stranded vessel is released, the salvage award is often divided four-fifths to the shipowner and one-fifth to the crew. In cases of towage on the high seas, where the salving crew has incurred considerable peril, the crew's share may run higher. An exceptional case arose when the "Katrina Luckenbach," steaming in convoy from Gibraltar to Hampton Roads in Aug. 1918, broke down at sea. The "Gaelic Prince," of the same convoy, took the "Katrina Luckenbach" in tow and brought her 1,366 m. to Hampton Roads, through an area in which German submarines were operating. Great risk was incurred by the master and crew of the "Gaelic Prince," because by taking the "Katrina Luckenbach" in tow their vessel became vulnerable to attack by a submarine. The court, in rendering a salvage award to the "Gaelic Prince" of \$93,000 in addition to the salvor's expenses, allowed two-thirds of it to the master, officers and crew (*Prince Line Ltd. v. The United States*, 61 Ct. Cls. 632). In cases of salvage services rendered to burning vessels, whether at sea or in port, the crew's share is usually from about one-quarter to one-

third, because of the personal risk involved. It may be more in cases of specific heroism. It should be borne in mind, however, that the facts of each case control the amount of salvage award and the share of it to be given to the officers and crew of the salving vessel. The services rendered by the personnel are considered by the court in fixing their share of the salvage award. Following this principle, if the facts show that the crew did nothing more than attend to their ordinary routine duties at sea, as in the case of towage of a vessel on a calm sea, the court may exclude the crew entirely from the award, particularly where both vessels are owned by the same interests (*The Lewis Bros.*, 287 Fed. 143; *The Lake Elmont*, 1924 A.M.C. 711). The crew's fund is usually pro-rated according to the monthly wages, the master's share figured on double his monthly wages.

Settlement Agreement.—The seaman is specially protected by law from those who would deprive him by agreement of his right to salvage award. He is the ward of the admiralty, and in order to protect him from those who would cause him to discount his rights in salvage, it has been provided by statute that every stipulation by which any seaman consents to abandon any right which he may have or obtain in the nature of salvage shall be wholly inoperative (*U.S. Rev. Stat. 4,535; Comp. Stat. s. 8,324*). However, it has been intimated in an *obiter dictum* that a settlement made with the seaman after the performance of the salvage service would be valid where the shipowner has acted in good faith (*Rivers v. Lockwood*, 239 Fed. 380).

Salvage awards are frequently agreed on by the parties without the need of litigation, and the shipowner commonly conducts the negotiations. If a suit proves necessary to collect the award, the shipowner has the right to sue on behalf of the crew (*Castner, Curran and Bullitt v. United States*, 5 F. [2nd] 214). The shipowner, however, has not any authority to bind the crew by any arrangement which he may make with the salvaged interests. Indeed, if the settlement which the shipowner agrees to accept is not commensurate with the services rendered, the crew may maintain direct action against the salvaged interests for their proper share of salvage award. The arrangements made by their shipowner are not a bar to their recovery (*Berger v. General Petroleum Co.*, 242 Fed. 967). The common practice in salvage settlements without litigation is that the salvaged interests, in paying the entire award to the owner of the salving ship, demand and receive an agreement of indemnity by which the owner of the salving vessel agrees to hold harmless the salvaged interests from any future claims which may be made by the crew in respect of the salvage services. Thus the owner of the salving vessel takes upon himself the responsibility for the salvage settlement and assumes the obligation of making good to his own crew any deficiency of salvage award which any court in the future may allow to the seamen in addition to their share of the award fixed by the settlement. It is generally considered that any payment which the seaman receives, whether in consideration of the surrender of his salvage rights, or in the distribution of a settlement fund received by his shipowner, is deemed a payment *pro tanto* on account of any salvage award to which the seaman may be entitled (*The Edward Lee*, Fed. Cas. No. 4,292; *The Adirondack*, 5 Fed. 214; *Baker Salvage Co. v. The Taylor Dickson*, 40 Fed. 261; *Rivers v. Lockwood*, 239 Fed. 380). See also SALVAGING. (E. S. M.)

SALVAGE CORPS. The London Salvage Corps was maintained by the fire offices of London. The corps was first formed in 1865 and began operations in March 1866. The staff of the corps which first formed consisted of 64. Since that time, owing to the many improvements that have taken place in the system of dealing with salvage, and the increase in the work to be done, the corps has necessarily been strengthened, and the staff now numbers above 80. The headquarters are situated at Watling street, which is called the No. 1 station, and this station protects the City of London enclosed by the Euston road, Tottenham

Court road, City road and the river Thames; this is known as the "B" district. No. 2 station is at Commercial road, and attends to the whole of the east and north-east portion of London to the north of the Thames, and is known as the "C" district. No. 3 station, opposite the headquarters of the Metropolitan Fire Brigade Station in the Southwark Bridge road, protects the whole of south London, and is known as the "D" district. No. 4 station at Poplar covers the East End of London. Finally, No. 5 station, in Upper street, Islington, guards the parish of Islington. The working staff, which is mainly recruited from the royal navy, consists of the chief officer, superintendents, firemen and crews. The stations of the corps are connected by telephone with the fire-brigade stations from whence the "calls" are received.

Generally speaking, the work of the corps may be divided into two distinct classes: (1) services at fires; (2) watching and working salvage.

Practical Work.—(1) *Services at Fires* form the most important feature of the work. Much depends upon the method of dealing with the salvage. If, for instance, a large Manchester goods warehouse was on fire in the top part, it would be very little advantage to the offices interested in the risk if the men were sent to work removing the stock off the ground floor. The best method is to cover up with tarpaulin all goods there, and prevent the water from collecting on the lower floors. It will be gathered that the most important work of the corps is to prevent damage to goods, and that water is mostly looked after. The tenders which immediately on receipt of an alarm proceed to the scene of the fire with their crew of men, carry every kind of appliance for the saving of goods from destruction by fire or damage by water, as well as lime-light apparatus for use in working after the fire has been extinguished, thus enabling the men to note the position of dangerous walls, etc.

(2) *Working Salvage*.—When a fire has taken place, a man is left behind in charge of the salvage if the property is insured; or if that fact cannot be ascertained, but it appears probable that it is, a man is left until the information is obtained later. The duty, if an important one, is divided into a day and night duty. This enables an experienced man to be sent on day duty to meet the assessor and to carry out his instructions regarding the working out of the salvage; and a junior man at night. The day man, if working out salvage, sometimes finds it requisite to employ outside men as helpers over whom he acts as a kind of foreman. The "working out" may take the form of dividing up damaged goods into lots ready for a sale to be held by the assessor or of sifting over the debris to find remains of certain articles claimed for. If, for instance, a large fire occurred at a pianoforte manufacturer's, and the debris was all in one common heap, the London Salvage Corps might have to arrange certain quantities of pegs and wires in order to give an idea of the number of pianos before the fire. The watching continues until the loss is settled, when the charge of the premises is given over to the assured.

There are also salvage corps on similar lines, but on a smaller scale, in Liverpool and Glasgow. (C. J. F.)

UNITED STATES SALVAGE CORPS

The earliest effort in America at putting salvage work on an organized basis was made in New York city in May, 1835, when the Association of Fire Insurance Companies laid the foundation of the New York Fire Patrol by appointing four men "to attend all fires and protect property exposed to fire and damage thereto by water." This force was enlarged in 1839 and again in 1855. In May, 1867, the New York Board of Fire Underwriters was chartered and this date marks the inception of the New York Fire Patrol as it was in 1939, with eight companies operating in Greater New York, having a total force of 244 men. Salvage corps, sometimes called fire patrols, are maintained by the underwriting interests in 17 of the larger cities in the United States; the latest of these to be established was in Indianapolis in 1914. It is the policy of the insurance companies, as expressed through the National Board of Fire Underwriters, that no additional salvage corps will be organized by them and that every effort will be

made to reduce the fire insurance patrol service so far as is consistent, for the reason that fire departments are organized and maintained for the broad purpose of saving property and life, and that the first duty of fire extinguishment and life saving is followed closely by the obligation to curtail the property loss. This principle that organized salvage work is a legitimate function of the municipal fire department has been recognized in a number of cities of which Los Angeles is the best example; in that city eight fully equipped salvage companies are in operation. In more than 20 cities, the fire departments have organized companies which perform salvage work as a chief duty. About 72% of all fire departments, in cities of the United States having populations of at least 20,000, are equipped with salvage appliances which are used to reduce the loss due to fire or other causes. The salvage corps apparatus carries a great variety of equipment, including waterproof covers, brooms, shovels, scoops, sponges, etc.

The usual first move of the patrol on arrival at a fire in a mercantile building is to spread covers to protect goods located on floors beneath the fire, commencing where the water is likely to descend first, and then widening out as far as the number of covers available will permit. In manufacturing buildings the procedure is about the same as in mercantile property; where the number of covers is not sufficient to protect both stock and machinery the former should be given the preference, since machinery can be dried, cleaned and oiled after a fire. In dwellings a somewhat different procedure is followed; the men roll up the carpet or rug, placing it on top of some piece of furniture, and then moving all the furniture to the centre of the room. Clothing is removed from closets and wardrobes and placed on top of the pile, over which one cover is usually sufficient for protection. The type of cover most commonly used is 12 ft. by 18 ft. in size, and is made of tightly woven, waterproofed canvas or rubber coated fabric. These rubber coated covers have the advantage of drying more quickly after service and are more certainly waterproof than other types; disadvantages are the higher costs, added weight and tendency to become soft when used in temperatures not unusual at fires or to become brittle and crack. Some of the corps make their covers, using linseed oil as a water-proofing to the fabric. In addition to spreading covers, the salvage corps, and many fire departments, proceed after the fire is extinguished to sweep and shovel out water and rubbish, cover holes in roofs with spare tarpaulins or tar paper, and perform other services tending to minimize damage to the building and the goods it contains.

Progressive salvage corps officers may also accomplish a great deal in the way of educating merchants and the general public in methods of storing stock on skids to raise it slightly above the floor level, and in constructing shelving and wall cases in such a way as to allow space for covering and to prevent stock from being wet.

The progressive officer will also find a large field for activity in promoting fire prevention activities and observing and reporting evidence of fires of incendiary or suspicious origin; it is usual practice to leave a man on watch to preserve such evidence, as well as to act in any emergency to prevent further damage or theft of the contents of a building. (W. E. MA.)

SALVAGING. Salvage work, or the raising and recovery of sunken ships and cargoes, has always had a fascination; first, for the reason that very little is known of the subject by the outside public; and secondly, because the spirit of adventure appeals to us still, although possibly in a modified degree compared with that which sent our forefathers out to search for hidden treasures in far-off lands.

Salvage engineering has always been confined to a small number of the engineering profession, although it is a highly technical business, where skill, experience and determination are pitted against wind and sea. It necessitates trained men and special appliances and is a work that must be carried on night and day whenever the elements permit.

Marine salvage may be divided up under a few principal headings:—

(1) The raising of vessels sunk in deep water by means of pontoons, etc.

(2) Raising by the application of compressed air to expel the water.

(3) Refloating of ships stranded on rocks or sand where the bottom is damaged and temporary repairs have to be made by divers, and where pumping plant of different descriptions is used to free the vessel of water.

(4) Uprighting of capsized vessels, etc.

Salvage Plant.—The salvage ship is one of the most important factors in salvage operations, and, although generally a small vessel, carries a very complicated equipment of appliances for use in the work with a view to rendering her as independent as possible of assistance from ashore, and enabling her to make repairs, etc., in out-of-the-way places where it would be difficult to obtain other assistance.

As an example, one of the most modern type is composite built (170 ft. long by 30 ft. wide), fitted with triple expansion engines, and has a speed of 14 knots. She accommodates about 80 officers and men, consisting of engineers, artisans, divers, motor engineers, electrical engineers and others. Her equipment consists of portable pumping plant of 5,000 tons per hour, which can be transferred to the wrecked vessel, portable oil-driven air compressors, portable electric lighting plant and electric submersible pumps which work under water.

At the mastsheads the vessel has powerful electric arc lamps of 5,000 c.p., with sufficient length of water-tight cables to allow of them being placed on the wrecked ship and operated by the salvage ship's dynamo; also searchlights, submarine arc and incandescent lamps for the divers, submarine oxyacetylene burning plant for cutting plates under water, also a complete equipment of submarine pneumatic drilling machines up to 3 in. in diameter, pneumatic hammers, rock-boring drills and submarine photographic apparatus. She is fitted with long-range wireless telegraphy. Being constructed of wood she is able to remain alongside a damaged ship in rough weather.

At one time steam pumps were entirely used in salvage operations, and were supplied with portable boilers so that they might be placed on board a wreck. They performed very excellent service, generally under most difficult conditions. To place such heavy gear on board a wrecked ship from a salvage craft rolling alongside on a winter night required a large amount of skill and care. When placed in position they had to be connected up to the portable boilers, and steam had to be raised before they were available for pumping. It was also necessary to place a supply of coal on board if the ship's bunkers were not available, and

FIG. 1.—DIAGRAM OF 9 IN. STEEL LIFTING WIRES IN POSITION UNDER A WRECK WITH THEIR FREE ENDS BUOYED. The wires are made fast to lifting ships at low tide so that when the tide rises, the wreck is lifted off the bottom.

this supply was often washed away. Steam pumps are still retained on board the salvage ship, as they are able to perform work that the present type of pumping plant cannot do; for instance, sand, coal, grain and even copper and iron ore can be discharged by them from under water.

The internal combustion engine (I.C.E.) went a great way to revolutionize salvage pumping plant. It was much lighter than the steam pump, required no boiler, and the fuel could be carried to the wreck in barrels or drums in an ordinary ship's life-boat. Further, when not required for work it can be stopped and

started again in a few minutes, while steam has always to be kept on the portable boilers of the steam pumps. The advantages of the oil motor-driven centrifugal pump will be obvious; it is just as efficient for pumping water as the steam pump, saves in cost of running, takes up less stowage space and uses paraffin or gasoline as fuel, which can generally be obtained without difficulty. The sizes in general use are 12 in. and 6 in.

The latest type of pumping machinery is the electrically driven submersible. It has been tried under all conditions and found

FIG. 2.—ON THE LEFT, THE LIFTING WIRES HAVE BEEN MADE FAST TO LIFTING LIGHTERS: ON THE RIGHT, THE WRECK IS CLEAR OF THE BOTTOM, AT HIGH WATER. IT IS THEN TOWED TO SHALLOWER DEPTHS AND THE OPERATION REPEATED

more efficient than any of the older types. It can be placed aboard in boats and driven from the dynamos of the salvage ship lying off the wreck. There is no necessity to secure it, as it works practically without vibration and can be used from the derricks and lowered down into the water. Its great advantage is that while the ordinary salvage pump has only a lifting capacity of 80 ft., the submersible is able to raise the water to a height of 80 ft.; no priming is necessary, and no particular attention need be paid to the discharge hose as far as making it air and watertight. Former electric salvage pumps that were tried were fitted with watertight cases, and proved entirely unsuccessful for this particular kind of work. In the submersible pump, water is allowed free access to the electrical parts.

Lifting Operations.—With this somewhat brief description of salvage plant used the particulars of actual salvage operations will be explained, commencing with the raising of sunken vessels from deep water by means of lifting barges dependent on the rise and fall of tide.

The method of procedure is to place lifting vessels of sufficient buoyancy over the wreck and pass a number of gin, steel wire ropes under the vessel, bringing the ends of the wires up and making them fast to the lifting ships at low water; then as the tide rises, if the calculations have been correct, the vessel is raised from the bottom the height of the rise of tide, and carried into shallower water where the wreck is grounded, and the operations are continued each tide until her decks are above water (see figs. 1 and 2). The fractures are then patched by the divers, salvage pumps installed and the vessel pumped out and floated. The dimensions of lifting vessels that have been employed in a large number of cases are: length 165 ft.; breadth 36 ft., and each with a lifting capacity of 1,500 tons maximum.

One of the principal difficulties with this method is the placing of the heavy wire cables under the bottom of the wreck, especially if she has sunk in sand, mud or clay. If not too deeply embedded this is generally accomplished by towing them under with two vessels, one on each side, and the ends of the cables attached to them. Where this is not found to be possible, owing to the wreck having become too deeply embedded, a system of hydraulic boring at high pressure is used.

In cases where there is little or no rise of tide submersible

pontoons are used. These are really steel cylinders with a lifting capacity ranging from 50 tons each to 250 tons or more. They are divided into three water-tight compartments and fitted with low pressure air connections for expelling the water, and with high pressure air for opening the valves. The ends of the cylinders used at the lifting of H.M.S. "Gladiator" were dome-shaped, and covered with collision mats to protect them against chafing. Strong channel bars were rivetted around the pontoons at intervals to carry the wire cables, and the whole of the cylinders between the channel bars were covered with 3 in. fir planking for protection against obstructions when lifting. Double gin, special extra flexible wire ropes were fitted in the required position around the pontoons, and to these were attached plate shackles to which the gin, lifting wires were fastened. In this case the pontoons were used to make the vessel upright, as she lay over on her beam ends at an angle of 113 degrees.

The gin, wire cables were swept under the wreck and the outside ends attached to the pontoons. These were filled with water and sunk alongside the ship; the other ends of the wires were then hove in as tightly as possible and made fast to massive steel bollards fastened to the upper side of the ship. The cylinders or pontoons were then emptied of water by means of compressed air and the vessel uprighted, assistance being also given by compressed air and pumping from some of the sound compartments. In this case pontoons were only used on one side, but in order to raise a vessel that is sunk and lying upright on the bottom two sets of cylinders are necessary, and the plan of lifting is as follows:—

A sufficient number of gin, wire cables are placed under the ship, the pontoons are attached to the ends of the wires on one side of the ship and filled with water, and by heaving in on the opposite cables they are hauled down into the required positions alongside the wreck. A special form of hydraulic gripping machines are attached to the pontoons on the other side of the wreck and the wire cables rove through these hydraulic grips. When everything is ready the pontoons are filled and allowed to slide down the wire cables to the bottom. The grips are then closed from the surface vessel and compressed air pumped down to all the pontoons, which expels the water, and if sufficient buoyancy has been given by the pontoons the vessel is brought to the surface.

In the method of lifting by compressed air all openings are closed by the divers, and compressed air pumped down to connections made to all the different compartments from air compressors of the salvage ships. The water is then expelled through the fractures and the vessel rises to the surface. This method entails a very large amount of diving work, as funnels, etc., have to be cut away and the openings closed and made air-tight. Decks have to be strongly shored up and supported.

The conditions of stranding are very varied. Assuming a large vessel stranded on a rocky bottom on an exposed coast and sustaining such damage that all compartments are filled with water and the vessel appears at first sight to be a hopeless wreck, a diver's survey of the position is made as soon as possible, and at the same time a careful survey is made of all compartments to ascertain whether the water falls in each at the same rate as the tide. Some compartments will generally be found to be holding water, that is to say the tide does not ebb and flow in them as it does outside. The amount of pumping plant required can thus be easily gauged for compartments under these conditions. When the tide ebbs and flows as it does outside it shows considerable damage to the outer bottom, which necessitates extra pumping plant and the patching of the fractures by divers.

(F. Y.)

SALVARSAN or "606," the trade name of dihydrochloride of dioxy-diamino-arsenobenzene, a remedy for syphilis, invented by Paul Ehrlich and introduced to the public in 1910. It is a yellow powder which is prepared for injection into a vein by a rather complicated process. A little later Ehrlich invented a modification, "914" or neosalvarsan, which was much easier to use; and preparations of this type became the most commonly employed until the advent of mapharsen and the antibiotics. Of

rather another order were silver salvarsan and neosilver salvarsan in which the action of arsenic is assisted by that of silver. There was a fairly large variety of arsenobenzene preparations made by different firms. They were sold in Great Britain only after satisfaction of government tests of toxicity and therapeutic activity applied to each batch. In the U.S. the arsenobenzene preparations became known as arsphenamines. A moderate dose of an arsenobenzene preparation usually caused the germs of syphilis to disappear from the secretions of open sores within a day and a rapid amelioration of symptoms followed, but it was necessary to treat for 1 to 2 years or more and to use either the older remedy, mercury, or the newer one, bismuth.

The arsenobenzene preparations were not tolerated equally well by all patients. In a minute percentage of cases they could cause death by damaging the small vessels of the brain or the kidneys. Other toxic effects were jaundice, and an inflammation of the skin (either of which might be fatal) and a variety of minor troubles. Serious effects from arsenobenzene injections were, however, far too rare to counteract their very great advantages. One of the most important of these was the rapidity with which patients were rendered noninfectious. See also VENEREAL DISEASES.

(L. W. H.; X.)

SALVATION ARMY, a religious philanthropic organization founded by William Booth (q.v.), who in 1865 began to hold meetings for preaching in the streets in London and in tents, music halls, theatres and elsewhere.

In 1878 the mission, which had spread beyond London, was reorganized on a quasi-military basis, and the title of the Salvation Army was definitely adopted in June 1880, with William Booth as "general" of the whole body. The spiritual operations of the army at once rapidly expanded in spite of much disorderly opposition in some places. In doctrine, the army is in harmony with the main principles of the evangelical bodies, "as embodied in the three creeds of the Church." Its preaching is practical and direct, asseverating the reality of sin and redemption, and the supreme duty of self-sacrifice for the sake of the salvation of others.

Great Britain.—The army was organized under the general for the time being, who issued all orders and regulations. Large powers devolved upon other officers, such as the chief of the staff, the foreign secretary and the chancellor, who directed affairs from the international headquarters in London. The system of government is autocratic, "unquestioning obedience" being required throughout all ranks. The army was divided, usually in harmony with national boundaries, into territories, each under a commissioner, with headquarters in the capital of the country. The territories were generally divided into provinces and these again into divisions, which included a number of corps, each supporting its own captain and lieutenant. The soldiers or members are drawn from all classes of the community. The property of the army in the United Kingdom was held by the general for the time being, for the benefit of the army exclusively, he being constituted the sole trustee of the property, in the disposal of which and in the appointment of his successor he was placed under the government of a deed poll, executed by Booth while the body was still known as the Christian Mission and enrolled in the court of chancery in Aug. 1878. In other countries various modifications were necessary, but the general's ultimate control was practically assured.

The announcement of the founder's death was accompanied by the intimation that his eldest son, William Bramwell Booth (q.v.), formerly his chief of staff, had become the new general. Under the deed poll of 1878, each general appoints his successor under seal, but the name of the person so chosen is not divulged until the proper time. At an international staff council in 1904 a supplementary deed poll was adopted, the principal object of which was to set up machinery for removing from the position any general who proved to be unworthy of confidence and also for the selection of a general by a high council of the army called into being for this purpose, in the event of the position becoming vacant through failure to appoint or other cause. In Jan. 1929 the high council voted to remove General Booth on the ground of incapacity, but Booth carried the issue to the courts. The court decided that the removal was illegal because no hearing

had been given the general or his representatives before the vote was taken. On Feb. 13 after such a hearing a second vote resulted as the first, and the council proceeded to elect Edward J. Higgins, formerly chief of staff, as the new general. Booth intended to continue the fight, but he died in June. In Sept. 1934 Comdr. Evangeline Booth, the founder's daughter, and leader of the army in the U.S., was elected to succeed General Higgins, and assumed command in November.

Extension.—In many quarters it was feared that after the withdrawal of the forceful and picturesque personality who had dominated Salvation Army affairs for a generation, and had raised up a world-wide following from what was originally a despised and derided local effort in the slums of London, the army would decline. World War I also was a menace to all international organizations. These fears, however, proved to be groundless. The number of adherents steadily increased, and the "field" occupied grew greatly in extent.

New organizations were called into existence, especially for influencing and instructing the young of both sexes. Careful provision was made to ensure a constant replenishment of officers by means of institutes for the training of cadets. Each year young men and women are trained for army work, to which they have to devote the whole of their time. Congresses on national and international lines were held frequently for the instruction and encouragement of officers; and constantly increasing use was made of the printing press.

Social Work.—The social work, which received its first great impetus in 1890 with the publication of *In Darkest England and the Way Out*, by William Booth, became not only more extensive but more varied in character. This work from the first was regarded by the army leaders as an organized warfare against social evils in order to clear the way for evangelization.

It was realized that the physical and environmental condition of many of the people, especially in great cities, made it extremely difficult for them to apprehend the spiritual message which the army had to deliver. Therefore various social activities arose, diverse in character but all actuated by the same purpose, from the provision of free breakfasts and night shelters to the settlement of people in overseas dominions. This last was a department of work characterized by careful selection of the emigrants, and was coupled, particularly in the case of the young, with training beforehand and effective provision for future care, while work was assured upon arrival. The efforts of the army in getting men to work on the land, both in England and overseas, called forth many commendations from statesmen and others.

Rescue work among women was one of the earliest social tasks to which the army set its hand. In this work Florence Booth, wife of Gen. Bramwell Booth, was the responsible leader from its inception until 1912. Maternity work was carried out by the army's ministering women, and for this in 1918 the army received a grant from the British government—the first state subsidy made to the army in the country of its origin. In other lands also social work proceeded, adapted to the different national conditions and needs, and often commended and assisted by the governments concerned. This was true also of eastern lands; thus, settlements for criminals were established in India, and leper colonies in the Dutch Indies.

Spiritual Character of the Work.—The army maintained its original character as a body of spiritual witness and aggressive evangelism. In theory and creed it is at one in almost every respect with orthodox evangelical belief, but its methods—its realistic presentation of religion, and its use of various constraining means to bring people to salvation—distinguish it from other religious bodies. It continues to lay the greatest emphasis upon the need for conversion, preceded by penitence, and followed by growth in holiness. The people gathered into its ranks are cared for by its officers and trained in a real separation from the world and devotion to Christ. They are set to work immediately with a definite objective, their zeal is employed in the winning of others, and public testimony is required from them by, however unlearned or backward in religious experience they may be.

A large place in the army's endeavours is given to music and

song. In every country the band—usually a brass band—is a feature of army work. The strains of such a band, reaching farther than the human voice, draw numbers within earshot of the army's message who would otherwise not be attracted. The army also made use of improvisations of various kinds, not only because in this way public attention is more likely to be caught, but because these methods prevent the officers from falling into the conventional and the ordinary.

The army exacts a high standard of behaviour from its adherents. In the series of *Orders and Regulations* for officers and for the rank and file, definite guidance is given even in the smaller matters of everyday conduct. Officers accept a relative poverty, being content to receive sufficient for their simple needs. There are contributory funds from which they receive allowances on retirement, and from which provision is made for widows and orphans. Marriages are solemnized "under the flag," and children of members are dedicated to become soldiers or officers in the "war." Officers wear a regulation uniform, which it is not permissible for the individual to vary. The uniform is regarded as a means of confessing to the world the fact of separation and consecration, as opening the way to many opportunities of usefulness which would not otherwise appear, and as making possible instant recognition and fellowship amongst Salvationists themselves. One of the great principles of the army, firmly adhered to, is that women have absolute parity of privilege, position and dignity.

Salvation Army funds are raised from the voluntary offerings of the corps, from open-air and other collections, from the profits on publications and general trading, and from friends interested in evangelical and charitable work. The financial statements of the various funds are annually published, certified by public accountants.

Reports and statistics of the spiritual and social operations of the army are given in the annual *Salvation Army Year Book* and in the *War Cry* and other publications issued at headquarters (Queen Victoria street, London, E. C. 4).

George Lyndon Carpenter was elected general in 1939, and in 1946 Albert Orsborn became the sixth general.

The army had corps and outposts in 89 countries and territories throughout the world in 1951. Its 17,119 corps included 26,803 commissioned officers, 99,952 local officers (laymen) and thousands of soldiers and adherents.

Gladstone, In Darkest England and the Way Out* (1890); Bramwell Booth, *Servants of All* (1899) and *Echoes and Memories* (1926); Booth-Tucker, *The Life of Catherine Booth* (1892); Raitton, *Heathen England, Twenty-one Years in the Salvation Army*; A. White, *Truth about the Salvation Army* (1899, 1900 and 1906); *The Great Idea* (1909; 2nd ed. 1920); T. F. G. Coates, *The Life Story of General Booth*, 2nd ed. (1906); Harold Begbie, *Broken Earthenware* (1909), and *Life of William Booth* (1920); Mrs. B. Booth, *Powers of Salvation Army Officers* (1923); H. L. Taylor, *General Booth's Journal* (1925). The criticisms by J. Manson in *The Salvation Army and the Public* (1906; 3rd ed. 1908) caused some public discussion, but are now mainly of historic interest. An important biography is St. John Ervine's *God's Soldier: General William Booth*, 2 vol. (1935).

THE UNITED STATES

In the United States the Salvation Army began its operations officially in March 1880, the U.S. being the first country to which evangelists were sent from England. A family of converts had gone to Philadelphia in 1879 and started evangelistic work. At their request Gen. William Booth sent Commissioner George Scott Raitton and seven women assistants as pioneer officers. The early years of the Salvation Army in the U.S. were strenuous ones; but the work prospered. The original staff soon found it impossible to cope with the success attending their efforts, and more help was sent from England. But the U.S. soon began to produce its own officers, a development which grew through the years until there were several training colleges devoted exclusively to maintaining the requisite supply of officers. These send out annually into the field young men and women as officer reinforcements, in addition to providing help for the missionary countries of the world.

Comdr. Evangeline Booth, daughter of the founder and first general, William Booth, became national leader in the U.S. in 1904 after serving for nine years in a similar capacity in Canada; she held the U.S. office until 1934. The years of her leadership witnessed great advances in every phase of Salvation Army activity.

Comdr. Booth showed herself a leader possessed of many outstanding qualities. She endeared herself to all sections of the nation by her simplicity of purpose and her devotion to the ideals she set forth so vividly in her public addresses. Faced at the onset with overwhelming problems of money and personnel, she revolutionized the financial system of the organization, and strengthened its resources.

The work of the Salvation Army during World War I endeared the organization to the nation in general. Comdr. Booth realized that extensive welfare work among the U.S. troops would be required. With a rare courage, she placed the whole resources of the Salvation Army at the disposal of the government. The resultant work at home and in France, where the army women ministered day and night to the soldiers' comfort right up to the front line trenches, was known and appreciated throughout the union. The president bestowed upon the commander the distinguished service medal as a mark of his appreciation in this connection.

Again during World War II, the Salvation Army was in the field with welfare work made possible by U.S. contributions. Aid to the fighting forces and to refugees was administered in Norway, Finland, Belgium, the Netherlands, France, Germany, England, Italy and other countries.

With the reactivation of the United Service organizations (U.S.O.) in May 1951, during the Korean war, the Salvation Army resumed its work of providing aid to the members of the armed forces. Sixteen U.S.O. clubs were operated during 1951.

Activities of the Salvation Army in the U.S. include sheltering, evangelistic meetings, rehabilitation centres, care for the unmarried mother and her child, children's homes, clinics, family welfare, aid to prisoners and their families, free employment bureaux, search for missing relatives, summer outings for women and children and social and religious instruction. In 1951 the army held 98,417 meetings on street corners in the U.S. In its social service program, 20,475 patients were treated in 7 clinics and dispensaries; 1,349 missing persons were located; 34 maternity homes and hospitals for unwed mothers cared for 11,884 women and children; and 48,683 mothers and children were sent to summer camps. A total of 105 men's social service centres provided shelter and work for 30,814 men.

In the field of prison work, 9,266 prisoners were assisted on discharge and given employment in 1951; 2,129 prisoners were paroled in care of the Salvation Army, whose officers devoted 6,962 hours to prison visitation.

When the rising waters of the Missouri river overflowed in July 1951 to cause one of the costliest and most destructive floods in the history of the U.S., the Salvation Army rendered help to hundreds of homeless victims.

SALVEMINI, GAETANO (1873—), Italian historian, was born in Molfetta in Sept. 1873. In 1902 he became professor of mediaeval and modern history at Messina university. He then went to Pisa university, and in 1917 was appointed to the chair of history at Florence university. His best known historical works were *Magnati e Popolani nel Comune di Firenze dal 1280 al 1295* (1899); *La Rivoluzione francese 1789-92* (1906); *Mazzini* (1905); and *L'Italia e gli Imperi Centrali dal 1871 al 1915*. He edited the Liberal newspaper *L'Unità* (1911-21). Before World War I, he vigorously criticised the Socialists for their half-hearted social work and attacked Giovanni Giolitti's electoral methods. During the war he was a leading advocate of Italian diplomatic moderation. He was a member of the Italian parliament 1919-21. After the Fascists captured power, however, his political activity was made impossible, and, being suspect, he was in constant personal danger. In June 1925 he was arrested in Rome and taken to Florence, where he was charged on the hearsay evidence of a printer with complicity in the production of an anti-Fascist newspaper *Non-Mollare*. His case was postponed till

July 1925 when he was provisionally released. In Oct. 1925 he left the country, going to London and later to the United States. In 1940 he became a naturalized citizen of the U. S. He was appointed in 1934 Lauro de Bois lecturer in history of Italian civilization at Harvard university, a post he held until he became professor emeritus in 1948. His later works included *The Fascist Dictatorship in Italy* (1927); *What To Do With Italy* (1943); *Historian and Scientist* (1939); and *Prelude to World War Two* (1949).

SALVIA, a large genus belonging to the family Labiateae (*g.u.*), containing about 550 species in the temperate and warmer regions of both hemispheres. The name is derived from the Lat. *salva*, from the healing properties of *S. officinalis*. *S. verbenaca* is found in Great Britain in dry pastures and waste places as is also *S. pratensis*.

Many native species of *Salvia* occur in western North America, especially in California, where 15 species are found. Among these are *S. carduacea* (thistle sage), cultivated for its thistle-like, white-woolly foliage and blue flowers; *S. columbiana* and related, mostly Mexican, species are the source of china.

Some Californian sages are important bee plants, among them the black sage (*S. mellifera*) and the bigflower sage (*S. grandiflora*).

Some of the salvias are among the most showy of soft-wooded plants, the blossoms being of a bright glowing scarlet. A useful species is *S. splendens*, a Brazilian shrub, commonly called scarlet sage. Treated as a tender annual, it is one of the most popular bedding plants in American gardens.

There are other very ornamental species of easy growth, increased by cuttings in spring, and succeeding well in ordinary rich loamy soil.

SALVIAN, a Christian writer of the 5th century, was born probably at Cologne (*De gub. Dei*, vi, 8, 13), some time between 400 and 405. He was educated at the school of Treves and seems to have been brought up as a Christian. His writings show logical knowledge. He married Palladia, the daughter of heathen parents, Hypatius and Queta, whose displeasure he incurred by persuading his wife to retire with him to a distant monastery, which is almost certainly that founded by St. Honoratus at Lerins.

It was presumably at Lerins that Salvian made the acquaintance of Honoratus (d. 429), Hilary of Arles (d. 449) and Eucherius of Lyons (d. 449). That he was a friend of the former and wrote an account of his life we learn from Hilary (*Vita Hon.*, ap. Migne, l. 126c). To Eucherius's two sons, Salonius and Veranus, he acted as tutor in consort with Vincent of Lerins. Salvian continued his friendly intercourse with both father and sons long after the latter had left his care; it was to Salonius (then a bishop) that he wrote his explanatory letter just after the publication of his treatise *Ad ecclesiam*; and to the same prelate a few years later he dedicated his great work, *De gubernatione Dei*. Salvian spent the last years of his life at Marseilles (Genadius, ap. Migne, viii, 1099). It has been conjectured that Salvian paid a visit to Carthage; but this is a mere inference based on the minute details he gives of the state of this city just before its fall (*De gub.* vii, viii.). He seems to have been still living at Marseilles when Genadius wrote under the papacy of Gelasius (492-496).

Of Salvian's writings there are extant *De gubernatione Dei* (more correctly *De presentis iudicio*) and *Ad ecclesiam*, and a series of nine letters. The *De gubernatione*, Salvian's greatest work, was written between 439 and 450; it furnishes a valuable if prejudiced description of life in 5th-century Gaul. Salvian deals with the same problem that had moved the eloquence of Augustine and Orosius. Why were these miseries falling on the empire? Could it be, as the pagans said, because the age had forsaken its old gods? or as the semi-pagan creed of some Christians taught, that God did not constantly overrule the world he had created (i. 1)? He concludes that the misery of the Roman world is all due to the neglect of God's commandments and the terrible sins of every class of society. It is difficult to credit the universal wickedness adduced by Salvian, especially in face of the contemporary testimony of Symmachus, Ausonius and Sidonius. Salvian was a 5th-century socialist of the most extreme type, and a zealous ascetic

who exaggerated, albeit unconsciously, the faults that he desired to eradicate.

The *Ad ecclesiam* was first printed in Sighard's *Antidotum* (Basel, 1528); the *De gubernatione* by Brassican (Basel, 1530). Salvian's works are reprinted (after Baluze) in Migne's *Cursus patrologiae*, ser. lat. vol. lxx. For bibliography, see T. G. Schoenemann's *Bibliotheca patrum* (ii, 823), and the prefaces to the editions of C. Halm (*Monum. Germ.*, 1877) and F. Pauly (Vienna, *Corp. scr. eccl. Lat.*, 1883). See also S. Dill, *Roman Society in the Last Century of the Western Empire*, pp. 115-120.

SALVINI, TOMMASO (1829-1915), Italian actor, was born at Milan on Jan. 1, 1829. His father and mother were both actors, and Tommaso first appeared when he was barely fourteen as Pasquino in Goldoni's *Donne curiose*. In 1847 he joined the company of Adelaide Ristori, and with her he played the title rôle in Alfieri's *Oreste* at the Teatro Valle in Rome. He fought in the cause of Italian independence in 1849; otherwise his life was an unbroken series of successes in his art. He acted frequently in England, and made five visits to America, his first in 1873 and his last in 1889. In 1886 he played there Othello to the lago of Edwin Booth. Apart from Othello, which he played for the first time at Vicenza in June 1856, his most famous impersonations included Conrad in Paolo Giacometti's *La Morte civile*, Egisto in Alfieri's *Merope*, Saul in Alfieri's *Saul*, Paolo in Silvio Pellico's *Francesca da Rimini*, Oedipus in Niccolini's play of that name, Macbeth and King Lear. Salvini retired from the stage in 1890, but in Jan. 1902 took part in the celebration in Rome of Ristori's eightieth birthday.

See his *Ricordi, aneddoti ed impressioni* (Milan, 1895); *Leaves from the Autobiography of Tommaso Salvini* (London, 1893); G. Piccini, *Vita aneddotica di Tommaso Salvini* (Florence, 1908).

SALWEEN, a district in the Tenasserim division of Burma. Area, 2,582 sq. mi. Pop. (1941) 56,878, of whom more than 50,000 were aboriginal tribesmen (mostly Karens and some Shans). Nearly the whole district is a maze of mountains intersected by deep ravines, the only level land of any considerable extent being found in the valley of the Yunnalin, while the country is covered with dense forest, of which portions are reserved. The district is drained by three principal rivers, the Salween, Yunnalin and Bilin, fed by mountain torrents. The Yunnalin, which rises in the extreme north, is navigable with some difficulty in the dry season as far as Papun; the Bilin is not navigable within the limits of the district except by small boats and rafts. The district headquarters are at Papun. The rainfall is heavy. A considerable trade is carried on with Siam by bridge paths across the mountains.

SALWEEN, a river of Tibet, China (Yunnan) and Burma. This river, called Nam Kóng by the Shans, Thanlwin by the Burmese, Lu Kiang, or Nu Kiang, or Lu Tzu Kiang by the Chinese, is the longest river in Burma, and one of the wildest and most picturesque streams in the world. It rises in Tibet south of the Kun Lun, and is thus a much longer river than the Irrawaddy. From the time it leaves Tibet it has a very narrow basin, and for long stretches has no other affluents than the mountain torrents from the hills, which rise from 3,000 to 5,000 or 6,000 ft. above the level of the river-bed. In the dry season the banks are alternate stretches of blinding white, fine sand, and a chaos of huge boulders, masses and slabs of rock, with here and there, usually where a tributary enters, long stretches of shingle. In the rains all these disappear, and the water laps against forest trees and the abrupt slope of the hills. The average difference between high and low water level of the Salween throughout the Shan States is between 50 and 60 ft., and in some places it is as much as 90. There are many rapids, caused by reefs of rock running across the bed, or by a sudden fall from one to several feet, which produce very rough water below the swift glide; but the most dangerous places for navigation are where a point juts out into the stream, and the current, thrown back, causes a violent double backwater. Nevertheless, long stretches of the river, extending to scores of miles, are habitually navigated by native boats. The current is extremely variable, from 4 m. an hour to ten knots. Launches ply regularly from Moulmein to the mouth of the Yunnalin, in Lower Burma. The worst part of the whole Salween,

so far as is known, is the gorge between the mouth of the Yunzalin and Kyauknmyat. It is quite certain that steam launches could ply over very long sections of the river above that, perhaps as far as the Kaw ferry, or even the Kunlong ferry. In British territory, however, there are very few settlements on the river itself, and frequently the ferry villages are built 1,000 ft. above the river.

The Chinese believe the Salween valley to be deadly to all strangers, but it is in Chinese territory—particularly in the Lu Kiang, or Möng Hkō state—that there is the largest population on the river until Lower Burma is reached. A description of the Salween resolves itself into a list of the ferries at which it can be crossed, for no one marches up the river. The river is bridged by the Chinese on the main route from Tēng Yüeh (Mömiē) and Bhamo to Tali-fu. Native boats can ply from Kyodan S., and light draught steamers ascend as far as Shwegün, 63 m. from Moulmein.

The Salween enters the sea in the Gulf of Martaban by two mouths, one to the north and one to the south of Bilugyun island. The southern mouth is the more important, and is the one by which ocean-going craft approach the port of Moulmein. The Salween cuts the British Shan States nearly in half, and is a very formidable natural obstacle. It seems probable, however, that long stretches of it can be opened to trade. It is certainly no less navigable than the Middle Mekong or the Yangtze-kiang above I-chang.

SALYES (Gr. Σάλως; also SALYES, SALYI, SALLUVII), a people occupying the plain south of the Druentia (Durancé) between the Rhone and the Alps. According to Strabo (iv. p. 203) the older Greeks called them Ligyes, and their territory *Ligystikē*. In 154 B.C. the inhabitants of Massalia, who had been connected with the Romans by ties of friendship since the second Punic war, appealed for aid against the Oxybii and Decietes (or Deciates). These people, called by Livy (*Epit.* 47) "transalpine Ligurians," were perhaps two smaller tribes included under the general name of Salyes. They were defeated by Quintus Opimius. In 125-124 A.C. hostilities broke out between the Romans and the Salyes from the same cause. Gaius Sestius Calvinus (123-122 A.C.), subdued the Salyes, destroyed their chief town, and founded near its ruins the colony of Aquae Sextiae (Aix). Part of their territory was handed over to Massaliots. From this time the Salyes practically disappear from history.

For ancient authorities see A. Holder, *Alteltischer Sprachschatz*, II (1904).

SALZA, HERMANN VON (c. 1170-1239), master of the Teutonic Order, and councillor of the emperor Frederick II, entered the Teutonic Order in early life, became very intimate with Frederick II, took part in the expedition to Damietta in 1221, and accompanied the emperor on the crusade of 1228. About 1210 he was appointed master of the Teutonic Order, and in 1226 received the province of Kulm from Conrad I., duke of Masovia, in return for help against the Prussians. In 1230 the conquest of Prussia was begun by the Order, although not under his immediate leadership. In 1225 he reconciled Valdemar II., king of Denmark, with Henry I., count of Schwerin, and thus won again the land on the right bank of the Elbe for the Empire, and the recognition of imperial superiority over Denmark. Trusted by Pope Gregory IX. and the emperor alike, he brought about the treaty of San Germano between them in 1230, was the only witness when they met in conference at Anagni in the same year, and it was he who, in 1235, induced Frederick's son, Henry, to submit to his father. He died on March 19, 1239 at Barletta in Apulia, and was buried there in the chapel of his Order.

See A. Koch, *Hermann von Salza, Meister des deutschen Ordens* (Leipzig, 1885).

SALZBRUNN, a watering-place in the Prussian province of Silesia, Germany, at the foot of the Riesengebirge, 30 mi. S.W. of Breslau, by rail to Waldenburg. Pop. (1933) 13,761. It consists of Ober-, Neu- and Nieder-Salzbrunn, and manufactures glass, wire goods and yarn. Its alkali-saline springs were known as early as 1316. Gerhart Hauptmann was born there in 1862.

SALZBURG, a province of Austria, seized by Germany in March 1938, covers an area of 2,762 sq.mi. It

includes from south to north parts of the following lithological belts of the Alps, the crystalline, the slate and schist, the limestone High Alps, and the *fynsch* zones. The first named extends from the glacier-capped Hobe Tauern and southern slopes of the Niedere Tauern to the line of the Pinzgau eastward to the Mandling pass. This is a region much dissected by tributaries of the Salzach and characterised by forestry and pastoral pursuits. The most important valley is that of the Gastein leading to a col between the Hobe and Niedere Tauern ranges and followed by a railway to Carinthia. North of this belt is a wedge-shaped mass of slates and schist, with softer outlines and lower forested heights, which is in turn replaced by the lake-strewn plateau of Dachstein limestone, split into several detached blocks, e.g., the eastern end of the Kitzbühl Alps, the Salzburg Alps (Birnhorn, 8,637 ft.), the Reiteralpe and the glacier-capped Schönfeldspitze mass (8,708 ft.). Part of the Dachstein group also belongs to Salzburg. Drainage is effected mainly by the Salzach which in its upper course follows a west-east marshy valley (Pinzgau) along the foot of the Hobe Tauern, at the junction of crystallines and slates, to Schwarzach St. Veit, where it takes a transverse course through a wider and more fertile valley (Ponzgau), breaking through a narrow pass between the Hagengebirge and the Tenneberge and reaching the foreland at Salzburg; the upper waters of the Enns and Mur take the drainage of the eastern half of the Niedere Tauern. Salzburg is noted for its numerous beautiful lakes and the many magnificent falls on its rivers, e.g., the four Krimmler falls, together 2,085 ft. high, the most important falls in the Eastern Alps and the Tauern fall (660 ft.).

The enclosed basins of the higher mountain districts experience very hard winters and settlement in them is thin and confined to the sunny slopes and alluvial fans. About 16% of the total area is unproductive and of the remainder some 11% is given over to crops and 10% to meadows. Forestry and pastoral activities, aided by a wealth of Alpine pasture (some 30% of the area) are most important. Mineral resources include: salt at Hallein, copper near Bischofshofen, iron-ore at Werfen, marble (Adnet) and small quantities of gold, silver and arsenic. The absence of coal is compensated by the rich stores of water, from which electrical power is developed at Lend Gastein, Bärenwerk, etc., yet industry is only moderately progressive. Catering for visitors to the spas, scenic resorts and centres for winter-sports is the most remunerative industry. Apart from Salzburg (q.v.), the capital, the population of 267,440 (1939) is ruraly distributed, mainly along the valleys and chief lines of traffic, and no other town reaches 10,000 inhabitants. The people are of German stock and mainly Roman Catholic in religion, with a high standard of education. In 1938 Salzburg was made a German gau.

See F. Martin, *Kunstgeschichte von Salzburg* (Vienna, 1924) and E. Spengler, *Geologischer Führer durch die Salzburger Alpen und das Salzkammergut* (Berlin, 1924); E. Krichbaum, *Salzburg und das Oberdonauland* (Berlin, 1938).

SALZBURG, the capital of the province of Salzburg, Austria, seized by Germany in March 1938, lies on both banks of the Salaach where this river leaves its narrow valley through the limestone Alps and enters the Alpine foreland.

The situation is important economically and strategically, for here several types of physical region, with differing agricultural possibilities, meet and the Orient route from Germany through Munich joins the Orient route from France through Switzerland and branches along the Salzach valley and through the Hobe Tauern to Carinthia and Italy. The site has been occupied since pre-Roman time, the original settlement being replaced by a Roman trading town (*Juvavum*) which was sacked by the barbarians (477). The modern city grew up around the monastery and bishopric founded here about 700 by St. Rupert of Worms, who preached Christianity in the district at the invitation of its ruler Duke Theodo of Bavaria, and its history from that time is closely bound up with that of the see. The present name, due to the local abundance of salt, appears first in 816 by which time it had been raised to an archbishopric. Its archbishops gained in temporal power and dignity and were made imperial princes by Rudolf of Hapsburg in 1278.

Relations between the ecclesiastical rulers on the one hand and

the nobles and people on the other were always difficult, e.g., during the Peasants' War of 1525-26, quelled with the aid of the Swabian League, and contributing to a reaction against the church when Salzburg became a stronghold of resistance to the Reformation. Persecution was rife and Protestant citizens were driven from the town. Nevertheless, the movement grew and in 1731-32, aided by the intervention of Frederick William I. of Prussia, 30,000 people sold their possessions and left the see, 6,000 of them leaving the capital. By the peace of Lunéville (1802) the see was secularized and given to the archduke of Austria. Following the peace of Pressburg (1805) it fell to Austria but four years later passed to Bavaria, returning to Austria in 1816 with the exception of a small portion on the left bank of the Salzach. In 1849 it became a crownland, several of its districts being transferred to Tirol, and remained so until 1918, when it became part of the Austrian republic. With the rest of Austria it was annexed to Germany by Hitler in March 1938.

Its ecclesiastical buildings include 8 convents and 25 churches, the majority interesting from their antiquity, architecture or associations. Of these, the 17th century cathedral, one of the largest and most perfect specimens of the Renaissance style in the Germanic countries, is on the model of St. Peter's at Rome. Though situated in the old town it is bounded on three sides by open squares, which permit its beauties to be appreciated. Other buildings of note are the old and new residences of the archbishops, the latter occupied by government offices, the present palace, the 15th century town-hall and the Mozart house and museum. The only relic of the university (1623-1810) is a theological seminary. By the suppression of its university Salzburg has been prevented from making that contribution to Austrian culture that its importance as an administrative and spiritual centre leads one to expect.

Salzburg has had a heavy seasonal tourist traffic, favoured by a healthy climate, delightful scenic surroundings and excellent music.

Its manufactures include brewing, book-binding, musical instruments and marble wares and light iron goods.

Pop. (1939) of the *Reichsgau* of Salzburg was 267,440; and of the town, 79,264.

SALZGITTER, a town in the province of Niedersachsen, Germany, on the Mittelland canal and the Hildesheim-Borsum railway, 12 mi. S.W. of Brunswick. Pop. (1939) 11,661. It was formerly only a small town, known chiefly for its salt baths; however, after 1937 it was enlarged into a model housing settlement as the residence for workers in the newly created Hermann Göring Coal and Iron works factories nearby. Coal and coke for smelting ore was brought cheaply and easily from the Ruhr by the Mittelland canal, opened in 1937.

SALZKAMMERGUT is a mountainous district of Austria forming the drainage area of the Traun and its tributaries above Gmunden. Originally its name (literally "salt-exchanger property") and its economic importance were derived from the valuable salt deposits, worked from prehistoric times at Hallstät and Aussee, but although these are still valuable the region is rapidly developing as a health and tourist resort. Belonging to the eastern Alps it contains the Dachstein group (Dachstein, 9,350 ft.) with the most easterly glaciers of the Alps, the Totes Gebirge (Grosser Priel, 8,248 ft.), the Hölleengebirge (Höllengebirge, 6,109 ft.), the Ischler and Sennen groups. Among its lakes are Traun, Hallstät, St. Wolfgang and Atter, largest in Austria (18 sq.mi., 1,527 ft. above sea-level, 560 ft. deep), each over-shadowed by forested heights. The district embraced parts of the Austrian provinces of Styria, Salzburg and Upper Austria, and the occupations of its population, apart from those suggested above, are cattle-rearing, forestry and the development of electricity. The towns are small, along the valleys and lake shores. Among them Gmunden (*q.v.*) is the chief, while Hallstät is famous for its museum of local finds illustrative of the cultural period to which it gave its name. Germany annexed the district in 1938.

SAMAIN, ALBERT VICTOR (1858-1900), French poet, was born at Lille on April 4, 1858. He was educated at the lycée of that town, and on leaving it entered a bank as a clerk. He enjoyed no literary associations, and his talent developed slowly

in solitude. About 1884 Samain went to Paris, having obtained a clerkship in the Préfecture de la Seine, which he held for most of his life. His earliest volume of poems, *Au Jardin de l'enfance*, led to the sudden recognition of his talent, and to applause from critics of widely different schools. In 1897 this book was reprinted in a more popular form, with the addition of a section entitled *L'Urne penchée*. Samain's second volume, *Aux Hameaux du vase*, appeared in 1898. His health began to fail and he withdrew to the country, where he died, in the neighbourhood of the village of Magny-les-Hameaux, on Aug. 18, 1900. A third volume of his poems, *Le Chariot d'or*, appeared after his death, with a lyrical drama, *Polyphème* (1901), which was produced at the Théâtre de l'Œuvre in 1904. Samain's natural life was patiently spent in squalid conditions; he escaped from them into an imaginative world of the most exquisite refinement.

See also R. Domic, "Trois Poètes," in *Revue des deux mondes* (Oct. 1900); L. Bocquet, *Albert Samain, sa vie, son œuvre* (1905); and E. W. Gosse, *French Profiles* (1905); F. Gohin, *L'Œuvre poétique d'Albert Samain, 1858-1900* (1919); G. Bonneau, *A. Samain, poète Symboliste* (1925).

SAMANA RANGE, mountain ridge in the Kohat district of the North-West Frontier Province of Pakistan, commanding the south boundary of Tirah. The ridge lies between the Khanki valley on the north and the Miranzai valley on the south, and extends for some 30 mi. W. from Hangu to the Samana Suk. It is some 6,000 to 7,000 ft. high. Beyond the Samana Suk lies the pass, known as the Chagru Kot, across which the Tirah Expedition marched in 1897. On the opposite hill on the other side of this road is the famous position of Dargai (see *TIKAR: Campaign*). After the Miranzai Expedition of 1891 this range was occupied by British troops and eleven posts were established along its crest, the two chief posts being Fort Lockhart and Fort Gulistan. In 1897 all the forts on the Samana were attacked by the Orakzais, and this and the Afridi attack on the Khyber pass were the two chief causes of the Tirah Expedition. When Lord Curzon reorganized the frontier in 1900, British garrisons were withdrawn from most of the Samana forts, which were later held by a corps of tribal police 450 strong, called the Samana Rifles.

SAMANIDS, the first great native dynasty which arose in Persia after the Arab conquest. In the 8th century Saman, a Persian noble of Balkh, who was a close friend of the Arab governor of Khurasan, Asad ibn 'Abdullah, was converted from Zoroastrianism to Islam. His son Asad, named after Asad ibn 'Abdullah, had four sons who rendered distinguished service to the caliph al-Ma'mun. In return they all received provinces: Nuh obtained Samarkand; Ahmad, Ferghana; Yahya, Shash; and Ilyas, Herat. In 875 Ahmad's son Nasr was recognized by the caliph al-Mu'tamid as governor of Transoxiana. He was succeeded in 892 by his brother Isma'il, who overthrew the Saffarids (*q.v.*) in Khurasan and the Zaidites of Tabaristan and thus, though remaining nominally a provincial governor under the caliph of Baghdad, established an almost independent rule over Transoxiana and eastern Persia, with Bukhara as his capital.

The descendants and successors of Isma'il, almost all renowned for the impulse that they gave both to the patriotic feelings and the national poetry of modern Persia (see *PERSIAN LITERATURE*), were Ahmad ibn Isma'il (907-914); Nasr II, ibn Ahmad, the patron and friend of the great poet Rudaki (914-943); Nuh I, ibn Nasr (943-954); 'Abd ul-Malik I, ibn Nuh (954-967); Mansur I, ibn Nuh, whose vizier Bal'ami translated Tabari's universal history into Persian (961-976); Nuh II, ibn Mansur, whose court poet Dakiki began the *Shahnama* (976-997); Mansur II, ibn Nuh (979-999); and 'Abd ul-Malik II, ibn Nuh (999). Under their government, which was organized on a loosely centralized feudal system, the provinces of Transoxiana and Khurasan attained a high degree of prosperity. The expansion of their industry and commerce is attested by the use of Samanid silver dirhems as currency all over the north of Asia, and they have been found in great numbers in Pomerania, Sweden and Norway, brought by Russian traders. The later interruption of the northern trade routes was a factor in weakening the dynasty; and it succumbed eventually to the internal feuds and rivalries of the nobles and to the pressure of the rising Turkish powers in central

Asia and Afghanistan.

Under Mansur I a Turkish slave, Alptagin, formerly commander of 'Abd ul-Malik's guard at Bukhara, had to flee for refuge to the mountainous regions of Ghazni, where he established a semi-independent rule, to which, after his death in 977, his son-in-law Sabuktigin, likewise a former Turkish slave, succeeded. Nuh II, in order to retain at least a nominal sway over those Afghan territories, confirmed him in his position and invested Sabuktigin's son Mahmud with the governorship of Khurasan, in reward for the help they had given him in his struggles with a confederation of disaffected nobles under the leadership of Fa'ik. During this conflict, the greater part of Transoxiana was occupied by the Turkish Kara-khanids, whose chief, Boghra Khan, occupied Bukhara for a short time in 992. Sabuktigin died in the same year as Nuh II (997); and Mahmud (see MAHMUD OF GHAZNI), confronted with an internal contest against his own brother Isma'il, had to withdraw for a short time from Khurasan. This interval sufficed for Fa'ik, supported by a Kara-khanid force under the Ilek khan Nasr I, to concentrate power in his own hands and to involve Mansur II in a conflict with Mahmud. After the deposition of Mansur, who was suspected of intending to come to an agreement with Mahmud, the latter took possession of Khurasan. A few months later, the Ilek khan Nasr marched on Bukhara and carried 'Abd ul-Malik and his relatives into captivity. The last prince of the Samanid house, Muntasir, a bold warrior and a poet of no mean talent, carried on guerrilla warfare for some years against both Mahmud and the Kara-khanids, till he was assassinated in 1005. (See CALIPHATE AND PERSIA: History)

SAMANIEGO, FELIX MARIA DE (1745-1801), Spanish fabulist. His *Fábulas en verso castellano* (1781-84), imitations or translations for the most part of Phædrus, La Fontaine and Gay, are excellent of their kind.

SAMARA (now KUIBYSHEV), a region of the Russian S.F.S.R., lying east of the Volga river, except for the territory enclosed in the great Volga loop, and south of the Tatar A.S.S.R. Its southern boundary lies between the Great Irizh and the railway from Saratov to Ural'sk, and runs parallel to the latter to the boundary of the Kazakhstan S.S.R., on the Obchsky Yert plateau. Chkalov region and the Bashkir A.S.S.R. lie to the east.

South of the Volga loop (Samarskaya Luka) is a low flat steppe recently emerged from the post-Pliocene Aral-Caspian basin, while from the Samara river to the Sok are Permian formations. The region is a transition area between the black earth and the salt steppe types of soil. The most fertile black earth, with a humus content of 18%, lies to the northeast of the region in the lyessosteppe area—i.e., steppe with patches of forest, here mainly oak. Between the Samara river and the Moksha, except for a patch north and south along the eastern part of the latter stream, the black earth is of poorer humus content, of a sandy type, and patches of salted soil appear, especially near the Volga. South of the Great Irizh river the soil is salt steppe, and there are salt marshes. South of the Samara river there is no forest, but the land in the loop and to the north of it is forested, and there is a patch of forest on the north bank, west of Buzuluk.

The region is undergoing a process of rapid desiccation. It has an arid climate, the rainfall varying from 8 to 16 in. per annum, mostly falling in spring and summer in heavy showers, so that the runoff is excessive and only the surface becomes saturated. The prevailing winds are from the northeast, dry and strong, and blowing with great violence in winter, so that snow does not lie and the ground is exposed to the severe winter frost. The average July temperature at Kuibyshev is 70.4° F. and January 9.3° F. An added disadvantage is the liability to years of excessive drought such as 1911 and 1921. Winter lasts for five months and rain falls on an average of 95 days per annum, 34 of which are in June-August. Thunderstorms are frequent in June and July and, if accompanied by dry hail, may ruin the crops.

Diminution in the spring rainfall causes the disastrous famines to which the region is subject. Of the inhabitants, 90% are occupied in agriculture, depending on the crops for sustenance and

for purchase of necessities. Bad harvests, therefore, such as those of 1911 and 1921, bring disaster. In 1921 great numbers died of starvation and starvation diseases and others fled from the region, many to perish on the road. Bands of starving children, whose parents had succumbed first in their efforts to feed the children, penetrated even as far as the Caucasus. Livestock diminished, and when the weakened survivors of the terrible period faced the next year there was a shortage of everything, from seeds and instruments to working cattle.

The area subsequently revived to an extraordinary degree, an evidence of the fertility of its famous black soil. Attention had been concentrated on the drought problem and the need for more intensive agriculture in Samara as early as 1864, and some efforts were made to improve the type of cultivation. Further evidence of the crisis of extensive agriculture in the region is the great variation in the harvest. In 1911 there was not enough to satisfy local needs, in 1913 a surplus of 110,000,000 poods (3,972,430,000 lb.). Six experimental stations were established to study local problems, Besenchuk, Buguruslan, Alekseyev, Bugulma, Buzuluk, and one connected with the Kuibyshev agricultural school at Kinel. In 1927 collective farming became the foundation of agricultural policy. Mechanized agriculture achieved considerable success in its struggle with drought.

The main lines along which attempts are being made to improve agriculture and lessen the chances of famine in the district are the increasing practice of irrigation; a wider range of variety in crops, and especially the sowing of grasses and lucerne, in which respect Kuibyshev stands first in the regions of the famine area; the preservation of what forest is left, and the planting of more trees, in view of their protective value in a windswept region, and their influence on moisture conditions in the soil; the greater extension of stock raising, in view of the increasing importance of meat, dairy products, furs and wool for the growing industrial regions. Though many experiments have been made, no kind of winter corn able to withstand the severe conditions has yet been discovered, but more drought resisting varieties of hard wheat, which commands a better market than soft wheat, have been introduced.

About 90% of Kuibyshev region is favourable for vegetation, and of this about two-thirds is ploughed land, about one-tenth is forest and scrub, and the rest is pasture, meadowland or garden. In the stock-raising areas, cattle, sheep and pigs are at pre-1914 level, but horses are still much below that level. Cattle plague often devastates the herds. A few dairy ariels have been established. Bee-keeping and poultry raising are subsidiary occupations. The manufactures in the region are entirely dependent on local products and include flour milling, distilling, starch manufacture, tobacco making, confectionery, woollen goods, leather and matches. Most of them are of the small scale, peasant type. Two sugar factories were working before 1914, and there is one factory producing agricultural machinery.

The population (1939) was 2,767,562 of which 1,994,409 was rural and 773,153 urban. The population consists mainly of Great Russians, with Mordvins, Chuvashes, Tatars and Bashkirs. The ethnographic variety is great, and the colonies of Poles, Mennonites from Danzig, and Circassians settled there in 1847-59 by the government added to it. Difficulties of overcoming illiteracy under these conditions are great. Area of the region is 33,475 sq.mi. The Volga is the great artery of commerce, but its tributaries are shallow and not suitable for navigation, with the exception of the Great Irizh up to Kushum. Kuibyshev is linked by rail with Moscow on the west, and with Ufa and Chkalov on the east, while a branch line reaches the Sok river. Roads are poor, there are few bridges, and transport difficulties hamper development. The chief towns are Kuibyshev (see SAMARA), Fugachevsk, Buzuluk (qq.v.), and Buguruslan.

See P. A. Proebrazhenskiy, *The Restoration of Agriculture in the Famine Area of Russia* (1912, in English); *Colonisation of the Samara Region* (1923, in Russian); M. M. Dubenskiy, *The Central Volga Region* (1921, in Russian).

SAMARA (now KUIBYSHEV), a town of the Russian S.F.S.R. in the region of Kuibyshev, in 53° 11' N., 50° 9' E., on the left

bank of the Volga loop, at the junction of the Samara river. Pop. (1939) 390,267. It is a fine river port, and acts as an entrepôt for goods brought by rail and transhipped, or *vice versa*. Its industries include the making of machinery, distilling, brewing, match-making, sawmilling, leatherwork and flourmilling. There are municipal electricity, water and canal and tram services. Near the town is a *kumys* or fermented mare's milk sanatorium. Samara was built in 1586 to secure communication between the recently conquered principalities of Kazan and Astrakhan. Later discontent among the serfs led to a rising in the district in 1774 and the town was the centre for its leader, Pugachev. In 1670, it had been captured by the rebel Stenka Razin. Its importance as a trading centre dates from the end of the 18th century, when colonization spread eastwards. In 1918 the Russian state gold treasure was transferred from Kazan to Samara, under the charge of employees of the tsarist government, but when the military situation became critical, it was removed under an escort of Czech soldiers. In spite of the difficulties of this period and of the famine conditions of 1921, the town's population increased.

SAMARIA, ancient city of Palestine in the tribe of Ephraim, 6 m. N. of Shechem (Nāblus). The site, an isolated hill in the centre of Palestine, is one of great natural strength. Sebastiyeh, a village of 600 inhabitants, occupies part of the area of the royal city; its houses are mostly built with ancient materials.

History.—Omri, king of Israel, bought the hill from its owner, Shemer, for two talents of silver, and erected a city which he made his capital (1 Ki. xvi. 24). The evidence of the excavations establishes that the site was unoccupied prior to the time of Omri (10th century B.C.). Ahab occupied the city, built a temple and remodelled Omri's palace, which was further extended later and probably by Jeroboam II. Ben-hadad II. of Syria in the days of Elijah and Elisha, after having been repulsed from its walls (1 Ki. xx. 34) returned to besiege it and bring it to dire straits through famine (2 Ki. vi. vii.). Shalmaneser IV. laid siege to it for three years (724–22 B.C.), but died during its progress. The operation was completed by Sargon, who deported its inhabitants and substituted for them a new body of settlers from Cutha, the ancestors of the Samaritans. Alexander the Great conquered it in 331 B.C., as did also later Ptolemy Lagi and Antiochus Ptolemaeus. It offered a lively resistance to the fanatical John Hyrcanus. Pompey rebuilt it; Gabinius restored it; but Herod the Great was its chief benefactor. A temple, hippodrome and colonnaded streets were amongst his endowments; their remains still arrest attention. He made it his capital and it took the name Sebaste (commemorating Augustus). The rise of Nāblus (Neapolis), restored by Vespasian, involved the gradual decay of Sebaste. The Crusaders built a church on the hill and established a bishopric. The church, like so many others, was later converted into a mosque. Here were shown the tombs of Elisha, Obadiah, and John the Baptist.

Archaeology.—From 1908 to 1910 excavations, under the auspices of Harvard University were carried out on the site, the results of which were published in 1924. The oldest edifice found on the hill was the palace of Omri, added to and enlarged by Ahab and Jeroboam II. An interesting discovery was that of a number of Hebrew texts traced in ink on tiles in Hebrew writing of a beautiful type belonging to the 9th century B.C. The foundations of a forum, senate-house, palace, city-gate flanked by two round towers, etc., have been laid bare. The low ground to the north-east was the site of the stadium.

See G. A. Reiner, C. S. Fisher, D. G. Lyon, *Harvard Excavations at Samaria (1908–10)* (1924); R. Dussaud, "Samarie au temps d'Achab," *Syria* 6 (1925), 314 seq. (E. Ro.)

SAMARITANS, primarily meaning "inhabitants of Samaria, or the region of Samaria," is specially used, in the New Testament and by Josephus, as the name of a peculiar religious community which had its headquarters in the Samaritan country, and is still represented by a few families at Nāblus, the ancient Shechem. They claim to be descendants of the ten tribes, and to possess the orthodox religion of Moses, accepting the Pentateuch only and transmitting it in a Hebrew text which for the most part has but slight variations from that of the Jews. But

they regard the Jewish temple and priesthood as schismatical, and declare that the true sanctuary chosen by God is not Zion but Mount Gerizim, over against Shechem (St. John iv. 20). The sanctity of this site they prove from the Pentateuch, reading Gerizim for Ebal in Deut. xvii. 4. With this change the chapter is interpreted as a command to select Gerizim as the legitimate sanctuary (cf. verse 7). Moreover, in Exod. xx. 17 and Deut. v. 21 a commandment (taken from Deut. xxvii.) is found in the Samaritan text, at the close of the decalogue, giving directions to build an altar and do sacrifice on Gerizim, from which of course it follows that not only the temple of Zion but the earlier shrine at Shiloh and the priesthood of Eli were schismatical.

The Samaritans must have derived their Pentateuch from the Jews after Ezra's reforms of 444 B.C., no doubt at the time of the expulsion from Jerusalem in 432 B.C. of a man of high-priestly family (Neh. xiii. 28), who had married a daughter of Sanballat. Cf. Josephus *Ant.* xi. 8. The story that they possess a copy of the Law written by Abisha, the great-grandson of Aaron, seems to have aroused a strangely wide-spread interest, so that tourists invariably ask to see it and, usually, claim to have succeeded in doing so. Considering the extreme reverence with which it is regarded, it may safely be said that this manuscript is never shown to them.

In spite of the differences which separated the two communities, their internal development and external history ran parallel courses till the Jewish state took a new departure under the Maccabees. The religious resemblance between the two bodies was increased by the institution of the synagogue, from which there grew up a Samaritan theology and an exegetical tradition. The latter is embodied in the Samaritan Targum, or Aramaic version of the Pentateuch, which in its present form is probably not much earlier than the 4th century A.D., but in general is said to agree with the readings of Origen's *ὁ Σαμαρειτῶν*. Whether the latter represents a complete translation of the Law into Greek may be doubted, but at any rate the Samaritans began already in the time of Alexander to be influenced by Hellenism. They as well as Jews were carried to Egypt by Ptolemy Lagi, and the rivalry of the two parties was continued in Alexandria (Jos. *Ant.* xii. 1. 2), where such a translation may have been produced. Of the Samaritan contributions to Hellenistic literature some fragments have been preserved in the remains of Alexander Polyhistor.

The troubles that fell upon the Jews under Antiochus Epiphanes were not escaped by the Samaritans (2 Macc. v. 23; vi. 2), for the account in Josephus (*Ant.* xii. 5. 5), which makes them voluntarily exchange their religion for the worship of Zeus, is evidently coloured to suit the author's hostility. Under the Maccabees their relations with Judaea became very bitter. They suffered severely at the hands of Hyrcanus, and the temple on Mt. Gerizim was destroyed. Although this treatment established an unalterable enmity to the Jews, as we see in the New Testament, in Josephus and in Jewish tradition, the two sects had too much in common not to unite occasionally against a common enemy, and in the struggles of the Jews with Vespasian the Samaritans took part against the Romans. They were not, however, consistent, for under Hadrian they helped the Romans against the Jews and were allowed to rebuild their temple on Mt. Gerizim. They seem to have shared in the Jewish dispersion, since in later times we hear of Samaritans and their synagogues in Egypt, in Rome and in other parts of the empire. In the 4th century they enjoyed a certain degree of prosperity, according to their own chronicles, under Baba the Great, who (re-)established their religious and social organization. In 484, in consequence of attacks on the Christians, the Gerizim temple was finally destroyed by the Romans, and an insurrection in 529 was suppressed by Justinian so effectively that, while retaining their distinctive religion, they became henceforth politically merged in the surrounding population, with a merely domestic history. They are mentioned in later times by the Jewish travellers Benjamin of Tudela (1173) and Obadiah Bertinoro (1488 in Egypt), by Sir John Maundeville and others, but little was known of them in Europe till Schlegel opened communications

with them in 1583. In consequence of the interest thus aroused, the traveller Pietro della Valle visited them in 1616 and succeeded in obtaining a copy of their Pentateuch and of their Targum. At the present day they live only at Nāhūs (Shechem), about 150 in number, the congregations formerly existing in Gaza, Cairo, Damascus and elsewhere having long since died out. Their ecclesiastical head is the "Priest-leveite," who claims descent from Uzziel the younger son of Kohath (Exod. vi. 18). The line of the high-priests, so called as being descended from Aaron, became extinct in 1623.

In religion, since they recognize no sacred book but the Pentateuch, they agree with the Jews in such doctrines and observances only as are enjoined in the law of Moses. They do not therefore observe the feast of Purim, nor the fast of the 9th of Ab, nor any of the later rabbinical extensions or modifications of the law. Briefly summarized, their creed is as follows: (a) God is one, and in speaking of Him all anthropomorphic expressions are to be avoided: creation was effected by his word: divine appearances in the Pentateuch are to be explained as vicarious, by means of angels (so as early as the 4th century A.D.); (b) Moses is the only prophet: all who have since claimed to be so are deceivers; (c) the Law, which was created with the world, is the only divine revelation; (d) Mt. Gerizim is the house of God, the only centre of worship; (e) there will be a day of judgment. Closely connected with these are the doctrines (also found in the 4th century) of a future life and of a messiah (Ta'eb), who shall end the period of God's displeasure (Panuta) under which his people have suffered since the schism of Eli and the disappearance of the Ark, and shall restore Israel to favour (Re'uta, Riqwān).

The Samaritan language properly so called is a dialect of Palestinian Aramaic, of which the best examples are found in the literature of the 4th century A.D. An archaic alphabet, derived from the old Hebrew, was retained, and is still used by them for writing Aramaic, Hebrew and sometimes even Arabic. After the Muslim conquest of Syria in 632 the native dialect of Aramaic gradually died out, and by the 11th century Arabic had become the literary as well as the popular language. In the Liturgy Hebrew was no doubt used from the earliest times side by side with Aramaic, and after the 11th century it became, in a debased form, the only language for new liturgical compositions.

Literature.—Their literature is, like that of the Jews, chiefly of a religious character. (For an account of it see Montgomery, *The Samaritans*.) Reference has been made above to Samaritan Hellenistic works which have perished except for a few fragments. According to Samaritan tradition, their books were destroyed under Hadrian and Commodus, but of the language and contents of them nothing is recorded. There can be no doubt that some, perhaps much, of the literature has been lost, for nothing is extant which can be dated before the 4th century A.D. The Targum, or Samaritan-Aramaic version of the Pentateuch was most probably written down about that time, though it was clearly based on a much older tradition and must have undergone various recensions. To the same period belong the liturgical compositions of Amram Darah and Marqah, and the latter's midrashic commentary (called the *Book of Wonders*) on parts of the Pentateuch, all in Aramaic. With the possible exception of one or two lyrics there is nothing further till the 11th century when there appears the Arabic version of the Pentateuch, usually ascribed to Abu Sa'id, but perhaps really by Abu'l-hasan of Tyre, who also wrote three Arabic treatises, still extant, on theological subjects, besides some hymns. Of the same date (1053) is an anonymous commentary on Genesis, preserved in the Bodleian Library at Oxford (MS. Opp. add. 4^o, 99), interesting because it quotes from books of the Bible other than the Pentateuch. In the 12th century, Munajja and his son Sadaqah wrote on theology; the earlier part of the chronicle called al-Ta'ulidāh was compiled in Hebrew (1149); and about the same time treatises on Grammar by Abu Sa'id and Abu Ishaq Ibrahim ibn Faraj. Ghazal ibn-al-Duwaik, who wrote on the story of Balak and on the restoration of the kingdom to Israel, is said to have lived in the 13th century, and another chronicle (in Arabic), called

the book of Joshua, is dated about the same time by T. W. J. Juynboll. In the second half of the 14th century lived three important liturgical writers, Abisha h. Phinehas (ob. 1376), Abdallah h. Solomon and Sa'd-allah (or Sa'd-ed-din) b. Sadaqah: Abu'l-fath, who composed his chronicle in 1355: a high priest Phinehas, author of a lexicon; and the anonymous writer of the commentary on the Kitāh al-asaṭir, a work, ascribed to Moses, containing legends of the Patriarchs. Another famous liturgist was Abraham Qahazi, whose pupil Isma'il Rumihi in 1537 wrote a work on the praise of Moses. Several members of the Danfi family were prominent in the 18th century as liturgists, among them Abraham h. Jacob, who also wrote a commentary on Gen. Num.; and of the levitical family Ghazal ibn Abi Sarur, who commented on Gen.-Exod. Another Ghazal (=Tabiah b. Isaac), priest-leveite, who died in 1785, was a considerable writer of liturgy. Of subsequent authors mention need only be made of the Hebrew chronicle by Ab Sakhwah (=Murjan) b. As'ad, of the Danfi family, in 1900, chiefly on the basis of al-Ta'ulidāh and Abu'l-fath; an Arabic chronicle by Phinehas b. Isaac (ob. 1898) of the levitical family; and an Arabic theological work, by the late priest-leveite, Jacob b. Aaron.

BIBLIOGRAPHY.—See Montgomery, *The Samaritans* (Philadelphia, 1907). Since then the Pentateuch has been edited with critical apparatus by August von Gall (Giessen, 1914-18). The Samaritan Liturgy, text and introduction, by A. Cowley (Oxford, 1909). The Asster, with introduction, translation and notes by M. Gaster (London, 1927). (A. Cy.)

SAMARIUM, a metallic element (symbol Sm, atomic number 62, atomic weight 150.4), belonging to the rare-earth group, was discovered in 1879 by Lecoq de Boisbaudran and obtained in the form of pure compounds by Demarcay about 1901. Samarium occurs in many minerals such as monazite, gadolinite, samarskite, etc. It is best separated from the other members by the fractional crystallization of the double magnesium nitrates from 50% nitric acid. The oxide, Sm₂O₃, forms a pale yellow powder practically soluble in most acids giving topaz-yellow salts such as Sm₂(SO₄)₃·5H₂O. The solutions show characteristic absorption and spark spectra. The metal has been prepared by the electrolysis of the fused anhydrous chloride. It slowly oxidizes in the air and melts at 1,300°-1,400° C. Samarium, like europium, gives a lower chloride, SmCl₂, which is produced by heating SmCl₃ in hydrogen. (See RARE EARTHS.) (C. J.)

SAMARKAND, a city of Asiatic Russia, in 39° 39' N., 66° 56' E., situated in the Uzbek S.S.R. Pop. (1939) 134,346. The city is the ancient Maracanda, the capital of Sogdiana, then the residence of the Moslem Samanid dynasty, and subsequently the capital of the Mongol prince Tamerlane. It was captured by the Russians under General Kaufman, after a fierce struggle, in 1868 and for a time declined. In 1900 its population was 58,194, but after the foundation of the Uzbek republic in 1924 with Samarkand as its administrative centre, the town grew rapidly, an electric power station was constructed and it has leather factories, cotton cleaning mills, flour mills, distilleries, and pencil and brick factories. It is linked by rail with Chkalov and with the Caspian, and these lines are joined up via Semipalatinsk with the trans-Siberian line, and it is hoped that cotton cultivation will develop markedly and the population will depend on Siberian grain. It is situated at a height of 2,358 ft. in the fertile loess valley of the Zarafshan, at the point where the river issues from the western spurs of the Tian Shan, on a high plain, with the snow clad Hissar range rising to the south, from which bracing winds blow and make the city more healthful than others in central Asia. Within a journey of a couple of days lie the glacier snouts of the Archa-Maidan, "Place of Junipers."

The Russian part of the town has wide streets lined with poplar, acacia, willow and elm trees, but the Moslem part is an intricate labyrinth of narrow, winding streets. Gardening, the making of pottery and metal goods, and trade in cotton, silk, wheat, rice, horses, asses, fruit and cutlery are among the occupations of the people. The native city, with its maze of yellow houses nestling among the trees, and from which rises the turquoise cupola of the Bibi-Khanum (a college erected in 1388 by a Chinese wife of Timur), centres on the Rigiistan, a square around which are three

madrassahs (Moslem colleges), Ulug-beg, Shir-dar and Tilla-kari, of great architectural symmetry and beauty, decorated with enamelled tiles of various colours. Outside the walls of Samarkand are the Hazret Shah-Zindeh, the summer palace of Timur, on a terrace reached by 40 marble steps, and the grave of Shah-Zindeh (Kasim ibn Abbas), a companion of Timur. The latter was a famous shrine in the 14th century (Ibn Batuta's *Travels*, iii, 52). The Gur Amir, the tomb of Timur, a dome-crowned chapel, has suffered much from time and earthquakes; on its interior walls are turquoise arabesques and inscriptions in gold.

Maracanda was destroyed by Alexander the Great in 329 B.C. and was the scene of the murder of Cleitus. Ruins of its buildings, among which are plain and enamelled tiles of Graeco-Bactrian coins, lie outside Samarkand and are now called Aphrosiab. The city reappears as Samarkand at the time of the Arab conquest, when it was finally reduced by Kotaiba ibn Muslim in A.D. 711-712. Under the Samanids it became a brilliant seat of Arabic civilization and is reported to have been defended by 110,000 men when besieged by Jenghiz Khan in 1221, by whom it was destroyed and pillaged. When Timur (Tamerlane) made it his residence in 1369, its inhabitants numbered 150,000. The magnificent buildings of Timur's successors, which still remain, testify to its former wealth, but by the beginning of the 18th century it was almost uninhabited. It fell under Chinese dominion and subsequently under that of the amir of Bukhara, and finally under that of Russia.

SAMAWA, a town on the Euphrates in 31° N., 45° E., at the junction of the Hindich and Hilla branches of the Euphrates. The town is on the Baghdad-Basra railway and there is a good clear stretch of river as far as Nasiriyeh 71 m. down stream (up stream the river is practically impassable). It is also situated on the caravan routes to Hilla, Nejef and Basra, in a fertile area and is a centre of trade in local agricultural products, including vegetables, rice and wheat and barley. Like most of the Euphrates towns it is a market for such imported goods as sugar, indigo and coffee and also Manchester goods. A good deal of wool is raised locally and woolen carpets are manufactured in the town. Pop. (estimated) 10,000.

SAMBALPUR, a town and district of British India, in the province of Orissa. The town is on the left bank of the river Mahanadi, and the terminus of a branch of the Bengal-Nagpur railway. Pop. (1931) 15,017. It contains a ruined fort with old temples.

The DISTRICT OF SAMBALPUR has an area of 5,419 sq. mi. and a population (1941) of 1,182,622. The Mahanadi, which is the only important river, divides it into unequal parts. The greater portion is an undulating plain, with ranges of rugged hills, the largest of which is the Bara Pahar, covering an area of 300 sq. mi., and attaining at Debrigarh a height of 2,267 ft. The Mahanadi affords means of water communication for 90 m.; its principal tributaries in Sambalpur are the Ib, Kelo and Jhira. To the west of the Mahanadi the district is under close cultivation; to the east the country is broken by hills and a considerable area is under forest. Gold dust and diamonds have been found near Hirkud, at the junction of the Ib and Mahanadi.

Sambalpur lapsed to the British in 1849, and was attached to Bengal until 1862, when it was transferred to the Central Provinces. In 1905 Sambalpur was transferred back again to Bengal, without the subdivisions of Phulbari and Chandrapur-Padampur. On the outbreak of the Mutiny in 1857 a general rising took place, and it was not until 1864 that tranquillity was restored.

SAMBOURNE, EDWARD LINLEY (1844-1910), English draughtsman, illustrator and designer, was born in London, on Jan. 4, 1844. He was educated at the City of London school, and also received a few months' education at the South Kensington school of art. After a six years' "gentleman apprenticeship" with John Penn and Son, marine engineers, Greenwich, his humorous and fanciful sketches made surreptitiously in the drawing-office of that firm were shown to Mark Lemon, editor of *Punch*, and at once secured him an invitation to draw for that journal. In April 1867 appeared his first sketch, "Pros and Cons," and from that time his work was regularly seen, with rare excep-

tions, in the weekly pages of *Punch*. In 1871 he was called to the *Punch* "table." He drew his first political cartoon, properly so called, in 1884, and ten years later began regularly to design, the weekly second cartoon, following Sir John Tenniel as chief cartoonist in 1901. He died on Aug. 3, 1910.

See M. H. Spielmann, *The History of Punch* (1895).

SAMBUCA, SAMBUTE, SAMBIUT, SAMBUE, SAMBUQUE, an ancient stringed instrument of Asiatic origin generally supposed to be a small triangular harp of shrill tone (Arist. Quint. Met. ii, p. 107). But there is no certainty on the point and the most widely different characters have been ascribed to the instrument from time to time in the older records. Thus it has been described as a kind of tambourine, as a sort of flute, as a cithara, as another form of the sackbut, and so on.

SAMLAND, a peninsula of Germany, in the province of East Prussia, on the Baltic. It separates the Frisches Haff on the west from the Kurisches Haff on the north-east, and is bounded on the south by the river Pregel and on the east by the Deime. Its shape is oblong; it is 43 m. long, and 18 broad, and has an area of 900 sq. m. The surface is mostly flat, but on the west sand-hills rise to a height of 300 ft. The chief product is amber. The former episcopal see of Samland was founded by Pope Innocent IV. in 1249 and subordinated to the archbishop of Riga. Bishop Georg von Polentz embraced the Reformation in 1523, and in 1525 the district was incorporated with the duchy of Prussia.

SAMNAN: see SEMNAN.

SAMNITES, the name given by the Romans to the warlike tribes inhabiting the mountainous centre of the southern half of Italy. The word *Samnites* was not the name, so far as we know, used by the Samnites themselves, which would seem rather to have been (the Oscan form of) the word which in Latin appears as *Sabini* (see below). The ending of *Samnites* seems to be connected with the name by which they were known to the Greeks of the Campanian coast. Both from tradition and from surviving inscriptions (see OSCAN and R. S. Conway, *Italic Dialects*, pp. 169-206) it is clear that they spoke Oscan; and tradition records that the Samnites were an offshoot of the Sabines (see e.g., Festus, p. 326 Müller). On two inscriptions, of which one is unfortunately incomplete, and the other is the legend on a coin of the Social War, we have the form *Safinim*, which would be in Latin *Sabinum*, and is best regarded as the nominative or accusative singular, neuter or masculine, agreeing with some substantive understood, such as *nummum* (see Conway, *ibid.*, p. 188, 216).

The abundance of the group names ending in the suffix *-no* in all the Samnite districts classes them unmistakably with the great Sabine stock (see SABINI). The Samnites are intimately related to the patrician class at Rome (see ROMAN: *Ancient History*).

The longest and most important monument of the Oscan language, as it was spoken by the Samnites (in, probably, the 3rd century B.C.) is the small bronze tablet, engraved on both sides, known as the *Tabula Agnonensis*, found in 1848 at the modern village Agnone, not very far from the site of Bovianum, which was the centre of the northern group of Samnites called *Penri*. This inscription, now preserved in the British Museum, is carefully engraved in full Oscan alphabet.

The text and commentary will be found in Conway, *op. cit.*, p. 191: it contains a list of deities to whom statues were erected in the precinct sacred to Ceres, or some allied divinity, and on the back a list of deities to whom altars were erected.

See R. S. Conway, *Dialectorum Italicarum exempla selecta*, and C. D. Buck, *Oscan and Umbrian Grammar*.

SAMO, a tall, robust-looking people inhabiting the borders of Upper Volta and the French Sudan. They speak a language, still little known, apparently related to Sia, and live in independent villages, distributed in quarters consisting of flat-roofed houses of mud. Marriage is restricted within the village but must be outside the extended family group. In the case of a divorce the children remain with the father. The family property passes to the brother of the deceased, and personal goods, or individual property, is inherited by the eldest son. The Samo are skilled cultivators, and raise cattle. They are animists and perform seasonal sacrifices and worship sacred animals protecting the

villages. The dead are exposed and then buried in special places set apart for (1) old men, (2) young men, (3) old women and (4) young women.

See Tauxier, *Le Noir du Yatenga* (1917).

SAMOA. The Samoa group of islands extends from 13° 26' to 14° 22' S. lat. and from 168° 10' to 172° 48' W. long, and is about 1,600 mi. E. of New Zealand, 2,700 mi. E. of Australia and 2,200 mi. S. of the Hawaiian Islands. The archipelago is divided administratively into two parts. The six islands east of 171° W. long, constitute American Samoa, a dependency of the U.S., and the nine islands west of the 171° meridian constitute Western Samoa, a trusteeship territory administered by New Zealand. American Samoa consists of the inhabited islands of Tutuila, Tau, Olosega, Ofu and Aunuu and the uninhabited coral atoll Rose Island. Swains Island, 210 mi. N.W. of Tutuila and considered to be outside the Samoan archipelago, was made a part of American Samoa in 1925. Western Samoa consists of the inhabited islands of Upolu, Savaii, Manono and Apolima and the uninhabited islands of Fanaatapu, Namua, Nuutele, Naulua and Nuausafee.

The total area of American Samoa is 76 sq. mi. Tutuila, the largest island of American Samoa, is about 18 mi. long and from 5 to 6 mi. across in the widest part. Western Samoa has a total land area of 1,133 sq. mi. Savaii, the largest island, has an area of about 700 sq. mi. and is 46 mi. long; Upolu has an area of about 400 sq. mi. and is 45 mi. long. The other seven islands of Western Samoa are quite small.

All the Samoan islands, except Nuausafee, are rocky and of volcanic origin. Upolu, Savaii and Tutuila have high inland ridges rising to peaks of 6,094 ft. in Savaii, 3,608 ft. in Upolu and 2,141 ft. in Tutuila. These islands have little level land except along the coast and in the case of Tutuila there is a broad fertile plain in the southwestern part of the island. The soil is alluvial and quite fertile in the valleys. Because of the heavy rainfall, the soil on hillsides is thin and there is no subsoil.

The climate of the islands is tropical but equable for a good portion of the year. The rainfall is heavy and the range in temperatures is small. From May to November strong southeast winds blow and the islands have experienced many severe hurricanes. June and July are the coolest and pleasantest months. The average temperature is 79.3° F. with a mean range from 73.8° to 84.7°. The average yearly rainfall for a period of 41 years has been 193.5 in.

History.—The archipelago was probably discovered by Jacob Roggeveen, a Dutchman, in 1722. The islands were subsequently visited by Louis de Bougainville in 1768, the comte de la Pérouse in 1787, Edwards in 1791 and Otto von Kotzebue in 1824. The first missionaries to go to Samoa were two members of the London Missionary society who established a mission in 1830. Charles Wilkes, a U.S. explorer, surveyed the islands in 1839. Great Britain, the U.S. and Germany appointed representatives on the islands in 1847, 1853 and 1861, respectively.

In Jan. 1878 the U.S. signed a treaty with the then independent Samoan kingdom which gave the U.S. the right to establish a coaling station in the harbour of Pago Pago, best in the archipelago. A trading agreement was also concluded. Germany and Great Britain received similar privileges the following year, but the interests of the three countries were often in conflict. A conference of the three powers, held in Berlin in 1889, concluded a general act providing for the neutrality of the islands and establishing in effect a tripartite protectorate over the islands.

This arrangement did not operate so successfully as planned, and on Nov. 7, 1899, a treaty was concluded between Great Britain, Germany and the U.S. by which the paramount interests of the United States in those Samoan islands east of 171° W. long, were recognized and Germany's interests in the other Samoan islands were similarly recognized. Great Britain withdrew from Samoa altogether in consideration of rights in Tonga and the Solomon Islands. The high chiefs of the islands of Tutuila and Aunuu ceded those islands to the U.S. on April 17, 1900, and the chiefs of Tau, Olosega and Ofu Islands ceded their islands to the U.S. on July 16, 1904. The U.S. congress accepted the islands

under a joint resolution approved Feb. 20, 1909.

Germany controlled Western Samoa until World War I. New Zealand troops occupied the islands on Aug. 30, 1914, and the League of Nations granted New Zealand a mandate over them in 1920. Western Samoa was made a trusteeship territory by the United Nations with New Zealand as the administering authority on Jan. 25, 1947.

Population.—The population of American Samoa totaled 18,937 in 1950 with about four-fifths of the population on the main island of Tutuila. The population of Western Samoa was estimated at 73,000 in 1948. The Samoans are Polynesian and closely akin to the people of Hawaii and the Maoris of New Zealand.

The Samoan language is believed to be the oldest form of Polynesian speech in existence. It is closely related to the Maori, Tahitian, Hawaiian and Tongan languages. Despite the increasing contacts with the western world, Samoan culture is still the dominant influence in the lives of the people. The village, composed of 30 to 40 households, is the basic social and political unit.

Most of the population have become converts to Christianity. In Western Samoa, one-half of the population is affiliated with the London Missionary society. Other major religious affiliations in Samoa are Roman Catholic, Methodist, Mormon and Seventh-Day Adventist.

Government.—*American Samoa.*—American Samoa is an unorganized U.S. possession with a governor appointed by the president of the United States. On Feb. 19, 1900, the islands were placed under the jurisdiction of the navy department, and the governor was a naval officer. Administration was transferred to the jurisdiction of the department of the interior on July 1, 1951.

For purposes of local administration, American Samoa is divided into three administrative districts. Each district has a governor who is appointed by the governor of American Samoa from the ranks of county chiefs. In each village of the district a chief is appointed by the district governor.

As a result of a legislative reorganization in Feb. 1948, the *annual fono*, which met annually or on the call of the governor, was replaced with a bicameral legislature, known as the legislature of American Samoa. The legislature consists of the house of representatives, with 54 members popularly elected for two-year terms, and the house of ali'i, with 12 members who hold the highest titles in American Samoa. Membership is restricted to permanent residents of the islands and 64 out of 66 members must be natives. The legislature has only advisory powers. The governor also has an advisory council consisting of from five to seven Samoans.

The judiciary consists of a high court presided over by a chief justice and two to four associate judges, six district courts each of which has one judge, and a village court in each village, presided over by a local magistrate. The seat of government is at Pago Pago on Tutuila.

Western Samoa.—An act of the general assembly of New Zealand, effective March 10, 1948, reorganized the government of Western Samoa. The administration is headed by a high commissioner (formerly the administrator) appointed by the governor-general of New Zealand. He governs with the aid of the council of state, which consists of Samoan leaders. The high commissioner consults the council of state on all proposals for legislation and on matters affecting Samoan customs and welfare.

The legislative assembly (formerly the legislative council) was created, presided over by the high commissioner or his nominee. The assembly consists of the Samoan members of the council of state, 11 additional Samoans who are nominated by a native *fono*, or assembly, no more than 5 elected Europeans and no more than 6 official members, of whom 3 are nominated by the governor-general of New Zealand and 3 by the high commissioner. The legislative powers of the assembly are wide, with certain notable exceptions such as laws relating to defense questions and foreign affairs. Village and local affairs are controlled by native village officials nominated by the villagers. The seat of government is at Apia on Upolu.

Education.—Education in American Samoa is compulsory for all children from 7 to 15 years of age, inclusive. Instruction is in English. It was estimated in 1950 that 93% of all persons ten years of age or older were literate. In that year there were 5,093 children enrolled in public and private schools with a total of 161 teachers; about 80% of the enrollment was in public schools. During the fiscal year ending June 30, 1950, about 56% of the expenditures of American Samoa went to public education.

Education in Western Samoa is dependent to a very great extent on the activities of various missions. In 1945 there were 500 schools of all types (of which 387 were missionary schools), with 724 teachers (of which 351 were pastors, 86 natives and 287 Europeans). In 1947 there were 11,391 pupils (of which 80,593 were in missionary schools). Education is not compulsory and there is no age limit on attendance. Instruction in elementary schools is in Samoan while in the more advanced schools it is largely in English. About 8% of Western Samoa's expenditures during the 1947-48 fiscal year went for public education.

Finance.—Total revenues collected in American Samoa during the

1949-50 fiscal year from such sources as per capita taxes, real estate taxes, licence fees and customs duties amounted to \$307,713 in addition to a U.S. government appropriation of \$55,000; expenditures amounted to \$661,143. The Bank of American Samoa, founded in 1914 by the naval government, is the only financial institution in the territory; it had resources of \$1,787,914 in Nov. 1947.

Western Samoa became self-supporting in 1931; as of March 31, 1947, the accumulated surplus totalled \$417,758. Resources in the 1947-48 fiscal year amounted to about £30,000 and expenditures to about £475,000, necessitating the use of a part of the accumulated surplus and a subsidy of £70,400 from the New Zealand government.

Economy.—The natural resources of Samoa are of little economic consequence. There are no minerals and no timber of sufficient quantity to warrant industrial development for export. Commercial fishing had not been developed at mid-20th century. The main products of American Samoa are copra and native handicraft consisting principally of mats and rugs woven from local grasses. Western Samoa's main products are copra, cocoa beans, desiccated coconut and bananas.

Agriculture is the basis of the Samoan economy. Crops cultivated are corn, beans, peas, watermelons, cucumbers, squash, eggplant, tomatoes, lettuce, radishes, sweet potatoes, breadfruit, papayas, bananas, taro and pineapple. There are also some cattle, and in American Samoa a small dairy industry.

Imports by American Samoa in the 1949-50 fiscal year totalled \$886,061; the major imports were preserved meat and textiles. Exports totalled \$313,070, two-thirds of which were copra (3,160,000 lbs.). Western Samoa's imports in 1946 amounted to \$478,895 and consisted mostly of foodstuffs and textiles; exports totalled \$719,050 and consisted mostly of copra, cocoa beans and desiccated coconut.

SAMOS, an island in the Aegean sea, separated from the mainland of Turkey by a strait of only about a mile in width; about 27 mi. in length, by 14 in greatest breadth; occupied by mountains, of which the highest, Mt. Kerkis, near its western end, is 4,710 ft. high. This range continues from Mt. Mycale on the mainland. Samos was annexed to Greece in 1912. The capital is at Vathy, in a deep bay on the north coast, a quite modern town, well paved and connected by carriage roads with villages round both sides of the bay, and with Tigani on the south coast, the site of the ancient city. A third port, Carlovasi, farther west on the northern coast, serves a separate lowland district. The island is remarkably fertile, and a great portion of it is covered with vineyards. Oil, raisins, silk, cotton and tobacco are also grown, and barges and sailing vessels are built at Tigani, almost wholly from native timber. Cigarette making employs many women and girls, the tobacco coming chiefly from Thrace. The population in 1940 was 69,138. The predominant religion is the Orthodox Greek; the metropolitan district is Samos and Icaria.

History.—At the time of the great migrations, in the 11th century B.C., Samos received an Ionian population mainly from Epidaurus in Argos. By the 7th century B.C. it had become one of the leading commercial centres of Greece through its position near the Mæander and Caÿster trade-routes from inner Asia Minor. The Samians also traded with the Black sea and with Egypt, and claimed to be the first Greeks to reach the Straits of Gibraltar. Their commerce brought them into close relations with Cyrene, Corinth and Chalced, but made them bitter rivals of their neighbour, Miletus. The feud involved both sides in the Levantine war (7th century B.C.) when Corinth built triremes for the Samians. The result favoured Miletus, but in the 6th century the insular position of Samos preserved it from mainland aggressions to which Miletus was exposed. About 535 B.C., when its oligarchy was overturned by the tyrant Polycrates (q.v.), Samos reached the height of its prosperity. Its navy "ruled the waves" from its new deep-sea harbour, and blockaded the mainland subjects of Persia; the tunnelled aqueduct (still open) secured copious water, and the great Temple of Hera was built. Polycrates first intrigued, and then quarrelled, with the Persian governor of Lydia,

and after his death by treachery, Darius conquered Samos and partly depopulated it. It had regained much when, in 499, it joined the general revolt of the Ionians against Persia; but owing to jealousy of Miletus, part of its contingent, at the decisive battle of Lade (494), deserted. In 479, however, following Xerxes' defeats in Greece, Samos betrayed the Persian fleet to the Greeks at Mycale. In the Delian League the Samians held special privilege and remained loyal to Athens until 440, when a dispute with Miletus, which the Athenians had decided against them, provoked them to secede. With a fleet of 60 ships they held their own for some time against a large Athenian fleet led by Pericles himself, but after a siege, capitulated and were degraded to a tributary rank. Towards the end of the Peloponnesian war, when Miletus became a Spartan naval base, Samos appears as one of the most loyal dependencies of Athens; and a temporary home of the Athenian democracy during the revolution of the Four Hundred at Athens (411 B.C.), and in the last stage of the war, it was rewarded with the Athenian franchise. This friendly attitude towards Athens was accompanied by the establishment of democracy. After the downfall of Athens, Samos was besieged by Lysander and again placed under an oligarchy. In 394, when the Spartan navy withdrew, the island declared its independence and re-established a democracy, but by the Peace of Antalcidas (387) it fell under Persian dominion. Recovered by the Athenians in 356, after a siege, it received a body of military settlers. After 322, when Athens was again deprived of Samos, its fate is obscure. For some time (about 275-270 B.C.) it served as a base for the Egyptian fleet, at other periods it recognized the overlordship of Syria; in 189 B.C. it was transferred by the Romans to the kings of Pergamum. Enrolled from 133 in the Roman province of Asia, it revolted to Aristonicus (132) and Mithridates (88), and forfeited its autonomy, but recovered it between the reigns of Augustus and Vespasian, and remained prosperous. Under Byzantine rule Samos became the head of the Aegean theme (military district). After the 13th century it passed through much the same changes as Chios (q.v.), and became the property of the Genoese firm of Giustiniani (1346-1566). At the Turkish conquest it was severely depopulated, and provided with new settlers, partly Albanians.

During the Greek War of Independence Samos bore a conspicuous part, and it was in the strait between the island and Mt. Mycale that Canaris blew up a Turkish frigate, in the presence of the army assembled for invasion. The enterprise was abandoned and Samos held its own to the end of the war. On the conclusion of peace the island was, indeed, again handed over to the Turks, but since 1835 held an exceptionally advantageous position, being in fact self-governed, though tributary to the Turkish empire, and ruled by a Greek governor nominated by the Porte, who had the title of "Prince of Samos," and was supported and controlled by a Greek council and assembly. The prosperity of the island bore witness to the wisdom of this arrangement, but did not prevent annexation to Greece when the political situation allowed it.

The ancient capital was on the south coast, at the modern Tigani, directly opposite to the promontory of Mycale. A natural cove, dominated by a low hill, has been converted by ancient and modern breakwaters into a safe port for small vessels. Behind the modern town rises a steep enclosing ridge, Astypalea, crowned by Polycrates' wall, and perforated by his aqueduct. From this city a road led about 4m. W. to the Temple of Hera, whose site, close to the shore, is still marked by a single column, which has given to the neighbouring headland the name of Capo Colonna. Though so little remains standing, German excavators have revealed its massive foundations.

The modern capital of the island was, until recently, at Khora, about 2m. from the sea and from Tigani, but in the 19th century the capital was transferred to Vathy, on the north coast.

Samos was the birthplace of Pythagoras (q.v.), the philosopher, whose name and figure are found on coins of the city in imperial times. It also produced a school of sculptors beginning with Rhœcus and Theodoros, who are said to have invented the art of casting statues in bronze. Rhœcus was also the architect of

the Temple of Hera. Another famous Samian sculptor was Pythagoras, who migrated to Rhegium. The vases of Samos are among the most characteristic Ionian pottery in the 6th century. The name Samian ware, often given to a kind of red pottery found in Roman settlements, has no scientific value; it is derived from a passage in Pliny, *N.H.* xxxv. 160 sqq.

SAMOSATA (Sumeisat, modern Samsat), a city on the right bank of the upper Euphrates on the borders of Mesopotamia and Armenia in 37° 30' N., 38° 30' E. Samosata is an important crossing place of the river close to the point where it enters the plain. It forms one of the series of border forts, of which Edessa (*q.v.*) was the most important, which had a stormy history in relation to the frontier defence of Upper Mesopotamia. It had an additional importance as forming a point at which the crossing of the river could be made. Although it is uncertain whether it was ever on the Persian royal road, there was a bridge at this point in Strabo's time, when the city is described as being strongly fortified and the centre of a small but very fertile district. From this point caravan routes diverge to Diarbekr in the north, and downstream to Urfa (Edessa) but it lies off the main route.

The fortunes of Samosata followed those of the great empires at whose boundaries it stood. It appears originally to have been a Hittite city, and it was incorporated in the Assyrian empire in 708 B.C. Later it passed into the hands of the successors of Alexander, and became the capital of Commagene. In A.D. 72 it became a Roman province. In later times it passed through a series of changes, losing its status as the capital city of a district under Constantine, and in the tenth century becoming temporarily a theme, or administrative military district of the Byzantine Empire. It is said in the thirteenth century to have been an Armenian settlement, but today it is mainly occupied by Kurds.

SAMOTHRACE (mod. Gr. *Samothraki*, Turk. *Semadrek*), an island in the north of the Aegean Sea, nearly opposite the mouth of the Hebrus (Maritza) north of Imbros and north-east of Lemnos. It has a population of 3,866, nearly all Greek. Though of small extent it is, next to Mount Athos, by far the most conspicuous natural feature in this part of the Aegean (5,240 ft.). In *Iliad* xiii. 12, the poet represents Poseidon using its summit to survey the plain of Troy. This mountainous character and the absence of harbours precluded political importance, while permitting the survival of the archaic worship of the *Cabeiri* (*q.v.*) which Herodotus (ii. 51) and others attributed to "Pelagian" aborigines. Probably on account of its sacred character the island always enjoyed autonomy, even in the time of Philip.

The "Victory of Samothrace," set up by Demetrius Poliorcetes c. 305 B.C., was discovered in the island in 1863, and is now in the Louvre. The ancient city was situated at Palaepoli below the modern village on the N. side of the island close to the sea; with considerable remains of ancient walls, in Cyclopean style, of the sanctuary of the Cabeiri, and of other edifices of Ptolemaic and later date. A considerable sponge fishery is carried on. On the N. coast are much-frequented hot sulphur springs.

Samothrace was occupied by Germany in World War II.

SAMOVAR [Russ. *samovar*], an urn for making tea after the Russian fashion; it is usually of copper, and is kept boiling by a tube filled with live charcoal passing through the centre. The word is usually taken in Russia to mean "self-boiler" (*samú*, self, and *boiít*, boil), but it is more probably an adaptation of a Tatar word *samabar*, a tea-urn.

SAMOYEDS, a Neo-Siberian tribe, spread in small groups from the Altai mountains down the basins of the Ob and Yenisei, and along the shores of the Arctic ocean from the mouth of the latter river to the White sea, subdivided into three main groups: (a) The Yuraks in the coast-region from the Yenisei to the White sea; (b) the Tavghi Samoyeds, between the Yenisei and the Khatanga; (c) the Ostiak Samoyeds, intermingled with Os-

tiaks, in the forest regions of Tobolsk and Yeniseisk.

The Samoyeds, who now maintain themselves by hunting and fishing on the lower Ob, are partly mixed in the S. with Ostiaks. Clothed in skins, they make use of implements in bone and stone, eat carnivorous animals—the wolf included—and cherish superstitions regarding the teeth of the bear. Their huts are erected with stone; their graves are mere boxes left in the tundra. Death is ascribed to an evil female spirit. Personal belongings are buried with the dead. The religion is fetishism mixed with Shamanism, the shaman (*tadjí-bei*) being a representative of the great divinity, Nim. Women become Shamans.

Of the S. Samoyeds, who are completely Tatarized, the Belirs live by agriculture and cattle-breeding in the Abakan steppe. They profess Christianity, and speak a language closely resembling that of the Sagi Tatars. The Kaibals, or Koibals, can hardly be distinguished from the Minusinsk Tatars and support themselves by rearing cattle. Castrén considers that three of their stems are of Ostiak origin, the remainder being Samoyedic. The Kamasins, in the Kansk district of Yeniseisk, are either herdsmen or agriculturists. They speak a language with an admixture of Tatar words, and some of their stems contain a large Tatar element. The interesting nomadic tribe of Karagases, in the Sayan mountains, is disappearing; the few representatives are rapidly losing their anthropological features, their Turkish language and their distinctive dress. The Motors are now little more than a memory. One portion of the tribe emigrated to China and was there exterminated; the remainder have disappeared among the Tuba Tatars and the Soyotes. The Samoyedes on the Ob in Tomsk may number about 7,000.

Castrén *Grammatik der samoyedischen Sprachen* (1854); *Dictionary* (1855); *Ethnologische Vorlesungen über die altaischen Völker* (1857); *Versuch einer koibalschen und karagassischen Sprachlehre* (1857); also A. Middendorf, *Reise in den nördlichen Norden und Osten Sibiriens* (1875) and M. A. Czaplicka, *Aboriginal Siberia* (1914).

SAMPAN, the name of the typical light boat of far Eastern rivers and coastal waters; it is usually propelled by a single scull over the stern, and the centre and after part is covered by an awning or screen of matting. The word is said to be Chinese, *sam*, thin, and *pan*, board. Others take it to be of Malay origin.

SAMPLE, a small portion of merchandise taken from the whole to serve as a specimen or evidence of the whole; hence a pattern or model. (See *SALE OF GOODS*.)

SAMPLER, a model or pattern to be copied, particularly a small rectangular piece of embroidery worked on canvas or other material as a pattern or example of a beginner's skill in needlework, as a means of teaching the stitches. Down to comparatively recent times every little girl worked her "sampler," and examples of 17th century work are still found and have become the object of the collector's search. See *ill.* on p. 924. They usually contained the alphabet, the worker's name, the date and Bible texts, verses, mottoes, the whole surrounded with some conventional design. The earliest sampler in existence is dated 1643 and is in the Victoria and Albert museum, South Kensington.

See M. B. Hulsh, *Samplers and Tapestry Embroideries* (1900).

SAMPSON, WILLIAM THOMAS (1840-1902), American naval commander, was born at Palmyra, N.Y., on Feb. 9, 1840, and graduated at the head of his class from the U.S. Naval academy in 1861. In this year he was promoted to master, and in the following year was made lieutenant. He was executive officer in the "Patapsco" when she was blown up in Charleston harbour in Jan. 1865. He served on distant stations and (1868-71 and 1876-78) at the Naval academy, and became lieutenant-commander in 1866 and commander in 1874. He was a member of the International Prime Meridian and Time Conference in 1884, and of the board of fortifications in 1885-1886; was superintendent of the Naval academy from 1886 to 1890; and was promoted to captain and served as delegate at the International Maritime Conference at Washington in 1889. He was chief of the Bureau of Ordnance in 1893-97. About 95% of the guns employed in the Spanish-American War were made under his superintendence. His influence was felt decisively in the distribution of guns and armour, and in the training of the personnel of the navy. He

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART
A SAMPLER OF 1747, FROM THE FISHBACK COLLECTION

superintended the gunnery training and prepared a new drill-book for the fleet. In Feb. 1898, Sampson, then a captain, was president of the board of inquiry as to the cause of destruction of the "Maine." At the outbreak of the war with Spain he was placed in charge of the North Atlantic Squadron, and conducted the blockade of Cuba. When it was known that Admiral Cervera, with a Spanish fleet, had left the Cape Verde islands, Sampson withdrew a force from the blockade to cruise in the Windward Passage, and made an attack upon the forts at San Juan, Porto Rico. After his return to the coast of Cuba he conducted the blockade of Santiago, and the ships under his command destroyed the Spanish vessels when they issued from the harbour of Santiago and attempted to escape. (See SPANISH-AMERICAN WAR OF 1898.) Sampson himself was not actually present at the battle, having started for Siboney just before it began to confer with Gen. Shafter, commanding the land forces. He reached the scene of battle as the last Spanish vessel surrendered, and the engagement was fought in accordance with his instructions. He was promoted to commodore in 1898, to rear-admiral on March 3, 1899, and was made commandant of the Boston (Charlestown) navy yard in October of the same year. He died in Washington, D.C., on May 6, 1902.

See W. A. M. Goode, *With Sampson Through the War* (1899); A. T. Mahan, "Sampson's Naval Career," *McClure's Magazine*, vol. xix, (1902); James Parker, *Rear Admirals Schley, Sampson and Cervera* (1910).

SAMSHUI ("Three Waters"), former treaty port in the province of Kwangtung, South China, in latitude 23° 5' N. and longitude 112° 49' E., about 25 miles due west of Canton. It commands an important position at the junction of the Si Kiang (West river) and Pei Kiang (North river) and lies at the apex of the deltaic network of river channels which lead to the Canton river or directly to the sea by the Si Kiang.

Samshui is thus favourably situated for the collection and distribution of trade commodities, but after the port was opened to

foreign trade in 1897 it did not grow to any considerable extent, largely owing to the proximity of Canton. Its trade was based on the large junk and launch traffic of the delta region. The export trade through the port was largely from Wuchow and Nanning higher up the Si Kiang.

The boycott of Hong Kong in 1925-26 affected the foreign trade of Samshui considerably.

After the outbreak of the Chinese-Japanese war in 1937 the trade of the port increased until the end of 1938, when the Japanese occupied the Canton delta.

The customs revenue figures for these years were as follows:

1936—\$77,908 (U.S.)

1937—\$518,344 (U.S.)

1938—\$437,787 (U.S.)

The town established railway connection with Canton in 1904; its estimated Chinese population in 1931 was 9,160.

SAMSON, whose deeds are recorded in Judges xiv-xvi., was a hero of early Hebrew folk-tales. He belonged to the tribe of Dan, and was renowned for his exploits against the Philistines. The narratives are marked by a grim and boisterous humour, and are so little concerned with religion that they may almost be called pagan. But, though they contribute little towards the understanding of Hebrew religion, they add much to our knowledge of early customs, and throw light on Philistine civilization. Their account of the relationships between Hebrews and Philistines, too, is of some historical worth. (See PHILISTINES.)

It has often been noted that there are points of resemblance between the story of Samson and the myths of Gilgamesh, Melkart, and Hercules; but, while the kinship must be admitted, Samson is much more human than his counterparts in pagan myth and legend, and is probably to be regarded as a historical person. The story contains many features drawn from solar mythology. The name Samson is a derivative, of uncertain meaning, from the Hebrew word *Sun-shemesh*. It is noteworthy that a shrine of the Sun, Beth-Shemesh, stood in the neighbourhood of Samson's home. Long hair, in which according to the story lay the secret of his strength, is a familiar feature of solar heroes, as a symbol of the sun's rays. His exploit with the gates of Gaza may be connected with the myth which represents the sun as passing through a double-gated door on the eastern horizon. It has, indeed, been argued that the entire Samson story is a solar myth; but it is apparently much more highly probable that in this case the story of a popular hero has been expanded and decorated by mythological motifs.

Why does a story so lacking in religious interest appear in the book, and why is an almost pagan character like Samson reckoned among the saviours of Israel, when the story itself does not record any deliverance of the people from Philistine oppression? There is some evidence that the story was not included in an earlier form of Judges, and that a later editor was constrained by its popularity to insert it. The account of Samson's birth—suspiciously reminiscent of an incident in the history of Gideon—and dedication as a Nazirite, Judges xiii., is an editorial attempt to fit for more respectable company the boisterous, sensual Samson of the folk-tales, who wears his Nazirite costume with some obvious difficulty, and is moved far more by his own erratic impulses than by the spirit of Yahweh. S. A. Cook, comparing Judges xiii. with vi. 11-24, suggests that Samson may have been regarded as the founder of a local Manahathite cult.

See Burney, *Judges*, pp. 335-408; A. S. Palmer, *The Samson-Sage, and its place in comparative Religion*; S. A. Cook, *Journ. of Theol. Stud.* 1927, pp. 372-390. (W. L. W.)

SAMSONOV, ALEXANDER (1859-1914), Russian general, passed through the cavalry school in St. Petersburg, and served in the war with Turkey in 1877-78. On passing out of the academy of the general staff in 1884 he was appointed on the general staff. He was commandant of the cavalry school at Elisavetgrad (1886-1904), and in 1902 was promoted to the rank of general. In the war with Japan (1904-05) he commanded the Ussuri mounted brigade and the Siberian Cossack division. In 1909 he was made ataman of the Don Cossacks, and became governor-general and commander of troops in Turkestan. In Aug.

1914 he was appointed commander of the 2nd army, concentrated on the Narev. The desire to take pressure off France at the earliest possible moment led the Russian supreme command to give an order for an advance into eastern Prussia in spite of Samsonov's report that his army was not ready for an advance. As a result of the absence of support from Rennenkampf's 1st army Samsonov's army was destroyed in the battle of Tannenberg (Aug. 26-29). Convinced that the battle was hopelessly lost, he ordered his staff to extricate themselves from the German ring, and shot himself in a wood.

SAMSUN (anc. *Amisus*), the chief town of the Samsun vilayet in Asiatic Turkey, situated on the south coast of the Black sea between the deltas of the Kizil and Yesil Irmaqs. Pop. (1950) 43,937. It is connected by metalled roads with Sivas and Kaisariye, and by sea with Istanbul. Samsun is a thriving town and the outlet for the trade of the Sivas vilayet. Steamers lie about 1 mi. from the shore in an open roadstead, and in winter landing is sometimes impossible. Its district is one of the principal sources of Turkish tobacco, a whole variety of which is known as "Samsun." Samsun exports cereals, tobacco and wool. Amisus, which stood on a promontory about 13 mi. N.W. of Samsun, was, next to Sinope, the most flourishing of the Greek settlements on the Buxine, and under the kings of Pontus it was a rich trading town. By the 1st century A.D. it had displaced Sinope as the north port of the great trade route from central Asia, and later it was one of the chief towns of the Commeni of Trebizond.

SAMUCAN, a group of tribes of South American Indians, constituting an independent linguistic stock, so called from the Samucos, one of its best-known tribes. The area occupied by this stock lies on the borders of the Bolivian Chaco, roughly between 19° 30' and 21° S. lat. and from slightly west of the Paraguay river westward to near the Parapiti. Living in a subdesert area, the Samucan tribes are mainly a seminomadic hunting folk of peaceful and friendly character and simple culture. They wear little or no clothing, and construct flimsy and temporary huts of mats. They have no canoes, but are excellent swimmers. The spear, club and a very long bow are their weapons. Their social organization is of the simplest. Their religious ceremonies are marked by elaborate masked dances.

See G. Boggiani, *I Ciamaeco (Atti Soc. Romana Antropologia*, vol. II); J. Cardus, *Missiones Franciscanas . . . de la Republica de Bolivia* (1886).

SAMUEL, a prophet who played an important part in the establishment of the Hebrew kingdom under Saul, and became naturally the hero of numerous legends, some of which are found interspersed among narratives of greater historical value in the early part of 1 Samuel. This mixture of legend with history tends to obscure the facts, and the difficulties of recovering the true story are aggravated because we find two absolutely contradictory representations of his attitude toward the idea of monarchy. According to one of these, after a severe defeat inflicted upon Israel by the Philistines, involving the temporary loss of the ark (1 Samuel, iv), Samuel, acting in the tradition of the judges, summons "all Israel" to Mizpah (vii), performs rites of purification, and offers sacrifice to Yahweh. The Philistines are subdued by the miraculous intervention of Yahweh, and Israel recovers its lost territory. Samuel thereafter rules as a theocratic judge. His sons, whom he would make his successors, are corrupt, and the people demand a king, like those of the surrounding nations, to rule them. Despite the solemn warnings of Samuel as to the arrogant oppression of kings the people are insistent, and, by Yahweh's instruction, Samuel concedes their demand, choosing, by sacred lot, Saul (x, 17-24). The same adverse attitude toward the institution of monarchy is even more emphatically expressed in the long farewell address of abdication made by Samuel (xii). Quite different is the view we find in 1 Sam. ix-x, 16. Here Samuel is a local seer of so little renown that his fame is unknown to Saul, who, seeking some lost asses, is advised by a servant to consult him. Samuel receives the divine command to anoint Saul as king, which, seemingly, he does with unqualified enthusiasm. It is obvious that of the two representations the latter will be nearer the truth; had Samuel been really a theocratic judge tradition would hardly have dwarfed him to the grade of a local

seer, whereas the contrary proceeding is quite natural. Further, the strong antimonarchical ideas are surely the product of a later age, when the nation had experienced the exactions and follies of subsequent kings, whom they came to look upon as responsible for the national misfortunes (viii, 7; x, 19; xii, 12).

What, then, is the nucleus of important fact in these traditions? It is probable that the birthplace of Samuel was Ramah, and that —though the story of his dedication to the service of the sanctuary at Shiloh is idyllic rather than history—he was a priestly seer who came into prominence during the dark days of Philistine oppression. The strong tradition as to his being the "king-maker," must rest on some historic basis; and, though later tradition has exalted Samuel at the expense of Saul, we may believe that he played an important part in the installation of Israel's first king. Though Samuel's denunciations of the monarchical idea are but the reflections of the views of a later age, they seem to have a point of contact with the history, for it is probable that the breach between Samuel and Saul in connection with Agag, 1 Samuel xv, was only the culmination of earlier divergences. Late tradition emphasizes this by its representation of Samuel as anointing David to replace Saul. (See **SAMUEL**, BOOKS OF.) (W. L. W.)

SAMUEL, HERBERT SAMUEL, 1st VISCOUNT (1870-), British politician, was born at Liverpool on Nov. 6, 1870. He was educated at University College school, London, and at Balliol college, Oxford. In 1895 and 1900 he unsuccessfully contested South Oxfordshire as a Liberal, and in 1902 was elected for the Cleveland division of Yorkshire. He entered Sir Henry Campbell-Bannerman's government in 1905 as parliamentary undersecretary to the home office. In 1908 he was sworn into the privy council. From 1909 to 1910 he was chancellor of the duchy of Lancaster, with a seat in the cabinet, and in 1910 became postmaster general. He held this office until 1914, and then became for a year president of the Local Government board. From 1915 to 1916 he was again postmaster general and chancellor of the duchy of Lancaster, and in 1916 became home secretary. He acted as chairman of the select committee on national expenditure (1917-18), and in 1919 was special commissioner to Belgium. He was high commissioner to Palestine, 1920 until Aug. 1925, when he was made chairman of the royal commission appointed to inquire into conditions in the coal industry. In 1926 he was created G.C.B. He was chairman, Liberal party organization, 1927-29; home secretary, national government, 1931; resigned in 1932; he went into opposition in 1933. In 1937 he was created a viscount. He became leader of the Liberal party in the house of lords in 1944. Samuel wrote *Memoirs* (1945) and *Essays in Physics* (1950).

SAMUEL, BOOKS OF, two books of the Old Testament, which in the Jewish canon are ranked among the Former Prophets (Joshua-Kings) in contrast to the Latter Prophets (Isaiah-Malachi).

Contents.—The books of Judges, Samuel and Kings are made up of a series of extracts from various sources, and freely handled by copyists down to a late date, as is shown by the numerous and often important variations between the Hebrew text and the Greek version (Septuagint). The main redaction of Judges and Kings was made under the influence of the ideas which characterize Deuteronomy, that is, after the reforms ascribed to Josiah (2 Kings, xxiii); but in Samuel the "Deuteronomism" hand is much less prominent and the chronological system which runs through Judges and Kings occurs only occasionally.

The book of Samuel completes the history of the "Judges" of Israel (11th century B.C.), and begins by relating the events which led to the institution of the monarchy under Saul, the part played by Samuel being especially prominent (1 Sam. i-xiv). The interest is then transferred to David, the founder of the Judean dynasty, and his early life is narrated with great wealth of detail. As Saul loses the divine favour, David's position advances, until, after the death of Saul and the overthrow of Israel, he gains the allegiance of a disorganized people (1 Sam. xv-2 Sam. iv), and Jerusalem becomes the centre of his empire (v-viii)—c. 1000 B.C. A more connected narrative is now given of the history of David (ix-xx), which is separated from the

account of his death and Solomon's accession (1 Ki. i, ii.) by an appendix of miscellaneous contents (xxi-xxiv.).

Samuel and Saul.—The introductory account (i-iv. 1a) of the birth, dedication and calling of the young prophet Samuel is a valuable picture of religious life at the sanctuary at Shiloh. It is connected by the prophecy of the punishment of the house of Eli (iii. 11 *sqq.*) with the defeat of the Israelites by the Philistines at Ebenezer near Aphek, the loss of the ark (iv. 1b-22), and its subsequent fortunes (v-vii. 1) A Philistine oppression of 20 years ends when Samuel, here the recognized "judge" of Israel, gains a great victory at Ebenezer near Mizpah (vii. 1). But the deliverance of Israel from the Philistines is also ascribed to Saul (xiv.); there is no room for both in the history of the prophet (see vii. 14), and it is now generally recognized that two conflicting representations have been combined: (a) vii, viii, x, 17-24, xli, (b) ix. 1-3, 15, xiv. *sqq.* (See further **SAMUEL SAUL**). The account of Eli, Shiloh and the ark (i-iii.) is a natural prelude to iv-vii., where, however, we lose sight of Samuel and the prophecy. The punishment of Eli and his sons (iv.) becomes a passing interest. The sequel of the defeat in iv. is not stated, although other allusions to the fall of Shiloh (Jer. vii. 12-15, xxvi. 6, 9, Ps. lxxviii. 60 *sqq.*), and the subsequent reappearance of the priestly family at Nob (xxi. *seq.*) suggest that a fuller account of the events must have been extant. A narrative of Eli and the priesthood of Shiloh has probably been used to form an introduction to Samuel's victory (vii.), and it has been supplemented partly by the account of the early life of the future prophet and judge (note the present abrupt introduction of Eli in i. 3) and partly by narratives of the history of the ark (v. *seq.*). The section was handled at a relatively late period. This is clear from the presence of the Deuteronomite prophecy in ii. 27-36, which hints at the rise of the Zadokite priests of Jerusalem. Also, Hannah's psalm (ii. 1-10)—the prototype of the "Magnificat"—is a post-exilic passage, "probably composed in celebration of some national success" (Driver); its present suitability rests upon the interpretation of verse 5.

Saul.—Saul's reign is introduced in xiii. 1, where a blank has been left for his age at accession (some mss. insert "30"); the duration of his reign is also textually uncertain. The formula is parallel to that in 2 Sam. i. 20 *seq.*, v. 4 *seq.*, and frequently in the Book of Kings, with the additional feature that the age at accession, there usually confined to the Judean kings, is here given for the Israelite Saul and his son Ishbosheth (i.e., Ishbaal). The summary in xiv. 47 *seqq.* is immediately followed by a reference to the continuous Philistine warfare (v. 52, contrast vii. 13) which forms an introduction to the life of David. But the summary gives a picture of Saul's ability and position which differs so markedly from the subsequent more extensive narratives of David's history that its genuineness has sometimes been questioned; nevertheless, it is substantiated by the old poem quoted from the Book of Jasher in 2 Sam. i. 17-27, and a fundamental divergence in the traditions may be assumed. Similarly in 2 Sam. ii. 8-10a, the length of Ishbaal's reign conflicts with the history of David (ii. 11 and iv. 1-3), and the reorganization of (north) Israel with the aid of Abner does not accord with other traditions, which represent David as the deliverer of (all?) Israel from the Philistine yoke (iii. 18, xix. 9). But ii. 8-10a, in common with 1 Sam. xiii. 1, xiv. 47-51 (*cf.*, also the introduction in 1 Sam. vii. 2 and the conclusion vii. 15-17), are of a literary character different from the detailed narratives; the redactional or annalistic style is noticeable, and they contain features characteristic of the annals which form the framework of Kings. In Kings the Israelite and Judean records are kept carefully separate and the independent standpoint of each is at once obvious. Here, however, much complication arises from the combination of traditions of distinct origin, independent records of Saul having been revised or supplemented by writers whose interest lay in David.

David.—The stories of the relations between the founders of the respective monarchies of Israel and of Judah reflect the popular interest in David (*q.v.*). Apart from the more detailed and continuous history, there are miscellaneous passages in 2

Sam. v-viii., with an introduction (v. 1-3), and a concluding chapter rounding off David's reign (viii.). A similar collection in xxi-xxiv. severs the closely-knit sequence of narratives in ix-xx. (the "Court history of David") from David's death in 1 Ki. i-ii. Their contents range over all periods, from the Amalekite war (viii. 12, *cf.* 1 Sam. xxx) to David's "last words" (xxiii. 1; but see 1 Kings i. 1 and ii. 1). In particular they narrate the capture of Jerusalem from the Jebusites (v. 6-10) and other fights in that district as far as Gazer (see 17-25), the purchase of land from a Jebusite for the erection of an altar (xxiv.; see 1 Chron. xxi-xxii. 1, 2, Chron. iii. 1), and the pacification of the Gibeonites (xxi. 1-14). The last two inter-related narratives are severed by the no less inter-related material in xxi. 15 *seqq.*, xxiii. 8 *seq.* (connected with the conflicts in ch. v.); and these in turn are now separated by the psalm in xli. (Ps. xxvii.) and by David's "last words." The repetition of the list of officials in vii. 15-18 and xx. 23-26 is attributed by several authorities (after Budde) to the later insertion of ix-xx. 22. On this view, the two groups v-viii., xxi-xxiv. were once continuous—though not necessarily in their present form or order.

The compiler of 2 Sam. v-viii. has placed *after* the capture of Jerusalem (v. 6 *seq.*) the conflict with the Philistines (v. 17 *seqq.*), where the "hold" is not Zion but some place of retreat, perhaps Adullam (*cf.* xxiii. 14). Similarly, the conflicts in xxi. 15 *seqq.*, xxiii. 8 *seqq.*, which are located around Gath, Lehi (so read xxiii. 11), Pas-dammim (so v. 9; see 1 Chron. xi. 13), Beth-lehem, and the valley of Rephaim, should also precede the occupation of Jerusalem and the subsequent partition of territory among David's sons and others (e.g., xxi. 23, near Bethel). These passages combine to furnish a representation of the events leading to the capture of the capital which is distinct from and now superseded by the detailed narratives in ii. 12-19. Here, Ishbaal is east of the Jordan, David's men are engaged in fighting Benjamin and Israel—even at Gibeon (about 6 m. N.W. of Jerusalem), the interest of the history is in David's former relations with Israel at Saul's court, and he is regarded as the future deliverer of the oppressed people. The fragments preserved in 2 Sam. v-viii., xxi-xxiv. throw another light upon David's relations to Saul's family (xxi. 1-14, contrast ix.); and the stories of heroic conflicts with giant-like figures of Gath, etc. (xxiii. 9 *seq.*, 28, *cf.* 1 Chron. xi. 11, 20) find no place by the side of the more detailed records of his sojourn under the protection of a king of Gath, one of a confederation of Philistine cities (1 Sam. xxvii., xxix.). It is possible that popular stories of the conquest of the earlier inhabitants have been applied to the Philistines (*q.v.*); their general character associates them with the legends of the "sons of Anak," who enter into Judean (perhaps originally Calebite) tradition elsewhere (Num. xiii. 22, 28), and who according to one group of traditions occupied all the hill-country from Hebron northwards (Josh. x. 21 *seqq.*, ix. 14).

Saul and David.—The accounts of David's conflicts with giant heroes and of the conquest of Jerusalem and its district belong to Judean traditions which have been almost superseded by other traditions of the rise of the Hebrew monarchy and by popular narratives of early relations between the Judean David and the (north) Israelite king and people. The emphasis (in 1 Sam.) upon the rejection of Saul, his enmity towards David, the latter's chivalry, and his friendship for Jonathan, partly account for the present literary intricacies. On quite general grounds, divine traditions of distinct origin (Calebite or Jerahmeelite; indigenous Judean; North Israelite or Benjamite) are to be expected in a work now in post-exilic form. Moreover, the late genealogy of Saul in 1 Chron. vii. 29 *seqq.*, ix. 35 *seqq.*, is evidence of a keen interest in the Saulidae in post-exilic times. David's history is handled independently of Saul in 1 Sam. xxv.; and the narrative, now editorially connected with the context (v. 1, see xxviii. 2, 3 and v. 44, see 2 Sam. iii. 15), gives a valuable picture of his life in the south of Palestine, which we may compare his relations with south Judean cities in xxx. 26-37. The chapter with the prophecy of Abigail may be of Calebite origin. His flight northwards to the Philistine king of Gath (xxvii.) is hardly connected with the preceding situations in xxiv. 17-22,

xxv., or xxvi. 21–25, or with his previous slaughter of Philistines at Keilah (xxiii. 1–15). His earlier successes over them are ignored in xxix. 5, although the couplet there quoted now finds its only explanation in xxvii. 7 after the death of Goliath and the defeat of the Philistines. These traditions of the relations between Judah and the Philistines (cf. xxvii. 5 seq.) are distinct from the popular stories of giants of Gath, and now form part of the joint history of David and Saul.

The independent narrative of Saul's fate represents one of the disastrous attacks which recur in earlier and later history of the north (xxviii–4, xix.). The geographical data are confused by the stories of David (see 1 Sam. xxviii. 4, xix. 1), and while the "Philistines" march north to Jereed to deliver their attack, David's presence is not discovered until Aphek is reached (xxix.). His journey is the opportunity for an Amalekite raid (xxx. cf. xxvii. 8 seq.), and a defeat of Amalek by David proves more successful than that which led to Saul's rejection (xv. 20 seq. 26–28). Similarly, Saul's disaster leaves Israel again in the hands of the "Philistines" (xxxi. 7, cf. xiii. 6 seq.), and it is for David to save the people of Israel out of their hands (2 Sam. iii. 18, cf. 1 Sam. ix. 16); so, also, David's wars (2 Sam. viii) bear a certain resemblance to those of Saul (1 Sam. xiv. 47). The sequel to the joint history has another version of Saul's death (2 Sam. i. 6–10, 13–16), and an Amalekite is the offender; contrast his death in i. 15 seq. with iv. 10 seq. The chapter explains the transference of the royal insignia from Israel to Judah. Here is quoted (from the "Book of Jasher") the old poetical lament over the death of the valiant friends Saul and Jonathan, describing their successful warlike career, the wealth they brought the people, and the vivid sense of national misfortune (i. 19–27). It is utilized for the history of David, to whom it is attributed.

In general, it appears that those narratives wherein the histories of Saul and David are combined—very much in favour of the latter—were originally distinct from those where (a) Saul's figure is more in accord with the old poem from the Book of Jasher, and (b) where David's victories over prehistoric giants and his warlike movements to Jerusalem pave the way for the foundation—from a particular Judaean standpoint—of his remarkably long dynasty, for the literary problem of 1 and 2 Samuel is that of the writing of the history of the early monarchy and how it came to be formed.

SAMUEL OF NEHARDEA, usually called **MAR SAMUEL** or **YARHINAI** (c. 165–c. 257), Babylonian Rabbi, was born in Nehardea in Babylonia and died there c. 257. He is associated with the fame of his great contemporary Rab ('Abba' Arika q.v.). Besides his mastery in the traditional Law, Samuel was famed for his scientific attainments. He was one of the first to compile a Calendar of the Jewish year, thus preparing the way for the fixation of the festivals by means of scientific calculations. But Samuel's fame rests on the service which he rendered in adapting the life of the Jews of the diaspora to the law of the land. "The law of the State is binding law," was the principle which Samuel enunciated. When the king of Persia, Shapur, captured Mazaca-Caesarea, the Cappadocian capital, Samuel refused to mourn for the 12,000 Jews who lost their lives in its defence.

See Graetz, *History of the Jews* (English translation), vol. ii, ch. xix. (I. A.)

SAN, BATTLES OF THE: see **DUNAJEC-SAN, BATTLES OF THE; VISTULA-SAN, BATTLES OF THE.**

SANĀ' (Arabic *Sanā'*), a town of Yemen, southwestern Arabia, situated in 15° 22' N. and 44° 10' E. It is placed in a broad depression, running locally nearly north and south, on the lofty uplitted western edge of the great Arabian land block. It is 7,500 ft. above sea level and is connected with its chief port,

Hodeida (q.v.), on the Red sea, by a road which crosses the Qarn al-Wal' pass (9,300 ft.), 25 mi. W. of the city, and then follows the plateau steps down to the coast. The population of Sana is estimated at 50,000.

Early traditions of ancient Sana connect it with the old kingdom of Himyar. Its early name was Azāl, possibly associated with Uzal of Gen. x. 27. A Syrian writer of the 6th century mentions a Himyarite nation of Auzalites. Its later name, signifying "fortified," is associated with the Abyssinian conquerors of Yemen. Sana was the capital of the Abyssinian, Abraha (A.D. 525), who built there the famous church (*al-qalis*) which was destroyed two centuries later by order of the caliph Mansur (Azaqi, p. 91). Its later history has been a record of desert raids interspersed with periods of prosperity. After the withdrawal of the Turks (1918), Sana became the capital of the Imam of Yemen proper.

The town consists of three parts: (1) the Medina, the old city, now the Arab quarter, on the east, containing the principal mosques. Here also, at its southeast corner, is the citadel al-Qasr. On the crest of Jabal Nukum (2,000 ft. above the valley) are the ruins of the old fort of al-Birash, and the Mutawakkil, formerly containing the palace of the imams, covering its western face; (2) the Bir 'Azab, west of the city, the residential area; and (3), on the extreme west, the Qā' al-Yahūd, or Jewish quarter. The city, with the Qasr and Mutawakkil, is surrounded by a lofty and thick wall. The Bir 'Azab and Qā' al-Yahūd are enclosed in a similar wall, but of more recent construction, connected with that of the city by the Mutawakkil, the whole forming a rough figure eight, some 2½ mi. long from east to west and ¾ mi. in breadth. The walls are pierced by eight gates. The city itself has narrow, paved streets, with massive flat-roofed houses of several stories. The Jamī Masjid, or principal mosque, with a model of the Ka'ba at Mecca in the centre, stands on the site of the Christian church built by Abraha (see above). Among the other mosques, of which there are 48 in all, that of Salah-al-Din is one of the finest. Ruins alone remain of the Qasr Ghumdan and other ancient buildings whose splendours were sung by the poets of the early days of Islam.

The neighbourhood of Sana suffers from a lack of water, but, in places where this is brought from the hill streams on the west, fields of barley and alfalfa (lucerne) and market gardens are seen, particularly at Raudha, a suburb 6 mi. N. of the town, and in the deep gorges of the Wadi Dhahr and Wadi Hadda, the terraced orchards of which are celebrated for their fine fruit trees. The water supply of the town is derived from numerous wells and from the Ghail Aswad, a small canal.

SANĀ'Ī, the common name of **ABULMAJID MAJDOD B. ADAM**, the earliest among the great Sūfic poets of Persia, was a native of Ghazni (in Afghanistan). He flourished in the reigns of the Ghaznevid sultans Ibrāhīm (1059–1099, 451–492 A.H.), his son Mas'ūd (1099–1114) and his grandson Bāhrām (1118–1152). He composed chiefly *qasidas* in honour of his sovereign Ibrāhīm and the great men of the realm, but the ridicule of a half-mad jester is said to have caused him to abandon the career of a court panegyrist and to devote his poetical abilities to higher subjects. For forty years he led a life of retirement and poverty, in which he wrote his great double-rhymed poem on ethics, which served as model to the masterpieces of Farid-uddin 'Attār and Jalāl ud-dīn Rūmī, the *Hadiqat ul-haqiqat*, or "Garden of Truth" (also called *Alkhitāb al-fakhrī*). Sanā'ī wrote, besides the *Hadiqat* and the *Tariq-i-haqiqat*, several other Sūfic mathnawīs of similar purport: for instance, the *Sair ul-ibādāt ilā ma'ād*, or "Man's Journey towards the Other World" (also called *Kunūz-ur-rumūz*, "The Treasures of Mysteries"); the *Ishq-nāma*, or "Book of Love"; the *Aql-nāma* or "Book of Intellect"; the *Kārnāma*, or "Record of Stirring Deeds," etc.; and an extensive *diwān* or collection of lyrical poetry. He died in 1150.

See Abdu'llatif al-'Abbāsī's commentary (completed 1632 and preserved in a somewhat abridged form in several copies of the India Office Library); on the poet's life and works, Ouseley, *Biogr. Notices*, 184–187; Rieu's and Flügel's *Catalogues*, etc.; E. G. Browne, *Literary History of Persia* (1906), ii. 317–322; H. Ethé in W. Geiger's *Grundriss der iranischen Philologie*, ii. 282–284.

SAN ANGELO, a city of southwest Texas, U.S., 217 mi. N.W. of San Antonio, on federal highway 87, at an altitude of 1,847 ft., county seat of Tom Green county. It is served by the Gulf, Colorado and Santa Fe and the Panhandle and Santa Fe railways.

Pop. (1950) 51,889; (1940) 25,802 by the federal census. It is an important wool and mohair market; has a large jobbing business and various manufacturing industries; and is the trade centre for a wide stock-raising and farming territory. Tom Green county has 200 mi. of spring-fed running streams and a large state and a large federal fish hatchery. San Angelo has an air force basic flying field. In 1915 the city adopted a commission-manager form of government.

Old Fort Concho, a post on the transcontinental mail-stage route, is still standing.

SAN ANTONIO, a city of Texas, U.S., and county seat of Bexar county; 80 mi. S.W. of Austin, on the San Antonio river at the mouth of the San Pedro. It is on federal highways 81, 87, 90, 181 and 281; has a municipal airport used by several air lines; and is served by the Missouri-Kansas-Texas, the Missouri Pacific and the Southern Pacific railways (with two direct lines to the deepwater port of Corpus Christi, 150 mi. S.E.) and by motor-bus lines in all directions. Pop. (1950) 406,811; (1940) 253,854 by the federal census.

San Antonio is surrounded by rich agricultural regions and there are still largely undeveloped, producing oil fields. It is the financial and commercial centre of a wide area; headquarters of the principal customs district on the Mexican border and has a foreign trade zone located at the municipal airport, the first such zone established inland. It is the seat of the largest military establishment of the United States government; one of the most picturesque and historically interesting of American cities; and a winter resort. The San Antonio, San Pedro and Acquia rivers together provide 30 mi. of winding waterways within the city limits, spanned by hundreds of bridges. The city consists of 69.4 sq. mi.

In the downtown section is the historic Alamo, the chapel of the Franciscan mission San Antonio de Valero (founded 1718), which since 1883 has been maintained by the state as a public monument and museum. Facing the Military plaza, where executions took place under Spanish and Mexican rule, is the former Governor's palace (1749), and south and west of the plaza lies the picturesque Mexican quarter.

The Veramendi palace, where Col. B. R. Milam was killed (Dec. 5, 1835) by a sharpshooter, is near by. Above and around the quaint old buildings rise the tall hotels and business structures of the modern city.

South of the city are four Franciscan missions: La Purísima Concepción de Acuña (founded in eastern Texas in 1716, and moved to San Antonio in 1731); San José de Aguayo (1720-31), one of the largest and most beautiful of the missions in America, with an exquisitely carved stone window; San Juan de Capistrano (1731); and San Francisco de la Espada (founded in eastern Texas in 1690 and moved to San Antonio in 1731). The city's drives are shaded by palms, live oaks and pecan trees. Its 56 public parks and plazas cover more than 2,000 ac. and provide facilities for polo, golf, rifle practice, swimming, tennis and other outdoor sports.

The water supply (purchased by the city from a private corporation in 1924 for \$7,000,000) comes from more than 30 artesian wells, with a daily capacity of more than 120,000,000 gal. In the southern suburbs are two artesian wells, with a daily flow of 800,000 gal. of hot sulphur water, used for the treatment of rheumatism and skin diseases.

Near one of these wells is the Southwestern State Hospital for the Insane (1892).

The establishment of the United States armed forces at San Antonio includes Fort Sam Houston on Government hill, headquarters of the 4th army; three aviation fields and two flying schools, one of which is Randolph field, "the West Point of the air"; Kelly Air Force base, Lackland Air Force base, Brooks Air Force base and Brooke Army Medical centre. The military pay-

roll expenditures amounted to more than \$130,000,000 annually at mid-20th century. The anniversary of the battle of San Jacinto (April 21) is celebrated regularly by a week-long fiesta; and in February each year the Texas open golf tourney and a polo tourney are held. San Antonio has 75 public and 52 private schools, including Our Lady of the Lake college (1896) conducted by the Sisters of Divine Providence; 265 churches; and a number of charitable institutions. It is the see of Protestant Episcopal and Roman Catholic bishops.

The city operates under a commission form of government, adopted in 1914. The assessed valuation of property for 1949 was \$415,749,350.

The area of the trade territory of San Antonio is greater than the combined area of several eastern states. The customs district of San Antonio has considerable commerce (largely exports) with Mexico. The city has about 720 wholesale houses, and its manufacturing establishments had an output in 1949 valued at \$73,000,000. The principal manufactures are iron and steel, textiles, cigars, leather goods, clothing and soap. The oil fields in the vicinity have developed rapidly since the first one at Somerset (18 mi. S.) was opened in 1919. Bank clearings were \$3,665,-359,463 in 1949.

San Antonio was important as the capital of Texas under Spanish and Mexican rule, and its history is closely bound up with that of the state (see TEXAS).

SAN ANTONIO DE LOS BAÑOS, a small town in Havana province, Cuba, about 23 mi. (by rail) S.W. of Havana. Pop. (1943) 16,512. San Antonio de los Baños is served by the western branch of the United Railways of Havana. It is on the banks of the Ariguano river, which drains a lake of the same name, and is itself one of the many "disappearing rivers" of the island; it becomes lost in a cave near San Antonio. The town has mineral springs and baths and is a summer resort. The tobacco of the Vuelta Abajo lands around the city is famous. The pueblo arose in the middle of the 18th century as a camp for convicts from Mexico. It became a villa in 1794.

Early in the 19th century refugees from Santo Domingo settled there and founded coffee estates that gave the place great prosperity for some years. Subsequently the cultivation of tobacco and development of the textile industry renewed its prosperity.

SANATRUQUES (*Sinatruques*, Pers. *Sanatrūh*), Parthian king. In the troublous times after the death of Mithradates II (c. 88 B.C.) he was made king by the Sacaraucae, a Mongolian tribe which had invaded Iran in 76 B.C. He was 80 years old and reigned 7 years; his successor was his son Phraortes III. (Lucian, *Macrob.* 15; Phelegon, fr. 12 ap. Phot. cod. 97; Appian, *Mithr.* 104; Dio Cass. xxxvi, 45).

SANAVIRONAN, a small group of tribes of South American Indians, supposed, on meagre evidence, to constitute an independent linguistic stock. The Sanavironas, from whom the stock is named, and their relatives the Comechingones, lived in the Sierra de Cordoba, in the province of that name in Argentina. Only brief references to them are made by the early writers, and they are now extinct. They were said to have worn long tunics and mantles of wool and to have had some copper ornaments. They were remarkable in that they lived in semisubterranean houses, each containing several families. They were agricultural and used irrigation.

SANABERREY.—E. Boman, *Antiquités de la Région Andine de la République Argentine*, etc. (Paris, 1908); P. Cabrera, *Cordoba del Tucumán prehispánica y post-histórica* (Cordoba, Sept.-Oct. 1931).

SAN BENITO, a city of Cameron county, Tex., U.S., in the rich valley of the lower Rio Grande, 20 mi. N.W. of Brownsville; on federal highways 83 and 281 and served by the Missouri Pacific railway lines. Pop. (1950) 13,264; (1940) 6,501 by the federal census. It is the trade centre of an irrigated region, which produces fruit, vegetables and cotton to the value of \$9,000,000 annually.

The city was founded in 1908, incorporated in 1910.

SAN BERNARDINO, a city of southern California, U.S., 60 mi. E. of Los Angeles, at the entrance to the Cajon pass from

the north and the San Geronimo pass from the east, 1,050 ft. above sea level; the county seat of San Bernardino county. It is on Federal highways 66 and 99, and is served by the Santa Fe, the Southern Pacific, the Union Pacific and by motor coach and truck lines in every direction. Pop. (1950) 63,058. The city is surrounded by the orange groves, vineyards, orchards and fields of the fertile San Bernardino valley, and has for background the San Bernardino mountain range, with Mt. San Bernardino (11,600 ft.) only 20 mi. E. It is a division terminal of the Santa Fe railroad, which maintains extensive repair shops there and employs altogether more than 2,500 persons in the city. Other leading industries are the manufacture of steel, iron and steel castings, aeroplanes, lumber and meat products, ice and refrigerators. Norton Air Force Base is there.

In 1810, on the feast day of San Bernardino of Siena, a party of missionaries, soldiers and Indians from the San Gabriel Mission, under the leadership of Father Dumetz, came into the San Bernardino valley to establish a station for travellers between the Mission and the Sierras to the north, and built a chapel on a site now within the southern boundary of the city. In 1851 a colony of Mormons (about 900) came from Salt Lake, laid out a city, and did much to develop the agricultural possibilities of the valley. The county was organized in 1853, with its seat at San Bernardino, which was incorporated as a town in 1854. It was chartered as a city in 1864 and again in 1905. The Southern Pacific in 1876, and the Santa Fe in 1885, connected it first with the ocean and then with the east, and by 1900 the population had grown to 6,150.

† **SAN BLAS**, a tribe of Indians, also known as the Cuna-Cuna or Tule, who live on the north coast of Panama between San Blas point and Port Obaldia. Although in contact with Europeans since the 16th century they have maintained racial purity and independence by vigorous opposition to foreign settlement. Their language is a Chibchan dialect, and their culture also shows South American origin. Reports of white Indians among this tribe have arisen from pronounced cases of hereditary albinism.

See H. W. Krieger, "Material culture of . . . South-eastern Panama" *U.S. National Museum, Bulletin 134* (1946).

SAN CARLOS, a municipality (with administrative centre and 17 *barrios* or districts) and port of the province of Negros Occidental, of the island of Negros, Philippine Islands. Pop. (1939), 69,090; 60 were white. San Carlos is a point of export for sugar, which is extensively produced in the surrounding region. The vernacular is a dialect of Bisayan. Of the inhabitants aged 6 to 19 inclusive, 13.5% attended school in 1939, and 22.2% of the population 10 years old and over was literate. The number of parcels of land declared for taxation in 1938 was 1,840.

SAN CARLOS, a municipality (with administrative centre and 51 *barrios* or districts) of the province of Pangasinan, Luzon, Philippine Islands, on the railway running from Manila to Dagupan. Pop. (1939) 47,334, of whom 23,093 were males and there were no whites. It is in the midst of a fertile agricultural region. The buri palm fibre is used for making the native helmet (*salacot*). The town has brickyards, pottery factories and trade of importance. The Pangasinan language is the vernacular. Of the inhabitants aged 6 to 19 inclusive, 33.5% attended school in 1939, while 50.1% of the population 10 years old and over was literate. (C. S. L.)

† **SANCERRE**, a town of central France, in the department of Cher, 34 mi. N.E. of Bourges by rail. Pop. (1946) 1,803. Sancerre, which gives its name to the small wine-growing district of Sancerre, stands on an isolated vine-clad hill (1,000 ft.) about 1 mi. from the left bank of the Loire. A cylindrical keep of the 15th century is the only relic of an ancient stronghold of the counts of Sancerre. From 1037 to 1152 the title of count of Sancerre was held by the counts of Champagne; from the latter year till 1640 it had its own counts, descended from Theobald IV of Champagne.*

SANCHI, a small village in Central India, famous as the site of what are almost certainly the oldest buildings in India now standing. They are Buddhist (Pali, *stūpa*; Sanskrit, *stūpa*), that is, memorial mounds, standing on the level top of a small sandstone hill about 300 ft. high on the left bank of the river Betwa. The number of *topes* on this and the adjoining hills is

considerable. On the Sanchi hill itself are only ten, but one of these is by far the most important and imposing of all. It is a solid dome of stone, about 103 ft. in diameter, and now about 42 ft. high. It must formerly have been much higher, the top having

FROM MARSHALL, "THE MONUMENTS OF SANCHI" (INDIAN STATE RAILWAYS)

A STŪPA AT SANCHI, INDIA. AN EXAMPLE OF BUDDHIST ARCHITECTURE, SHOWING THE SACRED UMBRELLA ON THE DOME

originally formed a terrace, 34 ft. in diameter, on which stood lofty columns. Round the base is a flagged pathway surrounded by a stone railing and entered at the four points of the compass by gateways some 18 ft. high. Both gateways and railing are elaborately covered with bas-reliefs and inscriptions. The latter give the names of the donors of particular portions of the architectural ornamentation, and most of them are written in the

FROM MARSHALL, "THE MONUMENTS OF SANCHI" (INDIAN STATE RAILWAYS)

GUPTA TEMPLE, SANCHI, INDIA: BUILT ABOUT A.D. 300-500

This Buddhist shrine is an example of Indian "Renaissance" architecture characters used before and after the time of Asoka in the middle of the 3rd century B.C. The monuments are Buddhist, the bas-reliefs illustrate passages in the Buddhist writings, and the inscriptions make use of Buddhist technical terms.

SANCHUNIATHON, an ancient Phœnician sage, who belongs more to legend than to history. He is said to have flourished "even before the Trojan times." Philo Herennius of Byblus claimed to have translated his writings from the Phœnician originals. According to Philo, Sanchuniathon derived the sacred lore from the mystic inscriptions on the Ἀμμοῦνείας (probably *hammūnīm*, "sun pillars," cf. Is. xxvii. 9, etc.) which stood in the Phœnician temples. That any writings of Sanchuniathon ever existed it is impossible to say. Philo conjured with a venerable name to gain credit for his narrative.

See Eusebius, *Præp. Ev.* i. 9 (Müller, *Fragm. hist. Græc.* iii. pp. 563 seq.).

SAN CRISTÓBAL (formerly called SAN CRISTÓBAL DE LOS LLANOS, CIUDAD DE LAS CASAS and CIUDAD REAL), a town of Mexico, in the State of Chiapas, on a level tableland about 6,700 ft. above sea level and 48 mi. E.N.E. of Tuxtla Gutiérrez. Population 11,768. The surrounding country is fertile and healthful and is populated chiefly by Indians. San Cristóbal was founded

in 1528 on the site of an Indian village, and afterwards was famous as the residence of Las Casas, bishop of Chiapas. It was the capital of Chiapas until near the end of the 19th century.

SANCROFT, WILLIAM (1616-1693), archbishop of Canterbury, was born at Fressingfield, Suffolk, on Jan. 30, 1616, and entered Emmanuel college, Cambridge, in July 1634. He became fellow in 1642, but was ejected in 1649 for refusing to accept the "Engagement." He remained abroad till the Restoration, after which he was chosen one of the university preachers, and in 1663 was nominated to the deanery of York. In 1664 he was installed dean of St. Paul's, to the rebuilding of which, after the fire of 1666, he gave £1,400. He also rebuilt the deanery, and improved its revenue. In 1668 he was admitted archdeacon of Canterbury upon the king's presentation, but he resigned the post in 1670. In 1677, being now prolocutor of the Convocation, he was unexpectedly advanced to the archbishopric of Canterbury. He attended Charles II. upon his deathbed. He wrote with his own hand the petition presented in 1687 against the reading of the Declaration of Indulgence, which was signed by himself and six of his suffragans. For this they were all committed to the Tower, but were acquitted. Upon the withdrawal of James II. he concurred with the Lords in a declaration to the prince of Orange for a free parliament, and due indulgence to the Protestant dissenters. But, when that prince and his consort were declared king and queen, he refused to take the oath to them, and was accordingly suspended and deprived. From Aug. 5, 1697, till his death on Nov. 24, 1693, he retired to his native place.

He published *Five prædestinatus* (1657), *Modest Politics* (1659), and *Three Sermons* (1664). *Nineteen Familiar Letters to Mr. North* (afterwards Sir Henry North) appeared in 1757. See G. O'Day, *Life of Sancroft* (2 vols., 1821); A. Stickland, *Lives of the Seven Bishops* (1866).

SANCTIONS AND GUARANTEES in international law correspond to the means adopted in national law to enforce legal decisions. During the years which followed the World War it became increasingly apparent that the most important and the most enduring of European political problems was that known as the problem of "security" (*q.v.*).

As a deduction from the new conception of security the word "sanctions" began to replace in the language of diplomacy the word "alliance." Security was now to be sought not in limited agreements between small groups of states to fight together whenever any of them should, for whatever cause, be involved in international conflict, but in common agreements among a greater or smaller number of states to act together when—and only when—the established rights of one of them had been violated by force. Security, therefore, must be found in "sanctions" against the wrongdoer. For some time indeed, the word "guarantees" was used instead of, or on an equal footing with, the word "sanctions," but gradually the use of the word "guarantee" disappeared and the word "sanctions" took its place.

The discussions which occurred after the war soon showed that there were two ways by which Governments believed the result in view could be achieved; first, by creating a general system embracing all the States throughout the world; and second, by creating limited arrangements applying to a certain number of States situated in geographical proximity to each other and bound together by common bonds of material interest.

Article 16 of the Covenant.—It was by the general method that the first step was made towards the organization of a true system of international sanctions. This first step consisted in the adoption of the Covenant of the League of Nations, Article 16 of which imposes obligations upon every member of the League to adopt common coercive measures, including especially a financial and economic boycott, against states which, in violation of the undertakings of the Covenant, resort to war. But unfortunately Article 16 contained ambiguities which seriously diminished the confidence of Governments in its efficiency. It was not, therefore, generally regarded as by itself creating a sufficiently sound system of sanctions to solve the problem of security. For that reason the Temporary Mixed Commission set up by the Council of the League of Nations prepared in 1923 the draft treaty of mutual guarantee (or assistance), on the basis of which was prepared the

Geneva Protocol of 1924. Both instruments were founded on the clear acceptance by all signatory states of obligations to co-operate by military or other necessary means against an aggressor.

Regional Guarantees.—The second method received its first application in the Anglo-American-French guarantee treaties drawn up in 1919 at Paris. These treaties failed to secure ratification, and were replaced by the Franco-Belgian, Franco-Polish and other similar treaties of alliance. The Little Entente was another example of the same method. But it was recognized even by the authors of these treaties that although they were subject to the Covenant of the League they were, nevertheless, liable to degenerate into alliances of the old sort, and that therefore they would be dangerous unless they were effectively controlled by the League. The Temporary Mixed Commission above mentioned in its draft treaty of mutual assistance for the first time combined the two methods into one coherent system. The Protocol similarly recognized the utility of special treaties in support of general sanctions, but on condition that such special treaties could only be applied after it had been recognized by some impartial arbitrator that aggression had taken place. After the failure of the combination method of the Geneva Protocol, a return was made in the Locarno Agreements to the method of partial treaties. These agreements, however, in no way resembled an old-time alliance; the concern of their authors was plainly to create one more stable element in a new system of general international sanctions against aggression. (See *LEAGUE OF NATIONS* and bibliography thereto and *INTERNATIONAL LAW, PUBLIC*.) (P. J. N.-B.)

On Oct. 9, 1935, the League Assembly, with Austria and Hungary dissenting, declared that Italy had resorted to war contrary to Article XII of the Covenant. Fifty member states pledged to apply collective sanctions against Italy and, in due course, these countries adopted an arms embargo. A financial embargo was added by 48 states, a boycott of imports from Italy by 47 states, a ban on certain exports to Italy by 47 states, and a pact of mutual support by 34 states. The U.S., acting independently, applied an embargo to both belligerents. League sanctions did not include oil and, as limited, they failed to arrest Italy's invasion of Ethiopia. In June 1936, sanctions were abandoned and an endeavour by France to apply sanctions to Germany when it marched troops into the Rhineland did not materialize.

BIBLIOGRAPHY.—*International Sanctions; A Report by a Group of Members of the Royal Institute of International Affairs* (1938); *Royal Institute of International Affairs, Sanctions* (London, 1935); P. S. Wild, *Sanctions and Treaty Enforcement* (1934).

SANCTI SPIRITUS, an old Cuban city in Las Villas province, is on a sandy plain in an angle of the Yaya river, which winds through the city. Pop. (1943), 28,262. It is connected by railway with Zaza del Medio, on the main railway line of the island, and with its port, Tunas de Zaza, 30 mi. (by rail) to the south. Sancti Spiritus was one of the seven cities founded by Diego Velázquez. Its settlement was ordered in 1514 and accomplished in 1516. The present city is about two miles from the original site (Pueblo Viejo). In 1518, as a result of the war of the Comunidades of Castile, a mimic war broke out in Sancti Spiritus among its two score villagers. The place was sacked by French and English corsairs in 1719. Sancti Spiritus grew rapidly in the second quarter of the 20th century in consequence of the expansion of the hide and dairy industries. (C. E. Mc.)

SANCTORIUS (the Latin form of SANTORIO SANTORIO) (1561-1636), professor at Padua and colleague of Galileo, owes his medical fame to his demonstration that loss by "insensible perspiration" exceeds all other bodily excretions combined. Being inspired by the devices of Galileo, he invented a thermometer and an apparatus for measuring the pulse, and also a trocar and a cannula. His chief works are the *De medicina Statica* (1614) and a commentary on the *Canon of Avicenna*.

SANCTUARY, a sacred or consecrated place, particularly one affording refuge, protection or right of asylum. The word is also applied to the privilege itself, the right of safe refuge, and even to places of refuge for animals, such as a "bird sanctuary." In Egyptian, Greek or Roman temples it was applied to the *cella* in which stood the statue of the god, and the Latin word for

altar, *ara*, was used for protection as well. In Roman Catholic usage sanctuary is sometimes applied to the whole church, as a consecrated building, but is generally limited to the choir. The idea that such places afforded refuge to criminals or refugees is founded upon the primitive and universal belief in the contagion of holiness. Hence it was sacrilege to remove the man who had gained the holy precincts; he was henceforth invested with a part of the sacredness of the place, and was inviolable so long as he remained there. The story of the death of Demosthenes (q.v.) is a famous instance. Not all Greek and Roman temples, however, had the right of sanctuary. But where it existed, the action of the Roman civil law was suspended, and in Imperial times the statues and pictures of the emperors were a protection against pursuit. Roman law did not recognize the use of Christian sanctuaries until toward the end of the 4th century, but the growing recognition of the office of bishop as intercessor helped much to develop it. In 399 the right of Christian sanctuary was finally and definitely recognized, and in 419 the privilege was extended in the western empire to 50 paces from the church door. In 431, by an edict of Theodosius and Valentinian it was extended to include the church court-yard and whatever stood therein, in order to provide some other place than the church for the fugitives to eat and sleep. Justinian in a Novel of the year 535 limited the privilege to those not guilty of the grosser crimes. In the new Germanic kingdoms, while violent molestation of the right of sanctuary was forbidden, the fugitive was given up after an oath had been taken not to put him to death. This legislation was copied by the Church at the council of Orleans in 511; the penalty of penance was added, and the whole decree backed by the threat of excommunication. Thus it passed into Gratian's Decretum, but historians like Gregory of Tours have many tales to tell showing how frequently it was violated.

The earliest extant mention of the right of sanctuary in England is contained in the code of laws issued by the Anglo-Saxon king Aethelberht in A.D. 602. By these he who infringed the church's privilege was to pay twice the fine attaching to an ordinary breach of the peace. Crosses inscribed with the word "Sanctuarium" were common on the highways, serving probably as sign-posts to guide fugitives to neighbouring sanctuaries. The canon law allowed the protection of sanctuary to those guilty of crimes of violence for a limited time only, in order that some compensation (*wergild*) should be made, or to check blood-vengeance. The procedure, upon seeking sanctuary, was regulated in the minutest detail. The fugitive had to make confession of his crime to one of the clergy, to surrender his arms, swear to observe the rules and regulations of the religious houses, pay an admission fee, give, under oath, fullest details of his crime (the instrument used, the name of the victim, etc.), and at Durham he had to toll a special bell as a formal signal that he prayed sanctuary, and put on a gown of black cloth on the left shoulder of which was embroidered a St. Cuthbert's cross. The protection afforded by a sanctuary at common law was this: a person accused of felony might fly for safeguard of his life to sanctuary, and there, within 40 days, go, clothed in sack-cloth, before the coroner, confess the felony and take an oath of *abjuration of the realm*, whereby he undertook to quit the kingdom, and not return without the king's leave. Upon confession he was, *ipso facto*, convicted of the felony, suffered attainder of blood and forfeited all his goods, but had time allowed him to fulfil his oath. The abjurer started forth on his journey, armed only with a wooden cross, bareheaded and clothed in a long white robe, which made him conspicuous among mediaeval wayfarers. He had to keep to the king's highway, was not allowed to remain more than two nights in any one place, and must make his way to the coast quickly. The time allowed for his journey was not long. In Edward III.'s reign only nine days were given an abjurer to walk from Yorkshire to Dover.

Under the Norman kings there appear to have been two kinds of sanctuary: one general, which belonged to every church, and another *peculiar*, which had its force in a grant by charter from the king. This latter type could not be claimed by prescription, and had to be supported by usage within legal memory. General sanctuaries protected only those guilty of felonies, while those

by special grant gave immunity even to those accused of high or petty treason, not for a time only but apparently for life. Of chartered sanctuaries there were at least 22: Abingdon, Armathwaite, Beaulieu, Battle Abbey, Beverley, Colchester, Derby, Durham, Dover, Hexham, Lancaster, St. Mary le Bow (London), St. Martin's le Grand (London), Merton Priory, Northampton, Norwich, Ripon, Ramsey, Wells, Westminster, Winchester, York. At the Reformation general and peculiar sanctuaries both suffered drastic curtailment of their privileges, but the great chartered ones suffered most. By the reforming act of 1540 Henry VIII. established seven cities as peculiar sanctuaries. These were Wells, Westminster, Northampton, Manchester (afterwards transferred to Chester), York, Derby and Launceston. By an act of James I. (1623), sanctuary, as far as crime was concerned, was abolished throughout the kingdom. The privilege lingered on for civil processes in certain districts which had been the site of former sanctuaries and which became the haunts of criminals who there resisted arrest—a notable example being that known as Whitefriars between Fleet Street and the Thames, east of the Temple. This locality was nicknamed *Alsatia* (the name first occurs in Shadwell's plays in Charles II.'s reign), and there criminals were able to a large extent to defy the law, arrests only being possible under writs of the lord chief justice. So flagrant became the abuses that in 1697 the "Escape from Prison Act," finally abolished all such alleged privileges. A further amending act of 1723 completed the work of destruction. The privileged places named in the two acts were the Minorities, Salisbury Court, Whitefriars, Fulwood's Rents, Mitre Court, Baldwin's Gardens, The Savoy, The Clink, Deadman's Place, Montague Close, The Mint and Stepney.

In Scotland the most famous sanctuaries were those attaching to the Church of Wedale, now Stow, near Galashiels, and that of Lesmahagow, Lanark. All religious sanctuaries were abolished in the northern kingdom at the Reformation. But the debtor found sanctuary from "diligence" in Holyrood House and its precincts until late in the 17th century. This sanctuary did not protect criminals, or even all debtors, *e.g.*, not crown debtors or fraudulent bankrupts; and it was possible to execute a *medietatis fugae* warrant within the sanctuary. The abolition of imprisonment for debt in 1881 practically abolished this privilege of sanctuary.

A presumptive right of sanctuary attached to the royal palaces, and arrests could not be made there. In Anglo-Saxon times the king's peace extended to the palace and 3,000 paces around it: it extended to the king himself beyond the precincts. At the present day members of parliament cannot be served with writs or arrested within the precincts of the houses of parliament, which extend to the railings of Palace yard. During the Irish agitation of the 'eighties Parnell and others of the Irish members avoided arrest for some little while by living in the house and never passing outside the gates of the yard. The houses of ambassadors were in the past quasi-sanctuaries. This was a natural corollary of their diplomatic immunities (*see* DIPLOMACY).

In Europe, generally, the right of sanctuary survived under restrictions down to the end of the 18th century. In Germany the more serious crimes of violence were always excepted. Highwaymen, robbers, traitors and habitual criminals could not claim church protection. In 1418 sanctuary was further regulated by a bull of Martin V. and in 1504 by another of Julius II. In a modified form the German *Asylrecht* lasted to modern times, not being finally abolished till about 1780. In France the *droit d'asile* existed throughout the middle ages, but was much limited by an edict of Francis I. in 1539. It was entirely abolished at the Revolution. **BIBLIOGRAPHY.**—Samuel Pegge, "Sketch of History of Asylum or Sanctuary," Soc. of Antiq. of London, *Archæologia* viii. 1-44 (1787); Henri Wallon, *Droit d'asile* (1837); Aug. von Bulmerincq, *Das Asylrecht* (Dorpat, 1853); A. SAND, GEORGE (1824-1876), the pseudonym of Madame Amandine Lucile Aurore Dudevant, née Dupin.

George Sand was the daughter of Maurice Dupin, a retired lieutenant, and of Sophie Delaborde, the daughter of a Paris bird-fancier. Their ill-assorted marriage took place only a month

before the birth of the child (July 1, 1804; at Paris). Her paternal grandfather was M. Dupin de Francueil, a farmer-general of the revenue, who married the widow of Count Horn, a natural son of Louis XV., she in her turn being the natural daughter of Maurice de Saxe, the most famous of the many illegitimate children of Augustus the Strong, by Marie Rinteau ("Mlle. de Verrières"). George Sand, who was a firm believer in the doctrine of heredity, devotes a whole volume of her autobiography (*Histoire de ma vie, 1857 seq.*) to the elaboration of this strange pedigree. She boasts of the royal blood which ran through her veins, but she is no less frank in declaring that she is *vaine et très vaine*, a daughter of the people who shares by birth their instincts and sympathies. Her birth itself was romantic. Her father died when she was a small child, and her mother, after a struggle, abandoned Aurore to the care of her grandmother, Madame Dupin de Francueil, who was a survival of the ancien régime.

Her childhood was spent at Nohant near La Châtre in Berry, Madame Dupin's country house. Here she imbibed the passionate love of country scenes and country life which neither absence, politics nor dissipation could uproot; here she learnt to understand the ways and thoughts of the peasants, and laid up that rich store of scenes and characters which a marvellously retentive memory enabled her to draw upon at will. Next to the grandmother, the most important person in the household at Nohant was Deschâtres. He was an ex-abbé who had shown his devotion to his mistress when her life was threatened during the Revolution, and henceforward was installed at Nohant as factotum. He was maire of the village, tutor to Aurore's half-brother, and undertook the education of the girl. At odd hours of lessons she picked up a smattering of Latin, music and natural science, but most days were holidays and spent in country rambles and games with village children.

From the free out-door life at Nohant she passed at thirteen to the convent of the English Augustinians at Paris, where for the first two years she never went outside the walls. Nothing better shows the plasticity of her character than the ease with which she adapted herself to this sudden change. One day in the convent chapel she underwent conversion in the mystical sense. There is no doubt of the sincerity of her narrative, or even the permanence of her religious feelings under all her many phases of faith and aberrations of conduct.

Again in 1820 Aurore exchanged the restraint of a convent for freedom, being recalled to Nohant by Mme. de Francueil, who had no intention of letting her granddaughter grow up a *dévôte*. She rode across country with her brother, she went out shooting with Deschâtres, she sat by the cottage doors on the long summer evenings and heard the flax-dressers tell their tales of witches and warlocks. She was a considerable linguist and knew English, Italian and some Latin, though she never tackled Greek. She read widely though unsystematically, studying philosophy in Aristotle, Leibnitz, Locke and Condillac, and feeding her imagination with *René* and *Childe Harold*. Her confessor lent her the *Génie du Christianisme*, and to this book she ascribes the first change in her religious views.

On her grandmother's death she married on Dec. 11, 1822, Casimir Dudevant, natural son of Baron Dudevant. He seems then to have been neither better nor worse than the Berrichon squires around him, and the first years of her married life, during which her son Maurice and her daughter Solange were born, except for lovers' quarrels, were passed in peace and quietness, though signs were not wanting of the coming storm. Among these must be mentioned her friendship with Aurélien de Sèze, advocate-general at Bourdeau, which her husband resented. So long as the conventions were preserved she endured her life, but when her husband took to drinking and made love to the maids under her eyes she resolved to break a yoke that had grown intolerable. She then discovered a paper docketed "Not to be opened till after my death," which was nothing but a railing accusation against herself. She at once quitted Nohant, taking with her Solange, and in 1831 an amicable separation was agreed upon, by which her whole estate was surrendered to the husband with the stipulation that she should receive, in return for this

relinquishment on her part, an allowance of £120 a year.

Aurore Dudevant had regained her liberty, and made no secret of her intention to use it to the full. She endeavoured unsuccessfully to eke out her irregularly paid allowance by various expedients, and lived in a garret. She found a friend in Delatouche, the editor of *Figaro*. He was a native of Berry, like herself, a stern but kindly taskmaster who taught her the trade of journalism. On the staff of *Figaro* was another compatriot, Jules Sandeau, a clever and attractive young lawyer. Articles written in common soon led to a complete literary partnership, and in 1831 there appeared in the *Revue de Paris* a joint novel entitled *Prima Donna* and signed Jules Sand. Shortly after this was published in book form with the same signature a second novel, *Rose et Blanche*. The sequel to this literary alliance is best recounted in George Sand's own words: "I resisted him for three months but then yielded; I lived in my own apartment in an unconventional style." Her first independent novel, *Indiana* (1832), was written at the instigation of Delatouche, and the world-famous pseudonym George (originally Georges) Sand was adopted as a compromise between herself and her partner. The one wished to throw *Indiana* into the common stock, the other refused to lend his name, or even part of his name, to a work in which he had had no share. The novel was received with instant acclamation. *Indiana* is a direct transcript of the author's personal experiences (the disagreeable husband is M. Dudevant to the life), and an exposition of her theory of sexual relations which is founded thereon. To many critics it seemed that she had said her whole say and that nothing but replicas could follow. *Valentine*, which was published in the same year, indicated that it was but the first chapter in a life of endless adventures, and that the imagination which turned the crude facts into poetry, and the fancy which played about them like a rainbow, were inexhaustible.

Her liaison with Jules Sandeau, which lasted more than a year, was abruptly terminated by the discovery in their apartment of an unexpected return from Nohant of *une blanchisseuse quelconque*. For a short while she was broken hearted:—"My heart is a cemetery!" she wrote to Sainte-Beuve. "A necropolis" was the comment of her discarded lover when years later the remark was repeated to him.

Her third novel, *Lélia* (1833), is in the same vein, a stronger and more outspoken diatribe against society and the marriage law. *Lélia* is a female Manfred, and Dumas had some reason to complain that George Sand was giving them "du lord Byron au kilo." But a new chapter in her life was now to open. In her despair she turned for comfort and counsel to Sainte-Beuve, now constituted her regular father confessor. He recommended new friendships, but she found Dumas "trop commis-voyageur," Jouffroy too serenely virtuous and Musset "trop dandy." Mérimée was tried for a week, but the cool cynic and the perverted apostle of women's rights proved mutually repulsive. Alfred de Musset was introduced, and the two natures leapt together.

The Musset Episode.—Towards the end of 1833 George Sand, after winning the reluctant consent of Musset's mother, set out in the poet's company for Italy, and in January 1834 the pair reached Venice, staying first at the Hôtel Danieli and then in lodgings. At first it was a veritable honeymoon; conversation never flagged and either found in the other his soul's complement. But there is a limit to love-making, and George Sand, always practical, set to work to provide the means of living. Musset, though he depended on her exertions, was first bored and then irritated at the sight of this *terrible vache à écrire*, whose pen was going for eight hours a day, and sought diversion in the cafés and other less reputable resorts of pleasure. The consequence was a nervous illness, through which George Sand nursed him with tenderness and care. But she made love at the same time to a young Venetian doctor whom she had called in, by name Pagello. The two found their way eventually to Paris, leaving Musset in Italy, deeply wounded in his affections, but, to do him justice, taking all the blame for the rupture on himself. George Sand soon tired of her new love, and even before she had given him his *congé* was dying to be on again with the old. She cut off her hair and sent it to Musset as a token of penitence; but Musset, though he still

flirted with her, never quite forgave her infidelity and refused to admit her to his deathbed. Among the mass of *romans à clef* and pamphlets which the adventure produced, two only have any literary importance, Musset's *Confessions d'un enfant du siècle* and George Sand's *Elle et lui*. In the former woman appears as the serpent whose trail is over all; in the latter, written twenty-five years after the event, she is the guardian angel abused and maltreated by men. *Lui et elle*, the rejoinder of the poet's brother Paul de Musset, was even more a travesty of the facts with no redeeming graces of style.

It remains to trace the influence, direct or indirect, of the poet on the novelist. Jacques was the first outcome of the journey to Italy, and in precision and splendour of style it marks a distinct progress. In *Les Lettres d'un voyageur*, which ran in the *Revue des deux mondes* between 1834 and 1836, we have not only impressions of travel, but the direct impressions of men and things not distorted by the exigencies of a novel. The Everard of the *Lettres* introduces us to a new and for the time a dominant influence on the life and writings. Michel de Bourges was the counsel whose eloquent pleadings brought the suit for a judicial separation to a successful issue in 1836. Unlike her former lovers, he was a man of masterful will, a philosopher who carried her intellect by storm before he laid siege to her heart. He preached republicanism to her by the hour, and even locked her up in her bedroom to reflect on his sermons. She was but half converted, and fled before long from a republic in which art and poetry had no place. Other celebrities who figure in the *Lettres* under a transparent disguise are Liszt and Mme. d'Agoult (known to literature as Daniel Stern), whom she met in Switzerland and entertained for some months at Nohant. Liszt, in after years when they had drifted apart, wrote of her: "George Sand catches her butterfly and tames it in her cage by feeding it on flowers and nectar—this is the love period. Then she sticks her pin into it when it struggles—that is the conge and it always comes from her. Afterwards she vivisects it, stuffs it, and adds it to her collection of heroes for novels." There is some truth in the satire, but it wholly misrepresents her rupture with Chopin.

Liaison with Chopin.—It was doubtless a revulsion of feeling against the doctrinaires, especially the strong influence of Lamennais and P. Leroux, and in particular against the puritanic reign of Michel that made her turn to Chopin. She found the *maestro* towards the end of 1837 dispirited by a temporary eclipse of popularity and in the first stage of his fatal malady, and carried him off to winter with her in the south. How she roughed it on an island unknown to tourists is told in *Un hiver à Majorque* (1842), a book of travel that may take rank with Heine's *Reisebilder*. In nearly all George Sand's loves there was a strong strain of motherly feeling. Chopin was first petted by her like a spoilt darling and then nursed for years like a sick child. In the end Chopin remonstrated with her for refusing to receive her ne'er do well son-in-law, Clésinger, at Nohant, and when she resented his interference, he left her in anger.

Meanwhile, during this, her second period, George Sand allowed herself to be the mouthpiece of others—"un écho qui embellissait la voix," as Delatouche expressed it. *Spérion* (1838) and *Les Sept cordes de la lyre* (1840) are mystic echoes of Lamennais. *Le Compagnon du tour de France* (1841), *Les Maîtres mosaïstes* and *Le Menuier d'Angibault* (1845), *Le Pêché de M. Antoine* (1847) are all socialistic novels. George Sand had adopted her socialism from Pierre Leroux, and many works of this period are inspired by his humanitarianism. *Consuelo* (1842-1844) and its sequel *La Comtesse de Rudolstadt* (1843-1845) are fantasies à la Chopin, though the stage on which they are played is the Venice of Musset. Chopin is the Prince Karol of *Lucresia Floriani* (1847), a self-portraiture unabashed as the *Tagebuch einer Verlorenen* and innocent as *Paul et Virginie*.

George Sand wrote with the rapidity of Walter Scott and the regularity of Anthony Trollope. For years her custom was to retire to her desk at 10 P.M. and not to rise from it till 5 A.M. She wrote, à la diable, starting with some central thesis to set forth or some problem to investigate, but with no predetermined plot or plan of action. Round this nucleus her characters (too

often mere puppets) grouped themselves, and the story gradually crystallized. This unmethodical method produces in her longer and more ambitious novels, in *Consuelo* for instance and its continuation, a tangled wilderness, the clue to which is lost or forgotten; but in her novelettes, when there is no change of scenery and the characters are few and simple, it results in the perfection of artistic writing, "an art that nature makes."

The Pastoral Novels.—From novels of revolt and tendency novels George Sand turned at last to simple stories of rustic life, the genuine pastoral. It is here that she shows her true originality and by these she will chiefly live. George Sand by her birth and bringing-up was half a peasant herself, in M. Fauguet's phrase, "un paysan qui savait parler." She had got to know the heart of the peasant—his superstitions, his suspiciousness and low cunning, no less than his shrewdness, his sturdy independence and his strong domestic attachments. *Jeanne* (1844) begins the series which has been happily called the Bucolics of France. To paint a Joan of Arc who lives and dies inglorious is the theme she sets herself, and through most of the novel it is perfectly executed. The last chapters when Jeanne appears as the Velida of Mont Barbot and the Grande Pastourelle are a falling off and a survival of the romanticism of her second manner. *La Mare au diable* (1846) is a clear-cut gem, perfect as a work of Greek art. *François le champi* and *La Petite Fadette* are of no less exquisite workmanship. *Les Maîtres sonneurs* (1853) brings the series of village novels to a close, but as closely akin to them must be mentioned the *Contes d'une grande-mère*, delightful fairy tales of the Talking Oak, Wings of Courage and Queen Coax, told to her grandchildren in the last years of her life.

The revolution of 1848 arrested for a while her novelistic activities. She composed manifestos for her friends, addressed letters to the people, and even started a newspaper. But her political ardour was short-lived; she cared little about forms of government, and when the days of June dashed to the ground her hopes of social regeneration, she returned to her quiet country ways and her true vocation as an interpreter of nature, a spiritualizer of the commonest sights of earth and the homeliest household affections. In 1849 she writes from Berry to a political friend: "You thought that I was drinking blood from the skulls of aristocrats. No, I am studying Virgil and learning Latin!" In her latest works she went back to her earlier themes of romantic and unchartered love, but the scene is shifted from Berry, which she felt she had exhausted, to other provinces of France, and instead of passionate manifestos we have a gallery of *genre pictures* treated in the spirit of *François le champi*. "Vous faites," she said to her friend Honoré de Balzac, "la comédie humaine; et moi, c'est l'épique humaine que j'ai voulu faire."

George Sand was as fond of acting as Goethe, and like him began with a puppet stage, succeeded by amateur theatricals, the chief entertainment provided for her guests at Nohant. Undaunted by many failures, she dramatized several of her novels with moderate success—*François le champi*, played at the Odéon in 1849, and *Les Beaux Messieurs de Bois-Doré* (1862) were the best; *Claudine*, produced in 1851, is a charming pastoral play, and *Le Marquis de Villemor* (1864) (in which she was helped by Dumas fils) was a genuine triumph. Her statue by Clésinger was placed in the foyer of the Théâtre Français in 1877.

George Sand died at Nohant on the 8th of June 1876. To a youth and womanhood of storm and stress had succeeded an old age of serene activity and then of calm decay. Her nights were spent in writing, which seemed in her case a relaxation from the real business of the day, playing with her grandchildren, gardening, conversing with her visitors—it might be Balzac or Dumas, or Octave Feuillet or Matthew Arnold—or writing long letters to Sainte-Beuve and Flaubert. "Calm, toujours plus de calme," was her last prayer, and her dying words, "Ne détruisez pas la verdure."

BIBLIOGRAPHY.—The collected edition of George Sand's works was published in Paris (1862-83) in 96 volumes, with supplement 109 volumes; the *Histoire de ma vie* appeared in 20 volumes in 1854-55. The *Étude bibliographique sur les œuvres de George Sand* by the vicomte de Spoelberch de Lovenjoul (Brussels, 1868) gives the most complete bibliography. Of Vladimir Karénin's (pseudonym of

Mme. Komarova) *George Sand*, the most complete life, the first two volumes (1899-1901) carry the life down to 1839. There is much new material in *George Sand et sa fille*, by S. Rocheblave (1905), *Correspondance de G. Sand et d'Alfred de Musset* (Brussels, 1904), *Correspondance entre George Sand et Gustave Flaubert* (1904), and *Lettres à Alfred de Musset et à Sainte-Beuve* (1897). E. M. Carls' *George Sand* (1887) is rather a critique than a life. See studies by Sainte-Beuve in the *Causseries de lundi* and in *Portraits contemporains*; Jules Lemaitre in *Les Contemporains*, vol. iv.; E. Faguet, *XIX^e Siècle*; F. W. H. Myers, *Essays Ancient and Modern* (1883); Henry James in *North American Review* (April 1902); Matthew Arnold, *Mixed Essays* (1897). See also René Doumic's *George Sand* (1909), which has been translated into English by Alys Hailand as *George Sand: Some Aspects of her Life and Writings* (1910); C. Maurras, *Les Amants de Venise*; *George Sand et Musset* (1916); L. Vincent, *George Sand et le Berry* (2 vols. 1919); E. A. A. L. Sillière, *George Sand* (1920); E. W. Schermerhorn, *The Seven Sisters of the Lyre. The Life of George Sand (1804-26)* (1928); and Eng. trans., by M. J. Howe, of her *Journal Intime* as *The Intimate Journal of George Sand* (1929).

SAND. The products of rocks and minerals broken down by natural or artificial agencies are gravels, sands, silts and clays. In the U.S. the term sand is applied to particles $\frac{1}{16}$ to 2 mm. diameter, and in Europe to those from .02 to 2 mm. diameter. Although most of the rock-making minerals occurring on the earth's crust are found in sands, only a limited number are met with at all frequently. For several reasons quartz is by far the commonest ingredient; it is abundant in rocks, is comparatively hard and has practically no cleavage so that it is not readily worn down to a fine state. Moreover it is nearly insoluble in water and does not decompose. In certain localities feldspar, calcareous material, iron ores and volcanic glass, among other substances, have been found to be dominant constituents of sand. Most quartzose sands contain a small quantity of feldspar. Small plates of white mica, which, though soft and very fissile, decompose slowly, are often present. In addition, all sands contain small quantities of "heavy" rock-forming minerals among which may be garnet, tourmaline, zircon, rutile, topaz, pyroxenes, amphiboles, iron ores, etc.

In certain shores and river sands these heavier constituents become concentrated as a result of current action and the removal of the lighter constituents. Economically valuable deposits may then be yielded. Such are the sands worked for diamonds and other gem stones, those bearing gold, platinum, tin, monazite and other ores. The greensands, widely distributed over the floor of the ocean and found in ancient strata on the continents, owe their colour to the presence of glauconite, a potash-bearing mineral. These sands are used for water softening and for land dressing, and attempts have been made to extract potash from them.

In the pottery, glassmaking and silicate (water glass) industries very pure quartzose sands are used in large quantities as a source of silica. Similar sands are required for lining the hearths of acid-steel furnaces and for foundry mixtures. Moulding sands, that is, the sands utilized in foundries for making the moulds in which metal is cast, usually have a clayey bond uniting the grains of quartz. Because of the hardness and poor cleavage of quartz, sands are used extensively as abrasives. Garnet sands, although of more restricted occurrence, are similarly used. Ordinary sands find a multitude of other uses, among which may be mentioned the preparation of mortar, cement and concrete. They are frequently sources of water supply. (P. G. H. B.; X.)

SANDALWOOD, a fragrant wood obtained from various trees of the natural order Santalaceae, and principally from *Santalum album*, a native of India. The use of sandalwood dates as far back at least as the 5th century B.C. It is still extensively used in India and China, wherever Buddhism prevails, being employed in funeral rites and religious ceremonies. In India it is used in the manufacture of boxes, fans and other ornamental articles of inlaid work. The oil, obtained by distilling the wood in chips, is used as a perfume, few native Indian attars or essential oils being free from admixture with it. As a powder or paste the wood is employed in the pigments, used by the Brahmans for their distinguishing caste-marks.

Red sandalwood is the product of a small leguminous tree, *Pterocarpus santalinus*, native of S. India, Ceylon and the Philippine Islands. A fresh surface of the wood has a rich deep red

colour, which on exposure, however, assumes a dark brownish tint; its principal application is in wool-dyeing. Several other species of *Pterocarpus*, notably *P. indicus*, contain the same dyeing principle and can be used as substitutes for red sandalwood. The harwood and camwood of the Guinea Coast of Africa, from *Baphia nitida* or an allied species, called *santal rouge d'Afrique* by the French, are also closely allied to the red sandalwood of Oriental countries.

As a substitute for copiba (g.v.), sandalwood oil, distilled from the wood of *Santalum album*, is pleasanter to take, but it is less efficient and more expensive.

SANDARAC, in mineralogy realgar or native arsenic disulphide, but generally a resinous exudation obtained from the small coniferous tree *Tetraclis articulata*, native of the northwest regions of Africa, and especially the Atlas mountains. The resin, a natural exudation on the stems, comes into commerce as small round balls or elongated tears, transparent, and having a delicate yellow tinge. It is used as a varnish and as incense, and by the Arabs medicinally as a remedy for diarrhoea. An analogous resin is procured in China from *Calitris sinensis*, and in southern Australia, under the name of pine gum, from various species of *Calitris*. (F. L. A.)

SANDAWÉ, less correctly Sandawi, a small tribe of about 15,000 persons living in the Kondo-Irangi district of Tanganyika Territory, Africa, between the rivers Bubu and Mponde. Attention was drawn to their language by the late Dr. Oskar Baumann, who visited their country in 1892, and was able to collect some specimens, being especially struck by the remarkable fact of its containing clicks (g.v.), which had up to that time only been observed in the Hottentot and Bushman languages of South Africa, and in those adjacent Bantu languages which had borrowed them. It was investigated at a later date by E. Nigmann (1909), and more scientifically, by Dr. Otto Dempwolff (1916). The only English writer who has treated the subject in any detail is F. J. Bagshawe, Political Officer at Mbulu, who was in close contact with these people from 1917 to 1923.

It has been assumed, though without sufficient reason, that all languages containing clicks must be related to each other, and that there can be no possible relationship between a click-language and one where clicks are absent. That this position, however, is by no means generally accepted, appears from the disputes which have arisen over the question whether the Hottentot and the Bushman groups (neither consisting of a single language) have a common origin, or are entirely distinct. (See AFRICA: *Anthropology and Ethnology*; *BUSHMAN LANGUAGES*.)

The three clicks found in Sandawe seem to be identical with three of the Nama clicks—those which have been adopted into Zulu and are represented in the current orthography by *c* (dental), *q* (cerebral or "retroflex") and *x* (lateral). The last-named is not produced in quite the same way as by the Nama, but, as observed by Dr. Dempwolff, the sound is exactly the same. Both Nigmann and Bagshawe have noticed the fact that the Sandawe clicks form a distinct syllable, at any rate in some cases (it is not clear from the latter's account whether the rule is invariably), whereas in Zulu they form an integral part of a syllable, the pronunciation of which constitutes one of the greatest difficulties to a European learner.

The word-stress appears to be extremely variable and is often the only distinction between words of similar form, but different meaning (e.g., *nôa* "elephant" and *nod* "claw"). Intonation ("tone") is also, as in the Hottentot and Bushman languages, a very important feature: *isa* with a high tone means "pot," with a low tone "tear." Both these points await fuller investigation.

A large proportion of the Sandawe vocabulary can be correlated with Nama words, and a less amount with other Hamitic languages, such as Tatoga, Iraku and even Somali. But this is an unsatisfactory basis for deducing relationship, otherwise Sandawe might be claimed as a Bantu language, since Dr. Dempwolff gives a longer list of words which can be identified as Bantu (obviously borrowed from Swahili, Gogo, Hehe, Irangi, etc.), than of those which he has traced to Nama. A far more trust

worthy criterion is to be found in the grammatical framework of the language and here there is little room for doubt. Sandawe possesses grammatical gender, suffixes to denote the plural, case-endings for nouns (an "instrumental case" is almost identical, both in form and meaning with that found in Nama), and other features in common with Nama and also, to a less extent, with other Hamitic languages. One peculiarity, the use of a different form for a verb in singular and plural (*e.g., the "he runs," giribe "they run"*), is neither Hamitic, Bantu nor Sudanic. The order of words in a simple sentence (subject, object, verb: "he cattle herds," instead of "he herds cattle") and the position of the genitive (possessor preceding the thing possessed: *Humbu tse, "ox's head,"* not, as in Bantu, "head of ox") are the same as in Nama, but differ from the normal Hamitic type. In both cases there would appear to be sufficient reasons for the difference.

Professor Alfredo Trombetti is inclined to think that the Sandawe are, of all existing peoples, those most nearly related to the Hottentots.

SANDAY, WILLIAM (1843-1920), English theological scholar, was born at Holme Pierrepont, Notts., on Aug. 1, 1843, the son of William Sanday, sheep and cattle breeder. Educated at Repton and Balliol College, Oxford, he became a scholar of Corpus Christi in 1863. He was a fellow and lecturer at Trinity in 1866, and was ordained in 1867. In 1876 after holding various college livings, he was appointed principal of Hatfield Hall, Durham. In 1882 he was appointed Ireland professor of exegesis at Oxford, and in 1895 Lady Margaret professor of divinity and canon of Christ Church, positions which he held until 1910. He died at Oxford on Sept. 16, 1920. Sanday was one of the pioneers in introducing to English students the mass of work done by Continental scholars in biblical criticism. An example of the admirable work he accomplished in this direction is his *Life of Christ in Recent Research* (1907).

His chief works are *The Authorship and Historical Character of the Fourth Gospel* (1872); *The Gospels in the Second Century* (1876); *The Oracles of God* (1891); *The Early History and Origin of the Doctrine of Biblical Inspiration* (1893); *Commentary on the Epistle to the Romans* (with Dr. Headlam, 1895); *Outlines of the Life of Christ* (1905, a republication of an article in Hastings' *Dictionary of the Bible*); *Christologies, Ancient and Modern* (1920) and *Personality in Christ and in Ourselves* (1911); *Bishop Gore's Challenge to Criticism* (1914); *New Testament Background* (1918).

SAND-BLASTING AND SHOT PEENING. Sand-blast is a method of cleaning or marking surfaces by the discharge of sand, steel shot or grit through a nozzle at high velocity by means of compressed air. The abrasive action can be effected on internal parts without difficulty. Concisely, the applications of the process may be summarized as follows: cleaning sand from castings, with or without a view to painting or enameling, or annealing; cleaning scale from stampings for similar reasons; cleaning partly-finished products, as sheets, tubes, strips, sometimes for subsequent electric or gas welding, or motorcar and cycle parts, etc., and numerous findings, prior to tinning, galvanizing or plating; cleaning tire moulds, printers' lithographic sheets, pottery ware after firing, iron and stone buildings and painted or rusty ironwork, hardened tools to enable cracks to be detected; sharpening and dressing files; matting ebonite articles to improve insulation and appearance; frosting, badging and marking glassware of all kinds.

Small apparatus for marking and engraving glass is worked with a hand bellows, but in larger outfits a power-driven compressor is employed. Pressures range from about 15 lb. to 80 lb. per square inch. Fine sand is selected for glass decoration and coarse sand or flint for uses where much is lost through no collecting apparatus being installed. For most metal work chilled sand or crushed iron shot is best, as it lasts a much longer time

than sand or flint before going into useless dust. The outfits are constructed in many ways, some having a flexible hose carrying the blast nozzle, and the operator wears a safety breathing helmet and plays the nozzle on the work. Another way is to have a metal cabinet with window through which the operator looks while he turns the object about under the fixed sand or flint nozzle; rubber gauntlets are worn, passed through arm holes in the

BY COURTESY OF TILGHMAN'S PATENT STEAM SAND-BLAST CO.
SAND-BLAST SHOWING JET DRIVING A STREAM OF SAND AND WATER AGAINST THE TEETH OF A NEWLY-CUT FILE

door. Castings are dealt with on machines, including the tumbling barrel, which constantly turns the castings over to expose all the surfaces to the action of the jet led through one or both ends. The rotary table cleaner carries the castings past a rubber curtain into a chamber containing one or more jets, and then out again. The reciprocating table design conveys large or long castings through the blast chamber, out to the other side, on which they are turned over and returned through by the table. In the Mathewson file-sharpening system a stream of very fine sand and water (in effect a liquid grindstone) is driven against the teeth by a steam jet. The backs of the teeth are thus ground off; newly-cut files have the burr driven away, much improving the cutting power, and worn files are freshened up practically as new. The sketch shows the apparatus on which the file is laid and moved to and fro by hand until found to be quite sharp.

"Gunite" is a process similar to sand-blasting by which a concrete mortar can be applied with an air gun to steel surfaces or to wood forms which may then be removed. The surface is often wrapped with wire mesh which becomes imbedded in the finished concrete surface. This process is much used for fireproofing or corrosion-proofing structural steel but it has also been used to produce canal linings, tanks, etc.

Shot Peening is a process by which the surface of a steel part of an automobile or other device that must undergo repeated stress and strain is blasted with round shot of steel, glass or other hard smooth material. The purpose is to prevent cracking during the normal service life of the structural piece. This process first came into use for automobile parts but its success brought it into widespread usefulness. It had long been observed that automotive parts which proved adequately strong under the usual static tests would crack through when placed under severe road tests or regular service. These cracks, known as fatigue cracks are well understood. They are microscopic cracks that start in an area of tension and slowly work their way through the part under repeated stress. It was known that such cracks did not start in areas that were compressed or under compressive stress. The success of shot peening in stopping the development of such cracks is due to the fact that a shot-peened surface is permanently deformed by thousands of tiny blows and it therefore retains a residual compressive stress which is usually larger than any applied tensile stress. Hence, at the surface where fatigue cracks usually start there is a compressive stress at all times which greatly inhibits the start of microscopic cracks. The beating and cooling of welded parts produces contraction stresses of both tensile and compressive nature. If the tensile contraction or cooling stresses are at the surface, fatigue cracking is a potential danger, but this danger may be greatly mitigated by shot peening the surfaces of the part after welding. (L. E. G.)

SANDBURG, CARL (1878-), U.S. author, was born Jan. 6, 1878, at Galesburg, Ill. The son of a poor immigrant, he

travelled west at the age of 17 and worked in Kansas as a farm hand and dishwasher. He served in the army in Puerto Rico during the Spanish-American War and in 1902 was graduated from Lombard college at Galesburg. Sandburg was secretary to the mayor of Milwaukee, 1910-12, and in 1913 was associate editor of *System* magazine in Chicago. In 1914 he won the *Poetry* magazine's Levinson prize for his poem *Chicago*. His *Chicago Poems* (1916) was written in a formless, free verse style and gave vivid images of the experiences of "the people" and a raw yet sensitive picture of Chicago, the "hog butcher of the world." His later books of poetry include *Cornhuskers* (1918); *Smoke and Steel* (1920); and *The People, Yes* (1936). He became an editorial writer for the *Chicago Daily News* and was a weekly columnist for the *Chicago Times* syndicate, 1941-45. In 1920 Sandburg began singing folk songs in public; he compiled *The American Songbag* (1927) and *New American Songbag* (1950). He also wrote *Rootabaga Stories* (1922) and other books for children and a long historical novel, *Remembrance Rock* (1948). But he became known as a prose writer primarily for his Lincoln biographies. *Abraham Lincoln—The Prairie Years* (1926) was widely acclaimed, and he won a Pulitzer prize for *Abraham Lincoln—The War Years*, 4 vol. (1930). In 1951 he won the Pulitzer prize for *Complete Poems* (1950).

SANDEAU, LÉONARD SYLVAIN JULIEN (JULES) (1811-1883), French novelist, was born at Aubusson, Fr., on Feb. 19, 1811. Sent to Paris to study law, he spent much of his time with unruly students. In 1831 he and Amandine-Lucile Aurore Duvefant (George Sand) were living in Paris. The intimacy did not last long, but it produced *Rose et Blanche* (1831), a novel written in common under the name Jules Sand, from which George Sand took the idea of her famous pseudonym.

Sandau continued for nearly 50 years to produce novels and to collaborate in plays. His works include *Marianne* (1839), in which he drew a portrait of George Sand; *Le Docteur Herbeau* (1841); *Catherine* (1845); and *Mademoiselle de la Seiglière* (1848), a picture of society under Louis Philippe, dramatized in 1851. *Le Gendre du M. Poirier* (1854) was one of several plays he wrote with Émile Augier.

Sandau was made conservateur of the Mazarin library in 1853, elected to the French academy in 1858 and the next year appointed librarian of St. Cloud.

He died in Paris on April 24, 1883.

SAND-EEL, or SAND-LANCE. The fishes known under these names form a small family (Ammodytidae). Their body is of an elongate-cylindrical shape, with the head terminating in a long conical snout, the projecting lower jaw forming the pointed end. A low dorsal fin occupies nearly the whole length of the back, and a low anal fin commences immediately behind the vent, which is placed about midway between the head and caudal fin. The tail is forked and the pectorals are short. The absence of ventral fins indicates the burrowing habits of these fishes. In the Japanese *Bleekeria* small jugular ventral fins are present. The scales, when present, are small; but generally the development of scales has only proceeded to the formation of oblique folds of the integument. The dentition is quite rudimentary.

Sand-eels are small littoral marine fishes, only one species attaining a length of 18 in. (*Ammodytes lanceolatus*). They live in shoals at various depths on a sandy bottom, and bury themselves in the sand on the slightest alarm. Sand-eels destroy a great quantity of fry and other small creatures, such as the lancelet (*Amphioxus*), which lives in similar localities. They are excellent eating, and are much sought after for bait. The eggs of sand-eels are small, heavier than sea-water and slightly adhesive; they are scattered among the grains of sand in which the fishes live.

Sand-eels are common in the north Atlantic; a species scarcely distinct from the European common sand-lance occurs on the Pacific side of North America, another on the east coast of South Africa. On the British coast three species are found.

SANDEFJORD, the oldest and most famous spa in Norway, on the coast, 86 mi. S.S.W. of Oslo by the Skien railway. Pop. (1946) 5,803. The springs are sulphurous, saline and chalybeate. Specimens of *jaettegryder* or giant's cauldrons may be seen at

Gaardasen and Vindalsbugt, some upwards of 23 ft. in depth.

SANDEMAN, SIR ROBERT GROVES (1835-1892), Indian officer and administrator, was the son of General Robert Turnbull Sandeman, and was born on Feb. 25, 1835. He was educated at Perth and St Andrews university, and joined the 33rd Bengal Infantry in 1856. In 1857, he took part in the final capture of Lucknow as adjutant of the 11th Bengal Lancers. After the suppression of the Mutiny he was appointed to the Punjab Commission by Sir John Lawrence. In 1866 he was appointed district officer of Dera Ghazi Khan, and there first showed his capacity in dealing with the Baluch tribes. He was the first to break through the close-border system of Lord Lawrence, by extending British influence to the independent tribes beyond the border. In his hands this policy worked admirably, owing to his tact in managing the tribesmen and his genius for control. In 1876 he negotiated the treaty with the khan of Kalat, which subsequently governed the relations between Kalat and the Indian government; and in 1877 he was made agent to the governor-general in Baluchistan, an office which he held till his death. During the second Afghan war in 1878 his influence over the tribesmen was of the utmost importance, since it enabled him to keep intact the line of communications with Kandahar, and to control the tribes after the British disaster at Maiwand. For these services he was made K.C.S.I. in 1879. In 1889 he occupied the Zhob valley, a strategic advantage which opened the Gomal Pass through the Waziri country to caravan traffic. He died at Bela, the capital of Las Bela state, on Jan. 29, 1892.

See T. H. Thornton, *Sir Robert Sandeman* (1895); and R. I. Bruce, *The Forward Policy* (1900).

SANDERS, NICHOLAS (c. 1530-1581), Roman Catholic agent and historian, born about 1530 at Charlwood, Surrey, was a son of William Sanders, once sheriff of Surrey, who was descended from the Sanders of Stanstedstead. Educated at Winchester and New College, Oxford, he was elected fellow in 1548 and graduated B.C.L. in 1551. Soon after Elizabeth's accession he went to Rome where he was befriended by Pole's confidant, Cardinal Morone; he also owed much to the generosity of Sir Francis Englefield (q.v.). He was ordained priest at Rome, and was, even before the end of 1550, mentioned as a likely candidate for the cardinal's hat. For the next few years he was employed by Cardinal Hosius, the learned Polish prelate, in his efforts to check the spread of heresy in Poland, Lithuania and Prussia. In 1565 like many other English exiles, he made his headquarters at Louvain, and after a visit to the Imperial Diet at Augsburg in 1566, he threw himself into the literary controversy between Bishop Jewel (see JEWEL, JOHN) and Harding.

His expectations of the cardinalate were disappointed by Pius V's death in 1572, and Sanders spent the next few years at Madrid trying to embroil Philip II, who gave him a pension of 300 ducats, in open war with Elizabeth. Sanders found his opportunity in 1579, when a force of Spaniards and Italians was despatched to Smernick to assist James Fitzmaurice and his Geraldines in stirring up an Irish rebellion. The Spaniards were, however, annihilated by Lord Grey in 1580, and after nearly two years of wandering in Irish woods and bogs Sanders died of cold and starvation in the spring of 1581.

The writings of Sanders have been the basis of all Roman Catholic histories of the English Reformation. The most important was his *De Origine ac Progressu schismatis Anglicani*, which was continued after 1558 by Edward Rishton, and printed at Cologne in 1585; it has been often re-edited and translated, the best English edition being that by David Lewis (London, 1877).

See Lewis's *Introduction* (1877); *Calendars of Irish, Foreign and Spanish State Papers, and of the Correspondence of the Cardinal Allen*; T. F. Kirby's *Winchester Scholars*; R. Bagwell's *Ireland under the Tudors*; A. O. Meyer's *England and the katholische Kirche unter Königin Elisabeth* (1910); the *Catholic Encyclopedia*; and T. G. Law in *Dict. Nat. Biogr.* 1, 259-261 with bibl.; T. M. Veitch, *Dr. Nicolas Sanders and the English Reformation 1530-1581* (Louvain, 1935).

SAND FLY, any of the blood-sucking biting midges belonging to the family Ceratopogonidae of the order Diptera (q.v.). They belong to the genera *Culicoides*, *Lasioheles* and *Leptocnops*

and attack man and warm-blooded animals most viciously. All are small, under 3 mm., and generally grayish or brownish in colour, but a few are yellow; the wings are covered with tiny hairs forming a weak pattern; the strong veins are in front, the other veins weak. Because of their minute size and difficulty of seeing them when they bite they are called "no-see-ums" in parts of North America; also "punkies." The larvae are aquatic, live in the tide zone of sandy beaches, in decaying vegetation, tree holes and mud. The adults are crepuscular and nocturnal but bite viciously on dark days; they are so fragile that they remain in hiding with even a moderate breeze, but may form large swarms in the lee of buildings and enter houses through mosquito screens. Many seashore areas are made extremely uncomfortable by them. Species of *Culicoides* are vectors in Africa and tropical America of the filarial worms, *Acanthocheilomonas persans* and *Mansonella ozzardi*, but these are nonpathogenic in man. There are 33 species of *Culicoides* in the British Isles. The name sand fly is also applied to species of *Simulium* in some parts of the world. (C. H. Cn.)

SAND-FLY FEVER (*Phlebotomus* fever, pappataci fever) is an acute, infectious, febrile disease caused by a specific filterable virus and producing temporary incapacitation. It is transmitted by the female sand fly, *Phlebotomus papatasi*, and is prevalent in the moist subtropical countries of the eastern hemisphere lying between 20° and 45° N. lat., particularly around the Mediterranean sea, in the middle east and parts of India. It breaks out in epidemic form during the summer season following the breeding of this species of fly, but between epidemics the reservoir is unknown and there is no conclusive evidence that the virus is congenitally transmitted in the insect host. The sand fly becomes infected from biting infected persons when the virus is circulating in the patient's blood, not more than 48 hours before the clinical onset and no more than the first 24 hours thereafter. The virus then requires seven to ten days incubation, after which the sand fly remains infected for life.

Pathogenesis and Symptomatology.—Man becomes infected from the bites of infected sand flies. Using human adults of both sexes and different racial groups as volunteers, A. B. Sabin, C. B. Philip and J. R. Paul (1944) obtained 95% infection following skin exposure to infected *Phlebotomus papatasi*. The virus multiplies and becomes widely disseminated throughout the body, and within two and one-half to five days after exposure there is suddenly a feeling of lassitude, abdominal distress and dizziness, followed within one day by a chilly sensation and a rapid rise in temperature during the next 24 to 48 hours to 102°–104.5° F. (38.8°–40.3° C.). As in dengue (*q.v.*) there are typically severe frontal headache and postorbital pain, intense muscular and joint pains, likewise a flushed appearance of the face, but no true rash or subsequent desquamation. During the first day of fever there is an accelerated pulse. Usually after two days the temperature slowly returns to normal; only rarely is there a second episode of fever. Following the febrile period there is great fatigue and weakness, accompanied by slow pulse and frequently subnormal blood pressure. Convalescence may require only a few days or several weeks.

Prognosis is always favourable in sand-fly fever. The average case is considerably less severe than in dengue. Diagnosis is based on the clinical manifestations, the geographical area in which the disease occurs, the prevalence of *Phlebotomus papatasi* and the epidemic development of the disease. More specifically, although there is no change in the total number of white blood corpuscles, there is an increase in the proportion of immature neutrophilic forms (*e.g.*, a marked shift to the left in the Schilling count). Treatment is entirely symptomatic.

Prevention.—Sand flies breed in vegetation within a few hundred feet of human habitations. These breeding places are difficult to discover, hence larvicidal control is impractical. The blood-sucking females feed only from sunset to sunrise and only at ground level, so that sleeping quarters above the ground floor provide moderately good protection. Ordinary mosquito netting and screening are useless, since the unfed female flies can pass through 18-mesh squares. Insect repellents such as dimethyl phthalate, dibutyl phthalate and benzyl benzoate, when applied to

exposed skin, will keep sand flies away for a few hours, but the use of DDT-pyrethrum sprays on verandas, on screens, around doors and windows and within habitations will readily kill all adult sand flies which alight on the sprayed surfaces. With this procedure an epidemic can be rapidly terminated.

SANDFORD, JOHN DE (d. 1294), archbishop of Dublin, was probably an illegitimate son of the baronial leader, Gilbert Basset (d. 1241), or of his brother Fulk Basset, bishop of London from 1241 until his death in 1259. John first appears as an official of Henry III in Ireland and of Edward I in both England and Ireland; he was appointed dean of St. Patrick's, Dublin, in 1275. In 1284 he was chosen archbishop of Dublin in succession to John of Darlington; some, however, objected to this choice and Sandford resigned his claim; but was elected a second time while he was in Rome, and returning to Ireland was allowed to take up the office. In 1288, during a time of great confusion, the archbishop acted as governor of Ireland. In 1290 he resigned and returned to England. Sandford served Edward I in the great case over the succession to the Scottish throne in 1292 and also as an envoy to the German king, Adolph of Nassau, and the princes of the empire. On his return from Germany he died at Yarmouth on Oct. 2, 1294.

SANDGATE, a watering-place of Kent, England, on the S.E. coast, 14 mi. W. of Folkestone, on the S. railway. In 1894 it was created an urban district, but this was abolished in 1934, and the town was transferred to Folkestone and Hythe. The population of the parish was 3,039 in 1931. Sandgate castle was built by Henry VIII in 1539 but on the formation of a camp here in 1806 it was so changed as to be more like a Martello tower. The camp of Shorncliffe lies on the heights north of the town.

SAND-GROUSE, the name applied to birds resembling grouse (*q.v.*) in certain features and inhabiting sandy tracts. They comprise the family *Pteroclididae* of the plover order. The commonest form is Pallas's sand-grouse (*Syrhaptes paradoxus*), inhabiting central Asia and occasionally invading Europe in large flocks. The nest is on the ground and contains four inconspicuous eggs. The wings are very long. The birds' plumage is adapted to the colour of the desert. Sand-grouse supply their young with water by soaking the breast feathers in water, which the little birds drink (see P. A. Buxton, *Animal Life in Deserts*). Fossil species occur in the Miocene formation.

SANDHURST, a town in the Wokingham parliamentary division of Berkshire, England, 9 mi. N. of Aldershot. Pop. (1931) 3,702. Two miles southeast of the town, near the villages of Camberley Town and York Town, and the railway stations of Blackwater and Camberley on the Southern Region railway, is the Sandhurst Royal Military college. The college, now at Sandhurst, was established by royal warrant in March 1802 in a house at Great Marlow. Near Sandhurst is Wellington college, one of the principal modern public schools of England, founded in memory of the duke of Wellington, and incorporated in 1853.

Since 1877 the course at Sandhurst has varied from one year to two, though during World War I, it was reduced for a short while to 4 months in order to increase the output. During that war 4,000 cadets were passed through the R.M.C. and at one time the numbers rose to 1,000. After the war subjects of general educational value were reintroduced into the curriculum and the length of the course became 18 months. The college stands in beautiful grounds, with a large lake and ample space for games. The college is within 10 miles of Aldershot and is thus suitably placed for keeping in touch with military training. The roll of cadets includes Lord Roberts (1847), Lord Allenby (1881)

and Lord Haig (1884). At the R.M.C. cadets are trained for commissions in the cavalry, infantry, royal tank corps, royal army service corps (after two years' service with any other arm) of the British service and for appointments to the unattached list for the Indian army. After 1922 a number of vacancies were specially reserved for selected noncommissioned officers of the regular army recommended to be trained for commissions. A limited number of vacancies are open to recommended candidates from the colonies, dominions, Newfoundland, Northern Ireland and Southern Rhodesia. A few New Zealand cadets are trained for service in their own army and a limited number of Indians also undergo training for service in the Indian army.

The course consists of three terms, of which there are two a year (Feb. 1 to mid-July, and Sept. 1 to mid-December). Cadets enter each half year at the age of 18-19 after passing a competitive entrance examination. The army entrance examination is conducted by the Civil Service commission. With the exception of certain candidates nominated by the army council, candidates are required to possess a school certificate before being permitted to sit for the army entrance examination. The cadets are organized in four companies on the lines of an infantry battalion. The staff of the college includes a commandant, a company commander for each company, company officers for each platoon and officers of the army educational corps. These latter are especially responsible for instruction in nonmilitary subjects; viz., constitutional history, European history, geography (obligatory), chemistry, mechanics, political and economic history, languages, electricity (alternative, one subject to be chosen by each cadet). The military and obligatory part of the course includes conduct of war, strategy, tactics and organization—illustrated from military history—map reading, military law, drill, riding and physical training.

At the end of the course commissions are allotted in various branches of the service according to existing vacancies, choice of regiment usually being given to those high up in the order of passing out. The normal fee is £700 a term and in addition certain charges are made for uniform, books, etc. The sons of officers of H.M. forces are, subject to certain conditions, admitted at a reduced normal rate of £600 a term. A limited number of cadets are admitted at reduced rates on account of pecuniary need at the discretion of the army council. The conditions of admission and fees, etc., vary from time to time, and information with regard to possible changes should be sought from the war office. (See also OFFICERS.) In 1939 the royal tank corps and the 18 mechanized cavalry regiments were amalgamated and named the royal armoured corps. The names of the individual regiments were retained, but the old tank unit was renamed the royal tank regiment. During World War II Sandhurst was the training ground for officers of the new armoured corps. In the vicinity of Wellington college is Broadmoor prison for criminal lunatics.

SAN DIEGO, a Pacific coast city of California, U.S., situated 16 mi. N. of the Mexican border; a port of entry and county seat of San Diego county. It is on federal highways 80, 101 and 395 and is served by the San Diego and Arizona Eastern and the Santa Fe railways, by American, United and Western air lines and by bus lines and coastal, intercoastal and foreign steamship lines. A municipal airport (Lindbergh field), lying along San Diego bay and within five minutes' drive of the city business centre, accommodates both land and sea planes, and there are several commercial and governmental airports.

The population of San Diego was 321,485 in 1930 and 303,341 in 1940 by federal census.

City land area is 98.98 sq. mi. and it extends back 13.8 mi. at its extreme width. The climate is equable, with mean average temperature of 61° F. and average annual precipitation (falling chiefly in winter) of ten inches. San Diego bay is a 14-mi.-long land-locked crescent-shaped basin separated from the ocean by a low, narrow sandspit extending northwest from the mainland below the city and expanding at its northwestern extremity to include the city of Coronado and the U.S. naval air station (North Island). San Diego's business district has many tall and massive stores, office buildings and hotels.

In the city's centre lies Balboa park (1,400 ac.), the site of the Panama-California exposition of 1915-16 and the California Pacific International exposition of 1935-36. The park contains a natural history museum, a museum of man, a fine arts gallery, botanical and zoological gardens and a contiguous stadium seating 30,000, occupying a natural amphitheatre. Near the northern extremity of the city, on the ocean north of La Jolla, is Scripps Institution of Oceanography (part of the University of California). The city contains the second largest state college, San Diego State college. San Diego public schools, under the supervision of a five-member board of education, spent \$13,449,214 during 1948-49, or an average of \$28.44 per pupil based on an average daily attendance of 45,828.

In 1931 the city adopted a council-manager form of government. Assessed valuation of property in 1950 was \$311,586,940; bank debts totalled \$3,103,075,285. Total new construction activity for the decade 1941-50 was approximately \$281,700,000. After World War II four major freeways to the city's outlying districts were built—Cabrillo, Mission Valley, Wabash and Montgomery. Water problems are solved by importation of Colorado river water, which is supplemented by collection of local runoff in eight near-by reservoirs.

San Diego offers many recreational opportunities. Water sports—speedboating, aquaplaning, yachting, swimming and rowing—may be enjoyed on its bays, harbour and beaches, while on land numerous sporting activities are available to resident and tourist alike. The \$23,000,000 Mission Bay development was begun in 1945 to provide a 4,000-ac. marine and recreation park and a San Diego river flood-control channel.

Two near-by race tracks, Del Mar Turf club and Agua Caliente track, provide horse-racing fans enjoyment the year around. The city is the home of many flying and gliding clubs and a centre for deep-sea and fresh-water fishing. Another tourist attraction is Cabrillo National monument on Point Loma. Tourist trade netted the area \$54,000,000 in 1949.

The roomy (22 sq. mi.) and accessible natural harbour is the first port of call for vessels operating through the Panama canal. A channel with an average width of 2,000 ft. and a minimum depth of 36 ft. was provided by government and municipal improvements. Terminal facilities include 57,210 ft. of berthing space, excluding government-owned wharves. From 1911 when the tidelands were ceded to the city by the state, to 1950 about \$14,000,000 was invested by San Diego in building and maintaining the port. Cargo handled in the 1949-50 fiscal year was 1,282,585 tons valued at \$77,090,980. Fishing is another important industry, with the local fishing fleet employing about 3,300 fishermen and 2,500 cannery workers (1951). An estimated 108,379 tons of fish valued at \$14,631,165 entered the port in the year 1949-50, and value of the tuna pack alone was \$58,000,000.

Aviation is one of San Diego's chief industries, with large and important factories in the area. Total factory pay rolls to an estimated 25,000 workers in all industries amounted to \$78,700,000 in 1949. Navy civilian and active duty personnel pay rolls were about \$97,000,000 for the same period. Approximately 445 industrial and manufacturing establishments produced goods valued at about \$275,000,000 (1950) and total pay rolls in San Diego, including civilian, military and governmental workers, approximated \$420,000,000. Total employment as of Oct. 1950 was 167,300 and unemployment 8,500 in the area. Of the total employment figure 45,500 were engaged in trade, 35,300 in service, 30,150 in manufacturing, 23,650 in government, 11,800 in construction, 8,700 in transportation, communications and utilities and 7,550 in agriculture.

San Diego is the headquarters of the 11th naval district and site of one of the largest and most diversified operational bases in the world. Major naval activities of the area include a naval station, air station, amphibious base, training centre, auxiliary air station, electronics laboratory, supply depot, fleet sonar school and marine corps recruit depot. Many world records in aviation were established by the army and navy at San Diego, and it was the scene of such feats as the first controlled glider flight (1883), the first photographs from the air (1911), the first night flying,

the first refuelling in flight and the first seaplane flight.

San Diego bay was discovered in 1542 by navigator Juan Rodríguez Cabrilho, in the service of Spain, and was named in 1602 by Spanish explorer Sebastián Vizcaíno. At Old Town, north of the city centre, the first European settlement in Upper California was made in 1769. On July 16 Father Junipero Serra founded the mission of San Diego de Alcalá (the first of the California chain of Franciscan missions) and shortly thereafter a military presidio was established. The mission was moved in 1774 to a site 8 mi. from the centre of the modern city, where it still stands in a good state of restoration.

San Diego began the revolt against Governor Victoria in 1837, but in 1836 was intensely loyal to Mexican authority, in opposition to Gov. Juan Bautista Alvarado and the northern towns. It was made a port of entry in 1828, and in 1840 had a population of 140. In July 1846 it was occupied by U.S. forces under Gen. John C. Frémont. In 1850 the city was incorporated, but as it did not grow it lost its charter in 1852. In 1867 there were only a dozen inhabitants. Then a pioneer builder, A. E. Horton (d. 1909), laid out a new city 3 mi. below the old site. By 1870 it had a population of 2,300, and in that year a military reservation was established on Point Loma. In 1871 work started on the Santa Fe railroad; in 1872 the new city was incorporated; and in 1874 it was made a port of entry. The boom was ended by the depression of 1873-76, but development was resumed when the railroad reached the city in 1884. By 1890 the population had grown to 67,550, and the city's growth thereafter was rapid. (D. C. Cr.)

SAND LILY (*Leucocoryn montanum*), a North American plant of the lily family (Liliaceae, *q.v.*), native to plains and mountain valleys from South Dakota and Nebraska west to the Pacific coast. It is a small stemless perennial with long, narrow, grasslike leaves tufted on a short rootstock from which rise also the nearly stalkless, pure white, fragrant, slender-tubed, lilylike flowers, about 2 in. long and $\frac{1}{2}$ in. across. The sand lily, often called star lily, is a conspicuous early spring flower in many parts of its range. (See SOAP PLANTS.)

SANDOMIERZ, a small town of Poland in the province of Kielce, 140 mi. S.S.E. of Warsaw by river and on the left bank of the Vistula, opposite the confluence of the San. It is one of the oldest towns of Poland, being mentioned as early as 1099; from 1339 to 1352 it was the chief town of the principality of the same name. In 1240 and in 1259 it was burned by the Mongols. In 1429 it was the seat of a congress for the establishment of peace with Lithuania, and in 1570 the "Consensus Sandomiriensis" was held there for uniting the Lutherans, Calvinists and Moravian Brethren. Subsequent wars, and especially the Swedish (*e.g.*, in 1655), ruined the town. There in 1702 the Polish supporters of Augustus of Saxony banded together against Charles XII of Sweden. The beautiful cathedral was built between 1220 and 1691; it was rebuilt in stone in 1360, and is one of the oldest monuments of Polish architecture. Two of the churches are fine relics of the 13th century. The castle, built by Casimir III (14th century), still exists. The city gives title to an episcopal see (Roman Catholic). It was occupied by Germany in 1939 and returned to Poland in 1945. Pop. (1946) 8,357.

SANDOWAY, a town and district in the Arakan division of the Union of Burma. The town (pop. 1931, 4,070) is an ancient one and is said to have once been the capital of Arakan. The district has an area of 4,157 sq. mi.; pop. (1941) 139,747. The country is mountainous. Some peaks in the north attain 4,000 ft. and more. The chief pass is the Taunggy crossed by a cart track leading from the village of Taunggy to Promé on the Irrawaddy. The streams are mountain torrents to within a few miles of the coast; the mouth of the Gwa forms a good anchorage for vessels from 9-10 ft. draught. The hills are clad with evergreen forest or useless bamboo brake on their lower slopes; by evergreen oak forests on the higher parts. Only small areas of the district are available for cultivation and except for a few acres of tobacco nearly all the cultivation is rice. Sandoway was ceded to the British, with the rest of Arakan (*q.v.*) by the treaty of Yandabo in 1826. It became part of the independent Union of Burma on Jan. 4, 1948.

SANDOWN, watering place, forming with Shanklin, an urban district, Isle of Wight, Eng., 6½ mi. S. of Ryde by rail. Pop. (1931) 6,302. It is on the southeast coast of the island, with a wide sandy shore. Pop., urban district (est. 1938), 10,930. Area 5.5 sq. mi.

SANDPAPER, an abrasive material prepared by coating stout paper with glue and sifting fine sand over its surface before the glue sets. Sandcloth is prepared in the same way. It is widely used for smoothing the surface of wood, for rubbing down paint and other purposes. (See also EMERY; GLASS-PAPER.)

SANDPIPER, the name given to all the smaller limicoline birds which are not plovers (*q.v.*), snipe (*q.v.*) or phalaropes (*q.v.*). The greenshank (*q.v.*) and the redshank (*q.v.*) are also related to the common sandpiper or summer snipe (*Tringa hypoleucos*). This little bird is a summer visitor to northern Europe and Asia. In the British Isles it arrives in May. It frequents clear streams, beside which it nests on the ground. There are four eggs, protectively coloured, as is also the case with the young. It winters in India, Australia and the Cape. In America it is replaced by *Actitis macularia*, the peewee or spotted sandpiper, having similar habits. The green sandpiper (*T. ochropus*) is unique among the group, except for the North American solitary sandpiper (*Calidris solitaria*), in using the old nests of other birds wherein to lay eggs. Another European species is the wood sandpiper (*T. glareola*), like the last very dark in colour.

Other forms include the knot (*q.v.*), the dunlin (*q.v.*), the sanderling (*Calidris arenaria*), which lacks the hind toe, the purple sandpiper (*C. striata*) and the little, Temminck's and American stints (*T. minuta*, *T. temminckii* and *Pisobia minutilla*). The American stint, often called the least sandpiper, is darker and ranges from the arctic to Brazil. Bonaparte's sandpiper (*P. fuscicollis*), distinguished by its white tail coverts, is a common American form. It is called the white-rumped sandpiper.

The semipalmated sandpiper (*Eremetia pusillus*) has partially webbed feet; it is a small form, breeding in arctic America. The buff-breasted sandpiper (*Tryngites subruficollis*) is common in the Mississippi valley in autumn and breeds in Alaska and Keewatin, wintering in Argentina and Uruguay.

SANDRINGHAM, a village in Norfolk, Eng., 3 mi. from the Wash and 2½ from Wolferton on the Eastern Region railway. Pop. (1931) 648. Sandringham house, a country seat of the king, was acquired by King Edward VII in 1863. The estate, of 15,578 ac., includes a park of 200 ac. The church of St. Mary Magdalene contains memorials of the royal family.

SAND SPRINGS, a city of Tulsa county, Okla., U.S., on the Arkansas river and federal highway 64, 8 mi. W. of Tulsa; served by the Missouri-Kansas-Texas and the Sand Springs railways. The population was 6,982 in 1950 and was 6,137 in 1940 by the federal census. It has important manufacturing industries, especially glassworks, cotton mills, chemical plants and smelters. The town was founded in 1911 and in 1918 it was chartered as a city.

SANDSTONE is a consolidated rock built up dominantly of grains of sand (*q.v.*) held together by a cementing substance. Sandstones are composed mainly of quartz, but may vary in composition in the same manner as sands. By increase in the size of their constituents they pass into conglomerates (*q.v.*) and by decrease into arenaceous shales and clay rocks. When the grains of sand are angular, the rock is termed a grit.

The minerals of sandstones are the same as those of sands. Quartz is the commonest; with it often occurs a certain amount of feldspar (as in the rock arkose) and frequently white mica. The flakes of mica may often be seen lying on the bedding planes and may give the sandstone a fissile character (*e.g.*, paving stone) of much value in quarrying. The cementing material is often fine chalcidonic silica, or it may be secondary quartz, when a quartzite-like rock is produced. Calcareous material (calcite), glauconite, iron oxides, carbonaceous matter and other substances also act as cements and give the sandstones characteristic colours. Glauconitic sandstones are greenish, ferruginous sandstones, red, brown and yellow or gray. When the cementing substance is clay, the rock is often of white or gray colour and firmly compacted.

Pure sandstones may contain as much as 99% of silica. If relatively soft they are crushed to sand for commercial purposes. If firmly cemented they are utilized, on account of the resistance of silica to heat, for the manufacture of silica bricks, furnace linings, hearths, etc. Of this character is the well-known rock "ganister" worked in the districts of Sheffield, South Wales, etc. Less pure, but firmly-cemented siliceous sandstones are used for the making of grindstones and millstones. Similar rocks, as well as calcareous, dolomitic (see DOLOMITE) and ferruginous sandstones are extensively worked as building-stones, mostly by quarries but sometimes by mines. As sandstones are always porous, they do not take a good polish, and are not used as ornamental stones, but this property makes them valuable storage basins and sources of water (e.g., the Trias of the Midlands). (P. G. H. B.)

SANDUSKY, a city of northern Ohio, U.S.A., a port of entry and the county seat of Erie county; on Sandusky bay (an arm of Lake Erie), 56 mi. southwest of Cleveland. It is served by the Baltimore and Ohio, the Big Four, the New York Central, the Nickel Plate and the Pennsylvania railways and by lake steamers. Pop. 1950 by federal census, 29,060. It has an extensive lake trade, the largest fresh-water fishing industry in the country and many diversified manufacturing industries. The traffic of the harbour in 1949 was 14,000,000 tons.

The aggregate factory output in 1949 was valued at \$60,000,000. Among the leading industries are the manufacture of crayons, radios, steel foundry products, ball bearings, paper-shipping cases and packing material. The city is built on a fine limestone ledge, and there are extensive deposits of marl, sand, gravel and clay in the vicinity. Just south of Sandusky is the Ohio Soldiers and Sailors home.

From Put-in-Bay (an island about 12 mi. northwest of Sandusky) Commodore Oliver Hazard Perry and his fleet sailed out on the morning of Sept. 10, 1813, for the battle of Lake Erie. English traders visited the site of Sandusky as early as 1749, and by 1763 a fort had been erected, which was burned by the Wyandot Indians on May 16 of that year, during the Pontiac uprising. Permanent settlement began in 1817, and in 1845 Sandusky was chartered as a city. In 1916 it adopted a commission-manager form of government.

SAND VERBENA (*Abronia*), a large genus of plants of the four-o'clock family (Nyctaginaceae), allied to the *Mirabilis* of the gardens, comprising about 50 species, native chiefly to dry sandy soils in western North America. They are low, often prostrate annuals or biennials, with opposite, entire, thick, sometimes viscid leaves; showy, red, yellow or white, usually fragrant flowers, clustered in stalked heads encircled at the base by bracts, and a broadly-winged fruiting achene enclosing a single shining seed. The white sand-verbena (*A. fragrans*), with very numerous fragrant flowers, occurs from Iowa to Idaho and south to Texas and Mexico. The yellow sand-verbena (*A. latifolia*) and the pink sand-verbena (*A. umbellata*), found along the seashore from southern California to British Columbia, are grown as ornamentals in borders and rockeries. Various species bloom in immense profusion in deserts during the short rainy season.

SANDWICH, EDWARD MONTAGU or MOUNTAGU, 1st EARL OF (1625–1672), English admiral, born on July 27, 1625, was a son of Sir Sidney Montagu (d. 1644) of Hinchinbrook, who was a brother of Henry Montagu, 1st earl of Manchester, and of Edward Montagu, 1st Lord Montagu of Boughton. He joined the parliamentary party at the outbreak of the Civil War. In 1643 he raised a regiment with which he fought at Marston Moor, Naseby and at the siege of Bristol. Though one of Cromwell's intimate friends, he took little part in public affairs until 1653, when he was appointed a member of the council of state. In 1656 he was made a general-at-sea, his colleague being Robert Blake. Having taken some part in the operations against Dunkirk in 1657, he was chosen a member of Cromwell's house of lords, and in 1659 he was sent by Richard Cromwell with a fleet to arrange a peace between Sweden and Denmark. After the fall of Richard he resigned his command and assisted in the restoration of Charles II. Again general-at-sea early in 1660, Montagu carried the fleet over to the side of the

exiled king, and was entrusted with the duty of fetching Charles from Holland. He was then made a knight of the Garter, and in July 1660 was created earl of Sandwich.

During the war with the Dutch in 1664–1665 Lord Sandwich commanded a squadron under the duke of York and distinguished himself in the battle off Lowestoft on June 3, 1665. When the duke retired later in the same year he became commander in chief. Trouble arose over certain valuable Dutch prizes which he had taken, and Lord Sandwich was dismissed from his command, but as a solatium was sent to Madrid as ambassador extraordinary. He arranged a treaty with Spain, and in 1670 was appointed president of the council of trade and plantations. When the war with the Dutch was renewed in 1672 Lord Sandwich again commanded a squadron under the duke of York, and during the fight in Southwold bay on May 28, 1673, his ship, the "Royal George," after having taken a conspicuous part in the action, was set on fire and was blown up. The earl's body was found some days later and was buried in Westminster Abbey.

Lord Sandwich claimed to have a certain knowledge of science, and his translation of a Spanish work on the *Art of Metals* appeared in 1674. Many of his letters and papers are in the British museum, the Bodleian library at Oxford, and in the possession of the present earl of Sandwich. He is mentioned very frequently in the *Diary* of his kinsman, Samuel Pepys. See also J. Charnock, *Biographia Navalis*, vol. I (1794); John Campbell, *Lives of the British Admirals*, vol. II (1779); and R. Southey, *Lives of the British Admirals*, vol. V (1840).

SANDWICH, JOHN MONTAGU, 4TH EARL OF (1718–1792), was born on Nov. 3, 1718, and succeeded his grandfather, Edward, the 3rd earl, in the earldom in 1729. Educated at Eton and at Trinity college, Cambridge, he spent some time in travelling, and on his return to England in 1739 he took his seat in the house of lords as a follower of the duke of Bedford. He was a commissioner of the admiralty, plenipotentiary to the congress at Breda (1746), first lord of the admiralty (1748), and in 1753 a principal secretary of state. He took a leading part in the prosecution of John Wilkes. He had been associated with Wilkes in the notorious fraternity of Medmenham, and his attitude now in turning against the former companion of his pleasures made him very unpopular, and, from a line in the *Beggar's Opera*, he was known henceforward as "Jemmy Twitcher." He was postmaster general in 1768, secretary of state in 1770, and again first lord of the admiralty from 1771 to 1782. For corruption and incapacity Sandwich's administration is unique in the history of the British navy. He died on April 30, 1792.

The Sandwich Islands (see HAWAII) were named after him by Captain Cook. His *Voyage round the Mediterranean in the Years 1738 and 1739* was published posthumously in 1799, with a very flattering memoir by the Rev. J. Cooke; the *Life, Adventures, Intrigues and Amours of the celebrated Jemmy Twitcher* (1770), which is extremely rare, tells a very different tale. See also the various collections of letters, memoirs and papers of the time, including Horace Walpole's *Letters and Memoirs* and the *Bedford Correspondence*.

SANDWICH, a market town, municipal borough, and one of the Cinque Ports, in the Isle of Thanet and Dover parliamentary divisions of Kent, England, 12 mi. east of Canterbury on the S.E. section of the Southern railway. Pop. (est. 1938) 3,913. Area, 3.3 sq. mi. It is 2 mi. from the sea, on the river Stour, which is navigable up to the bridge for vessels of 200 tons. The old line of the walls on the land side is marked by a public walk. The Fisher gate and a gateway called the Barbican are interesting; but the four principal gates were pulled down in the 18th century. St. Clement's church has a Norman central tower, and St. Peter's (restored), said to date from the reign of King John, has interesting mediaeval monuments. The curfew is still rung at 8 p.m. at St. Peter's. There are three ancient hospitals; St. Bartholomew's has a fine Early English chapel of the 12th century. The establishment of the railway and of the St. George's golf links (1886) rescued Sandwich from the decay into which it had fallen in the earlier part of the 19th century. The links are among the finest in England.

Richborough castle, 1½ mi. north of Sandwich, is one of the finest relics of Roman Britain. In the 4th century it was a fort of the coast defense along the Saxon shore.

The situation of Sandwich on the Wantsum, once a navigable

channel for ships bound for London, made it a famous port in the time of the Saxons, who probably settled here when the sea receded from the Roman port of Richborough. In 973 Edgar granted the harbour and town to the monastery of Christ Church, Canterbury, and at the time of the Domesday Survey Sandwich supplied 40,000 herrings each year to the monks. A charter of John in 1205 confirmed privileges enjoyed by the town in the time of William I. As one of the Cinque Ports, Sandwich owed a service of five ships to the king, and shared the privileges granted to the Cinque Ports from the reign of Edward I onwards. At the end of the 13th century the monks granted the borough, with certain reservations, to Queen Eleanor; a further grant of their rights was made to Edward III in 1364, the crown being thenceforward lord of the borough. The governing charter until 1835 was that granted by Charles II in 1684.

During the middle ages Sandwich was one of the chief ports for the continent, but as the sea gradually receded and the passage of the Wantsum became choked with sand the port began to decay, and by the time of Elizabeth the harbour was nearly useless. In her reign Wallons settled here and introduced the manufacture of woollen goods and the cultivation of vegetables; this saved the borough from sinking into unimportance. Representatives from the Cinque Ports were first summoned to parliament in 1265; the first returns for Sandwich are for 1366, after which with Deal and Walmer it returned two members until disfranchised in 1885.

See W. Boys, *Collections for History of Sandwich* (1792); E. Hasted, *History of Kent* (1778-99); *Victoria County History* (Kent).

SANDYS (Sändz), **SIR EDWIN** (1561-1629), British statesman and a founder of the colony of Virginia, was the second son of Edwin Sandys, archbishop of York, and his wife Cecily Wilford. He was born in Worcestershire on Dec. 9, 1561. He was educated at Merchant Taylors' school and at Corpus Christi College, Oxford, and, though he never took orders, became a prebendary of York. He retained his prebend until 1599. He was entered in the Middle Temple in 1589. From the year 1593 till 1599 he travelled abroad. When in Venice he became closely connected with Fra Paolo Sarpi, who helped him in the composition of the treatise on the religious state of Europe, known as the *Europæa speculum*. In 1605 this treatise was printed from a stolen copy under the title, *A Relation of the State of Religion in Europe*. Sandys procured the suppression of this edition, but the book was reprinted at the Hague in 1629. He was member for Andover in 1586 and for Plympton in 1589. On James I's accession Sandys was knighted. He sat in the king's first parliament as member for Stockbridge. He assailed the great monopolies, and he endeavoured to secure to all prisoners the right of employing counsel. He had been connected with the East India Company before 1614, and took an active part in its affairs till 1629. His most memorable services were, however, rendered to the (London) Virginia Company, to which he became treasurer in 1619. He sat in later parliaments as member for Sandwich in 1621, for Kent in 1624, and for Penryn in 1625. He died in Oct. 1629.

See Alex. Brown's *Genesis of the United States* (London, 1890).

SANDYS, GEORGE (1578-1644), English traveller, colonist and poet, the seventh and youngest son of Edwin Sandys archbishop of York, was born on March 2, 1578. He studied at St. Mary Hall, Oxford, but took no degree. On his travels, which began in 1610, he first visited France; from North Italy he passed by way of Venice to Constantinople, and thence to Egypt, Mt. Sinai, Palestine, Cyprus, Sicily, Naples and Rome. His narrative, dedicated, like all his other works, to Charles (either as prince or king), was published in 1615, and formed a substantial contribution to geography and ethnology. He also took great interest in the earliest English colonization in America. In April 1621 he became colonial treasurer of the Virginia Company and sailed to Virginia with his niece's husband, Sir Francis Wyatt, the new governor. When Virginia became a crown colony, Sandys was created a member of council in August 1624; he was reappointed to this post in 1626 and 1628. In 1631 he returned to England.

In 1621 he had already published an English translation of part of Ovid's *Metamorphoses*; this he completed in 1626; on this mainly his poetic reputation rested in the 17th and 18th centuries.

He also began a version of Virgil's *Aeneid*, but never produced more than the first book. In 1636 he issued his famous *Paraphrase upon the Psalms and Hymns dispersed throughout the Old and New Testaments*; in 1640 he translated *Christ's Passion* from the Latin of Grotius; and in 1641 he brought out his last work, a *Paraphrase of the Song of Songs*. He died, unmarried, at Bogley, near Maidstone, Kent, in 1644.

See Sandys' works as quoted above; the travels appeared as *The Relation of a Journey begun on Dom. 1610, in four books* (1615); also the Rev. Richard Hooper's edition, with memoir, of *The Poetical Works of George Sandys*; and Alexander Brown's *Genesis of the United States*, pp. 546, 989, 992, 994-995, 1032, 1063; article, "Sandys, George," in *Dictionary of National Biography*.

SAN FERNANDO, a seaport of southern Spain, in the province of Cadiz, on the Isla de León, a rocky island among the salt marshes which line the southern shore of Cadiz bay. Pop. (1940) 32,300 (mun. 38,581). San Fernando was probably a Carthaginian settlement. On a hill to the south stood a temple dedicated to the Tyrian Hercules; to the east is a Roman bridge, rebuilt in the 15th century after partial demolition by the Moors. The arsenal was founded in 1790. During the Peninsular War the cortes met at San Fernando (1810), but the present name of the town dates only from 1813; it was previously known as Isla de León. San Fernando is one of the three principal naval ports of Spain. The town is connected with Cadiz (4½ mi. N.W.) by a railway, and there is an electric tramway from the arsenal (in the suburb of La Carraca) to Cadiz. In the neighbourhood salt is largely produced and stone is quarried; the manufactures include spirits, beer, leather, export fabrics, soap, hats, sails and ropes; and there is a large iron-foundry. Nationalists occupied San Fernando early in the civil war of 1936-39.

SAN FERNANDO (DE LA UNION), a municipality, capital and port of the mountainous province of La Union, Luzon, Philippine Islands, on the west coast, 208 mi. from Manila. Pop. (1939) 23,366; 26 were whites. A good road connects it with Bauang, whence there is railway connection with Manila. Tobacco is produced in the surrounding region and is shipped from the port in considerable quantities. Other agricultural products are palay (rice), abaca (Manila hemp), maize (corn), sugar and coco-nuts. Ilocano is the vernacular. Of the inhabitants aged 6 to 19 inclusive, 46.4% in 1939 attended school, and 60.2% of the population 10 years old and over was literate. (C. S. L.)

SAN FERNANDO (DE PAMPANGA), a municipality (with 32 barrios or districts) and capital of the province of Pampanga, Luzon, Philippine Islands, on the Manila-Dagupan railway, in the southeast part of the province. Pop. (1939) 35,662. It is the centre of a fertile agricultural region and has a trade of considerable importance. The vernacular is Pampanga. Of the inhabitants aged 6 to 19 inclusive, 40.3% were reported in 1939 as attending school, while 64% of the population 10 years old and over was reported as literate.

SANFORD a city in central Florida, U.S., the county seat of Seminole county; on Lake Monroe (the head of navigation on the St. Johns river) about midway (by rail) between Jacksonville and Tampa.

It is on federal highways 17 and 92, and is served by the Atlantic Coast Line railroad and river transportation.

Pop. (1950) 11,935; (1940) 10,217 by federal census. The city lies around a wide curve in the lake shore and has several small lakes within its limits. Sanford is a winter resort, with several hotels and provision for all the sports and pleasures compatible with the climate. In 1920 it adopted a commission-manager form of government, and development came under the supervision of a city planning and zoning commission established in 1923. It is the centre of a subirrigated region devoted chiefly to the growing of celery and other truck crops. Sanford is a division point on the railroad; and has precooling plants, a large icing station and several manufacturing industries.

The city was founded about 1871 by Gen. Henry S. Sanford and was incorporated in 1877. In 1887 it suffered from a disastrous fire. The first citrus nurseries in Florida were planted there and Sanford became the chief centre of the production and shipping of oranges. The "great freeze" of 1895

wiped out this industry. Later, however, the cultivation of citrus fruits was revived.

SAN FRANCISCO, premier port and financial centre of the Pacific coast, is centrally located on the coast of California in $37^{\circ} 47' 22.55''$ N. lat. and $122^{\circ} 25' 40.76''$ W. long. It is situated on a peninsula bounded on the west by the Pacific ocean, north and east by San Francisco bay and south by the wooded hills and fertile valleys of San Mateo county. The highest elevation is 938 ft. San Francisco bay is one of the finest and safest landlocked harbours in the world, which partially accounts for the city's importance as a port. Entrance from the Pacific to the bay is through the Golden Gate, a channel having a depth of 63 fathoms and a width of $1\frac{1}{2}$ mi. The city covers 44.6 sq. mi. and is built to an appreciable extent on hills—Telegraph, Russian, Nob, Rincon, Bernal heights, Potrero, Larsen peak, Twin peaks, Mt. Davidson (933.6 ft.), Mt. Olympus, Buena Vista, Lone mountain and Lincoln park. Romantic and cosmopolitan in character, San Francisco holds a lure peculiar to few cities of the world. Population (1950) 760,753; (1940) 634,536; (1930) 634,394, (1920) 416,912.

San Francisco bay contains several picturesque islands, while a number of large cities line the lateral side of the bay. Yerba Buena and Treasure Islands are about half way between San Francisco and Oakland. Yerba Buena is used as a naval station and training school. Treasure Island, site of the Golden Gate International exposition of 1939-40, is used as a naval receiving station. Alcatraz Island stands high above the water and is surmounted by a great military prison, topped by a lighthouse 274 ft. high. Angel Island lies to the north of Alcatraz. Upon it is located Ft. McDowell, the United States quarantine and immigrant station. During World War I the island was used as a training and internment camp.

Belvedere Island is an exclusive residential and yachting territory and lies to the northwest of Angel Island. San Francisco and 11 other contiguous cities account for 1,521,923 persons or one half of the total population of the San Francisco bay region (1950 U.S. census).

The construction of two mammoth bridges has expedited travel over the bay remarkably. The first, the San Francisco-Oakland Bay bridge extending $8\frac{1}{2}$ mi. across the bay, was opened on

one or two extreme exceptions when a very light snowfall was recorded. Long records show heaviest rainfall from November through March, ranging from two to five inches for a single month. Between April and October the rainfall averages less than 0.3 in. per month, with only a trace in July and August. Long records of the U.S. weather bureau show: temperature, mean maximum 62.6°, mean minimum 50.2° and monthly mean 56.1°; relative humidity 69%; total precipitation 22.02 in.; average hourly wind velocity 9.2 m.p.h., prevailing direction, west; sunshine 65% of possible, with 167 all-clear days. Hours of fog over San Francisco bay average 153 per year.

Government.—San Francisco has a consolidated city and county government, with legislative powers vested in a board of supervisors of 11 members, 5 being elected every two years for four-year terms. The mayor, treasurer, assessor, city attorney, public defender, district attorney, sheriff and superior and municipal court judges are elected by the people and serve terms of four years. The chief administrative officer is appointed by the mayor but thereafter has permanent tenure. The controller, appointed by the mayor, subject to confirmation by the supervisors, also has permanent tenure. The mayor appoints members of and supervises police, fire, civil service, public utilities, park and recreation, welfare, library and city planning boards or commissions, and may remove his appointees except civil service, public utilities and welfare commissioners. The mayor also has a power of veto over legislation. The San Francisco Unified school district and the city and county have coterminous boundaries. Members of the board of education are nominated by the mayor and passed on by the voters.

San Francisco's five charters were granted respectively in 1850, 1856, 1861, 1898 and 1932. Initiative and referendum clauses were first embraced in the 1898 charter.

Outstanding are the many public buildings, street improvements, parks and other achievements. The fire and police departments were established on a sound base. The police department in 1950 employed 1,771 and the fire department 1,734. The water system is municipally operated. The average daily water demand on the system is 83,300,000 gal. The city also possesses extensively developed power resources.

History.—In his search for Monterey, Don Gaspar de Portola, governor of Lower California, left San Diego in July 1769 and some months later members of his little band discovered San Francisco bay and the tip of the peninsula whereon the city is situated. From that time until California became a part of the United States, San Francisco became an objective of international strategy.

In 1775, Don Manuel Ayala sailed through the Golden Gate in the "San Carlos," a packet of the Spanish royal navy. It was the first ship to gain entrance to the bay from the Pacific ocean. While the Spaniards won the credit of the discovery, the English, years before, narrowly missed gaining possession of the bay and the surrounding territory as well, for in 1579 Sir Francis Drake, the English explorer, sailed within a few miles of the "Golden Gate" and came to anchor in a little cove a few miles north, in what is known as Drake's bay.

In 1776 a land expedition commanded by Col. Juan Bautista de Anza arrived on the peninsula and established the Presidio and the Misión Dolores. The following year (1777) Padre Junípero Serra, father of the California missions, arrived. With the establishment of the Presidio, and the subsequent establishment of the *pueblo* of Yerba Buena, began the San Francisco of the present. From 1776 until 1806 the inhabitants, soldiers and missionaries led a quiet, happy existence, occupying themselves with building the mission and the presidio, and doing only work enough to get the necessities of life. For excitement they had their Spanish *fiestas*, cockfights and rodeos, while from time to time sailors, adventurers and visiting ranchers added a novelty. Trading in hides and tallow constituted the principal business of the period, though wines and brandies made by the missionaries were exchanged for ship's goods of varied assortment. Fur trading was also beginning to take on a commercial aspect. Eventually, this proved to be the principal business of the community.

WEATHER GRAPH OF SAN FRANCISCO. THE THERMOMETER INDICATES THE ANNUAL MEAN TEMPERATURE. THE MIDDLE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE. THE CURVES ABOVE AND BELOW, THE HIGHEST AND LOWEST EVER RECORDED. THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION

Nov. 12, 1936. It is the longest bridge in the world over navigable water and was erected at a cost of \$77,200,000, to be liquidated by tolls. The second bridge spans the famous Golden Gate with a central suspension section of 4,200 ft. It was erected at a cost of \$35,000,000 and was opened to the public on May 28, 1937.

The climate is practically free from extremes, with a uniform relative humidity and an abundance of sunshine. Rainfall constituted the entire precipitation over a period of 50 years, with

In 1806 Russia made an attempt through Nicolai Rezanov (q.v.) to establish a settlement and lay claim to some territory on the name of the tsar.

They were unsuccessful, but a Russian colony was eventually planted at Ft. Ross, less than 100 mi. north of San Francisco, which was intended to serve as a supply station and vegetable farm for the Russian possessions in Alaska. The outpost was established in March 1811 and a stockade was built on Bodega bay. It became the headquarters for Russian traders and trappers of seal and sea otter. Until they abandoned it in 1841, their growing inroads toward the San Francisco bay area were a source of irritation to the provincial authorities.

With the exception of a few quarrels between Mexicans and foreign colonists, as the Americans and other nationalities were called, all was tranquil until war was declared by the United States on Mexico on May 13, 1846. There was great excitement in San Francisco some weeks later when the news arrived. On July 9, 1848, Capt. John B. Montgomery of the U.S. navy, arrived with the sloop-of-war "Portsmouth" and raised the U.S. flag on the plaza, known now as Portsmouth plaza, claiming the territory for the United States. The community continued under the name of Yerba Buena until 1847 when it was changed to San Francisco. At this time there were some 200 buildings and 800 inhabitants in the village.

The discovery of gold at Coloma in Jan. 1848 was not taken seriously in San Francisco, and it was not until April of that year that the settlement became infected with the "gold bug." Then every one with an outfit stampeded for the mountains in search of gold. Then a city of tents and shanties arose; gambling was rife and prices extraordinary.

During the early '50s San Francisco experienced its darkest days. Crime was rampant, while the city government was too inefficient or too indifferent to suppress it. Bancroft, in his *History of California*, states that up to 1854 there were 4,200 homicides and 1,200 suicides, while the records of the next few years following show many deaths by violence, the high mark being reached in 1855 with 585.

In 1851 the Vigilance committee was formed and freed the city of most of the lawless element, either by hanging or driving them from the town. It was necessary for the committee to come together again in 1856, when for a second time it succeeded in restoring order in the community. Altogether more than 8,000 reputable citizens served on the two committees.

With the decline of gold production between 1855 and 1860, San Francisco came into its own as the Pacific coast's main port, and through world trade the city grew substantially and conservatively. This reign of conservatism, however, was interrupted by the unparalleled development of the Nevada silver mines and the city again experienced days similar to those of '49. There was a long period of frenzied speculation during which huge fortunes were won and lost within a few minutes. Panic gripped the people and only the financially strong survived. Many descendants of the successful financial giants of the silver period reside in San Francisco and have so handled their heritage that they are numbered among California's wealthiest and most influential citizens.

At the outbreak of the Civil War San Francisco showed evidence of being strongly pro-Union although thousands of arms were shipped in, to Southern sympathizers, for the purpose of winning Californians over to their cause or to encourage them to launch an independent republic. Nothing came of this venture and San Francisco remained, with California, a Union stronghold. The famed Pony Express, established in 1860, for a short time gave San Francisco quick mail and express communication with the interior of the country. The city's isolation, however, was not permanently removed until the first transcontinental railway was opened in 1869. The railway to Los Angeles was completed in 1876, thereby giving San Francisco connections with the east and south. (See below for an account of the earthquake and fire of 1906.)

Industries and Commerce.—California department of employment figures for 1947 showed that in San Francisco there were 2,315 manufacturing establishments, 71,013 wage earners

and \$242,120,000 in annual wages. According to the federal census for 1947, there was \$410,326,000 value added by manufacture. In the six-county bay area there were 3,671 establishments, 131,761 wage earners making \$393,346,000, \$1,049,490,000 value added by manufacture.

The ten manufacturing groups reported with the highest value added by manufacture in San Francisco in the 1947 U.S. census, as shown in the accompanying table, amounted to \$358,659,000 out of a total value added by manufacture for all products of \$410,326,000.

Food and kindred products	• • • • •	\$122,436,000
Printing and publishing	• • • • •	71,260,000
Apparel and related products	• • • • •	35,815,000
Fabricated metal products	• • • • •	35,108,000
Chemicals and allied products	• • • • •	18,164,000
Machinery, except electrical	• • • • •	23,228,000
Furniture and fixtures	• • • • •	14,517,000
Paper and allied products	• • • • •	19,189,000
Electrical machinery	• • • • •	5,120,000
Miscellaneous manufacturing	• • • • •	7,601,000

The sales of San Francisco firms selling at wholesale, in 1948 federal census, amounted to \$4,020,854,000 or \$2,643,240,000 above the 1939 total. Trade at retail in San Francisco of 23,863 licensed retail outlets, as reported in 1949 by the state board of equalization, was \$1,274,357,000. The annual pay roll amounted to \$175,268,000. In addition to the retail trade in San Francisco there were 6,558 service establishments reporting in 1947, with annual receipts of \$187,890,000. These establishments reported 47,859 employees and an annual pay roll of \$128,328,000.

San Francisco's business extends to all parts of the world; in the confines of the immediate trade area are a number of cities and towns, the greater number of which border on the bay. In the west bay section, on the San Francisco peninsula, the outstanding communities are San Francisco, Burlingame, San Mateo, Redwood City, Palo Alto and San Jose. North of San Francisco on the Marin peninsula are the towns of San Rafael, Sausalito, Mill Valley and San Anselmo.

In the east bay region are Oakland, Alameda, Berkeley, Richmond and San Leandro.

These sections form a central unit and comprise the immediate all-year market.

Transportation and Distribution.—Converging in San Francisco are 7 major transcontinental rail routes and numerous local routes; 68 regularly scheduled shipping services plus 105 other lines calling irregularly, and 13 bulk carrier fleets including tankers; more than 40 common carrier truck lines and hundreds of others offering nonscheduled services; and 4 transcontinental bus routes.

The San Francisco bay area ranked sixth (1947) in tonnage of water-borne commerce of all U.S. ports, with an 18,000,000-ton lead over any other Pacific coast port. San Francisco is the focal point of two bridges, the San Francisco-Oakland Bay bridge, a link in both federal highways 40 and 50, and the Golden Gate bridge, a link in federal highway 101.

Three modern air terminals in the bay area are within 30 min. of the heart of San Francisco. The enlarged municipal airport is the focal point of transcontinental and north-south services by transport planes. In 1950 there were five scheduled domestic air carriers and scheduled overseas services to the Hawaiian Islands, the orient and Australia.

The bay area is 450 sq. mi. The harbour has 18 mi. of berthing space, including 43 modern piers equipped with complete facilities. The harbour is controlled by a board of state harbour commissioners appointed by the governor.

In 1949, 3,731 ships with a registered tonnage of 18,189,385 arrived, and 3,726 ships with a tonnage of 18,146,704 departed. San Francisco's exports in 1949 were valued at \$311,469,972; imports, \$212,614,866.

The ten largest export classifications are vegetable products, edible and inedible and beverages; machinery and vehicles; textiles; nonmetallic minerals; chemicals; animals and animal products, edible and inedible; metals; wood and paper.

The principal imports are raw silk, coffee, sugar, copra, coco-

nut oil, burlap, newsprint and tea. The 1948 report of the army chief engineer shows the relative tonnages of the water-borne commerce of San Francisco bay as follows: total (long tons) 29,042,055; foreign 2,885,902; coastwise 19,225,593; internal and intraport 7,676,571.

Rail traffic in San Francisco totalled 167,822 cars in 1949. San Francisco airport traffic in 1949 totalled 78,332 planes, 1,038,962 passengers, 14,956,009 lb air mail and 6,935,745 lb. air express.

Finance.—The Federal Reserve bank of San Francisco is the headquarters of the 12th federal reserve district, which ranked third among the 12 districts with the volume of business during 1949, measured by bank debits totalled \$115,375,573,000. The San Francisco stock exchange (nation's second largest regional security market) transactions during 1949 reached a market value of \$145,591,885. There is also the San Francisco mining exchange.

There were 18 banks in San Francisco in 1950, several with branches. A few operated branch systems throughout the state. Thirteen banks were under state supervision—six commercial; two commercial and savings; two commercial, savings and trust; one savings, two savings and trust; and one title insurance company operating trust departments. There were five national banks.

San Francisco bank clearings in 1949 totalled \$19,512,000,000 and ranked fifth in the nation, and bank debits totalled \$28,032,353,000. San Francisco's 18 banks reported as of Dec. 31, 1949, total deposits of \$8,795,095,670, of which \$4,048,466,479 were time and \$4,746,629,191 demand. Total resources amounted to \$9,452,612,874.

Since there is no state property tax, the only levy in San Francisco is the combined city and county tax. The tax rate for the fiscal year 1949-50 was \$5.66 on \$100 assessed valuation. Revenues receivable during the 1949-50 fiscal year were estimated at \$133,320,341, of which \$60,647,398 was from taxes on property assessed by city and county and the state board of equalization.

Education.—San Francisco's institutions of learning include the affiliated colleges of the University of California, San Francisco State college, the University of San Francisco, City College of San Francisco and numerous law and medical schools. Eight miles across the bay from San Francisco, at Berkeley, is the University of California, one of the largest in the United States; while at Palo Alto is Leland Stanford Jr. university (g.v.). Near Oakland is St. Mary's college, and in the hills of Oakland is Mills college, an institution for women.

During the school year ended June 1950 San Francisco public day schools had an enrolment of 184,285—9,419 in kindergartens, 40,529 in elementary schools, 12,402 in junior and junior-senior high schools and 15,323 in high schools. At the same time there were thousands in special schools, 91,609 adults in evening schools and 17,013 in junior colleges. There were 3,270 teachers. The average daily attendance was 79,289 in public schools. The operating cost per average daily attendance in 1949 was \$278.39. The value of the school property was \$52,362,854.

Public schools were listed as follows: 78 kindergartens, 81 elementary and grammar; 20 junior high schools; 9 senior high schools; 3 adult evening schools; 1 continuation school; 5 adult day schools and 1 junior college.

Public Buildings and Parks.—The group of buildings in the civic center consists of the city hall, Exposition auditorium which has a seating capacity of 12,000 in the main auditorium, San Francisco public library, the state building, an opera house and other buildings, and a federal office building. A mint building was finished early in 1937.

California palace of the Legion of Honor, in Lincoln park overlooking the Golden Gate, is a replica of the palace of the Legion of Honor in Paris.

In Golden Gate park are the De Young Memorial museum, Academy of Sciences, Steinhart aquarium and the Museum of Anthropology. Near the Presidio is the San Francisco museum of art. At Kearny and Washington streets is the Hall of Justice, containing police courts and the criminal department of the superior court. Other buildings are the old United States

mint, built in 1874; the post office; the customs house and the United States appraiser's buildings; and the Ferry building, built by the state in 1896, which is 659 ft. long and 156 ft. wide, containing many state offices.

San Francisco is noted for its parks. There are 54 parks and 94 recreational units, with a total acreage of 4,635.37. In addition to the municipal parks, the several government reservations, the largest of which is the Presidio comprising 1,542 ac., all go toward augmenting the aggregate area of the city parks. All of San Francisco's parks are "man-made."

The Golden Gate park, a well-known playground, comprises 1,017 ac. and is about 3 mi. long and 1/2 mi wide, extending from Stanyan street on the east to the Pacific ocean on the west, and lies in the midst of San Francisco's residential districts. In the park are many museums and monuments, an aviary, aquarium, music temple, stadium, tennis courts, baseball and football grounds, bridle paths, an athletic field and running track, paddocks and children's playgrounds. Improved driveways in the park exceed 25 mi in length. At the western end of the park is to be seen the sloop "Gjoa," the only vessel that ever navigated the northwest passage; it was given to San Francisco by its owner, Capt. Roald Amundsen.

Streets and Boulevards.—San Francisco's street system was begun in 1835 when Calle de la Fundación or Foundation street was laid out. The first survey, made in 1839, covered what is now the financial and retail sections of the city. Other streets and avenues were gradually added until 1845 when Jasper O'Farrell made a second survey. This system applied the "checkerboard layout" with Market street the main artery and division point.

The streets north of Market run north and south and east and west; the streets south run parallel to Market street and at right angles. The Market street slant is about southwest and northeast. Among the scenic boulevards are the Marina, Twin Peaks, Market street extension, Lincoln, Embarcadero and Great Highway paralleling the ocean.

San Francisco's Chinatown comprises an area paralleling Grant Ave. between Bush St. and Columbus Ave. The "town" is hedged in by the financial, hotel and apartment house districts and a part of North Beach or "Latin Quarter."

A chamber of commerce study indicated that in 1949 there were 20,000 Chinese residents in San Francisco, most of whom resided in Chinatown.

Fires, Earthquake and Reconstruction.—Seven times San Francisco has been swept by disastrous fires. The first fire of note occurred on Dec. 24, 1849, and was followed in quick succession by others on May 4, 1850; June 14, 1850; Sept. 17, 1850; May 4, 1851, and June 22, 1851. In 1906 came the greatest conflagration experienced on the western coast.

Following the earthquake which occurred early on the morning of April 18, 1906, flames swept through the city creating havoc, especially in the central business and residential sections. Thousands of buildings, hundreds of lives and approximately \$350,000,000 were the losses sustained. An area of 497 city blocks, or 4 sq.mi., was devastated. According to official records 28,138 buildings valued at \$105,000,000 were destroyed. The value of the contents of the structures wiped out was impossible to estimate. Insurance companies and San Francisco financial houses estimate the insurance paid at \$300,000,000, though many companies failed in the attempt to meet their obligations, while others repudiated them. Aid in the form of money to the sum of \$10,000,000 was contributed by American, European and Asiatic communities, while additional millions in food and clothing were rushed to the stricken city, whose inhabitants slept in the remaining houses, parks and the streets for weeks. The flames were subdued by the generous use of dynamite, with the result that many expensive buildings were sacrificed to "back-fire" to save other sections of the city. While San Francisco had experienced earthquake disturbances in 1868, 1898 and 1900, that of 1906 was the most violent.

Within a remarkably short time San Francisco began the struggle to rehabilitate itself. Owing to the courage and energy of

the people, within a year following the catastrophe the city was taking on a somewhat normal appearance. The new structures were planned along more costly and substantial lines. With the aid of San Francisco banks and the money received from insurance companies, the city went forward step by step and a beautiful San Francisco once more arose from the debris and ashes.

(R. B. Kr.; W. Br.)

SANGER, JOHN (1816-1889), English circus proprietor, was born at Chew Magna, Somerset, in 1816, the son of an old sailor who had turned showman. In 1845 he started with his brother George a conjuring exhibition at Birmingham. The venture was successful, and the brothers, who had been interested spectators of the equestrian performances at Astley's amphitheatre, London, then started touring the country with a circus entertainment consisting of a horse and pony and three or four human performers. Eventually John and George Sanger became lessees of the Agricultural hall, London, and there produced a large number of elaborate spectacles. In 1871 the Sangers leased Astley's where they gave an equestrian pantomime every winter, touring in the summer with a large circus. Subsequently the partnership was dissolved, each brother producing his own show. John Sanger died while touring, at Ipswich on Aug. 22, 1889, the business being continued by his son.

SANGERHAUSEN, a town in the Prussian province of Saxony, Germany, near the south base of the Harz mountains, 30 mi. W. of Halle. Pop. (1939) 12,653. Sangerhausen is mentioned in a document of 991 as appertaining to the estates of the emperor.

By marriage it passed to the landgrave of Thuringia, it fell in 1249 to Meissen, and in 1291 to Brandenburg. In 1372 it passed to Saxony and formed a portion of that territory until 1815 when it was united with Prussia.

SAN GERMÁN, a town in the southwestern part of Puerto Rico, about 5 mi. from the Mona channel on the west and the Caribbean sea on the south.

The population of the town by the census of 1950 was 8,872, and of the municipal district, 29,553.

The original settlement was founded in 1512 by Diego, a son of Columbus. The modern town of San Germán was founded in 1573, after the old San Germán was destroyed by French pirates. For many years San Germán was the seat of government of the western district.

The Porta Coeli convent, one of the oldest buildings of the Spanish settlement in the West Indies, was built in 1538. The Puerto Rican Polytechnic institute, offering undergraduate studies, is located at San Germán. (J. L. Ex.)

SANGIHE (SANGIR) AND TALAUT ISLANDS, a group of islands off the northeast coast of Celebes, Netherlands Indies. Area, 808 sq. mi.; population (1930) 158,729, including 93 Europeans and 2,814 Chinese.

The Sangihe Islands continue the northeastern extension of Celebes toward Mindanao, in the Philippines, and are set upon a long, narrow ridge, along a volcanic band, with very deep water on either side.

Although fringed with recent coral formation, they are distinctly volcanic, with active volcanoes, Mount Awu, on Sangihe Island, having experienced recent severe eruptions, while earthquakes also have occurred. Sangihe, Siau and Tagulanda are the chief islands, and Talisse and Banka (Banka lies off the east coast of Sumatra) are between Tagulanda and the mainland of Celebes.

Banka gives its name to Banka passage, the channel by which entry is obtained from Celebes sea to the Molucca passage. Sangihe is 27 mi. long, and from 9 to 17 in width, is mountainous in the north, elevation decreasing considerably in the south, and has a coast which is generally steep. It has an average rainfall of 195 in., and, with Siau, has an exceptionally fertile volcanic soil with extensive cultivation of nutmegs, coco-nuts and Manila hemp. Taruna, on the west coast, is the capital, where a *contrôleur* resides who is in charge of all of the islands. It, and Peta, on the east coast, are regular ports of call; also Huhu, the capital and port of Siau, and Tagulandang, and Talisse, on the islands of that name. Tagulandang has two mountains of 2,500

ft., sloping from east to west, and Ruang, a small island west of Tagulandang, has an active volcano.

The people of Sangihe and Siau are closely related to the people of Minahasa and of portions of the Philippine Islands, with fair complexion, high nose and stiff, short black hair. They were formerly terrorized by the dreaded pirates of Sulu (islands off the S. E. coast of Mindanao, in the Philippines). But later, under direct Dutch rule, the Sangihe and Siau islanders progressed wonderfully, under the peaceful regime of Dutch rule, like their near relatives the Minahasese, and like these also, they became mostly Christians. Society is based on the matriarchal system, and the people, who speak a language of their own, live by agriculture and fishing and trading in wood, copra and nutmegs. The very fine and white Manila hemp they grow is practically only for domestic consumption, and its weaving is the most important industry. The Talaut, or Talaud, Islands consist of a group lying northeast of Sangihe, the chief of which is Karakelang, 39 mi. long and 15 wide, in the north. Heights of 2,300 ft. are said to exist in the southern part. The coast is steep, except on the south shore, which is fringed by a wide reef. Some tiny islands known as the Nanusa Islands lie northeast of Karakelang, and vessels run regularly to these, and to Beo, the capital of Karakelang, and of the group, where a *gezaghebber* resides, also to Lirung, the port and capital of a long lying lying close to and southeast of Karakelang. The Sangihe and Talaut Islands were incorporated under the direct rule of the Dutch governor of Ternate as far back as 1677. Later they were attached to the residency of Manado; in 1942, during World War II, they passed under Japanese military control. (E. E. L.; X.)

SAN GIMIGNANO, a town of Tuscany, Italy, in the province of Siena, 24 mi. N.W. of Siena, at an elevation of 1,089 ft. Pop. (1936) 3,426 (town); 11,270 (commune). Being surrounded by its ancient walls, and retaining 13 out of its original 72 towers, it is, with its predominantly Gothic architecture, a thoroughly mediaeval town in appearance. In the Palazzo Comunale (1288-1323) is a fresco by Lippo Memmi of the Madonna enthroned (1317), copied from the "Majestas" at Siena. The Collegiata (the former cathedral) of the 12th century was enlarged after 1466 by Giuliano da Maiano, whose brother Benedetto carved the altar and ciborium in the chapel of S. Fina. The beautiful frescoes with scenes from her life (she was a local saint who died at the age of 15 in 1253) are the earliest work of Domenico Ghirlandajo (1475). The cathedral contains other 14th-century and early Renaissance paintings, including New Testament scenes by Barna da Siena (1380) and some fine choir stalls. S. Agostino (1280-1298) contains a famous series of frescoes by Benozzo Gozzoli, with scenes from the life of St. Augustine (1463-1467). The town was independent in the 13th century, but in 1353, owing to the dissensions of the Salvucci (Ghibellines) and Ardinghelli (Guelphs), it fell into the hands of Florence.

See R. Pantini, *San Gimignano e Certaldo* (Bergamo, 1905).

SAN GIULIANO, ANTONINO PATERNO-CASSELLI, MARQUIS DI (1852-1914), Italian statesman, was born at Catania on Dec. 10, 1852, a member of a noble Sicilian family. After graduating in law at the University of Catania he became, in 1879, mayor of his native city, and in 1882 was elected to parliament. When in 1892 Signor Giolitti became premier, San Giuliano was selected as undersecretary for agriculture, while in the second Pelloux ministry (1899-1900) he held the portfolio of posts and telegraphs. Having been defeated at the election of 1904, he was nominated senator. When in Dec. 1905 Signor Fortis became prime minister he was appointed minister for foreign affairs, and on the fall of the cabinet early in 1906 he was appointed ambassador in London, where he remained until 1910. From London he was transferred to Paris, but he soon returned to the Consulta as foreign minister in the Luzzatti cabinet (1910-1911), and continued at the same post in Signor Giolitti's administration. San Giuliano was an ardent believer in the Triple Alliance but having retained his portfolio under Salandra, after Giolitti's resignation in March 1914, he carried out with complete loyalty the policy of neutrality adopted by Italy on the outbreak of World War I. He died in Rome on Oct. 16, 1914.

SANGLI, an Indian state, in Deccan and Kolhapur Agency, ranking as one of the Southern Mahratta Jagirs. The territory is widely scattered among other Indian states and British districts. Area, 1,146 sq.mi. Pop. (1941) 293,381. The town of Sangli has a station on the Madras and Southern Mahratta railway, 11 mi. from Miraj Junction. Pop. (1941) 34,781.

SANHEDRIN: see SYNDORIUM.

SANITATION: see HYGIENE.

SANITATION OF BUILDINGS. To preserve the health of the occupiers of any building, it is imperative that all polluted water and solid organic refuse should be removed from the premises at frequent intervals. Where the buildings are in a town it is usual for the local authority to remove the solid dry refuse by carting, but where a public water supply is available, liquid wastes are flushed away through a system of pipes. These latter comprise waste pipes to carry washing water, soil pipes to carry human excreta and rainwater pipes. If such pipes pass under the grounds of the premises they are termed drains and usually discharge eventually into the sewers in the public highway or into cesspools or septic tanks.

Drains.—Outside drains are usually composed of glazed stoneware or vitrified earthenware pipes, 2 ft long, not often larger than 4 in. diameter for branches and 6 in. diameter for the main drain. All drains inside a building, whether under or above ground, are usually of iron pipe. If the pipes are cast iron the joints are caulked with oakum and molten lead. If of wrought iron or steel they are screw joints.

All drains that carry solids should be provided with accessible clean-out caps, which can be readily unscrewed for the admission of cleaning rods, to remove obstructions which may choke the drains. It is good practice to have a clean-out cap or plug at each change in direction of a drain pipe. The drains must be run straight between these clean-out points.

Soil Pipes.—In British plumbing practice these are not disconnected where they are joined to the drains, but waste pipes and rainwater pipes discharge into or onto gully traps at the base of the wall. Each house should have its own system of drains, separated from the sewer by a disconnecting chamber or manhole. The chamber is usually placed near the boundary of the property so as to prevent, as far as possible, the entry of sewer gas into the house drainage system. The intercepting trap is shaped so as to allow of removing obstructions on the outer side of the trap, and it is preferable for the manhole cover to be sealed. If the chamber is in an isolated position, the cover, which should be of cast iron, may be provided with a grating to afford means of ventilation, otherwise the chamber is fitted with a ventilating pipe to form a fresh-air inlet, and this is carried up well above ground level to some position where an accidental emission of drain gas would not cause a nuisance. Any such chamber should be built of the best bricks or cement concrete, suitably provided with curved channels for the branch connections. Such channels may be formed in the concrete or composed of half-round glazed pipes. Where inspection at bends is required, or where branches meet, but where it is considered to be too expensive or unnecessary to build a chamber, a shaft of 6 inch pipes is sometimes substituted, the whole being carefully jointed and supported by concrete. Since complete access to the drain is then impossible, the inspection will be confined to locating the position of a blockage or leakage to any particular length of pipes. When there is any possibility of the drains being flooded by the sewer, special interception traps are used in which a floating ball seals the inlet, and so prevents the reversal of the flow. No traps in which hinged valves or other mechanical contrivances are made use of, should be allowed.

— In American plumbing practice all soil and waste stacks are usually installed within the buildings to prevent them from becoming frozen. These stacks generally are connected at their base to a system of iron main drain and branch drains in the basement, either at the basement ceiling or under the basement floor. In some cities, it is compulsory to have a main drain-trap with a fresh air inlet pipe located at the point where the main house-drain leaves the building to disconnect the house from street sewer gas,

and to insure a proper ventilation of the house drainage system.

In other sections of the United States, however, the main drain-trap and fresh air inlet are not permitted. In such places the house-drains run directly to the sewer, cesspool, or septic tanks, without the intervention of a main or intercepting trap.

The gradients of the drains are usually arranged as to not only ensure the system being self-cleansing, but also so that they do not discharge their contents at such a rate that the solids are left behind to putrify on the sides of the channels. It is usual to fix the velocity at about 3 feet per second for these purposes.

Advantage may be taken of an inspection chamber or shaft to provide ventilation to the drains. All connections between branches and the main drain are made by specially designed pipes provided with junctions.

Drain Tests.—Drain testing is undertaken for two reasons:—(a) to ensure that the system of a new house is satisfactory before the dwelling is inhabited, (b) to locate defects in systems already in use. The testing in each case differs somewhat as it is considered that new drains should be able to pass severer tests than those which have been in use some years. New drains are, therefore, usually subjected to the "water test" in which any length of the drain is first closed at the lower end by some form of plug or stopper, and the drain is then filled with water so as to give a maximum head of pressure of not more than about 6 feet. The stopper is fitted with an expanding rubber ring, and constructed in some cases so that the air can escape, and the required head may be obtained by adding vertical lengths of 1 inch diameter pipe to a similar plug at the upper end of the pipe line. A slight diminution in the head may be observed at the commencement of the test, due to absorption by the joints and possibly by the pipes, but this will soon cease, and no further drop should occur for a period of an hour. The pipe trenches should all be left open until the tests have been made, the inspector being thus able to locate any fault if indicated by a fall in water level. For drains already in use it is customary to use the "smoke test." For this machine are used which generate smoke and then, by means of fans or pistons, pump it into the branch or main drain. Compressed air tests are also used, any leakage being shown on the gauge attached to the pump. Smoke "rockets" have been advocated in the past, but the amount of smoke generated is small and the effect is local. Smell tests, using peppermint, calcium carbide, etc., have also been used, but the difficulty in locating the leakage of a smell, and the great difficulty in preventing the chemical getting on the hands or clothes, has made this test almost obsolete. If smoke is used it is generated in a receiver connected to the fan or pump on one side and to a hose on the other, and is formed by the burning of oily waste, or any substance which will give off a dense cloud.

Obstructions in drains are usually removed by rods which can be jointed together to form any length, and occasionally fitted with brushes or scrapers.

Traps.—In British plumbing practice all parts of the drainage system, when there is any possibility of drain air entering the house, are disconnected by traps, the only exception being the soil pipe, which is connected to the drain by a bend. Such traps are placed either on the drainage system itself, or under each of the house plumbing fixtures and the "Seal" should always be about 2 in. to avoid the effect of evaporation. Gully-traps

are installed to disconnect roof-leaders and sink waste-pipes from the drainage system. For sink wastes the liquid has to pass along an open channel outside the building for a length of at least 78 in. before entering the trap. It is intended to so prevent grease entering the drain by causing it to cool and solidify and remain either in the channel or the trap.

Grease traps are frequently specially provided where large quantities of grease may be expected, as from the cooking departments of hotels and clubs. The hot liquid enters near the base of the apparatus and leaves at the same level, and the grease rises

FIG. 1.—RAINWATER GULLY

to the surface where it cools and solidifies. The water area is made as large as practicable and a wire basket or galvanized iron cage is provided to remove the grease, which operation should be frequently carried out.

Another type of grease trap operates by means of a syphon, the grease on the water surface being broken up by a flush, but it is generally found unsatisfactory. Traps are always placed under all sanitary fittings and are of the P or S type.

In American plumbing practice every plumbing fixture including baths, shower receptors, water closets, urinals, lavatories, or wash basins, sinks, laundry tubs, floor-drains, area-drains, roof

water-leaders and every fixture or fitting that discharges into a house drainage system must be properly and effectively trapped as close to the fixture or fitting as conditions will permit. These traps are of a variety of forms such as P. S. bottles, pot or drum, etc. All have water seals. Some are provided with check valves to prevent a back-flow of sewage through them. None, however, are permitted which depend upon mechanical contrivances as a substitute for a water seal. The water seal may, however, be augmented by a float, a check valve or other contrivance which will automatically close against back pressure. This protects the house against a backing-up of sewage as from a choked or flooded street sewer.

All fixture traps within a building must be protected against loss of seal by syphonage or air compression. The seal must remain intact to prevent sewer gas from entering the building through the traps. This trap protection is accomplished by the installation of special arrangements of vent piping which opens to the outer air and maintains the air pressure back of the trap seals practically at atmosphere.

Antisiphonage.—Since every sanitary fixture in a building must be trapped, possibilities might arise in which the seals of such traps would be broken by either increase or decrease of the air pressure unless provided against. Such cases would occur where a range of fixtures were connected to one soil or waste pipe and hence an antisiphonage or vent pipe is always provided. If no ventilating branches were provided it might be possible for a fitting on an upper floor to syphon out the water in the trap

FIG. 2.—GREASE TRAP

FIG. 3.—VENTILATION SYSTEM FROM LAVATORIES

of the fittings below by reducing the air pressure in the branch. Unsealing could also happen through the discharge of the upper fitting compressing the air in a branch below and so forcing the seal of a trap below. While such possibilities are not nowadays considered of such importance as formerly, the antisiphonage pipes are always fitted, as they form a convenient method of ventilating the branches. Each antisiphonage pipe connects the head of the trap to a ventilating stack which may be carried up above the eaves of the house, or may be connected into the soil pipe above the highest branch. Such soil pipe has, in any case, to be continued full bore either well above the eaves, or to such a position that the gases let free cannot cause a nuisance or enter the house by means of chimneys, skylights, windows or other openings. The open ends of soil pipes, and any other pipes used as ventilators, are best covered by a wire cage to prevent their being used by birds for nesting purposes.

Water Closets.—Of the sanitary fittings or fixtures usually found in buildings, the water closet is of the most importance. The "wash-down" and syphon closets are now practically the standard types, being simple self-cleansing, reasonably quiet and

having no moving parts. They may either stand on the floor or be supported by brackets.

The "valve" closet is the most modern adaptation of the now obsolete "pan" closet. It has the disadvantage of possessing many moving parts, and requires careful setting and use. It can, however, be quite a successful and hygienic apparatus but is usually expensive.

All closet basins are now made of the plainest and simplest design possible and are usually of white glazed stoneware. All sharp bends or angles are carefully avoided, and no part of the apparatus is allowed to be concealed by woodwork or ornamental finish. The flushing is arranged to not only throw a strong rush of water into the trap, but a portion of the flush is passed round the hollow rim to cleanse the sides of the basin.

Flushing Cisterns.—In Great Britain these are always specified to be of the "waste-water-prevention" type as the Water

FIG. 4.—COMBINED SYSTEM OF HOUSE DRAINING
FIG. 5.—SEPARATE SYSTEM OF HOUSE DRAINAGE

Companies insist that their discharge shall be limited to a specified amount at each use. Two gallons is usually allowed, but three would be better, and unfortunately as little as one and a half gallons is often found. The cistern should be placed not less than five feet above the fitting flushed and connected to the latter by a $1\frac{1}{2}$ inch diameter pipe, so as to give a good rush of water. An overflow must be placed below the inlet and should discharge direct into the open air, so as to give warning of irregular working of the valve. Similar cisterns are also made to discharge automatically at chosen intervals and so flush such fittings as ranges of urinals and closets. It is compulsory for such cisterns, whether automatic or otherwise, to be fitted to all apparatus receiving human excreta, so that there shall be no possibility of contamination of the rest of the water in the building. As regards the regulations in force for house drainage, reference should be made to the local by-laws, as these vary in detail in the different towns.

In the United States the water closets in general use in residences are flushed by "low-drain" tanks usually of vitreous china. The flush connection is generally about 2 in. diameter and short. The tank is supplied with water through a ball catch and a $\frac{1}{2}$ in. supply pipe. The flushing appliance generally is either in the form of a syphon within the tank or a hollow flush valve usually of rubber. Each tank is provided with an overflow to the closet bowl, and a re-fill tube, which re-establishes the seal in the closet-trap after the flush has stopped and while the tank is being re-filled by the ball cock. Tank closets are generally installed in residences and other buildings, where the water supply pipes are comparatively small in diameter.

Direct Flush Valves.—In large buildings such as hotels, office buildings, etc., where the water supply pipes are comparatively large, the water closets are flushed directly from the water supply pipes through slow-closing flush valves. These may be regulated to any length of flush desired. When the closet is properly flushed the valve shuts automatically. It is a mistake to install these valves when the supply pipes are too small or the pressure too low. The pipes should be larger than one inch and the pressure greater than 20 lb. per square inch behind the valve.

Baths.—In Great Britain baths are now usually made of enamelled cast iron or glazed stoneware, but copper and zinc have occasionally been used. The two latter, however, require the support of framing, which is usually of wood, a material which is unsuitable for the hot, moist atmosphere of a bathroom. Cast iron baths may be provided with feet, but the stoneware type generally rest direct on the floor. The end at which the taps and outlet are fixed should be as close to the outer wall of the room as possible, so as to shorten the branch waste-pipe, and an overflow must be provided, which should not discharge into the trap as is sometimes permitted, but into the open air. The bath should be not less than six feet in length and should hold about 30 gallons of water when filled up to the overflow level.

In the United States baths are generally made of cast iron enamelled, both inside and out. Those standing on feet and detached from the wall are now seldom installed, except in cheap buildings. The most popular forms of baths are of the "built-in" type. Their sides are extended down to the floor and their rims are let into the wall, the floors and walls being tiled around the bath and made watertight.

As a sanitary precaution to prevent the bath contents from becoming syphoned back into the water supply pipes, when the water is shut off, and thereby contaminating them, it is advisable to have the bath supply-nozzle above the bath overflow level. Submerged supply-nozzles should not be installed.

Showers.—The shower is the most hygienic form of bath, as one bathes in running water. It is very popular in residences, hotels, schools, factories, gymnasiums, etc. Special care should be taken in designing shower supply piping that the temperature of the shower will not change suddenly while a bather is under it. Otherwise the bather may become scalded. Prevention lies in a proper piping arrangement, or a hot water supply temperature 120 degrees or lower, or by the installation of appliances to control automatically the shower temperature. A shower may be arranged over a bath, or over a floor receptor furnished with a floor drain. The control valves should be located so that they may be reached from outside the shower. Shower bathing has become so popular in America that many of the leading hotels are now equipped with one shower in each room, in addition to the regular plunge baths.

Urinals.—In Great Britain these fittings are not usually provided in private houses but are necessary in such places as hotels and clubs. They should be simple in design and provided with an automatic flushing cistern. They are usually about 4 feet high, are made of glazed porcelain and in as few parts as possible, and flushed by pipes or sprays at the back. The old types with straight sides and back and made of slate or cast iron cannot be kept clean and are to be considered obsolete. The liquids are removed by an open channel to a trapped gully close to the outside wall. The liquid is then removed by a pipe similar to a soil pipe which is not trapped at ground level.

In the United States there is quite a variety of urinals in use in hotels, clubs and public buildings. Usually they are made of vitreous china and are attached to the wall or stand on the floor. Some are flushed from overhead tanks with chain-pull, or by timed automatic-flush. Others are equipped with direct flush valves which close slowly and automatically, being adjusted to a suitable time and volume of flush. Several makes are provided with local ventilation attachments to which vent pipes may be connected to remove offensive odors and prevent them from diffusing throughout the toilet rooms.

Lavatories.—In America the lavatories, or wash basins, are practically all made of vitreous china. Some are attached to the walls by brackets. Others are supported on legs or china pedestals.

To permit of washing in running water, if desired, the hot and cold supplies should connect into a nozzle arranged at a suitable height over the lavatory slab. The waste outlet is preferably of the "pop-up" type, the plug being operated by a knob or handle over the lavatory slab. Every lavatory should have an overflow connection and be separately trapped close to the bowl. The fixture should have no woodwork enclosing any part. It should all be open with access for keeping it clean.

FIG. 6.—CESSPOOL

Kitchen Sinks.—These are made of enamelled cast iron, vitreous china or glazed porcelain and are set on legs, their backs being secured to the wall. There is a great variety of forms on the American market. The latest and best are one-piece fixtures with sink, drain boards, backs and apron all in one casting. The sink supply should be in the form of a combination faucet which permits the user to regulate the temperature of the water drawn. Sinks in some residences are provided with an electric dish washer compartment. Some are made in combination with a laundry tub. Some of the latest combinations comprise a sink in the middle, an electric dish washer at one end, and an electric clothes washer at the other end, all three compartments discharging their wastes through the trap under the sink.

Where much greasy dishwater will pass through a sink trap, the trap should be of a type especially designed to intercept the grease. This prevents the grease from getting into and clogging the house drains. The best type of grease trap for placing under a sink has its body in the form of a cold water jacket. Cold water to the plumbing fixtures passes through the grease trap jacket and so chills the grease in the sink waste water much more effectively than the air, or earth-cored grease trap. (G. S. Co.; T. N. T.)

SAN JOSE, a city of California, U.S., 30 mi. S.E. of San Francisco and 7 mi. S.E. of the southern end of San Francisco bay; the county seat of Santa Clara county. It is served by the Southern Pacific, the Western Pacific and by numerous motor-coach and truck lines. The population was 95,280 in 1930 and was 68,437 in 1940 by the federal census.

It is a delightful residential city in the heart of the beautiful and fertile Santa Clara valley, and the largest fruit-canning and packing centre of the United States. The county has 95,468 ac. in orchards (including 51,590 ac. of prunes), 1,503 in berries and 26,707 in vegetables. In and near the city are 44 canneries with an annual volume of about 9,000,000 cases; also evaporators and dehydrators; and 32 packing plants, which produce a total of more than 150,000 tons annually of dried fruit. The output of all the manufacturing establishments within the city limits in 1947 was valued at \$57,581,000. San Jose is the seat of San Jose State college, the oldest in California (established 1862). The University of Santa Clara (1851) is in an adjoining suburb; Stanford university is 18 mi. northwest; and on the top of Mt. Hamilton (4,209 ft.), 26 mi. E., is the Lick observatory. Besides several parks in the city, San Jose owns a tract of 716 ac. in the foothills 7 mi. E. (Alum Rock park) which contains many mineral springs and sulphur baths. The New Almaden quicksilver mine, which has been worked since 1824, is 14 mi. S. In 1916 the city adopted a council-manager form of government. The assessed valuation for 1949 was \$108,995,540. Bank clearings in that year totalled \$561,186,111. Near San Jose is Moffett field, base of the United States military air transport service, and the Ames Aeronautical Research laboratory of the national advisory committee on aeronautics. Also in this area is the world's largest cement plant.

The Pueblo de San José de Guadalupe, the first Spanish pueblo in California, was founded on Nov. 29, 1777, primarily to promote agriculture, so that the country need not be dependent on Mexico for provisions. Father Junípero Serra had already (Jan. 18, 1777) established the Mission of Santa Clara de Asís in the vicinity.

Plants, seeds and cuttings were supplied to the mission and to the settlers. In March 1846 Gen. J. C. Frémont, with a party of 62, entered the valley, and in July the town was occupied by Capt. Fallon and the U.S. flag was raised over it. The first state legislature convened in San Jose on Dec. 15, 1849, and this was the seat of government until May 1, 1851. The city was incorporated in 1850 and reincorporated in 1865. By 1870 the population was 9,089. After the secularization of the church properties in 1834 the mission orchards and gardens were neglected, and the Santa Clara valley was given over largely to cattle and horse raising. The foundation of the fruit industry on a commercial scale is credited to Louis Pellier, who in 1856 brought a number of prune cuttings from his home near Agen.

SAN JOSÉ or SAN JOSÉ DE COSTA RICA, the capital of the republic of Costa Rica and of the department of San José; in the central plateau of the country, 3,868 ft. above sea level, and on the transcontinental railway from the Pacific port of Puntarenas to the Atlantic port of Limón. Pop. (1950) 86,718. San José is an episcopal see, the most populous city in Costa Rica and the centre of a rich agricultural region; its climate is temperate, its water supply pure and abundant. The city was founded in 1738, and became the capital in 1823. It is thoroughly modern in appearance, with well-paved streets lighted by electricity; its houses are one- or two-storied to minimize the danger from earthquake. The suburbs consist chiefly of cane huts, tenanted by Indians and mestizos. The larger of two public gardens, the Morazán park, contains a representative collection of the Costa Rican flora. The principal buildings are the cathedral, founded in the 18th century but restored after 1870, the hospital, government offices, institutes of law and medicine and of physical geography, training school for teachers, national bank, museum, library and barracks. The staple trade of San José is in coffee. (See also COSTA RICA.)

SAN JUAN, an Andean province of Argentina, bounded north and east by La Rioja, south by San Luis and Mendoza and west by Chile, from which it is separated by the Andean cordilleras. Area 33,257 sq.mi.; pop. (1947 estimate) 258,778. It is roughly mountainous, and belongs to the closed drainage basin of western Argentina, centring in the province of Mendoza. It is traversed by several rivers, fed by the melting snows of the Andes and discharging into the swamps and lagoons in the southeastern part of the province, the largest of which is the Huancacache lagoon. The largest of these rivers are the Bermejo, Jachal or Zonión and San Juan. They are all used for irrigation. The climate is extremely hot and dry in summer, but the winter temperature is mild and pleasant. Agriculture is the principal occupation of its inhabitants, though the soil is generally sterile and the rainfall uncertain and very light. Cereals are grown in some localities, and fruits and wine grapes of excellent quality are cultivated under irrigation on a large scale.

The province contains gold, silver, copper, iron, lead, coal and salt. Pastoral interests are largely in feeding cattle for the Chilean markets, for which large areas of alfalfa are grown in the irrigated valleys of the Andes. Rail communication is provided by the Belgrano and the San Martín railways.

The capital of the province is San Juan (estimated population, 1943, 80,000), in a great bend of the San Juan river, 97 mi. N. of Mendoza and about 750 mi. from Buenos Aires by rail. The city was founded in 1562 by Juan Jufre, a companion of Pedro del Castillo, the founder of Mendoza, and was the capital of the province after 1820. The original settlement, named San Juan de la Frontera and now referred to as Pueblo Viejo, 4 mi. N., was abandoned in 1593 because of frequent inundations. The present town is about 2,165 ft. above sea level and is defended from inundations by an embankment called the Murrallón. The city has suffered severely from political disorders, and in 1894 was nearly destroyed by an earthquake. But with the possible exception of the earthquake of March 20, 1861, which completely destroyed the city of Mendoza, Argentina never suffered a greater disaster than the earthquake that occurred in San Juan province on Jan. 15, 1944. Whatever the intensity of the shock may have been elsewhere in the province, the worst damage and greatest

loss of lives were sustained by the city of San Juan. More than 90% of the buildings, including the cathedral, the government house, municipal building, churches, schools, hospitals, railway station and historical monuments, were either destroyed or damaged beyond repair, and the toll of lives was numbered in the thousands. (R. W. R., 2.)

SAN JUAN, the capital of Puerto Rico and its oldest, largest and most important city. Its population according to the census of 1950 was 367,846 (actually 223,949 on that date, but in 1951 the capital city absorbed the neighbouring municipality of Río Piedras, which in 1950 had a population of 132,369). In 1940 the population of San Juan was 160,247. In its growth, the city also absorbed Santurce, Condado, Miramar and other suburban districts.

BY COURTESY OF THE U.S. BUREAU OF INFORMATION
IN SULLAS AFFAIRS
THE GOVERNOR'S PALACE, SAN JUAN

Afterward, in 1508, Ponce de León was sent on an exploring expedition to the island, and then for the first time saw the bay on which San Juan is situated and called it "Puerto Rico," or Rich Port. After reporting his discoveries he was again sent to the island to effect a settlement, and did so near the modern site of the city.

The first settlement, known as Caparra, was on the mainland, because of its greater safety from enemies approaching from the sea. Soon, however, that site was abandoned, and the modern one was selected. Substantial buildings, forts and fortifications were built during the following years. The city was completely surrounded by a massive wall, with moats and gates and bridges which made San Juan a typical walled city of the Spanish type. On a high bluff overlooking and commanding the entrance to the harbour Morro Castle was built for the protection of the harbour and city against the numerous fleets of the enemies of Spain. Along the harbour walls were other fortifications, and on the ocean front, besides Morro Castle, the great fortress of San Cristóbal, the Escambrón, the Princesa and other batteries were built.

Streets and Buildings.—The city is of the Spanish type, with narrow streets and numerous and rather low buildings, with balconies. Among the notable modern buildings are the marble capitol, of classic type, completed in 1928; the Condado-Vanderbilt and the Caribe Hilton hotels; the Federal building, housing the post office, the U.S. court and other federal offices, the U.S. customs house; the University of Puerto Rico; the Puerto Rico casino; the Athenaeum; the Y.M.C.A. building; the Carnegie library; the Central High school building; the Professional building; and many others. The city retains many of its ancient characteristics, however.

There are many buildings of historic interest. Besides the old castles, El Morro and San Cristóbal, are the Casa Blanca, built for the son of Ponce de León, and the cathedral, which contains his tomb. La Fortaleza, the governor's residence and offices, was commenced and partially built in 1533, only 40 years after Columbus' discovery of the island. It was also called in Spanish times the Palace of Santa Catalina.

Commerce.—The harbour is one of the best and most commodious in the West Indies. Several passenger steamers are in regular service between San Juan and New York city. Steamers from France and Spain visit the island. Freight lines connect the city and nearly all southern and eastern ports of the U.S., and regular service is maintained with other West Indian islands. Passenger and freight service is also maintained with South American ports. The number of vessels entering and clearing San Juan

is nearly 3,000 annually..

Air transportation is of great importance to Puerto Rico, which is located midway between North and South America. The city of San Juan links three continents, the Antilles and the Virgin Islands, and serves as a port of entry to the French, British and Dutch West Indies. Sugar, coffee, tobacco and fruits are the principal products exported, while the principal imports are lumber, iron and steel, machinery, automobiles and trucks, flour, rice and other food products. The city is a distributing point for the West Indies of many important manufactured products.

(H. M. T.; J. L.-Ee.)

SAN JUAN or HARO ISLANDS, an archipelago (San Juan, Orcas, Shaw, López, Blakely, Cypress, etc.) lying between Vancouver island and the mainland of North America. These islands were for many years the subject of dispute between the British and the U.S. Governments, and were finally assigned to the latter country by the arbitration of the emperor of Germany (on Oct. 21, 1872). Geographically, the cluster certainly belongs to the mainland, from which it is separated by Rosario Strait, generally much under 50 fathoms in depth, while Haro Strait, separating it from Vancouver island, has depths ranging from 100 to 190 fathoms. In 1873 the islands, formerly considered part of Whatcom county, Wash., were made the separate county of San Juan. Of the total area of 200 sq.m., about 60 are in San Juan, 60 in Orcas and 30 in López.

See *Papers relating to the Treaty of Washington*, vol. v. (1872), and the map in *Petermann's Mittheilungen* (1873).

SANKARAN NAIR, SIR CHETTUR (1857-1934), Indian jurist and politician, was born in the Malabar country on July 11, 1857, and educated for a legal career. Enrolled as a vakil of the Madras high court, he was appointed in 1899 government pleader and public prosecutor in Madras. In 1907 he was appointed advocate general, being the first Indian to hold the post in the province. In the following year he was made puisne judge of the Madras high court. He was by this time well known as a strong social reformer, a supporter of the Indian National Congress (being president of the 13th meeting, held at Amraoti in 1897), as a publicist and as founder and editor of the *Madras Review* and *The Madras Law Journal*. He was for many years a member of the Madras legislature. One of the first Indians and the first Madras to become a member of the Government of India he was selected for the education portfolio in 1915, but resigned in July 1919, on the ground that martial law was being continued in the Punjab too long after the disturbances had ceased. Taking a favourable view of the Montagu-Chelmsford reforms, he was appointed to the India Council in London in January 1920, but resigned to take office in the Indore State in November 1922. A vigorous condemnation of the non-cooperation movement entitled *Gandhi and Anarchy* (1922) contained references to the Punjab troubles, which led Sir Michael O'Dwyer, late lieutenant-governor of the Punjab, to bring a successful libel action against the author in London in the summer of 1924. Elected a member of the Council of State of India in 1925 Nair continued to pursue an independent line, and when that house decided in 1928 to co-operate with the Statutory commission under Sir John Simon, the viceroy appointed him chairman of the all-India committee to sit with the commission, comprising members of both houses of the legislature. (F. H. Br.)

SANKEY, JOHN SANKEY, 1st Viscount, of MORETON (1866-1948), British lawyer, was born on Oct. 26, 1866. Educated at Lancing and at Jesus college, Oxford, he was called to the bar at the Middle Temple in 1892. He took silk in 1909 and from that time advanced rapidly in his profession. He became a judge in the King's Bench division in 1914 and a lord justice of appeal in 1928.

Sankey was chairman of the royal commission on the coal industry in 1919. In 1929 he was raised to the peerage and appointed lord chancellor. He was created a viscount in 1932 and retired in June 1935. He died Feb. 6, 1948.

SANKHYA or SAMKHYA, the oldest system of Indian philosophy, its founder, Kapila, having been born at Kapilavastu, probably a century before Buddha's birth. For the system see

SANSKRIT LANGUAGE AND LITERATURE: *Philosophical Systems*.

SAN LEANDRO, a city of Alameda county, California, U.S.A., adjoining Oakland. It is served by the Southern Pacific and the Western Pacific railways. Pop. (1950) 27,498. San Leandro produces air conditioning and mechanical draft equipment, aircraft supplies, automobiles and automobile parts, calculating machines, farm equipment, metal stampings and spring and wire products. San Leandro was settled in 1836 and incorporated in 1872.

SAN LUCAR (SANLÚCAR DE BARRAMEDA), a fortified seaport of southern Spain, in the province of Cádiz; 27 mi. by sea from Cádiz, on the left bank of the Guadalquivir estuary, and on the Puerto de Santa María-San Lucar and Jerez de la Frontera-Bonanza railways. Pop. (1940), 28,446 (mun., 32,848). Inscriptions and ruins prove that San Lucar and Bonanza were Roman settlements, though the original names are unknown. San Lucar was captured from the Moors in 1264, after an occupation lasting more than five and a half centuries. After 1492 it became an important centre of trade with America. From this port Columbus sailed across the Atlantic in 1498, and Magellan started in 1519 to circumnavigate the world. The 14th-century church and the palace of the dukes of Medina Sidonia contain many valuable pictures. The hospital of St. George was established by Henry VIII of England. The Guadalquivir estuary is deep and sheltered. Bonanza, 2 mi. by rail up the river, and on the same bank, is the headquarters of the shipping and fishing trades. It is named after a chapel dedicated here by the South American Company of Seville to the Virgin of Fair Weather (*Virgen de la Bonanza*). The fisheries and agricultural trade of San Lucar are considerable; there are flour mills in the town.

SAN LUIS, one of the three Argentine provinces forming the region of Cuyo, an Araucanian word meaning "land of sand." Area, 29,632 sq.mi.; pop. (1914 census) 116,266 (1947 est.) 164,379. Although the province is in the Andean plain, much of its surface is broken by chains of mountains, the largest of which is the Sierra de San Luis. Except in the west, where temperatures are excessively high, the climate is warm and dry. In the moister regions forests are extensive and provide an important source of wealth, as do also the mineral resources (copper, iron, wolfram, gold, silver, mica and lead). There are relatively few rivers, the principal ones being the Desaguadero, Quinto, Conlara and San Luis. The economy is based chiefly on mining, lumbering, agriculture and stock raising, the emphasis with respect to the latter two categories being placed on cattle, sheep, cereals and fruits. The capital is San Luis, pop. (1941 est.) 30,021, founded in 1596 by Martín de Loyola, governor of the captaincy general of Chile. Mercedes, the largest city in the province, has an estimated population of 37,666. Both cities have rail connections with Buenos Aires and with Santiago, Chile, across the Andes, and are on the Santiago-Buenos Aires link of the Pan American highway (R. W. Ro.; X.)

SAN LUIS OBISPO, a city of California, U.S.A., 8 mi. from the ocean and 190 mi. N.W. of Los Angeles; county seat of San Luis Obispo county. It is on federal highway 101 and the Pacific Coast and the Southern Pacific railways. Pop. (1950) 14,162. Its harbour (Port San Luis, on the bay 9 mi. S.W. of the city) is an important oil port. The city was founded by Father Junipero Serra, who built there his fifth mission, now used as a parish church. The California State Polytechnic college is there.

SAN LUIS POTOSI, a central state of Mexico, bounded north by Coahuila, east by Nuevo León, Tamaulipas and Veracruz, south by Hidalgo, Querétaro and Guanajuato, and west by Zacatecas. Area, 24,411 sq.mi. Pop. (1950) 855,336. The state belongs wholly to the high plateau region, with the exception of a small area in the southeast angle, where the tableland breaks down into the tropical valley of the Pánuco. The surface is comparatively level, with some low mountainous wooded ridges. The mean elevation is about 6,000 ft., ensuring a temperate climate. The rainfall is light and uncertain and the state is poorly provided with rivers. The soil is fertile and in favourable seasons large crops of wheat, Indian corn, beans and cotton are grown on the uplands. In the low tropical valleys, sugar, coffee,

THE TOWN OF SAN MARINO, CAPITAL OF THE REPUBLIC

San Marino, founded probably in the 4th century, is situated on the slopes of the mountain whose steep sides and crags constitute in great part the territory of the Republic. It has three citadels, all overlooking Rimini (Italy) and the Adriatic. The turreted building on the left is the Parliament house

PAUL POPPER, LTD

2. The militia of San Marino

3. Buildings in the Borgo

tobacco, peppers and fruit are staple products. Stock raising is an important industry and hides, tallow and wool are exported. Fine cabinet and construction woods are also exported to a limited extent. San Luis Potosí ranks among the leading mining states of Mexico. The Catorce district has some of the richest silver mines in the country. Other well-known silver mining districts are Peñón Blanco, Ramos and Guadalcázar. The development of Guadalcázar dates from 1620 and its ore yield gold, copper, zinc and bismuth, as well as silver. In the Ramos district, Cocinera lode is said to have had a total yield of more than \$60,000,000. Railway facilities are provided by the Mexican National lines. The capital is San Luis Potosí, and other towns, with populations as of 1940, are: Matehuala (16,548), a mining town 20 mi. E. by W. of Catorce, with which it is connected by a branch railway; Catorce (7,000 in 1910 and only 753 in 1940), an important mining town 110 mi. N. (direct) of San Luis Potosí (capital) and 8 mi. from its railway station on the Mexican National; at an elevation of 8,780 ft., Santa María de Río (2,816), 37 mi. S.E. of the capital; Venado (2,011), 45 mi. N. of the capital; Rioverde (8,503), an agricultural centre with a national agriculture experiment station in its vicinity; Soledad Díez Gutiérrez (2,227), near the capital.

SAN LUIS POTOSÍ, a city of Mexico and capital of a state of the same name, near the head of the valley of the Río Verde (a tributary of the Pánuco), 215 mi. N.W. of Mexico City. Pop. (1950) 256,324. The city is served by the Mexican National railway. The altitude of the city, 6,168 ft. above sea level, gives it a cool temperate climate, though the sun temperatures are high.

Notable buildings are the cathedral and government palace fronting on the Plaza Mayor, the latter conspicuous for its façade of rose-coloured stone; the churches of El Carmen, San Francisco and Guadalupe; the La Paz theatre, mint, penitentiary and the Instituto Científico, in which law, medicine and science are taught. San Luis Potosí is an important railway and distributing centre, with a considerable trade in cattle, tallow, wool, hides and minerals. Its proximity to the port of Tampico, with which it was connected by railway in 1885, greatly increased its commercial importance, though in earlier days it was also one of the principal centres of the diligence and pack-train traffic of this part of Mexico. The city has cotton and woollen factories, and large smelting works. Ores and crude metals from adjacent states are brought there for smelting and refining.

San Luis Potosí was founded in 1586. It was the centre of colonial administration and played a very important part in the civil wars and political disorders following Mexican independence. It was the seat of the Mexican government of Benito Juárez in 1863. Imprisoned there by Porfirio Díaz in June 1910, Francisco I. Madero drew up his famous "Plan of San Luis Potosí" (Oct. 7) which launched the Mexican Revolution on Nov. 20, 1910.

SAN MARCOS, a city of south central Texas, U.S., on federal highway 81, 30 mi. S. of Austin; county seat of Hays county. It is served by the Missouri-Kansas-Texas and the Missouri Pacific railways. Pop. (1950) 9,980; 6,006 in 1940 by the federal census. It is the seat of the Southwest Texas State Teachers college and San Marcos academy. San Marcos is a centre of hybrid corn and cotton breeding farms and livestock marketing. Industrial development includes nonferrous metal die-casting, ceramic products, feed dehydrating, meat processing and wool scouring for processing into consumer goods. San Marcos was founded in 1848 and was chartered as a city in 1877.

SAN MARINO, a republic in northern Italy, 14 mi. S.W. of Rimini by road. It is the smallest republic in the world (38 sq.mi. in area). The population in 1950 was 12,780. Most of the republic falls within the diocese of Montefeltro, a small portion within that of Rimini.

The council consists of 60 members and is elected by proportional representation from single party lists. Its functions are deliberative and legislative, while a council of 12 exercises the executive functions of government. The peaceful revolution of March 25, 1906, restored the original system of election to the council (which had become a close corporation, renewed by co-optation) by the *Arengo*, or assembly of heads of families, one-third

of the council being henceforth renewable every three years. In 1909 the household suffrage was replaced by universal male suffrage, but women have never yet been enfranchised. The election of the two *capitani reggenti* takes place every six months. They enter into office on April 1 and Oct. 1 with much traditional pomp and preside over the two councils; but the real governmental power is in the hands of two secretaries of state.

The available armed forces of the republic form a total of about 1,200 men, all citizens able to bear arms being technically obliged to do so from the age of 16 to 60 years. Italian money is current.

The republic entered into treaty relations with Italy in 1862; and a considerable part of its revenue is drawn from the Italian government in exchange for an acknowledgment of the Italian state monopolies in tobacco, playing cards, etc. Only in 1922 did San Marino find it necessary to introduce an income tax. No longer are titles conferred for a consideration, but a fruitful source of revenue is found in the frequent change of postage stamps (first issued in 1877). In addition, a casino was licensed in 1949, but strong Italian pressure led to its closure in 1951. The chief exports, besides postage stamps, are stone from Monte Titano—the legendary founder of San Marino was a Dalmatian stone cutter—and the strong wine grown on this volcanic soil.

After the destruction of the San Marino-Rimini railway in World War II, San Marino was linked to the outside world only by a bus service.

Antiquities.—The old church is first mentioned in 951. There are traces of three different *enceintes* of the 14th, 15th and 16th centuries. The principal church (Pieve), in classical style, dates from 1826–38 and contains the body of St. Marinus. The museum contains among other curiosities the banner of Garibaldi's "Italic Legion" which sought refuge at San Marino in 1849. The archives were rearranged and described by C. Malagola. The arms of the republic are three peaks, each crowned with a tower.

History.—According to tradition, the republic was founded by Marinus, a native of Arbe, probably after the middle of the 4th century. The *Castellum Sancti Marini* is mentioned in 755; the oldest document in the republican archives mentions the abbot of San Marino in 885. The republic, as a rule, avoided the faction fights of the middle ages but joined the Ghibellines and was interdicted by the pope in 1247–49. After this it was protected by the Montefeltro family (later dukes of Urbino) and the papacy and successfully resisted the attempts of Sigismondo Malatesta against its liberty. It fell into the hands of Caesar Borgia in 1503 but soon regained its freedom. Other attacks failed, but civil discords in the meantime increased. Its independence was recognized in 1631 by the papacy. In 1739 Cardinal Alberoni attempted to deprive it of its independence, but this was restored in 1740 and was respected by Napoleon.

In World War II San Marino remained neutral, but suffered a severe bombing raid and other infringements of its neutrality. In contrast with Italy, after the overthrow of the Fascists in 1945, the republic was governed by a "popular front" coalition of Liberals, Radicals, Socialists and Communists, while the Christian Democrat party provided the opposition. The control of profits and the establishment of social services were the main items of the government's policy.

SAN MARTÍN, JOSÉ DE (1778–1850), South American soldier and statesman, was born at Yapeyá, on the river Uruguay, on Feb. 25, 1778. He was educated in Madrid for a military career and served against the Moors and in the struggle against Napoleon. In 1812 he offered his services to the Government of

Buenos Aires in its war for independence. Early in 1814 he was placed in command of the revolutionary army operating against the Spaniards in upper Peru, but soon resigned his command, realizing that the permanent success of the revolutionary movement depended upon the expulsion of the Spaniards from Chile, and also from their stronghold in Peru. To carry out this purpose, he enlisted the co-operation of the government of Buenos Aires, and, assisted by Bernardo O'Higgins, raised and equipped at Mendoza, a well-trained army of Argentines and Chileans for the invasion of Chile. In Jan. 1817, he suddenly carried his army (3,000 infantry, 1,000 cavalry and baggage) across the Andes through the Uspallata pass, outgeneraled the Spanish commanders and routed a large part of their forces at Chacabuco, on Feb. 12, 1817. Northern Chile, including Santiago, the capital of the country, being now freed of the Spanish, he turned the government over to O'Higgins, and set about the reconquest of the south, which he effected in the decisive victory of Maipú (April 5, 1818), thus completely establishing the independence of Chile.

With half of his program accomplished, he laid his plans for the attack upon Peru. He not only reorganized the army, but with the aid of Lord Cochrane constructed a fleet to operate simultaneously with it. In July 1821, the Spaniards evacuated Lima before the combined forces of the army and navy, and retired to the mountains. San Martín entered the city, proclaimed the independence of Peru, and assumed the reins of government under the title of protector. His position, however, was not yet secure. He was threatened by royalist operations in the interior, by jealousy among the patriots and by the rivalry of Bolívar, whose victories in Colombia and Ecuador had carried him southward to the northern borders of Peru. The great Colombian's ambition could brook no rival, and on Sept. 20, 1822, San Martín, having paved the way for the conclusive victories of Junín (1824) and Ayacucho (1824), resigned his authority and retired from the country. Finding it impossible to live a peaceful private life in South America, he withdrew as an exile to Europe. There he lived in poverty until his death at Boulogne on Aug. 17, 1850, from time to time vainly offering his services to the distracted nations he had helped to found.

San Martín did more than any other man for the cause of independence in the Argentine, Chile and Peru. He was an able soldier and a clear-sighted and vigorous statesman.

See W. S. Robertson, *Rise of the Spanish Republics* (1918); Anna Schoelkopf, *Don José de San Martín, 1778-1850, A Study of His Career* (1924); and B. Mosses, *The Intellectual Background of the Revolution in South America, 1810-1824* (1926). (W. B. P.)

SAN MARTÍN, a department of Peru, has an area of 17,450 sq. mi., and a population (1930) of 141,730. It includes mountainous areas and the valley of the Huallaga river, a tributary of the Marañón and the Amazon. It is bounded on the north and east by the department of Loreto, from which it was formed in 1906, south by Huánuco, and west by the departments of Libertad and Amazonas. The capital is Moyobamba (pop., 1950, 9,202), situated on the Mayo river, a tributary of the Huallaga. The principal trade outlet is through Yurimaguas (Loreto), a port on the Huallaga, to Iquitos about 50 mi. distant. A highway through the department was under construction in the early 1950s. (L. W. Bn.)

SAN MATEO, a city of San Mateo county, California, U.S.A., on the west side of San Francisco bay, 19 mi. S. of San Francisco. It has a commercial airport and is served by the Southern Pacific railway and by bus lines. Pop. (1950) 41,782. The city operates under a city-manager form of government.

SANMICHELE, MICHELE (1484-1559), Italian architect, was born in San Michele near Verona. He was a pupil of his father Giovanni and his uncle Bartolommeo, both architects at Verona, and went at an early age to Rome to study classic sculpture and architecture. Among his first works are the duomo of Montefascone, the church of San Domenico at Orvieto, several palaces and a fine tomb in S. Domenico. He was also employed by the signoria of Venice as a military architect. One of Sanmichele's most graceful designs is the Cappella del Peregrino in the church of S. Bernardino at Verona. He built a number of

fine palaces at Verona, including those of Canossa, Bevilacqua and Pompei, as well as the graceful Ponte Nuovo. In 1527 Sanmichele began to transform the fortifications of Verona according to the newer system of corner bastions which he did much to advance. His last work (1559) was the round church of the Madonna di Campagna, 1½ mi. from Verona. He also wrote a work on classic architecture, *I Cinque Ordini dell' architettura*, printed at Verona in 1735.

See Romani and Lucifoli, *Fabbriche . . . di M. Sanmichele* (Venice, 1852); and Selva, *Elogio di Sanmichele* (Rome, 1814).

SAN MIGUEL, the capital of the department of San Miguel, El Salvador; 80 mi. E. by S. of San Salvador, near the right bank of the Río Grande, and at the foot of the volcano of San Miguel or Jucupa (7,120 ft.). Population (1950) 26,831.

San Miguel is an important city, on the main line of the International railways of Central America. It possesses several handsome churches, municipal buildings, law courts and two well-equipped hospitals.

Near it are the ruins of an ancient Indian town. San Miguel has a flourishing trade in coffee, cotton, sisal, grain, cattle and indigo. Its port is La Unión (q.v.).

San Miguel was founded in 1530 by Spanish settlers and became a city in 1586.

SAN MIGUEL, a municipality (with administrative centre and 18 barrios or districts) of the province of Bulacan, Luzon, Philippine Islands, about 40 mi. N. of Manila on the Manila-Dagupan railway. Pop. (1939), 26,759 of whom 13,505 were males and 5 were white. The fertile surrounding region produces abundant crops of paddy (rice). Maize (corn) and sugar are also produced. Cattle breeding and fish breeding are extensively carried on, and the municipality is noted for the manufacture of hats and silk textiles, furniture, and alcohol from the nipa palm. There is much weaving and tanning. Sibul springs, about 8 mi. N.E., is a health resort. Tagalog is the vernacular. Of the inhabitants of San Miguel aged 6 to 10 inclusive, 32.3% attended school in 1939, while 64.2% of the population 10 years old and over was literate.

SAN MINIATO, a town and episcopal see of Tuscany, Italy, in the province of Pisa, 26 mi. W. by S. of Florence by the railway to Pisa, 512 ft. above sea level, on a hill 2 mi. S. of the railway. Pop. (1936) 3,082 (town); 21,463 (commune). Its cathedral was remodelled in 1489 and has a façade decorated with disks of majolica. It manufactures glass, olive oil, leather and hats and has a castle of Frederick II, the residence of the imperial governors of Tuscany from 1226 to 1286, and from them bears the name of San Miniato al Tedesco.

SAN NICOLÁS DE LOS ARROYOS, a town and river port of Argentina, in the province of Buenos Aires, on the west bank of the Paraná, 150 mi. by rail N.W. of the city of Buenos Aires. Population (1940 est.) 39,059. It is a flourishing commercial town and a port of call both for river and ocean-going steamers of medium tonnage. It is a rail station on the main line from Buenos Aires to Rosario and north and is also the terminus of a branch line running from Pergamino. It exports wheat, flour, wool and meat. The town is the judicial centre for the northern district of Buenos Aires. San Nicolás was founded in 1749 by José de Aguilar on lands given for that purpose by his wife (nde Ugarte). Its growth was slow until near the end of the 19th century.

SANOCRYSYN. A proprietary gold preparation (gold and sodium thiosulphate) which is of proved value in the treatment of certain skin diseases and of doubtful value in rheumatoid arthritis and tuberculosis. Incautious use may lead to widespread toxic manifestations including skin rashes, gastrointestinal upsets and blood changes.

SAN PABLO, a municipality of the province of Laguna, Luzon, Philippine Islands, about 9 mi. S. of Laguna de Bay, and about 35 mi. S.S.E. of Manila. Pop. (1939) 46,311 (a gain of 14,912 since 1918) of whom 22,952 were males and 32 were white. It has railway connections with Manila by way of Malvar, in the province of Batangas. Coconut palms grow in great abundance, and copra is the chief product. Abacá and rice are also grown.

The language spoken is Tagalog. (C. S. L.)

SANQUHAR, a royal and small-burgh of Dumfriesshire, Scotland. Pop. (1951) 3,356. It is situated on the Nith, 26 mi. S.W. of Dumfries by the L.M.S. railway. It became a burgh of barony in 1484 and a royal burgh in 1596, and was the scene of the exhibition of the Covenanters' Declaration, attached to the market cross in 1680 by Richard Cameron and in 1685 by James Renwick. The town is a popular summer resort and the principal coal mart in the county. Industries include iron, brick and spade works. There are cattle and sheep fairs, and an agricultural show is held every May. Sanquhar castle, on a hill overlooking the Nith, once belonged to the Crichtons, but is now a ruin, though considerably restored.

SAN RAFAEL, a beautiful residential city of California, U.S.A., 10 mi. N. of San Francisco, on San Pablo straits, at the foot of Mount Tamalpais; the county seat of Marin county. It is served by the Northwestern Pacific railroad and interurban bus lines. Pop., 1950, federal census, 13,830; in 1940, 8,573. There are private schools and the Dominican College of San Rafael (established in 1850, at Monterey). A Franciscan mission was established there in 1817 and around it a settlement grew up. The original mission has been completely destroyed, but a replica was built on the site. The city was incorporated in 1874.

SAN REMO, a seaport of Liguria, Italy, in the province of Imperia, on the Riviera di Ponente, 95 mi. E. of Ventimiglia by rail, and 84 mi. S.W. of Genoa. Pop. (1936) 23,063 (town); 31,769 (commune). Climbing the slope of a steep hill it looks south over a small bay, and, protected towards the north by hills rising gradually from 500 to 8,000 ft., it is in climate one of the most favoured places on the whole coast, which accounts for its reputation as a winter resort. The older town, with its narrow steep streets and lofty sombre houses protected against earthquakes by arches connecting them, contrasts with the new visitors' town, containing all the public buildings, which has grown up at the foot of the hill. The small harbour is sheltered by its sickle-shaped mole, 2,300 ft. long. Besides the Romanesque cathedral of San Siro, the white-domed church of the Madonna della Costa, at the top of the old town, may be mentioned. The Emperor Frederick's residence at San Remo in 1887-1888 greatly increased its reputation as a winter resort. Flowers, especially roses and carnations, are extensively grown for export, and olives, lemons and palms are also cultivated.

SAN REMO, CONFERENCE OF (April 19-26, 1920). This conference was preceded by a meeting of the Supreme Allied Council (Mr. Lloyd George, M. Millerand, and Sig. Nitti) from Feb. 12 to 23 in London, where the main lines of the future Treaty of Sévres (*see* SÈVRES, TREATY OF) with Turkey were laid down, and the draft treaty with Hungary and the Fiume question were discussed. At San Remo itself, where the three statesmen above mentioned were joined by representatives of Greece, Belgium and Japan, the Turkish Treaty was the first and principal business dealt with, and the framework of the Sévres Treaty was there constructed. The mandates for Syria, Palestine and Iraq were assigned to France and Great Britain respectively, and an Anglo-French oil agreement was negotiated which covered Rumania and the French and British non-self-governing colonies as well as the Middle East. The most controversial question dealt with, as between the Allies, was that of the maximum strength of the German army—both its total and the number of troops allowed in the neutral zone skirting the area under Allied occupation. On account of the Kapp Putsch and other internal disorders the German Government asked the conference to permit the increase of the German army to twice the strength allowed by the Versailles Treaty. This request was refused and Germany charged with default in respect both of reparations and disarmament. At the same time the German Government was informed of the intention of the Allies to invite them to a direct conference. (*See* SPA, CONFERENCE OF)

SAN SALVADOR, the capital of the republic of El Salvador; situated in the valley of Las Hamacas, on the river Asaguate, at an altitude of 2,115 ft., and 30 mi. inland from the Pacific. Pop. (1950) 160,380.

San Salvador is connected by rail with La Unión on the Pacific

and with all of the chief cities of El Salvador, and by the through line of the International Railways of Central America and the National Railways of Mexico with Guatemala, Mexico and the United States; also with the Pacific port of Acajutla by the older El Salvador railway. It is connected with the port of La Libertad by highway.

In addition to the government offices, its buildings include a handsome university, a modest cathedral, a national theatre, an academy of science and literature, a chamber of commerce, an astronomical observatory and a number of hospitals and charitable institutions. There are two large parks and an excellent botanical garden.

In the Plaza Morazán, the largest of many shaded squares, is a bronze and marble monument to the last president of united Central America, from whom the plaza takes its name. San Salvador is the only city in the republic which has important manufactures; these include the production of soap, silk goods, cotton cloth, cigars, flour and spirits. Beyond these activities, there had been little industrial development by the 1950s.

The city has an abundant water supply. It was founded by Don Jorge de Alvarado in 1528, at a spot near the present site, to which it was transferred in 1539.

Except for the year 1839-40 San Salvador was the capital of the republic from 1834 on. It was temporarily ruined by earthquakes in 1854 and 1873.

SANS-CULOTTES, the term originally given during the early years of the French Revolution to the ill-clad and ill-equipped volunteers of the Revolutionary army, and later applied generally to the ultra-democrats of the Revolution. They were for the most part men of the poorer classes, or leaders of the populace, but during the Terror public functionaries and persons of good education styled themselves *citoyens sans-culottes* ("citizens without knee-breeches"). The distinctive costume of the typical sans-culotte was the *pantalon* (long trousers)—in place of the *culottes* worn by the upper classes—the *carmagnole* (short-skirted coat), the red cap of liberty and *sabots* (wooden shoes). The influence of the sans-culottes ceased with the reaction that followed the fall of Robespierre (July 1794), and the name itself was proscribed. In the Republican Calendar the complementary days at the end of the year were at first called *Sans-culottides*; this name was, however, suppressed by the Convention when the constitution of the year III (1795) was adopted, that of *jours complémentaires* being substituted.

SAN SEBASTIAN (Basque *Iruñedo*, and officially Guipúzcoa), a seaport and capital of the Spanish province of Guipúzcoa, on the Bay of Biscay, and on the Northern railway from Madrid to France. Pop. (1950) 100,000 (mun., 113,776). The city became the summer residence of the court in 1886. It occupies a narrow sandy peninsula, which terminates on the northern or seaward side in a lofty mass of sandstone, Monte Urgull; it is flanked on the east by the estuary of the river Uruma, on the west by the broad bay of La Concha. The old town, rebuilt after the fire of 1813, lies partly at the foot of Monte Urgull, partly on its lower slopes. Until 1863 it was enclosed by walls and ramparts, and a strong fort, the Castillo de la Mola, still crowns the heights of Urgull. The Alameda separates the old town from the new and gardens and villas now extend right up Monte Igeldo. The bay of La Concha has a broad sandy shore. There are saw and flour mills, and manufactures of preserves, soap, candles, glass and paper, especially in the busy suburb that has sprung up on the right bank of the Uruma. The fisheries are important. Vessels of 12 ft. draught can nearly always enter both dock and harbour. Larger vessels anchor south-east of Santa Clara Island. Nationalist forces captured San Sebastian during the civil war of 1936-39.

SAN SEVERINO (anc. *Septemvada*), a town and episcopal see of the Marches, Italy, in the province of Macerata, from which it is 18 mi. W. by 2½ by rail. Pop. (1936) 3,975 (town); 16,741 (commune). The lower town is situated 781 ft. above sea-level, and contains the new cathedral of S. Agostina, with a fine altar-piece by Pinturicchio (1489). S. Lorenzo in Doliolo and S. Domenico are both Romanesque churches. The Palazzo

Comunale has some interesting pictures by artists of the Marches. Lorenzo and Giacomo Salimbeni da San Severino, who painted an important series of frescoes in the oratory of S. Giovanni Battista at Urbino in 1416, were natives of the town. So was Lorenzo di Alessandro, of the end of the 15th century, whose pictures are mainly to be found in the Marches. The old cathedral of S. Severino is in the upper town (1,129 ft. above sea-level); it contains frescoes by the two Salimbeni, and very fine choir stalls (1483-1513). The ancient Septempeda lay in below the modern town, on the branch road which ran from Nuccia Camellaria, on the Via Flaminia.

SAN SEVERO, a city in Apulia, Italy, in the province of Foggia, from which it is 17 mi. N.W. by rail. Pop. (1936) 37,150 (town), 37,702 (commune). It lies at the foot of the spurs of Monte Gargano, 292 ft. above sea-level. It is the see of a bishop (since 1580), and has some remains of its old fortifications. San Severo dates from the middle ages. It was laid in ruins by Frederick II. In 1799 the town was almost entirely destroyed by the French. In 1627, 1828 and 1851 the town suffered from earthquakes. It is surrounded by fertile vineyards and oliveyards.

SANSKRIT LANGUAGE AND LITERATURE. The most important branch of the Indo-European family of languages in Asia is Aryan or Indo-Iranian, with two main divisions: Iranian and Indo-Aryan. Languages belonging to the latter are spoken to-day by 250 million people in India, where they are the dominant languages except in the south, in Ceylon and the Maldiv Islands, and throughout western Asia and Europe by colonies of Gypsies (see ROMANY LANGUAGE). As languages of administration they spread at one time far into central Asia, where now is Chinese Turkestan; and as vehicles of Buddhism they have influenced through translation the whole of central and eastern Asia; Hindu civilization carried their vocabulary into the East Indies and the Malay peninsula. The oldest documents of Indo-Aryan are composed in Sanskrit. These are the Vedic texts. Their exact date is unknown, but it is probable that the oldest of them belong to the latter half of the second millennium B.C. They were probably composed before the Aryans had learned the use of writing; but being religious texts which it was essential to preserve unchanged they were handed down by an oral tradition which by various controls was made exceedingly exact. Even at the time of entry into India there must have been some dialectical differences in the language as spoken by the various invading tribes; with their further extension into India itself these differences became accentuated. The language of the Vedic texts shows a certain mixture, but is in the main founded upon the dialect of the north-west of India. With the advance of Aryan culture into the Punjab and the Gangetic plain the eastern dialects gained in importance; and this eastern influence, discernible in the earliest texts, constantly gains ground.

The most archaic of these texts is the Rig-veda, a collection of liturgical hymns; this is followed by the Atharva-veda, consisting chiefly of magical formulas, of prayers, curses and incantations. Considerably later come the first compositions in prose, commentaries on the Veda and philosophical treatises termed Brāhmanas and Upanishads. Although originally preserved as a religious language, Sanskrit was finally used for secular purposes. The earliest inscription in Sanskrit dates from 150 A.D., but it became the regular language of official inscriptions only in the 4th century A.D. But long before that the grammarians (of whom the most celebrated was Pāṇini in the 4th century B.C.) had fixed it as a learned language to which alone a strict interpretation confines the name Sanskrit, "the perfected," but which may conveniently be termed Classical Sanskrit as opposed to the Vedic or older form. As a literary language it is still cultivated; and a vast literature—philosophical, narrative, lyrical, dramatic, technical—has been written in it. Standing, in form at least, between the later Vedic and the Classical, but more nearly approaching the latter, is the language of the two great epics, the Mahābhārata and the Rāmāyaṇa, in which the influence of the spoken language can clearly be seen. For in the meantime the spoken dialects continued to develop. Some of these, such as Pali and the Prakrits (q.v.), were in turn crystallized and used as religious languages

by new sects as well as for secular purposes before Sanskrit was so employed. From these vernaculars are eventually derived the modern Indo-Aryan languages. Sanskrit, the literary language, though preserving the sound-system of Vedic practically unchanged, did not escape the influence of its descendants. The grammar was considerably changed, chiefly in a simplifying and normalizing direction; meanings of words were altered and de-

FROM MACDONELL, "SANSKRIT GRAMMAR FOR STUDENTS" (CLARENDON PRESS)

veloped, and vast quantities of new words were gradually absorbed after being given a Sanskrit form. On the other hand Sanskrit has continued to influence the spoken languages.

Sounds.—The sound-system of Sanskrit consisted of: (a) Fourteen vowels, viz.: Twelve simple vowels: *a, ā, i, ī, u, ū, r, ṛ, ̄, ṛ, ṛ, ṛ, ṛ, ṛ*. Two diphthongs: *ai, au*.

(b) Thirty-six consonants, viz.: Five series of stops and nasals: guttural: *k, kh, g, gh, ṅ*; palatal: *c, ch, j, jh, ñ*; cerebral: *ṭ, ṭh, ḍ, ḍh, n*; dental: *t, th, d, dh, n*; labial: *p, ph, b, bh, m*. Four semi-vowels: *y, r, l, v*. Three sibilants: palatal *ś*, cerebral *ṣ*, dental *s*. Two aspirates: voiced *h*, unvoiced *h̄* (*visarga*). A nasal with loose closure of the lips *m̄* (*anusvāra*), and another nasal *m̄* (*anuvāra*) which probably was a simple nasalization of the vowel rather than a consonant proper.

Vowels.—The vowel-system was inherited practically unchanged from the common Indo-Iranian period, the only specific Sanskrit development being the change of the Indo-Iranian short diphthongs **ai, *au* (=Avestic *ae, ao*) to *ē, ṛ* (still classed as diphthongs by Indian grammarians) and of the long diphthongs **āi, *āu* to *ai, au*. Thus to Avestic *dāuho haomo uxδθāi gāuš* Sanskrit corresponds with *dāvāḥ sōmāḥ usthāḥ gāuḥ*. The comparative simplicity of the vowel-system and the great predominance of the vowels *a* and *ā* were due to the fact that in the Indo-Iranian period four distinct Indo-European sounds—*t, o, a, n* (*h, ṛ, ṛ, ṛ*)—had coalesced in the one sound *a* (similarly *ē, ṛ, ṛ* had all become *ā*). The only trace left of the earlier differentiation was the fact that an original guttural before *ā* representing older *ṛ* had become a palatal: thus we have *sācātē*, "follows," from **sek-wetāi* (Greek *hēpetai*, Latin *sequitur*), but *sācāt*, "he shall follow" beside Gk. *hēpetai*. Similarly the 12 *ā* diphthongs—*ai, oi, āi, eu,*

ou, au, ēi, ōi, āi, ēu, ōu, āu—were merged in four Skt. sounds ē, ō, ai, au. In this way the vowel alternation (especially between e and o), a characteristic feature of Indo-European, was largely lost. Nevertheless, where the word contained a sonant the alternation, although diminished in scope, was still discernible: e.g., I.E. *ei*: *oi*: *i* became Skt. *ē*: *i* (e.g., Gk. *leipōi*: *leipōs*: *dīpe* = Skt. *reṇati*: *reṇah*: *aricāt*), I.E. *o*: *ō*: *i* became Skt. *a*: *i*. The correspondences thus resulting—*a*: *i*; *ē*: *i*; *ō*: *a*; *u*: *ō*; *ṛ*: *ar*: *ā*—being associated with particular grammatical formations were still further developed in Sanskrit into a system, which, early recognized by the Indian grammarians, was used by them in their description of the formation of the language.

Consonants.—The consonant-system has remained much truer to the original Indo-European. It is characterized by the rarity of spirants and by the opposition of unaspirated and aspirated stops (both surd and voiced) in each series. In preserving the voiced aspirate stops unchanged, Sanskrit and its descendants (for most of the modern Indo-Aryan languages still possess these sounds) are unique among the Indo-European languages, in which these sounds either became surd aspirates and later spirants (as in Greek and Latin) or lost their aspiration (as in Iranian, Balto-Slavonic, Armenian, Albanian, Germanic, Celtic). Thus to Greek *phérō*, Latin *fero*, Eng. *bear*, Sanskrit corresponds with *bhārámi*, to Gk. *éthēke*, Lat. *fecit*, Eng. *deed* with *dāhāt*.

Some consonants were restricted in their use: *ñ* appeared only before or after palatals, *ṇ* only finally or before gutturals (and where a guttural had subsequently disappeared), *ṣ* only between vowels and semivowels or before cerebral stops, *ś* only finally or before sibilants and surd gutturals or labials, *m* only finally or before consonants. Neither aspirate *h* nor *ś* ended a word. At the end of a sentence only the following consonants were used: *k*, *t*, *p*, *ñ*, *n*, *m*, *h*.

Of the palatals *ch* appears as a single consonant only initially: elsewhere it is always doubled unless preceded by another consonant, for it corresponds to the Indo-European group *sk*: e.g., *chindānti* "they cut" = Latin *scindunt*, *gāchāmi* "I go" = Greek *báskō*, *vāchā* "wish" = Germ. *Wunsch*. *j* represents two I.E. sounds (1) palatal *g* (=Gk. *g*, Avestic *z*): *jānah* "birth" = Av. *zanō*, *gēnos*, Lat. *genus*; (2) velar *gʷ* before an original *i* or *j* (=Av. *j*): *jīvāḥ* "alive" = Av. *jiuō*, Lat. *vivō*, cf. Gk. *bios*, Eng. *quick*, *jñ* does not belong to the Indo-European part of the vocabulary, but appears only in onomatopoeic and borrowed words, or in words taken from the vernacular in which the frequent Sanskrit groups *dhj* and *hy* became (*j*)*ñ*.

Of the sibilants *ś* corresponds to I.E. palatal *k*: in this Sanskrit agrees with the other eastern I.E. languages (Balto-Slavonic, Albanian, Armenian, Iranian) which have an *s* or *sh* sound as opposed to the *k* (*h* in Germanic) of the western languages: e.g., *śatām* "roo" = Av. *saēm*, Lithuanian *šiūtas*, but Gk. *he-katōn*, Lat. *centum*, Eng. *hundred*. Before the surd dentals *ś* became *ṣ*: *viśditi* "enters," *viśṣṭh* "entered." But *ṣ* also corresponds to I.E. *s* when preceded by *t*, *n*, *r* or *h*, agreeing in this with Iranian and partly with Armenian and Balto-Slavonic. The chief innovation in the consonant-system is the introduction of the third series, the cerebrals or linguals (better termed retroflex). The dentals were formed by the tip of the tongue striking the roots of the teeth, the cerebrals by the tip of the tongue, bent backwards, striking further back on the palate. In the oldest Sanskrit they are derived from the dentals when immediately preceded by *ṣ* or *ṣ* (which subsequently disappeared): thus **diśtas* (=Lat. *dictus*) became **diśtas* and then *diśṭh*; **misadhōm* (=Gk. *mis-thōs*) became **miḡdhām* and then *miḡdhām*. Later also under the influence of a preceding *r* or *ṛ* dentals became cerebrals: such words are loans from the popular dialect, but they begin to appear in the literary language even as early as the Rigveda: thus *vikataḥ* "monstrous" is derived from *vīkṭah* "strange." Some words, however, contain cerebrals which cannot be explained as derived from dentals in either of these ways. It is probable that these sounds were characteristic of both the families of languages, Muṇḍā and Dravidian, which the Aryan speakers of Sanskrit found in possession of India; and the appearance of them in Sanskrit and its descendants (and in a few of the adjoining Iranian

languages such as Baluchi and Pashto) can scarcely be unconnected with this fact.

The Indian grammarians emphasized the difference in the pronunciation of consonants according as they came at the beginning, in the middle or at the end of a word or before other consonants. These differences, though slight, have ended in transforming the whole Sanskrit consonant-system in its descendants, the modern Indo-Aryan languages. Final consonants were pronounced without being fully exploded: in the spoken languages these final consonants had disappeared before the middle of the 3rd century B.C. A similar pronunciation is assigned to consonants before stops: in the spoken languages these were early assimilated (e.g., *supāh* became *sūtō*). *y* and *v* were pronounced more strongly initially than intervocally: in the modern languages initial *y*—has remained or become *j*, but intervocalic *-y-* has been lost. [This contrast is observable even in the dialect of the Rigveda. For in the phonetically weak position of the termination and in certain accessory words intervocalic *-dh-* has lost its occlusion and become *-h-*: *ihī* "go" = Greek *íthi*, *śemahē* "we lie" = Gk. *keimetha*. Further in all words intervocalic *-d-* has become *-j-*, although other more easterly dialects still preserve it (through whose influence it was afterwards re-established in Classical Sanskrit): thus Classical *nīḡdh* "nest" (from **niḡda-*) is *nīḡdh* in Vedic.]

Accent.—Our knowledge of the accent of Sanskrit words is derived from its marking in the more important Vedic texts and from the statements of grammarians. It was predominantly a musical or tonic, not a stress, accent. Three different types are generally distinguished, the *udatta* "raised," *anudatta* "unraised" and *svorita* the rising-falling accent following the *udatta*. Generally the position of the *udatta* agrees, as far as can be ascertained by comparison, with that of the chief word accent of Indo-European. The rhythm of Sanskrit was purely quantitative; in verse metre depended only on the number and the length of the syllables composing a line, and was entirely independent of accent. In this respect, the Yashits of Avestan literature are similar.

GRAMMAR

Nouns.—Sanskrit makes a perfect distinction between nouns (including adjectives, pronouns and indeclinables) and verbs. The declension of nouns comprises three numbers—singular, dual and plural; and eight cases, viz., nominative, accusative, instrumental, dative, ablative, genitive, locative, vocative. In the majority of declensions ablative and genitive are not distinguished in the singular, nor dative and ablative in the plural, while the dual universally has only three separate forms,—(1) nom.-acc.-voc., (2) inst.-dat.-abl., (3) gen.-loc. These confusions were inherited from Indo-European, but the tendency to confuse still further the forms and functions of the cases continued within Sanskrit itself, the genitive especially enlarging its sphere at the expense of other cases. This process, continued in the spoken languages down to the present day, has resulted in a noun declension, which for the most part consists of two cases only—(1) a direct case founded on the Sanskrit nominative and accusative; (2) an oblique case founded on the Sanskrit genitive or, perhaps, in some forms, the dative. Among the numbers the dual by itself was reserved to express natural pairs (such as *akṣi* "the eyes," *karyāu* "the ears"), or any two objects or persons already referred to or present in the mind of the speaker or hearer; otherwise the use of the word for "two" itself was required.

Although the idea of case was in the main expressed by the termination (as, e.g., the nominative by *-s* in *dēvās* = Latin *deus*, the accusative by *-m* in *dēvām* = *deum*), it was sometimes accompanied by change in the pre-terminational element, and was connected with a shift of accent:

	Skt.	Greek	Skt.	Greek	Skt.	Greek
nom.	<i>pāṇi</i>	<i>pōs</i> (Doric)	<i>dyaūh</i>	<i>Zeūs</i>	<i>pītā</i>	<i>patēr</i>
acc.	<i>pādām</i>	<i>pōda</i>	<i>dyaōm</i>	<i>Zēn-a</i>	<i>pītāram</i>	<i>patērā</i>
gen.	<i>paūh</i>	<i>pōdō</i>	<i>dyaōh</i>	<i>Diaō</i>	<i>pītāh</i>	cf. <i>patrōs</i>
dat.	<i>padē</i>	cf. <i>padī</i>	<i>dyaū</i>	cf. <i>Dīē</i>	<i>pītā</i>	cf. <i>patrōs</i>
loc.	<i>padī</i>	<i>padī</i>	<i>dyaūi</i>	Lat. <i>Jove</i>	<i>pītāi</i>	cf. <i>patrōs</i>
voc.			<i>dyaūh</i>	<i>Zeū</i>	<i>pītār</i>	<i>patēr</i>

There was, however, one important class of stems, namely masc.

and neut. in *-a* and fem. in *-ā* (corresponding to the *-o* and *-ā* stems of Greek and Latin), in which the accent was fixed either on the stem or on the termination throughout the paradigm without any change in the form of the stem, of the type *dāvah* = Gk. *híppos*, Lat. *equus*. There had, moreover, been a tendency in the pre-Sanskrit period to fix the form even of the variable stems, especially those consisting only of a root: thus the long vowel was generalized in *vāc*—“voice” (nom. *vāk*):

acc.	Skt.	Latin	Avestic	Greek
<i>gāṃ</i>	<i>vācam</i> <i>vācāḥ</i>	<i>vōcem</i> <i>vōcis</i>	<i>avēstic</i> <i>vaoč</i>	<i>opās</i>

But in the process of normalization the vowel declension (and especially with the stems in *-ā*) was predominant, and even in Sanskrit itself there was a considerable transference of consonant-stems and root-stems to this declension: e.g., *pāda*—“foot,” *dvara*—“door,” *danta*—“tooth” replaced *pād-*, *daut-*, *dat-*, *dvar-*, *dūr-*. This proceeded apace in the spoken tongue, for the declension of the modern languages rests exclusively on vowel-stems and of these chiefly on the *-ā* stems.

As in Indo-European, the pronominal declension differed from the nominal, that of the personal pronouns radically, that of the demonstratives and others to a varying degree. In the personal pronoun each number had a different root (*tū* *yām* “thou,” *yūyam* “you”), while that of the first person had different roots also for the nominative and the oblique cases (*aḥam* “I,” *mām* “me,” *vayām* “we,” *asmān* “us”). The tendency of the two declensions, the nominal and the pronominal, to influence each other is observable: e.g., the nominal ending of the neuter sing. nom. and acc. *-m* as in *kīn* “what?” (= Lat. *quid*) replaced the *-d* or *-t* still found in other pronouns (*tāt* “that” = Lat. *is-tud*). In the spoken language this mutual influence continued to react until practically all distinction between the two types of declension was lost. Perhaps the most satisfactory explanation of the various elements that stand between Indo-European demonstrative pronouns and their case endings is to be found in Hittite where the original pronominal stems were appended to the sentence connective (Skt. “tasmīn” = Hitt. “ta [sentence connective] + smi [pronoun]”; Sk. “as” = Hitt. “ta+as”), etc.

Numerals.—The numeral-system, built upon a decimal basis, is that of Indo-European. There are separate names for the numbers up to 10; from 11 to 19 compounds of the units with the word for 10 partly correspond with those of Greek and Latin: e.g., *d(ū)vādaśa* “12” = Gk. *dōdeka*, Lat. *duodecim*. Above that the tens (20, 30, etc.) were in origin probably compounds expressing a number of tens, and the intermediate numbers were formed by compounds of the units with these: e.g., *pāñca* “5” (Gk. *pēnte*, Lat. *quinq̄ue*), *pañcāśāti* “50” (cf. Gk. *pentēkonta*, Lat. *quinḡuaginta*), *pañcapañcāśat* “55.” There are separate words for 100 and 1000. The special word for 100,000 (*lakṣa*), whence modern *lakh* is post-Vedic. The numerals from 1 to 19 are adjectives; the rest are substantives.

Gender.—Traces of the distinction of gender between animate (=masculine and feminine) and inanimate (=neuter) are seen in the use of the neut. *udākam* “water as a medium of floating, etc.” and the fem. *āpah* “waters as personified as sentient beings.” But for the most part in Sanskrit gender is grammatical and largely independent of nature, except that male and female living beings are usually (though not always) respectively masculine or feminine. There were three genders—masculine, feminine and neuter. The neuter was distinguished by its termination (or lack of termination) in the nominative and accusative, and by the fact that the form of the accusative was the same as that of the nominative. But the masculine and feminine substantives were primarily distinguished only by the form of an adjective, if there were one, in agreement with them (as often, e.g., in French or German). But there was a tendency to reserve certain types of stem for one or other gender. Thus the *-a* stems in Sanskrit are reserved only for masculine and neuter nouns (although in Greek they may still be feminine, e.g., *hē hīppos* “the mare”); and the *-ā* stems are mostly feminine. In the older language the *-ī* stems might be masculine or feminine; in the later language they are

almost all feminine. Similarly even in Classical Sanskrit *-ī* stems are either masculine or feminine; but in the spoken language there was a growing tendency to confine them to feminine: thus words of this declension which are masculine in Sanskrit become feminine in the modern languages: *agnīḥ* m. “fire” (= Lat. *ignis*) becomes Hindi *āg* f.

Verbs.—In the Vedic language the verbal system is of considerable complexity. A verb might have various stems, viz. present (sometimes more than one), aorist (three in number, root, e.g., *āsthām* = Gk. *ástēn*, strong, e.g., *aricam* = Gk. *ārīpon*, sigmatic, e.g., *arāksam* = Gk. *ēlēipsa*); perfect (characterized by reduplication and peculiar terminations); future (rare in the old language). The significance of the stems lay in the mode of action they expressed. Very generally speaking, the present indicated continuous action, the aorist momentary action, the perfect a state resulting from past action. The various present stems indicated various types of present-stem action, such as intensive, repetitive, inchoative, causative, desiderative, etc. Each of the first three stems had five moods—indicative expressing fact, injunctive and subjunctive expressing will and futurity, optative expressing wish, imperative expressing command. In the indicative of the present, perfect and future stems there were two tenses, present and past; the aorist stem was in the indicative confined to the past tense. Each tense had three persons and three numbers—singular, dual and plural. Finally each tense could be conjugated in two voices with different terminations—active and middle. Among the parts of the infinitive verb there was connected with each stem a participle which could be either active or middle, present, past, or perfect, and independent of tense stems a past participle, one or more infinitives (for the most part case-forms of verbal nouns), a gerundive (=future passive participle) and an indeclinable participle or gerund. The total number of possible forms belonging to any one verb is thus very great.

The idea of time was expressed in the indicative primarily by the termination: the primary endings expressing present and future time, the secondary endings past (and also, to some extent, future) time. Past time was usually still further defined by the prefixing of a particle, *a* or *ā*, before the verb (corresponding to the Greek and Armenian augment), e.g., *dādhāmi* “I place,” *dādadhām* “I placed” = Gk. *tithēmi*, *titithēn*. The active voice indicated that the action performed had reference to some person or thing other than the doer, the middle that the action had reference to the doer in some way or other: e.g., active *tanūlātā nēnēkti* “he washes the rice” (French *il lave*), middle *pañt nēnēkti* “he washes his hands” (*il se lave les mains*). As in Greek, the middle could also be used to express passive sense, but this use was later confined to the perfect and especially the aorist stems, while a special present stem (characterized by the suffix *-yā-* with middle terminations) was used for the present passive: e.g., *labhatē* “he takes,” *labhyatē* “is taken.” The expression of person was inherent in the verbal form, and pronouns were used only when emphasis was desired. As with the nouns, there were two types of stems—the thematic with variable accent and variable stem form to which the terminations were directly attached (type *ds-ti* “he is” = Gk. *estī*, Lat. *est*), the thematic with invariable accent and stem between which and the termination the vowel *a* was inserted (type *vā-a-ti* = Lat. *veh-t-t*). There was a growing tendency for verbs to be brought into this class from the other, since its conjugation was the more normal; thus *yunāḥ-ti* (3rd plur. *yunāḥ-anti*) “joins,” contrasted with the already thematic Lat. *iung-t-t*, became later *yunāḥ-a-ti* (3rd plur. *yunāḥ-a-nti*). This type almost alone survives in the modern languages.

This verbal system was greatly simplified in Classical Sanskrit. The injunctive mood almost, and the subjunctive entirely, disappeared or were incorporated in the imperative. The aorist and perfect stems remained only in the indicative, and the aorist participle disappeared. The infinitive was reduced to one form only (the accusative of a noun in *-tū-*, corresponding in form to the Latin supine, e.g., *frātum* “to know” = [g]nātum), and the absolute to two, one for simple, one for compound verbs. This left the present stem predominant; and though the aorist and the perfect survived in the indicative, their meaning was scarcely,

if at all, to be distinguished from that of the past tense of the present stem (*i.e.*, the imperfect). Finally even in Sanskrit itself the imperfect tended to be replaced by the past participle used as a finite verb. Among the spoken languages in some areas the aorist seems to have been developed further as a past tense, but as a whole the verb of the modern languages possesses a present system based on the Sanskrit present stem and a past system based on the Sanskrit past participle.

Syntax.—In its main lines the syntax of Sanskrit is Indo-European, and the primary uses of its cases, moods and tenses can be paralleled from other Indo-European languages. Its most peculiar development was in the region of composition. Compounds, usually of not more than two members, are common in the Vedic texts. Even in the Epic their extension is considerable, and compounds consisting of three or four separate members are not rare. In the later, more artificial, language compounds may be met with which extend over a page or more.

Vocabulary.—Sanskrit shows a constant change and development of vocabulary. Part of this is in the natural evolution of already existing material. The main constituent of the vocabulary of Vedic Sanskrit is Indo-European, but even here there are some words which are not Indo-European. One source of such words is undoubtedly the languages which the Aryans found in India; and recently J. Przyluski has demonstrated that some (such as *bhūdh* "arrow," *mayīrah* "peacock," *kurpāsam* "cotton") were received from *Miyāra* or Austro-Asiatic languages. Another source for new words was found in the spoken Aryan languages: words taken from these were given a Sanskrit form. In this way even original Sanskrit words returned under a new form: we have already seen how *vikṛita*, having in the spoken language become *vikṛa*, was readopted in that form in the literary tongue, and retained side by side with *vikṛita*.

LITERATURE

The history of Sanskrit literature like the political history of ancient India suffers from the total want of anything like a fixed chronology. In its vast range there is scarcely a work of importance the date of which can be fixed with absolute certainty. The original composition of most Sanskrit works can indeed be confidently assigned to certain general periods but as to many of them, there is reason to doubt whether they have come down to us in their original shape.

The history of Sanskrit literature readily divides itself into two main periods—the Vedic and the classical. These periods partly overlap, and some of the later Vedic works are included in that period on account of their subject matter, and archaic style, rather than for any claim to a higher antiquity than some of the oldest works of classical Sanskrit. The first period may be put at 1500–200 B.C. and the second 500 B.C.–A.D. 1000.

THE VEDIC PERIOD

Samhitās.—The term *veda*, *i.e.* (sacred) "knowledge," "lore"—embraces a body of writings the origin of which is ascribed to divine revelation (*śruti*, literally "hearing"), and which forms the foundation of the Brāhmanical system of religious belief. This sacred canon is divided into three or (according to a later scheme) four co-ordinate collections, likewise called *Veda*: (1) the *Rig-veda*, or lore of praise (or hymns); (2) the *Sāma-veda*, or lore of tunes (or chants); (3) the *Yajur-veda*, or lore of prayer (or sacrificial formulas); and (4) the *Atharva-veda*, or lore of the Atharvans. Each of these four Vedas is a collection (*saṃhitā*) of sacred, mostly poetical, texts of a devotional nature, called *mantra*. This entire body of texts (and particularly the first three collections) is also known as the *trayi vidyā*, or threefold wisdom, of hymn (*rich*), tune or chant (*śāwan*), and prayer (*yajus*)—the fourth Veda, when included, being classed together with the *Rik*.

Classes of Priests.—The Brāhmanical religion finds its practical expression chiefly in sacrificial performances. The Vedic sacrifice requires for its proper performance the attendance of four officiating priests, each of whom is assisted by one or more (usually three) subordinate priests, viz.: (1) the *Hotar* (or *hotri*, *i.e.*, either "sacrificer," or "invoker"), whose chief business is to invoke the gods, in prayers or hymns; (2) the *Udgātā* (udgātṛ), or chorister, who has to perform chants (*stotra*) in connection with the hotar's invocations; (3) the *Adhvaryu*, or offering priest *par excellence*, who performs all the material duties of the sacrifice, such as the kindling of the fires; (4) the *Brāhmaṇ*, or chief "priest," who superintends the performance and rectifies any mistakes that may be committed. The *Sāmaveda* and *Yajurveda* form special song and prayer books, arranged for the practical use of the udgātā and adhvaryu respectively; while the *Rik-saṃhitā*, though not arranged for any such practical purpose, contains the entire body of sacred lyrics whence the hotar draws the material for his recitations. The brāhmaṇ had no special textbook assigned to him, but was expected to be familiar with all the *Samhitās* as well as with the practical details of the sacrificial performance. (See *BRĀHMAN* and *BRĀHMAṆA*.)

Brāhmaṇas.—The several *Samhitās* have attached to them certain theological prose works, called *Brāhmaṇa*, which also form part of the canon. Their object is to explain the relationship of the Vedic texts to the now very elaborate sacrificial ceremonial and to explain their mystic import. (See *BRĀHMAṆA*.)

Āraṇyakas and Upanishads.—Closely connected with the *Brāhmaṇas* are two classes of treatises called *Āraṇyaka* and *Upanishad*. The *Āraṇyakas*, *i.e.*, works "relating to the forest," intended to be read or expounded by anchorites in the quiet of the forest, resemble the *Brāhmaṇas*, which they supplement by dealing with special points of ritual. The *Upanishads* are of a more mystical nature, and form the first attempts at a systematic treatment of metaphysical questions. From their pantheistic views later developed the Vedānta philosophy. The *Upanishads* have to be assigned to very different periods of Sanskrit literature. The oldest treatises of this kind are doubtless those which form part of the *Samhitās*, *Brāhmaṇas* and *Āraṇyakas* of the three older Vedas.

Different Recensions.—As the sacred texts were not committed to writing till a much later period, but were handed down orally in the Brāhmanical schools, it was inevitable that local differences of reading should spring up, which in course of time gave rise to a number of independent versions. Such different text-recensions, called *śākhā* (*i.e.*, branch), were at one time very numerous, but only a limited number have survived. As regards the *Samhitās*, the poetical form of the hymns, as well as the concise style of the sacrificial formulas, rendered these texts less liable to change.

Vedāṅgas.—Besides the purely ceremonial matter, the *Brāhmaṇas* also contained a considerable amount of matter bearing on the correct interpretation of the Vedic texts; and, indeed, the sacred obligation incumbent on the Brāhmins of handing down correctly the letter and sense of those texts necessarily involved a good deal of serious grammatical and etymological study in the Brāhmanical schools. These literary pursuits resulted in the accumulation of much learned material, which it became desirable to throw into a systematic form. These practical requirements were met by a class of treatises, grouped under six different heads or subjects, called *Vedāṅgas*, *i.e.*, members, or limbs, of (the body of) the Veda. In their present form these works represent a rather advanced stage of scientific development. Though a few of them are composed in metrical form—the majority belong to a class of writings called *sūtra*, *i.e.*, "string," consisting of strings of rules in the shape of tersely expressed aphorisms, intended to be committed to memory.

Sūtras.—The *Sūtras* form a connecting link between the Vedic and the classical periods of literature. These treatises are included among the Vedic writings, and in point of language may be considered as the latest products of the Vedic age, but they are no longer *śruti* or revelation. They are of human, not of divine, origin. The *Sūtras* are regarded nevertheless as works of great authority, second only to that of the revealed Scriptures;

in contrast to the latter they are called *smṛiti*, or tradition.

The six branches of Vedic science, included under the term Vedāṅga, are as follows:—

1. *Śikṣā*, or Phonetics.—In addition to a small treatise ascribed to the great grammarian Pāṇini, the *Paṇiniyā śikṣā*, there are usually included under this head certain works, called *Prātiśākhya*, i.e., "belonging to a certain śākhā or recension," which deal minutely with the phonetic peculiarities of the several Saṃhitās, and are of great importance for Vedic textual criticism.

2. *Chandas*, or Metre.—Tradition makes the *Chandaḥ-sūtra* of Piṅgala the starting-point of prosody. The Vedic metres, however, occupy but a small part of this treatise; they are particularly dealt with in the *Nidāna-sūtra* of the *Sāmaveda*, and in a chapter of the *Rik-prātiśākhya*. For later profane prosody, on the other hand, Piṅgala's treatise is valuable.

3. *Vyākaraṇa*, or Grammar.—Pāṇini's famous grammar is said to be the *Vedāṅga*; but it marks the culminating point of grammatical research rather than the beginning, and treats chiefly of the post-Vedic language.

4. *Nirukta*, or Etymology.—Yāska's *Nirukta* deals entirely with Vedic etymology and exegesis. It consists, in the first place, of strings of words in three chapters: (1) synonymous words; (2) such as are purely or chiefly Vedic; and (3) names of deities. These lists are followed by Yāska's commentary, interspersed with numerous illustrations. Yāska quotes the works of several predecessors but his is by several centuries the oldest surviving work of its kind. The above four studies deal with the correct understanding of texts, the next two with rites and their proper seasons.

5. *Jyotiṣa*, or Astronomy.—The metrical treatise which has come down to us in two different recensions under the title of *Jyotiṣa*, ascribed to one Lagadha, or Lagata, seems to be the oldest existing systematic treatise on astronomical subjects.

6. *Kalpa*, or Ceremonial.—Sacrificial practice gave rise to a large number of systematic sūtra-manuals for the several classes of priests. The most important of these works have come down to us, and they occupy by far the most prominent place among the literary productions of the sūtra-period. The *Kalpa-sūtras*, or rules of ceremonial, are of two kinds: (1) the *Srauta-sūtras*, which are based on the *śruti*, and teach the performance of the great sacrifices, requiring three sacrificial fires; and (2) the *Smṛiti-sūtras*, or rules based on the *smṛiti* or tradition. The latter class again includes two kinds of treatises: (1) the *Grihya-sūtras*, or domestic rules, treating of ordinary family rites, such as marriage, birth, name-giving, etc., connected with simple offerings in the domestic fire; and (2) the *Sāmāyāchārika-* (or *Dharma-*) *sūtras*, which treat of customs and temporal duties, and are supposed to have formed the chief sources of the later law-books.

THE FOUR VEDAS

After this brief characterization of the various branches of Vedic literature, we proceed to take a rapid survey of the several Vedic collections.

Rigveda.—The *Rigveda-saṃhitā* has come down to us in the recension of the Śākala school, which shows that it consists of 1,028 hymns, including eleven so-called *Vālakhilyas*, probably of later date. The hymns are composed in a great variety of metres, and consist, on an average, of rather more than 10 verses each, or about 10,600 verses altogether. This body of sacred lyrics has been subdivided by ancient authorities in a twofold way, viz. either from a purely artificial point of view, into eight *aṣṭakas* of about equal length, or, on a more natural principle, based on the origin of the hymns, and invariably adopted by European scholars, into ten books, or *maṇḍalas*, of unequal length. Tradition has handed down the names of the reputed authors, or rather inspired "seers" (*ṛishi*), of most hymns. These indications have enabled scholars to form some idea as to the probable way in which the *Rik-saṃhitā* originated, though much still remains to be cleared up by future research.

Maṇḍalas ii.-vii. are evidently arranged on a uniform plan. Each of them is ascribed to a different family of *ṛishis*, whence they are usually called the six "family-books": ii., the *Gṛtsa-*

madas; iii., the *Viśvāmītras* or *Kuśikas*; iv., the *Vāmadevyas*; v., the *Atṛis*; vi., the *Bharadvājas*, and vii., the *Vasiṣṭhas*. Further, each of these books begins with the hymns addressed to Agni, the god of fire, which are followed by those to Indra, whereupon follow those addressed to minor deities—the *Viśve Devāḥ* ("all-gods"), the *Maruts* (storm-gods), etc. Again, the hymns addressed to each deity are arranged in a descending order, according to the number of verses of which they consist.

Maṇḍala i., the longest in the whole *Saṃhitā*, contains 191 hymns, ascribed, with the exception of a few isolated ones, to sixteen poets of different families, and consisting of one larger (50 hymns) and nine shorter collections. Here again the hymns of each author are arranged on precisely the same principle as the "family-books" *Maṇḍalas* viii. and ix., on the other hand, have a special character of their own. To the *Sāmaveda*, these two *maṇḍalas* have contributed a much larger proportion of verses than any of the others. The hymns of the eighth book are ascribed to a number of different *ṛishis*, mostly belonging to the *Kāyva* family. The chief peculiarity of this *maṇḍala*, however, consists in the strophic character of its composition and the numerous repetitions throughout it. It is closely connected with the first half of the first *maṇḍala* and they were evidently added as beginnings and end to the collected ii.-vii. The ninth *maṇḍala* consists entirely of hymns (114) addressed to *Soma*, the deified juice of the so-called "moon-plant" (*Sarcostemma viminale*, or *Asclepias acida*), and ascribed to poets of different families. They are called *pavanāni*, "purification," because they were to be recited by the *hotar* while the juice expressed from the soma plants was clarifying. The hymns are by poets of the same families as ii.-vii. and it is evident that when these hymns were collected the soma hymns were taken out and put into a single collection. There are also a few soma hymns in the later books (i., viii., x.).

Maṇḍala x. contains the same number of hymns (191) as the first, which it nearly equals in actual length. In the latter half of the book the hymns are clearly arranged according to the number of verses, in decreasing order—occasional exceptions to this rule being easily adjusted by the removal of a few apparently added verses. This *maṇḍala* came into existence after the other nine were in their present form, a fact of which there is abundant evidence. It shows considerable uniformity and is all older than the latest insertions in other books of the former collectors.

It is usual to call the *Rik-saṃhitā* (as well as the *Atarvan*) an historical collection, as compared with the two *Saṃhitās* put together for purely ritualistic purposes. And indeed, although the *Rigveda* itself, in its oldest form, may have been intended as a common prayer-book, for the whole of the *Brahmaṇsa* community, it is certain that in the stage in which it has been finally handed down it includes a certain portion of hymn material (and even some secular poetry) which could never have been used for purposes of religious service. It may, therefore, be assumed that the *Rik-saṃhitā* contains all of the nature of popular lyrics that was accessible to the collectors, or seemed to them worthy of being preserved. The question as to the exact period when the hymns were collected cannot be answered with any approach to accuracy. For many reasons, however, which cannot be detailed here, scholars have come to fix on the year 1000 B.C. as an approximate date for the collection of the Vedic hymns. From that time every means that human ingenuity could suggest was adopted to secure the sacred texts against the risks connected with oral transmission. But, as there is abundant evidence to show that even then not only had the text of the hymns suffered corruption, but their language had become antiquated to a considerable extent, and was only partly understood, the period during which the great mass of the hymns were actually composed must have lain considerably farther back, and may very likely have extended over the earlier half of the second millennium, or from about 2000 to 1500 B.C.

As regards the people which raised for itself this imposing monument, the hymns exhibit it as settled in the regions watered by the mighty Sindhu (Indus), with its eastern and western tributaries, the land of the five rivers (*Pañj-āb*) thus forming the central home of the Vedic people. But, while its advanced guard

has already debouched upon the plains of the upper Gaṅgā and Yamunā, those who bring up the rear are still found loitering far behind in the narrow glens of the Kubhā (Cabul) and Gomati (Gomati). Scattered over this tract of land, in hamlets and villages, the Vedic Āryas are leading chiefly the life of herdsmen and husbandmen. The numerous clans and tribes, ruled over by chiefs and kings, have still constantly to vindicate their right to the land but lately wrung from an inferior race of darker hue. Not infrequently, too, the light-coloured Āryas wage internecine war with one another—as when the Bharatas, with allied tribes of the Panjāb, goaded on by the royal sage Viśvāmitra, invade the country of the Triṣṭu king Sudās, to be defeated in the "ten kings' battle," through the inspired power of the priestly singer Vaiśiṣṭha. The priestly office has already become one of high social importance by the side of the political rulers, and to a large extent an hereditary profession; though it does not yet present the baneful features of an exclusive caste.

The religious belief of the people consists in a system of natural symbolism, a worship of the elementary forces of nature, regarded as beings endowed with reason and power superior to those of man. In giving utterance to this simple belief, the priestly spokesman has, however, frequently worked into it his own speculative and mystic notions. Indra, the stout-hearted ruler of the cloud-region, receives by far the largest share of the devout attentions of the Vedic singer. His ever-renewed battle with the malicious demons of darkness and drought, for the recovery of the heavenly light and the rain-spending cows of the sky, forms an inexhaustible theme of spirited song. Next to him, in the affections of the people, stands Agni (*īgnis*), the god of fire, invoked as the genial inmate of the Aryan household, and as the bearer of oblations, and mediator between gods and men. Indra and Agni are thus, as it were, the divine representatives of the king (or chief) and the priest of the Aryan community; and if, in the arrangement of the Saṁhitā, the Brāhmanical collectors gave precedence to Agni, it was but one of many avowals of their own hierarchical pretensions. Hence also the hymns to Indra are mostly followed, in the family collections, by those addressed to the Viśve Devāḥ (the "all-gods") or to the Maruts, the warlike storm-gods and faithful companions of Indra, as the divine impersonations of the Aryan freemen, the *viś* or clan. But, while Indra and Agni are undoubtedly the favourite figures of the Vedic pantheon, there is reason to believe that these gods had but lately supplanted another group of deities who play a less prominent part in the hymns, viz., Father Heaven (Dyaus Pitar, *Zēds watēr*, Jupiter); Varuna (probably *oivavōs*), the all-embracing (esp. nocturnal) heavens; Mitra (Zend. *Mithra*), the genial light of day; and Savitar, the quickener, and Sūrya (*ḥēlios*), the vivifying sun.

Brāhmaṇas of Rigveda.—Of the Brāhmaṇas that were handed down in the schools of the *Bahurichas* (i.e., "possessed of many verses"), as the followers of the Rigveda are called, two have come down to us, viz. those of the Aitareyins and the Kaushitaks. The *Aitareya-brāhmaṇa* and the *Kaushitaki* (or *Sāṅkhāyana*)-*brāhmaṇa* evidently have for their groundwork the same stock of traditional exegetic matter. They differ, however, considerably in their arrangement of this matter. There is also a certain amount of material peculiar to each of them. The *Kaushitaki* is, upon the whole, far more concise in its style and more systematic in its arrangement—features which would lead one to infer that it is probably the more modern work of the two. While the *Aitareya* deals almost exclusively with the Soma sacrifice, the *Kaushitaki* first treats of the several kinds of *haviryajña*, or offerings of rice, milk and ghee, and then of the Soma sacrifice. Sāyana, in the introduction to his commentary on the work, ascribes the *Aitareya* to the sage Mahidāsa Aitareya (i.e., son of Itarā), also mentioned elsewhere as a philosopher; and it seems likely enough that this person arranged the *Brāhmaṇa* and founded the school of the Aitareyins. Regarding the authorship of the sister work we have no definite statement. Probably it is what one of the manuscripts calls it—the *Brāhmaṇa* of Sāṅkhāyana (composed) in accordance with the views of Kaushitaki.

Each of these two Brāhmaṇas is supplemented by a "forest-book," or *Āraṇyaka*. The *Aitareyāranyaka* is not a uniform production. It consists of five books (*āraṇyaka*), three of which, the first and the last two, are of a liturgical nature, treating of the ceremony called *mahāvratā*, or great vow. The last of these books, composed in sūtra form, is, however, doubtless of later origin. The second and third books are purely speculative, and are also styled the *Bahurichā-brāhmaṇa-upanishad*. Again, the last four chapters of the second book are usually singled out as the *Aitareya-upanishad*, ascribed, like its Brāhmaṇa (and the first book), to Mahidāsa Aitareya; and the third book is also referred to as the *Saṁhitā-upanishad*. As regards the *Kaushitaki-āranyaka*, this work consists of fifteen adhyāyas, the first two (treating of the mahāvratā ceremony) and the seventh and eighth of which correspond to the first, fifth, and third books of the *Aitareyāranyaka* respectively, whilst the four adhyāyas usually inserted between them constitute the highly interesting *Kaushitaki* (*brāhmaṇa*)-*upanishad*, of which we possess two different recensions. The remaining portions (9-15) of the *Āraṇyaka* treat of the vital airs, the internal Agnihotra, ending with the vāmā, or succession of teachers. Of *Kalpa-sūtras*, or manuals of sacrificial ceremonial, composed for the use of the hotar priest, two different sets are in existence, the *Āśvalāyana*- and the *Sāṅkhāyana-sūtra*. Each of these works follows one of the two Brāhmaṇas of the Rik as its chief authority: the *Aitareya* and *Kaushitaki* respectively. Both consist of a *Srauta*- and a *Grihya-sūtra*. *Āśvalāyana* seems to have lived about the same time as Pāṇini (? c. 400 B.C.)—his own teacher, Saunaka, who completed the *Rik-prātiśākhya*, being probably intermediate between the great grāmman and Yaska, the author of the *Nirukta*. Saunaka himself is said to have been the author of a *Srauta-sūtra* (which was, however, more of the nature of a Brāhmaṇa) and to have destroyed it on seeing his pupil's work. A *Grihya-sūtra* is still quoted under his name by later writers. The *Āśvalāyana Srauta-sūtra* consists of twelve, the *Grihya* of four, adhyāyas.

Regarding Sāṅkhāyana still less is known; but he, too, was doubtless a comparatively modern writer, who, like *Āśvalāyana*, founded a new school of ritualists. Hence the *Kaushitaki-brāhmaṇa*, adopted (and perhaps improved) by him, also goes under his name, just as the *Aitareya* is sometimes called *Āśvalāyana-brāhmaṇa*. The *Sāṅkhāyana Srauta-sūtra* consists of eighteen adhyāyas. The last two chapters of the work are, however, a later addition, while the two preceding chapters, on the contrary, present a comparatively archaic, brāhmaṇa-like appearance. The *Grihya-sūtra* consists of six chapters, the last two of which are likewise later appendages. The *Sāṁbhavya Grihya-sūtra*, of which a single ms. is at present known, seems to be closely connected with the preceding work. Professor Bühler also refers to the *Rigveda* the *Vāsisṭha-dharmasūtra*, composed of mixed sūtras and couplets.

A few works remain to be noticed, bearing chiefly on the textual form and traditional records of the Rik-saṁhitā. The *Prātiśākhya* have already been referred to as the chief repositories of śikṣā or Vedic phonetics. Among these works the *Rik-prātiśākhya* occupies the first place. The original composition of this important work is ascribed to the same Sakalya from whom the vulgar recension of the (Sākala) Saṁhitā takes its name. He is also said to be the author of the existing *Pada-pāṭha* (i.e., the text-form in which each word is given unconnected with those that precede and follow it).

Sāmaveda.—The term *sāman*, of uncertain derivation, denotes a solemn tune or melody to be sung or chanted to a *rich* or verse. The set chants (*stotra*) of the Soma sacrifice are as a rule performed in triplets, either actually consisting of three different verses, or of two verses which, by the repetition of certain parts, are made, as it were, to form three. The three verses are usually chanted to the same tune; but in certain cases two verses sung to the same tune had a different *sāman* enclosed between them. One and the same *sāman* or tune may thus be sung to many different verses; but, as in teaching and practising the tunes the same verse was invariably used for a certain tune, the term *sāman*, as well as the special technical names of *sāmāns*, are

not infrequently applied to the verses themselves with which they were ordinarily connected.

In accordance with the distinction between *rich* or text and *sāman* or tune, the sāman-hymnal consists of two parts: the *Sāma-veda-saṃhitā*, or collection of texts (*rich*) used for making up sāman-hymns, and the *Gāna*, or tune-books, song-books. The textual matter of the Saṃhitā consists of somewhat under 1600 different verses, selected from the Rik-saṃhitā, with the exception of some seventy-five verses, some of which have been taken from Khila hymns, whilst others which also occur in the Atharvan or Yajurveda, as well as those not otherwise found, may perhaps have formed part of some other recension of the Rik. The *Sāma-veda-saṃhitā* is divided into two chief parts, the *pūrva*- (first) and the *uttara*- (second) *ārchika*. The second part contains the texts of the sāman-hymns, arranged in the order in which they are actually required for the *stōtras* or chants of the various Soma sacrifices. The first part, on the other hand, contains the body of tune-verses, or verses used for practising the several *sāmans* or tunes upon—the tunes themselves being given in the *Grāma-geyagāna* (i.e., songs to be sung in the village), the tune-book specially belonging to the Pūrvarchika.

Sāmaveda-brāhmaṇas.—The title of *Brāhmaṇa* is bestowed by the Chhandogas, or followers of the Sāmaveda, on a considerable number of treatises. The majority of the Sāmaveda-brāhmaṇas present, however, none of the characteristic features of other works of that class; but they are rather of the nature of sūtras and kindred treatises, with which they probably belong to the same period of literature. Moreover, the contents of these works—as might indeed be expected from the nature of the duties of the priests for whom they were intended—are of an extremely arid and technical character, though they all are doubtless of some importance, either for the textual criticism of the Saṃhitā or on account of the legendary and other information they supply.

If the Sāmaveda has thus its ample share of Brāhmaṇa-literature, though in part of a somewhat questionable character, it is not less richly supplied with sūtra-treatises, or works on exegesis, some of which probably belong to the oldest works of that class.

Yajurveda.—This, the sacrificial Veda of the Adhvaryu priests, divides itself into an older and a younger branch, or, as they are usually called, the Black (*kṛishya*) and the White (*śukla*) Yajurveda. Tradition ascribes the foundation of the Yajurveda to the sage Vaisampāyana. Of his disciples three are specially named, viz: Kaṭha, Kālāpīn and Yāska Pāṇī, the last of whom again is stated to have communicated the sacrificial science to Taittiri. We have three old collections of Yajus-texts, viz. the *Kāṭhaka*, the *Kālāpaka* or *Maitrāyaṇi Saṃhitā*, and the *Taittirīya-saṃhitā*. The *Kāṭhaka* and *Kālāpaka* are frequently mentioned together; and the author of the "great commentary" on Pāṇini once remarks that these works were taught in every village. From the *Kaṭhas* and *Kālāpas* proper schools seem early to have branched off, each with their own recensions of the text. As regards the *Taittirīya-saṃhitā*, that collection, too, in course of time gave rise to a number of different schools, the text handed down being that of the Āpastambas.

The four collections of old Yajus texts, so far known to us, while differing more or less considerably in arrangement and verbal points, have the main mass of their textual matter in common. This common matter consists of both sacrificial prayers (*yajus*) in verse and prose, and exegetic or illustrative prose portions (*brāhmaṇa*). A prominent feature of the old Yajus texts, as compared with the other Vedas, is the constant intermixture of textual and exegetic portions. The Charakas and Taittirīyas thus do not recognize the distinction between Saṃhitā, and Brāhmaṇa in the sense of two separate collections of texts, but they have only a Saṃhitā, or collection, which includes likewise the exegetic or Brāhmaṇa portions. The Taittirīyas seem at last to have been impressed with their want of a separate Brāhmaṇa and to have set about supplying the deficiency in rather an awkward fashion: instead of separating from each other the textual and exegetic portions of their Saṃhitā, they merely added to the latter a supplement (in three books), which shows the same mixed condition, and applied to it the title of *Taittirīya-brāhmaṇa*.

The *Maitrāyaṇi Saṃhitā*, the identity of which with the original Kālāpaka has been proved pretty conclusively by Dr. L. v. Schroder, who attributes the change of name of the Kālāpaka to Buddhist influences, consists of four books, attached to which is the *Maitrī- (or Maitrāyaṇi) upanishad*. The *Kāṭhaka*, on the other hand, consists of five parts, the last two of which, however, are perhaps later additions, containing merely the prayers of the hotar priest, and those used at the horse-sacrifice. There is, moreover, the beautiful *Kaṭha- or Kāṭhaka-upanishad*, which is also, and more usually, ascribed to the Atharvaveda, and from which Sāṅkhya-Yoga ideas may have developed.

Saṃhitā of the White Yajurveda.—The defective arrangement of the Yajus texts was at last remedied by a different school of Adhvaryus, the Vājasaneyins. The reputed originator of this school and its text-recension is Vājñanvalkya Vājasaneyi (son of Vajasani). The result of the rearrangement of the texts was a collection of sacrificial mantras, the *Vājasaneyi-saṃhitā*, and a Brāhmaṇa, the *Satapatha*. On account of the greater lucidity of this arrangement, the Vājasaneyins called their texts the White (or clear) Yajurveda—the name of Black (or obscure) Yajus being for opposite reasons applied to the Charaka texts. Both the Saṃhitā and Brāhmaṇa of the Vājasaneyins have come down to us in two different recensions, viz., those of the *Mādhyaṇḍina* and *Kāṇva* schools. In several points of difference the Kāṇva recension agrees with the practice of the Rik-saṃhitā, and there probably was some connection between the Yajus school of Kāṇvas and the famous family of pishis of that name to which the eighth maṇḍala of the Rik is attributed.

The *Vājasaneyi-saṃhitā* consists of forty adhyāyas, the first eighteen of which contain the formulas of the ordinary sacrifices. The last fifteen (or even twenty-two) adhyāyas are doubtless a later addition. The last adhyāya is commonly known under the title of *Vājasaneyi-saṃhitā (or Jāṇvīya-) upanishad*. Its object seems to be to point out the fruitlessness of mere works, and to insist on the necessity of man's acquiring a knowledge of the supreme spirit.

The last book is of the Upanishad order, and bears the special title of *Bṛihad- (great) āraṇyaka*; its last six chapters are the *Bṛihadāraṇyaka-upanishad*, the most important of all Upanishads. As regards the age of the Satapatha, the probability is that the main body of the work is considerably older than the time of Pāṇini, but that some of its latter parts were considered by Pāṇini's critic Kātyāyana to be of about the same age as, or not much older than, Pāṇini.

The consolidation of the Brāhmaṇical hierarchy and the institution of a common system of ritual worship, which called forth the liturgical Vedic collections, were doubtless consummated in the so-called Madhya-dēśa, or "midland," lying between the Sarasvatī and the confluence of the Yamunā and Gaṅgā; and more especially in its western part, the Kuru-kṣetra, or land of the Kurus, with the adjoining territory of the Pañchālas, between the Yamunā and Gaṅgā. From thence the original schools of Vaidik ritualism gradually extended their sphere over the adjacent parts. The Charakas seem for a long time to have held sway in the western and north-western regions; while the Taittirīyas in course of time spread over the whole of the peninsula south of the Narmadā (Nerbudda), where their ritual has remained pre-eminently the object of study till comparatively recent times. The Vājasaneyins, on the other hand, having first gained a footing in the lands on the lower Ganges, chiefly, it would seem, through the patronage of King Janaka of Videha, thence gradually worked their way westwards, and eventually succeeded in superseding the older schools north of the Vindhya.

Atharvaveda.—The Atharvan was the latest of Vedic collections to be recognized as part of the sacred canon. That it is also the youngest Veda is proved by its language, which in vocabulary and grammar marks an intermediate stage between the main body of the Rik and the Brāhmaṇa period. In regard also to the nature of its contents, and the spirit which pervades them, this Vedic collection occupies a position apart from the others. Whilst the older Vedas seem clearly to reflect the recognized religious

notions and practices of the upper classes of the Aryan tribes, as jealously watched over by a priesthood deeply interested in the unimpaired maintenance of the traditional observances, the fourth Veda, on the other hand, deals mainly with all manner of superstitious practices such as have at all times found a fertile soil in the lower strata of primitive and less advanced peoples, and are even apt, below the surface, to maintain their tenacious hold on the popular mind in comparatively civilized communities. Although the constant intermingling with the aboriginal tribes may well be believed to have exercised a deteriorating influence on the Vedic people in this respect, it can scarcely be doubted that superstitious practices of the kind revealed by the Atharva and the tenth book of the Rik must at all times have been present among the Aryan people, and that they only came to the surface when they received the stamp of recognized forms of popular belief by the admission of these collections of spells and incantations into the sacred canon. If in this phase of superstitious belief the old gods still find a place, their character has visibly changed so as to be more in accordance with those mystic rites and magic performances and the part they are called upon to play in them, as the promoters of the votary's cabalistic practices and the avengers of the malicious designs of mortal enemies and the demoniac influences to which he would ascribe his fears and failures as well as his bodily ailments. The fourth Veda may thus be said to supplement in a remarkable manner the picture of the domestic life of the Vedic Aryan as presented in the Gṛhya-sūtras or house-rules; for while these deal only with the orderly aspects of the daily duties and periodic observances in the life of the respectable householder, the Atharvaveda allows us a deep insight into "the obscurer relations and emotions of human life"; and, it may with truth be said that "the literary diligence of the Hindus has in this instance preserved a document of priceless value for the institutional history of early India as well as for the ethnological history of the human race" (M. Bloomfield). It is worthy of note that the Atharvaveda is practically unknown in the south of India.

This body of spells and hymns is traditionally associated with two old mythic priestly families, the Atharvans and Angiras, their names, in the plural, serving either singly or combined (Atharvāṅgirasas) as the oldest appellation of the collection. The two families or classes of priests are by tradition connected with the service of the sacred fire; but whilst the Atharvans seem to have devoted themselves to the auspicious aspects of the fire-cult and the performance of propitiatory rites, the Angiras, on the other hand, are represented as having been mainly engaged in the uncanny practices of sorcery and exorcism. The current text of the *Atharva-saṃhitā*—apparently the recension of the Śaunaka school—consists of some 750 different pieces, about five-sixths of which is in various metres, the remaining portion being in prose. The whole mass is divided into twenty books. The principle of distribution is for the most part a merely formal one, in books i.-xiii. pieces of the same or about the same number of verses being placed together in the same book. The next five books, xiv.-xviii., have each its own special subject: xiv. treats of marriage and sexual union; xv., in prose, of the Vṛitaya, or religious vagrant; xvi. consists chiefly of prose formulas of conjuration; xvii. of a lengthy mystic hymn; and xviii. contains all that relates to death and funeral rites. Of the last two books no account is taken in the Atharva-prātiśākhya, and they indeed stand clearly in the relation of supplements to the original collection. The nineteenth book evidently was the result of a subsequent gleaming of pieces similar to those of the earlier books, which had probably escaped the collectors' attention; while the last book, consisting almost entirely of hymns to Indra taken from the Rik-saṃhitā, is nothing more than a liturgical manual of recitations and chants required at the Soma sacrifice; its only original portion being the ten so-called *kuntāpa* hymns (127-136), consisting partly of laudatory recitals of generous patrons of sacrificial priests and partly of riddles and didactic subjects.

The Atharva has come down to us in a much less satisfactory state of preservation than any of the other Saṃhitās. The discovery in Kashmir of a second recension of the Atharva-saṃhitā, 19-LL

contained in a single birch-bark ms., written in the Śāradā character, has provided further material for its study. This new recension, ascribed to the Paippalāda school, consists likewise of twenty books (*kāṇḍa*), but in textual matter and arrangement it differs very much from the current text. While lacking much of the latter the new version offers a good deal of fresh matter, amounting to about one-sixth of the whole. From the *Mahābhāṣya* and other works quoting as the beginning of the Atharva-saṃhitā a verse that coincides with the first verse of the sixth hymn of the current text, it has long been known that at least one other recension must have existed; but the first leaf of the Kashmir ms. having been lost, it cannot be determined whether the new recension (as seems all but certain) corresponds to the one referred to in those works.

Atharvaveda-brāhmaṇa.—The only Brāhmaṇa of the Atharvan, the *Gopatha-brāhmaṇa*, is one of the most modern and least important works of its class. It consists of two parts, the first of which contains cosmogonic speculations, interspersed with legends, mostly adapted from other Brāhmaṇas, and general instructions on religious duties and observances; while the second part treats, in a very desultory manner, of various points of the sacrificial ceremonial.

Atharvaveda-sūtras.—The *Kalpa-sūtras* belonging to this Veda comprise both a manual of śrautarites, the *Vaitāna-sūtra*, and a manual of domestic rites, the *Kaushika-sūtra*. The teacher Kaushika is repeatedly referred to in the work on points of ceremonial doctrine. The last sūtra-work to be noticed in connection with this Veda is the *Saunakiyā Chaturvādyīyikā*, being a Prātiśākhya of the Atharva-saṃhitā, so called from its consisting of four lectures (*adhyāya*). Although Śaunaka can hardly be credited with being the actual author of the work, considering that his opinion is rejected in the only rule where his name appears, there is no reason to doubt that it chiefly embodies the phonetic theories of that teacher, which were afterwards perfected by members of his school. Whether this Śaunaka is identical with the writer of that name to whom the final redaction of the Śikhalprātiśākhya of the Rik is ascribed is not known.

Upanishads.—Another class of writings traditionally connected with the Atharvaveda are the numerous *Upanishads*, which do not specially attach themselves to one or other of the Saṃhitās or Brāhmaṇas of the other Vedas. The Atharvāna-upanishads, mostly composed in śloka, may be roughly divided into two classes: those of a purely speculative or general pantheistic character, treating chiefly of the nature of the supreme spirit, and the means of attaining to union therewith, and those of a sectarian tendency. Of the former category, a limited number—such as the *Praśna*, *Mundaka* and *Māndūkya*-upanishads—have probably to be assigned to the later period of Vedic literature; whilst the others presuppose more or less distinctly the existence of some fully developed system of philosophy, especially the *Vedānta* or the *Yoga*. The sectarian Upanishads, on the other hand—identifying the supreme spirit either with one of the forms of Vishnu (such as the *Nārāyaṇa*, *Nṛsiṃha*-tāpanīya, *Rāma*-tāpanīya, *Gopāla*-tāpanīya Upanishads), or with Śiva (e.g., the *Rudra*-upanishad), or with some other deity—belong to post-Vedic times.

THE CLASSICAL PERIOD

The Classical Literature of India is almost entirely a product of artificial growth, in the sense that its vehicle was not the language of the general body of the people, but of a small and educated class. It would scarcely be possible, even approximately, to fix the time when the literary idiom ceased to be understood by the common people. We only know that in the 3rd century B.C. there existed several dialects in different parts of northern India which differed considerably from the Sanskrit, and Buddhist tradition states that Gautama Śākyamuni himself, in the 6th century B.C., used the local dialect of Magadha (Behar) in preaching his new doctrine. Not unlikely, indeed, popular dialects, differing perhaps but slightly from one another, may have existed as early as the time of the Vedic hymns, when the Indo-Aryans, divided into clans and tribes, occupied the Land of the Seven Rivers; but such dialects must have sprung up

after the extension of the Aryan sway and language over the whole breadth of northern India. But there is no reason why, even with the existence of local dialects, the literary language should not have kept in touch with the people in India, as elsewhere, save for the fact that from a certain time that language remained altogether stationary, allowing the vernacular dialects more and more to diverge from it. Although linguistic research had been successfully carried on in India for centuries, the actual grammatical fixation of Sanskrit seems to have taken place about contemporaneously with the first spread of Buddhism; and indeed that popular religious movement undoubtedly exercised a powerful influence on the linguistic development of India.

Epic Poems.—The Hindus, like the Greeks, possess two great national epics, the *Mahābhārata* and the *Rāmāyaṇa*. The *Mahābhārata*, i.e., "the great (poem or tale) of the Bhāratas" is not so much a uniform epic poem as a great collection of poetry, consisting of a mass of legendary and didactic matter, worked into and round a central heroic narrative. The authorship of this work is aptly attributed to Vyāsa, "the arranger," the personification of Indian recession. Only the bare outline of the leading story can here be given.

At Hastināpura (sixty miles from the modern Delhi) in the Bhārata country Dhritrāshtra, the elder of the princes, being blind, was passed over for his brother Pāṇdu on the death of their father. On the death of Pāṇdu, however, Dhritrāshtra assumed the government, assisted by his uncle Bhishma, the Nestor of the poem. Pāṇdu had five sons, Yudhishtira, Bhima and Arjuna, by his chief wife Kūnti, and the twins Nakula and Sahadeva by his wife Mādrī. From their great-grandfather Kuru both families are called *Kauravas*; but for distinction that name is more usually applied to the sons of Dhritrāshtra, while their cousins, as the younger line, are named, after their father, *Pāṇavas*. The Pāṇavas were brought up at their uncle's court like his own sons. The rivalry and varying fortunes of these two houses form the main plot of the great epic. The Pāṇdu princes soon proved themselves greatly superior to their cousins; and Yudhishtira, the eldest of them all, was to be appointed heir-apparent. But they had to leave the country to escape the plots of their jealous cousins. In their exile Draupadi, daughter of King Drupada of Panchāla, won by Arjuna in open contest, became the wife of the five brothers. At the contest they met their cousin, nephew of their mother Kūnti, the famous Yādava prince Krishna of Dvārakā, who ever afterwards remained their faithful friend and confidential adviser. Dhritrāshtra now divided the kingdom between the two houses; whereupon the Pāṇavas built for themselves the city of Indraprastha (on the site of the modern Delhi). After a time of great prosperity, Yudhishtira, in a game of dice, lost everything to Duryodhana, when it was settled that the Pāṇavas should return to the forest for twelve years, but should afterwards be restored to their kingdom if they succeeded in passing an additional year in disguise. During their forest-life they met with many adventures, among which may be mentioned their encounter with King Jayadratha of Chedi, who had carried off Draupadi from their hermitage. After the twelfth year has expired they leave the forest, and, assuming various disguises, take service at the court of King Virāṭa of Matsya. Here all goes well for a time till the queen's brother Kichaka, a great warrior and commander of the royal forces, falls in love with Draupadi, and is slain by Bhima. The Kauravas, profiting by Kichaka's death, now invade the Matsya kingdom, when the Pāṇavas save with King Virāṭa, and there ensues, on the field of Kurukshetra, during eighteen days, a series of fierce battles, ending in the annihilation of the Kauravas; only the Pāṇavas, Arjuna and his charioteer Krishna survived on the victorious side. Yudhishtira now at last becomes yuva-rāja, and eventually king—Dhritrāshtra having resigned and retired with his wife and Kūnti to the forest, where they soon after perish in a conflagration. Learning also of the death of Krishna, Yudhishtira himself at last becomes tired of life and resigns his crown; and the five princes, with their faithful wife, and a dog that joins them, set out for Mount Meru, to seek admission to Indra's heaven. On the way one by one drops off, till

Yudhishtira alone, with the dog, reaches the gate of heaven; but, the dog being refused admittance, the king declines entering without it, when the dog turns out to be no other than the god ^{Indra}. Justice himself, having assumed that form to test Yudhishtira's constancy. But, finding neither his wife nor his brothers in heaven, and being told that they are in the nether world to expiate their sins, the king insists on sharing their fate, when this, too, proves a trial, and they are all reunited to enjoy perpetual bliss.

The complete work consists of upwards of 100,000 couplets—its contents thus being nearly eight times the bulk of the *Iliad* and *Odyssey* combined. It is divided into eighteen books, with a supplement, entitled *Harivamśa*, or genealogy of the god Hari (Krishna-Vishnu). The portion relating to the feud of the rival houses constitutes somewhere between a fourth and a fifth of the work; and it is by no means improbable that this portion once formed a separate poem, called the *Bhārata*. While some of the episodes are so loosely connected with the story as to be readily severed from it, others are so closely interwoven with it that their removal would seriously injure the very texture of the work. This, however, only shows that the original poem must have undergone some kind of revision, or perhaps repeated revisions. That such has indeed taken place, at the hand of Brāhmins, for sectarian and caste purposes, cannot be doubted. According to Lassen's opinion, which has been very generally accepted by scholars, the main story of the poem would be based on historical events: on a destructive war waged between the two neighbouring peoples of the Kurus and Panchālas, who occupied the western and eastern parts of the Madhyadesa (or "middle land" between the Ganges and Jumna) respectively, and ending in the overthrow of the Kuru dynasty. On the original accounts of these events—perhaps handed down in the form of lays or sagas—the Pāṇava element would subsequently have been grafted as calculated to promote the class interests of the Brāhminical revisers.

Date of the Epic.—The earliest direct information regarding the existence of epic poetry in India is in a passage of Dion Chrysostom (c. A.D. 80)—"even among the Indians, they say, Homer's poetry is sung, having been translated by them into their own dialect and tongue." It is generally agreed that this does not imply an Indian translation of Homer but means that the Indians had similar works. Whence Dion derived his information is not known; but as many leading names of the *Mahābhārata* and even the name of the poem itself are mentioned in Pāṇini's grammatical rules, not only must the Bhārata legend have been current in his time (? c. 400 B.C.), but most probably it was at the time of Patañjali, the author of the "great commentary" on Pāṇini (c. 150 B.C.). It cannot, however, be doubted that long before that time heroic song had been diligently cultivated in India at the courts of princes and among Kshatriyas, the knightly order, generally. In the *Mahābhārata* itself the transmission of epic legend is in some way connected with the Sūtas, a social class which, in the caste-system, is defined as resulting from the union of Kshatriya men with Brāhmana women, and which supplied the office of charioteers and heralds, as well as (along with the Māgadhās) that of professional minstrels. Be this as it may, there is reason to believe that, as Hellas had her *dædaloi* who sang the κλέα Ἀργείων, and Iceland her skalds who recited favourite sagas, so India had from olden times her professional bards, who delighted to sing the praises of kings and inspire the knights with warlike feelings. If in this way a stock of heroic poetry had gradually accumulated which reflected an earlier state of society and manners, we can well understand why, after the Brāhminical order of things had been definitely established, the priests should have deemed it desirable to subject these traditional memorials of Kshatriya chivalry and prestige to their own censorship, and adapt them to their own canons of religious and civil law. Such a revision would doubtless require considerable skill and tact; and if in the present version of the work much remains that seems contrary to the Brāhminical code and pretensions—e.g., the polyandric union of Draupadi and the Pāṇdu princes—the reason probably is that such features were too firmly rooted in the popular tradition to be readily eliminated; and all the revisers could do was to explain them away as best

they could. Thus Draupadi's abnormal position is actually accounted for in five different ways, one of these representing it as a part of duty and filial obedience on the part of Arjuna who, on bringing home his fair prize and announcing it to his mother, is told by her, before seeing what it is, to share it with his brothers. The epic in time became a great treatise on duty (*dharma*) inculcating the divine origin of Brahman institutions, the caste system and the superiority of the priestly caste not only over the people but over kings. From inscriptions we know that by the end of the 5th century A.D. the Mahābhārata was appealed to as an authority on matters of law, and that its extent was practically what it now is, including its supplement, the Harivaṃśa. Indeed, everything seems to point to the probability of the work having been complete by about A.D. 200. But, whilst Bhārata and Kuru heroic lays may, and probably do, go back to a much earlier age, it seems hardly possible to assume that the Pāṇḍava epic in its present form can have been composed before the Greek invasion of India, or about 300 B.C. Moreover, it is by no means impossible that the epic narrative was originally composed—as some other portions of the works are—in prose, either continuous or mixed with snatches of verse. The leading position occupied in the existing epic by Krishna (whence it is actually called *kārṣṇa-veda*, or the veda of Krishna), and the Vaishnava spirit pervading it, make it very probable that it assumed its final form under the influence of the Bhāgavata sect with whom Vāsudeva (Krishna), originally apparently a venerated local hero, came to be regarded as a veritable god, and incarnation of Viṣṇu. Its culminating point this sectarian feature attains in the *Bhagavat-gītā* (i.e., the upaniṣad, "sung by the holy one"—the famous theosophic episode, in which Krishna, in lofty and highly poetic language, expounds the doctrine of faith (*bhakti*) and claims adoration as the incarnation of the supreme spirit. Of the purely legendary matter incorporated with the leading story of the poem, not a little, doubtless, is at least as old as the latter itself. Some of these episodes—especially the well-known story of Nala and Damayanti, and the touching legend of Sāvitrī—themselves form epic gems of high poetic value.

The *Rāmāyana*, i.e., poem "relating to Rāma," is ascribed to the poet Vālmīki; and, allowance being made for some later additions, the poem indeed presents the appearance of being the work of an individual genius. In its present form it consists of some 24,000 śloka, or 48,000 lines of sixteen syllables, divided into seven books.

(I.) King Daśaratha of Kośala, reigning at Ayodhyā (Oudh), has four sons borne him by three wives, viz., Rāma, Bharata and the twins Lakṣmaṇa and Saṭrugṇa. Rāma wins for a wife Sītā, daughter of Janaka, king of Videha. (II.) On his return to Ayodhyā he is to be appointed heir-apparent; but Bharata's mother persuades the king now to grant her a long promised boon and insists on his banishing his eldest son for fourteen years, and appointing her son instead. Separation from his favourite son soon breaks the king's heart, whereupon the ministers call on Bharata to assume the reins of government. He refuses, however, and, betaking himself to Rāma's retreat on the Chitrakūṭa mountain (in Bundelkhand), implores him to return; but, unable to shake Rāma's resolve to complete his term of exile, he consents to take charge of the kingdom in the meantime. (III.) After a ten years' happy residence in the forest, Rāvana, the demon-king of Ceylon, carries off Sītā to his capital Lankā while her two protectors are away in pursuit of a golden deer sent to mislead them. While she resolutely rejects the Rākṣhasa's addresses, Rāma sets out with his brother to her rescue. (IV.) After numerous adventures they enter into an alliance with Sugriva, king of the monkeys; and, with the assistance of the monkey-general Hanu-mān, and Rāvana's own brother Vibhishana, they prepare to assault Lankā* (V.) The monkeys, tearing up rocks and trees, construct a passage across the straits—the so-called Adam's Bridge, still designated Rāma's Bridge in India. (VI.) Rāma crosses with his allies, slays the demon and captures the strong-hold; Sītā successfully undergoes an ordeal by fire to clear herself of the suspicion of infidelity; they return to Ayodhyā, where, after a triumphal entry, Rāma is installed. (VII.) Rāma, how-

ever, seeing that the people are not yet satisfied of Sītā's purity, resolves to put her away; whereupon, in the forest, she falls in with Vālmīki himself, and at his hermitage gives birth to two sons. While growing up there, they are taught by the sage the use of the bow, as well as the Vedas, and the Rāmāyana as far as the capture of Lankā and the royal entry into Ayodhyā. Ultimately Rāma discovers and recognizes them by their wonderful deeds and their likeness to himself, and takes his wife and sons back with him.

The first and last books are later additions by which the poem has been turned to the glory of Viṣṇu. In these two books Rāma has become deified and identified with the god Viṣṇu, whilst in the body of the poem his character is simply that of a perfect man and model hero. The background of the epic is a purely mythological one—Rāma representing the god Indra, and Sītā—in accordance with the meaning of the name—the personified "Furrow," as which she is already invoked in the *Rigveda*, and hence is a tutelary spirit of the tilled earth, wedded to Indra, the Jupiter Pluvius. Rāvana would correspond to the demon Vritra of the *Rigveda*.

One version of the same story, with, however, many important variations of details, forms an episode of the *Mahābhārata*, the *Rāmopākhyāna*, the relation of which to Vālmīki's work is still a matter of uncertainty. In respect of both versification and diction the Rāmāyana is of a distinctly more refined character than the larger poem; and, indeed, Vālmīki is seen already to cultivate some of that artistic style of poetry which was carried to excess in the later artificial poems (Kāvya), whence the title of *ādī-kāvī*, or first poet, is commonly applied to him. The *Rāmāyana* itself contains a prophecy like that of Horace's to the effect that it will always live on the lips of men, and it has been more than fulfilled. No story in India has attained such popularity. It has been translated into many vernaculars and through the version of Tulsī Das has exerted a tremendous influence on the spiritual life of India. To characterize the Indian epics in a single word: though often disguised by fancies and exaggerations, they are yet noble works, abounding in passages of remarkable descriptive power, intense pathos, and high poetic grace and beauty; and while, as works of art, they are far inferior to the Greek epics, in some respects they appeal far more strongly to the romantic mind of Europe, namely, by their loving appreciation of natural beauty, their exquisite delineation of womanly love and devotion, and their tender sentiment of mercy and forgiveness.

Purāṇas and Tantras.—The *Purāṇas* are partly legendary, partly speculative histories of the universe, compiled for the purpose of promoting some special, locally prevalent form of Brāhmanical belief. They deal with cosmogony, stories of gods, sages and heroes, Viṣṇu's avatars, the solar and lunar lines of kings and other pseudo-historical matter. They are sometimes styled a fifth Veda, and may indeed in a certain sense be looked upon as the scriptures of Brāhmanical India. The term *purāṇa*, signifying "old," applied originally to prehistoric, especially cosmogonic, legends, and then to collections of ancient traditions generally. They are popular encyclopaedias of useful knowledge mostly with a Vaishnava tendency. They are connected in subject matter with the *Mahābhārata* and have some relationship to the law books and go back to a common source.

They are almost entirely composed in the epic couplet, and indeed in much the same easy flowing style as the epic poems, to which they are, however, as a rule greatly inferior in poetic value.

According to the traditional classification of these works, there are said to be eighteen (*Mahā*, or great) *Purāṇas*, and as many *Upa-purāṇas*, or subordinate *Purāṇas*. The former are by some authorities divided into three groups of six, according as one or other of the three primary qualities of external existence—goodness, darkness (ignorance), and passion—is supposed to prevail in them, viz. the *Viṣṇu*, *Nārada*, *Bhāgavata*, *Garuda*, *Padma*, *Varāha*—*Matsya*, *Kūrma*, *Liṅga*, *Siva*, *Skanda*, *Āgni*—*Brahmaṇḍa*, *Brahmavaivarta*, *Mārkaṇḍeya*, *Bhaviṣya*, *Vāmana* and *Brahma-Purāṇas*. The eighteen principal *Purāṇas* are said to consist of together 400,000 couplets. In northern India the Vaishnava *Purāṇas*, especially the *Bhāgavata* and *Viṣṇu*, are by far the

most popular. The former is held in the highest estimation, and, especially through the vernacular versions of its tenth book, treating of the story of Kṛṣṇa, has powerfully influenced the religious belief of India.

From the little we know regarding the Upa-purāṇas, their character does not seem to differ very much from that of the principal sectarian Purāṇas. Besides these two classes of works there is a large number of so-called *Sthala-purāṇas*, or chronicles recounting the history and merits of some holy "place" or shrine, where their recitation usually forms an important part of the daily service.

The *Tantras* have to be considered as partly a collateral and partly a later development of the sectarian Purāṇas; though, unlike these, they can hardly lay claim to any intrinsic poetic value. These works are looked upon as their sacred writings by the numerous *Sāktas*, or worshippers of the female energy (*śakti*) of some god, especially the wife of Śiva, in one of her many forms (Pārvatī, Devī, Kālī, Bhavānī, Durgā). This worship of a female representation of the divine power appears already in some of the Purāṇas; but in the *Tantras* it assumes quite a peculiar character, being largely intermixed with magic performances and mystic rites, partly, indeed, of a grossly immoral nature. (See HINDUISM.) See the series of Tantric works edited by A. Avalon.

Artificial Epics and Romances.—About the beginning of the Christian era a new class of epic poems begins to make its appearance, differing widely in character from those that had preceded it. These later productions are of a decidedly artificial character, and must necessarily have been beyond the reach of any but the highly cultivated. They are, on the whole, singularly deficient in incident and invention, their subject matter being almost entirely derived from the old epics. Nevertheless, these works are by no means devoid of merit and interest; and a number of them display considerable descriptive power and a wealth of genuine poetic sentiment. The simple heroic couplet has been largely discarded for various more or less elaborate metres; and in accordance with this change of form the diction becomes gradually more complicated.

The generic appellation of such works is *kāvya*, which, meaning "poem," is the work of an individual poet (*kavi*), is, as we have seen, already applied to the *Rāmāyaṇa*. Six poems of this kind are singled out by native rhetoricians as standard works, under the title of *Mahākāvya*, or great poems. Two of these are ascribed to the famous dramatist Kālidāsa, the most prominent figure of this period of Indian literature and truly a master of the poetic art. In a comparatively modern couplet he is represented as having been one of nine literary "gems" at the court of a king Vikramāditya. Whether this name refers to Chandragupta II, Vikramāditya or not, Kālidāsa must have flourished about this time, c. A.D. 400. Of the principal poets of this class, whose works have come down to us, he appears to be one of the earliest; but there can be little doubt that he was preceded in this as in other departments of poetic composition by many lesser lights, eclipsed by the sun of his fame, and forgotten. Thus the *Buddhacarita*, a Sanskrit poem on the life of the reformer, which was translated into Chinese about A.D. 420, and the author of which, Aśvaghoṣa, is placed by Buddhist tradition as early as the time of Kaṁśhka (who began to reign in A.D. 78), calls itself, not without reason, a "mahākāvya"; and the panegyrics contained in some of the inscriptions of the 4th century likewise display, both in verse and ornate prose, many of the characteristic features of the *kāvya* style of composition.

Of the six universally recognized "great poems" here enumerated, the first two, and doubtless the two finest, are those attributed to Kālidāsa. (1) The *Raghuvamśa*, or "race of Raghu," celebrates the ancestry and deeds of Rāma. The work, consisting of nineteen cantos, is manifestly incomplete; but hitherto no copy has been discovered of the six additional cantos which are supposed to have completed it. (2) The *Kumāra-sambhava*, or "the birth of (the war-god) Kumāra" (or Skanda), the son of Śiva and Pārvatī, consists of seventeen cantos, the last ten of which are looked upon as spurious by some scholars, mainly on account of their erotic character, not a strong argument. There is no reason to doubt that the eighth canto is by Kālidāsa but he cannot have

written much of the other nine. (3) The *Kīrtitārjuniya*, or combat between the Pāṇḍava prince Arjuna and the god Śiva, in the guise of a Kīrāta or wild mountaineer, is a poem in eighteen cantos, by Bhāravi, who is mentioned together with Kālidāsa in an inscription dated A.D. 634. (4) The *Śiśupāla-badha*, or slaying of Śiśupāla, who, being a prince of Chedi, reviled Kṛṣṇa, who had carried off his intended wife, and was killed by him at the inauguration sacrifice of Yudhishtira, is a poem consisting of twenty cantos, attributed to Māgha (ninth cent.), whence it is also called *Māghikāvya*. (5) The *Rāvaṇabaddha*, or "slaying of Rāvaṇa," more commonly called *Bhāṭṭikāvya*, was composed for the practical purpose of illustrating the less common grammatical forms and the figures of rhetoric and poetry. Bhāṭṭi, apparently the author's name, is usually identified with the well-known grammarian Bhāṭṭihari, whose death Professor M. Müller, from a Chinese statement, fixes at A.D. 650, while others make him Bhāṭṭihari's son. (6) The *Naishadhiya*, or *Naishadha-charita*, the life of Nala, king of Nishadha, is ascribed to Śrī-Harsha (son of Hira), who is supposed to have lived in the latter part of the 12th century. The *Nalodaya* deals with the same subject but the author's main object is to show his skill in tricks of style and metre. The long lost and recently discovered *Janakiharana of Kumāradaśa* (eighth cent.) takes its subject (the rape of Sītā) from the *Rāmāyaṇa* strongly imitative of Kālidāsa; it is, however, the work of a poet of no mean ability. The stanzas of the *Rāghava-pāṇḍavīya* are so ambiguously worded that the poem may be interpreted as relating to the leading story of either the *Rāmāyaṇa* or the *Mahābhārata*. Less ambitious in composition, though styling itself a mahākāvya, is the *Vikramānka-devacarita*, a panegyric written about A.D. 1085 by the Kashmir poet Bīlhaṇa, in honour of his patron the Chūlūka king Vikramāditya of Kalyāṇa, regarding the history of whose dynasty it supplies some valuable information.

In this place may also be mentioned, as composed in accordance with the Hindu poetic canon, Kalhaṇa's *Rājataranginī* (c. A.D. 1150) or "river of kings," being a chronicle of the kings of Kashmir, and the only important historical work in the Sanskrit language, although even here considerable allowance has to be made for poetic licence and fancy.

Under the general term "*kāvya*" Indian critics include, however, not only compositions in verse, but also certain kinds of prose works composed in choice diction richly embellished with flowers of rhetoric. The feature generally regarded by writers on poetics as the chief mark of excellence in this ornate prose style is the frequency and length of its compounds; whilst for metrical compositions the use of long compounds is expressly discouraged by some schools of rhetoric.

The Drama.—The Hindus ascribe the origin of dramatic representation to the sage Bharata (the word in Sanskrit means also "actor"). We know that treatises on the dramatic art existed at the time of Pāṇini, as he mentions two authors of *Nāṭya-sūtras*, or "rules for actors," Śīlāliṇa and Kṛiśāva. Now the words *nāṭa* and *nāṭya*—as well as *nāṭaka*, the common term for "drama"—being derived (like the modern vernacular "Nautch"—*nṛtya*) from the root *naṭ* (*nṛi*) "to dance," seem to point to a pantomimic or choral origin of the dramatic art. Fortunately, however, Patañjali, in his "great commentary," speaks of the actor as singing, and of people going "to hear the actor." Nay, he even mentions two subjects, taken from the cycle of Vishnu legends: the slaying of Kāṁsa (by Kṛṣṇa) and the binding of Bali (by Vishnu)—which were represented on the stage both by mimic action and declamation. Judging from these allusions, theatrical entertainments in those days seem to have been very much on a level with the old religious spectacles or mysteries of Europe. It is not, however, till some centuries later that we meet with the first real dramas, which mark at the same time the very culminating point of Indian dramatic composition. Although we know the names of at least five predecessors of Kālidāsa, nothing but a few quotations from them have been preserved.

The long disputed possibility of Greek influence on the Sanskrit drama is not now maintained, although there are some superficial points of resemblance. The Hindu dramatist has little regard for

the "unities" of the classical stage, though he is hardly ever guilty of extravagance in his disregard of them. Unlike the Greek dramatic theory, it is an invariable rule of Indian dramaturgy, that every play, however much of the tragic element it may contain, must have a happy ending. A death never takes place on the stage, nor is anything indecorous allowed. The dialogue is invariably carried on in prose plentifully interspersed with those neatly turned lyrical stanzas in which the Indian poet delights to depict some aspect of nature, or some temporary physical or mental condition. The outstanding feature of the Hindu play, however, is the mixed nature of its language. While the hero and leading male characters speak Sanskrit, women and inferior male characters use various Prakṛit dialects. As regards these dialectic varieties, it can hardly be doubted that at the time when they were first employed in this way they were local vernacular dialects; but in the course of the development of the scenic art they became permanently fixed for special dramatic purposes, just as the Sanskrit had, long before that time, become fixed for general literary purposes. Thus it would happen that these Prakṛit dialects, having once become stationary, were soon left behind by the spoken vernaculars, until the difference between them was as great as between the Sanskrit and the Prakṛits.

The *Mṛicchhakatikā*, or "little clay cart," has been considered earliest of the existing dramas because of a certain clumsiness of construction, but probably does not antedate the sixth century. According to several stanzas in the prologue, the play was composed by a king Śūdraka, but it is probably the work of a poet patronized by him. Chārudatta, a Brāhman merchant, reduced to poverty, and Vasantasenā, an accomplished courtesan, meet and fall in love with each other. This forms the main plot, which is interwoven with a political underplot, resulting in a change of dynasty. The connection between the two plots is effected by means of the king's rascally brother-in-law, who pursues Vasantasenā with his addresses, as well as by the part of the rebel cowherd Aryaka, who, having escaped from prison, finds shelter in the hero's house. The wicked prince, on being rejected, strangles Vasantasenā, and accuses Chārudatta of having murdered her; but, just as the latter is about to be executed, his lady love appears again on the scene. Meanwhile Aryaka has succeeded in deposing the king, and, having himself mounted the throne of Ujjain, he raises Vasantasenā to the position of an honest woman, to enable her to become the wife of Chārudatta. The play is one of the longest, consisting of not less than ten acts, some of which, however, are very short. The interest of the action is, on the whole, well sustained; and, altogether, the piece presents a vivid picture of the social manners of the time, whilst the author shows himself imbued with a keen sense of humour, and a master in the delineation of character.

Kālidāsa.—In Kālidāsa the dramatic art attained its highest point of perfection. From this accomplished poet we have three well-constructed plays, abounding in stanzas of exquisite tenderness and fine descriptive passages: the two well-known mytho-pastoral dramas, *Sakuntalā* in seven and *Vikramorvaśī* in five acts, and a piece of court intrigue, distinctly inferior to the other two, entitled *Mālavikāgnimitra* in five acts. The plot of the last named is as follows: King Agnimitra, who has two wives, falls in love with Mālavikā, maid to the first queen. His wives endeavour to frustrate their affection for each other, but in the end Mālavikā turns out to be a princess by birth, and is accepted by the queens as their sister.

Śrī Harshadeva.—Śrī-Harshadeva—identical with the king (Śīlāditya) Harshavardhana of Kānyakubja (Kanauj) mentioned above, who ruled in the first half of the 7th century—has three plays attributed to him; they are probably only dedicated to him by poets patronized by him. This at least commentators state to have been the case as regards the *Ratnāvalī*, the authorship of which they assign to Bāna. Indeed, had they been the king's own productions, one might have expected the Chinese pilgrims (especially I-tsing, who saw one of the plays performed) to mention the fact. The *Ratnāvalī*, "the pearl necklace," is a graceful comedy of domestic manners, with well-drawn characters. Ratnāvalī, a Ceylon princess, is sent by her father to the court of

King Udayana of Vatsa to become his second wife. She suffers shipwreck, but is rescued and received into Udayana's palace under the name of Sagarikā, as one of Queen Vāsavadattā's attendants. The king falls in love with her, and the queen tries to keep them apart, but, on learning the maiden's origin, she becomes reconciled, and recognizes her as a "sister." Very similar in construction, but inferior, is the *Priyadarśikā*, in four acts, having for its plot another amour of the same king. The scene of the third play, the *Nāgānanda*, or "joy of the serpents" (in five acts), on the other hand, is laid in semi-divine regions. In spite of its shortcomings of construction the *Nāgānanda* is a play of considerable merit, the characters being drawn with a sure hand, and the humour is by no means despicable.

Bhāvabhūti, a Brāhman of Vidārāha, passed his literary life chiefly at the court of Yaśovarman of Kanauj (c. A.D. 700). Bhāvabhūti was the author of three plays, two of which, the *Mahāvīracharita* ("life of the great hero") and the *Uttararāmacharita* with very little action ("later life of Rāma"), in seven acts each, form together a dramatized version of the story of the *Rāmāyana*. The third, the *Mālatīmādhava*, is a domestic drama in ten acts, representing the fortunes of Mādhava and Mālatī, the son and daughter of two ministers of neighbouring kings, who from childhood have been destined for each other, but, by the resolution of the maiden's royal master to marry her to an old and ugly favourite of his, are for a while threatened with permanent separation. The action of the play is full of life, and abounds in stirring, though sometimes improbable, incidents. The poet is considered by native critics to be not only not inferior to Kālidāsa, but even to have surpassed him in his *Uttararāmacharita*.

Minor Dramatists.—Bhaṭṭa Nārāyaṇa, the author of the *Veṅṣaṅkṛā* ("the binding up of the braid of hair," based on an incident in the Mahābhārata), is known to have been alive in A.D. 840. The piece is composed in a style similar to that of Bhāvabhūti's plays, but is inferior to them in dramatic construction and poetic merit, though valued by critics for its strict adherence to the rules of the dramatic theory, and popular in India, owing to its partiality for the cult of Kṛishṇa. The *Hanuman-nāṭaka* is a dramatized version of the story of Rāma, interspersed with numerous purely descriptive poetic passages. Contrary to the general practice, Sanskrit alone is employed in it. The play is attributed to Dāmodara Mīśra (11th cent.), but gives the impression of being the production of different hands. Bhāsa is traditionally one of the great dramatists of India, a predecessor of Kālidāsa, but nothing of his has survived.

The *Mudrārākshasa*, or "Rākshasa (the minister) with the signet," is unique in being a drama of political intrigue, partly based on historical events, the plot turning on the reconciliation of Rākshasa, the minister of the murdered king Nanda, with the hostile party, consisting of Prince Chandragupta (the Greek Sandrocottus, 315–291 A.C.), who succeeded Nanda, and his minister Chāṇakya. The plot is developed with considerable dramatic skill, in vigorous, if not particularly elegant, language. The play was composed by Viśākhadatta, not much later than A.D. 360.

The *Prabodha-chandrodaya*, or "the moon-rise of intelligence," composed by Kṛishṇamīśra about the 12th century, is an allegorical play, in six acts, the *dramatis personae* of which consist entirely of abstract ideas and symbolical figures divided into two conflicting hosts; it is full of vigour, however. It depicts the struggle between the wicked king Error and the good king Reason.

Lyrical, Descriptive and Didactic Poetry.—Allusion has already been made to the marked predilection of the mediæval Indian poet for depicting in a single stanza some peculiar physical or mental situation. The profane lyrical poetry consists chiefly of such little poetic pictures, which form a prominent feature of dramatic compositions. Numerous poets and poetesses are only known to us through such detached stanzas, preserved in native anthologies or manuals of rhetoric, and enshrining a vast amount of descriptive and contemplative poetry. An excellent specimen of a longer poem, of a partly descriptive, partly erotic character, is Kālidāsa's *Meghadūta*, or "cloud messenger," in which a

banished yaksha (demi-god) sends a love-message across India to his wife in the Himālaya, and describes, in verse-pictures of the stately paṇḍakrānti metre the various places over which the messenger, a cloud, will have to sail in his airy voyage. Another much-admired descriptive poem by Kālidāsa is the *Ritū-saṃhāra*, or "collection of the seasons," in which the attractive features of the six seasons are successively set forth.

As regards religious lyrics, the fruit of sectarian fervour, a large collection of hymns and detached stanzas, extolling some special deity, might be made from Pūrāṇas and other works. Of independent productions of this kind only a few of the more important can be mentioned here. Śaṅkara Āchārya, the great Vedāntist, who seems to have flourished about A.D. 800, is credited with several devotional poems, especially the *Ānanda-lahari*, or "wave of joy," a hymn of 103 stanzas, in praise of the goddess Pārvatī. The *Sūrya-saṅketa*, or century of stanzas in praise of Sūrya, the sun, is ascribed to Mayūra, the contemporary (and, according to a tradition, the father-in-law) of Bāṇa (in the early part of the 7th century). The latter poet himself composed the *Chandikā-stotra*, a hymn of 102 stanzas, extolling Śiva's consort. The *Rāmadāśarastī*, a poem celebrating the ten avatāras of Viṣṇu, is ascribed to no other than Hanumān, the monkey general, himself. Jayadeva's beautiful poem *Gitagovinda*, which, like most productions concerning Kṛṣṇa, is of a very sensuous character, is a religious drama.

Didactic Poetry.—The particular branch of didactic poetry in which India is especially rich is that of moral maxims, expressed in single stanzas or couplets, and forming the chief vehicle of the *Nīti-śāstra* or ethic science. Excellent collections of such aphorisms have been published—in Sanskrit and German by Böttlingk, and in English by John Muir. Probably the oldest original collection of this kind is that ascribed to Chāṇakya, but really much later.

Fables and Narratives.—For purposes of popular instruction stanzas of an ethical import were early worked up with existing prose fables and popular stories. A collection of this kind, a mirror for princes, was translated into Pahlavi in the reign of the Persian king Khusrū Anushirvān, A.D. 531-579; but neither this translation nor the original is any longer extant. A Syriac translation, however, made from the Pahlavi in the same century, under the title of "Quelling and Dimming"—from the Sanskrit "Karataka and Damanaka," two jackals who play an important part as the lion's counsellors—has been discovered and published. The Sanskrit original, which probably consisted of fourteen chapters, was afterwards recast—the result being the *Panchatantra*, or "five books" (or headings), of which several recensions exist. A popular but late summary of this work, in four books, the *Hithopadeśa*, or "Salutary Counsel," has been shown by Peterson to have been composed by one Nārāyaṇa. Other highly popular collections of stories and fairy tales, interspersed with sententious verses, are: the *Veṭāla-panchavimśatī*, or "twenty-five (stories) of the Veṭāla" (the original of the Baitāl Pachtisi), older than the 11th century, since both Kṣhemendra and Somadeva have used it; and the *Suka-saptatī*, or "seventy (stories related) by the parrot," the author and age of which are unknown.

SCIENTIFIC AND TECHNICAL LITERATURE

Law (Dharma).—Among the technical treatises of the later Vedic period, certain portions of the Kalpa-sūtras or manuals of ceremonial, peculiar to particular schools, are the earliest attempts at a systematic treatment of law subjects. These are the *Dharma-sūtras*, or "rules of (religious) law." The Dharma-sūtras consist chiefly of strings of terse rules, containing the essentials of the science, and intended to be committed to memory, and to be expounded orally by the teacher—thus forming, as it were, epitomes of class lectures. These rules are interspersed with stanzas or "gīthās," in various metres, either composed by the author himself or quoted from elsewhere, which generally give the substance of the preceding rules. One can well understand why such couplets should gradually have become more popular, and should ultimately have led to the appearance of works entirely composed in verse. Such metrical law-books did spring up

in large numbers, not all at once, but over a long period of time. These works are the metrical *Dharma-sūtras*, or, as they are usually called, the *Smṛiti*, "recollection, tradition,"—a term which, as we have seen, belonged to the whole body of Sūtras (as opposed to the *Śruti*, or revelation), but which has become the almost exclusive title of the versified institutes of law (and the few Dharma-sūtras still extant). Of metrical Smṛitis about forty are known to exist, but their total number probably amounted to at least double that figure.

Manu.—With the exception of a few of these works—such as the *Agni-, Yama- and Viṣṇu-Smṛitis*—which are ascribed to the respective gods, the authorship of the Smṛitis is attributed to old rishis, such as Atri, Kāṇva, Vyāsa, Śāṇḍilya, Bharadvāja. It is, however, extremely doubtful whether, as a rule, there really existed a traditional connection between these works and their alleged authors or schools named after them. The idea, which early suggested itself to Sanskrit scholars, that Smṛitis which passed by the names of old Vedic teachers and their schools might simply be metrical recasts of the Dharma- (or Grihya-) sūtras of these schools, was a very natural one, and, indeed, is still a very probable one, though the loss of the original Sūtras makes it difficult to prove. One could, however, scarcely account for the disappearance of the Dharma-sūtras of some of the most important schools except on the ground that they were given up in favour of other works; and it is not very likely that this should have been done, unless there was some guarantee that the new works, upon the whole, embodied the doctrines of the old authorities of the respective schools. Thus, as regards the most important of the Smṛitis, the *Mānava-Dharmaśāstra*, there exist both a Śrauta- and a Grihya-sūtra of the Mānava school of the Black Yajus, but no such Dharma-sūtra has hitherto been discovered, although the former existence of such a work has been made all but certain by Professor Bühler's discovery of quotations from a *Mānavam*, consisting partly of prose rules, and partly of couplets, some of which occur literally in the Manusmṛiti, whilst others have been slightly altered there to suit later doctrines, or have been changed from the original tristubh into the epic metre. The idea of an old law-giver Manu Svīyambhuva—"sprung from the self-existent (svayam-bhū)" god Brahman (m.)—reaches far back into Vedic antiquity: he is mentioned as such in early texts; and in Yāska's *Nirukta* a śloka occurs, giving his opinion on a point of inheritance. But whether or not the Mānava-Dharmaśāstra embodied what were supposed to be the authoritative precepts of this sage on questions of sacred law we do not know; nor can it as yet be shown that the Manusmṛiti, which seems itself to have undergone considerable modifications, is the lineal descendant of that Dharmaśāstra.

The Mānava Dharmaśāstra consists of twelve books, the first and last of which, treating of creation, transmigration and final beatitude, are, however, generally regarded as later additions. In them the legendary sage Bhṛigu, here called a Mānava, is introduced as Manu's disciple, through whom the great teacher has his work promulgated. Except in these two books the work shows no special relation to Manu, for, though he is occasionally referred to in it, the same is done in other Smṛitis. The oldest existing commentary on the *Mānava-Dharmaśāstra* is by Mādhatī, who is usually supposed to have lived in the 10th century. The most esteemed of the commentaries is that of Kullūka Bhaṭṭa, composed at Benares in the 13th century.

Yājñavalkya.—Next in importance among Smṛitis ranks the *Yājñavalkya Dharmaśāstra*. Based on the Manusmṛiti, it represents a more advanced stage of legal theory and definition than that work. Yājñavalkya, as we have seen, is looked upon as the founder of the Vījāsaneyinis or White Yajus, and the author of the Śatapatha-brāhmaṇa. The work bears some resemblance to the *Pāraskara-grīhyasūtra* of the white Yajur Veda but a connection between it and the *Mānava-grīhyasūtra* seems, however, likewise evident. As in the case of Manu, ślokas are quoted in various works from a *Bṛhat-* and a *Vṛiddha-Yājñavalkya*. The *Yājñavalkya-smṛiti* consists of three books, corresponding to the three great divisions of the Indian theory of law: *āchāra*, rule of conduct (social and caste duties); *vyavahāra*, civil and criminal law; and *prāyścitta*, penance or expiation.

Nārada-smṛiti.—The *Nāradya-Dharmaśāstra*, or *Nārada-smṛiti*, is a more practical work; indeed, it is probably the most systematic and businesslike of all the Smṛitis. It does not concern itself with religious and moral precepts, but is strictly confined to law.

Whether any of the Dharmaśāstras were ever used in India as actual "codes of law" for the practical administration of justice is doubtful. No doubt these works were held to be of the highest authority as laying down the principles of religious and civil duty; but it was not so much any single text as the whole body of the Smṛiti that was looked upon as the embodiment of the divine law. Hence, the moment the actual work of codification begins in the 11th century, we find the jurists engaged in practically showing how the Smṛitis confirm and supplement each other, and in reconciling seeming contradictions between them. This new phase of Indian jurisprudence begins with Viṣṇuśaṅkara's *Mītiśāstra*, which, although primarily a commentary on Yājñavalkya, is so rich in original matter and illustrations from other Smṛitis that it is far more adapted to serve as a code of law than the work it professes to explain. This treatise is held in high esteem all over India, with the exception of the Bengal or Gauriya school of law, which recognizes as its chief authority the digest of its founder, Jīmūtavāhana, especially the chapter on succession, entitled *Dāyabhāga*. Based on the Mītiśāstra are the *Smṛitichandrikā*, a work of great common sense, written by Devaṇḍa Bhaṭṭa, in the 13th century, and highly esteemed in Southern India; and the *Vṛamitrodaya*, a compilation consisting of two chapters, on *āchāra* and *vyavahāra*, made in the first half of the 17th century by Mitrāmbara, for Rājā Virasimha, or Bīrshih Deo of Orchhā, who murdered Abul Fazl, the minister of the emperor Akbar, and author of the *Ain-i Akbari*. There is no need here to enumerate any more of the vast number of treatises on special points of law, the more important of which will be found mentioned in English digests of Hindu law.

Philosophy.—The contemplative Indian mind shows at all times a strong disposition for metaphysical speculation. In the old religious lyrics this may be detected from the very first. Not to speak of the abstract nature of some even of the oldest Vedic deities, this propensity betrays itself in a certain mystic symbolism, tending to refine and spiritualize the original purely physical character and activity of some of the more prominent gods, and to impart a deep and subtle import to the rites of the sacrifice. The primitive worship of more or less isolated elemental forces and phenomena had evidently ceased to satisfy the religious wants of the more thoughtful minds. Various syncretist tendencies show the drift of religious thought towards some kind of unity and of the divine powers, be it in the direction of the pantheistic idea, or in that of an organized polytheism, or even towards monotheism. In the latter age of the hymns the pantheistic idea is rapidly gaining ground, and finds vent in various cosmogonic speculations; and in the Brāhmana period we see it fully developed. The fundamental conception of this doctrine finds its expression in the two synonymous terms *brāhmaṇa* (neutr.), probably originally "mystic effusion, devotional utterance," then "holy impulse," and *ātman* (masc.), "breath, self, soul."

The recognition of the essential sameness of the individual souls, emanating all alike (whether really or imaginarily) from the ultimate spiritual essence (*parama-brāhmaṇa*) "as sparks issue from the fire," and destined to return thither, involved some important problems. Considering the infinite diversity of individual souls of the animal and vegetable world, exhibiting various degrees of perfection, is it conceivable that each of them is the immediate efflux of the Supreme Being, the All-perfect, and that each, from the lowest to the highest, could re-unite therewith directly at the close of its mundane existence? The difficulty implied in the latter question was at first met by the assumption of an intermediate state of expiation and purification, a kind of purgatory; but the whole problem found at last a more comprehensive solution in the doctrine of transmigration (*saṃsāra*). This doctrine not found in the *Rigveda* was probably aboriginal and adopted by the Aryan invaders. The notion of *saṃsāra* has become an axiom, a universally conceded principle of Indian philo-

sophy. Thus the latter has never quite risen to the heights of pure thought; its object is indeed *jīhāsā*, the search for saving knowledge; but it is an inquiry (*mīmāṃsā*) into the nature of things undertaken not solely for the attainment of the truth, but with a view to a specific object—the discontinuance of *saṃsāra*, the cessation of mundane existence after the present life. The task of the philosopher is to discover the means of attaining *mokṣha*, "release" from the bondage of material existence, and union with the Supreme Self—in fact, salvation. Desire is due to ignorance or wrong knowledge of the true nature of things and is the cause of transmigration. The purpose of each philosophical school is to attain true and saving knowledge. Intense self-contemplation being the only way of attaining the all-important knowledge, this doctrine left little or no room for those mediatorial offices of the priest, so indispensable in ceremonial worship; and indeed we actually read of Brāhmaṇa sages resorting to Kshatriya princes (in the Upanishads) to hear them expound the true doctrine of salvation. But, in spite of their anti-hierarchical tendency, these speculations continued to gain ground; and in the end the body of treatises propounding the pantheistic doctrine, the Upanishads, were admitted into the sacred canon, as appendages to the ceremonial writings, the Brāhmaṇas. The Upanishads thus form literally "the end of the Veda," the *Vedānta*; but their adherents claim this title for their doctrines in a metaphorical rather than in a material sense, as "the ultimate aim and consummation of the Veda."

In later times the radical distinction between these speculative appendages and the bulk of the Vedic writings was strongly accentuated in a new classification of the sacred scriptures. According to this scheme they were supposed to consist of two great divisions—the *Karma-kāṇḍa*, "the work-section," or practical ceremonial (exoteric) part, consisting of the Samhitās and Brāhmaṇas (including the ritual portions of the Aranyakas), and the *Jñānakāṇḍa*, "the knowledge-section," or speculative (esoteric) part. These two divisions are also called respectively the *Pūrvā-* ("former") and *Uttara-* ("latter," or higher) *kāṇḍa*; and when the speculative tenets of the Upanishads came to be formulated into a regular system it was deemed desirable that there should also be a special system corresponding to the older and larger portion of the Vedic writings. Thus arose the two systems—the *Pūrvā-* (or *Karma-*) *mīmāṃsā*, or "prior (practical) speculation," and the *Uttara-* (or *Brāhma-*) *mīmāṃsā*, or higher inquiry (into the nature of the godhead), usually called the Vedānta philosophy.

Philosophical Systems.—It is not yet possible to determine, even approximately, the time when the so-called *Darśanas* (literally "demonstrations"), or systems of philosophy which subsequently arose, were first formulated. And, though they have certainly developed from the tenets enunciated in the Upanishads, there is some doubt as to the exact order in which these systems succeeded each other. Of all the systems the Vedānta has indeed remained most closely in touch with the speculations of the Upanishads, which it has further developed and systematized. The authoritative expositions of the systems have, however, apparently passed through several redactions; and in their present form, these sūtra-works evidently belong to a comparatively recent period, none of them being probably older than the early centuries of our era. By far the ablest general review of the philosophical systems (except the Vedānta) produced by a native scholar is the *Sarva-darśana-saṅgraha* ("summary of all the Darśanas"), composed in the 14th century, from a Vedāntist point of view, by the great exegete Mādhava Achārya.

Among the different systems, six are generally recognized as orthodox, as being (either wholly or for the most part) consistent with the Vedic religion—two and two of which are again more closely related to each other than to the rest, viz :

- (1) *Pūrvā-mīmāṃsā* (*Mīmāṃsā*), and (2) *Uttara-mīmāṃsā* (*Vedānta*);
- (3) *Sāṅkhya*, and (4) *Yoga*;
- (5) *Nyāya*, and (6) *Vaiśeṣika*.

Mīmāṃsā.—1. The (*Pūrvā-*) *Mīmāṃsā* (First Inquiry) is not a system of philosophy in the proper sense of the word, but rather a system of dogmatic criticism and scriptural interpretation. It maintains the eternal existence of the Veda, the different parts of

which are minutely classified. Its principal object, however, is to ascertain the religious (chiefly ceremonial) duties enjoined in the Veda, and to show how these duties must be performed, and what are the special merits and rewards attaching to them. Hence arises the necessity of determining the principles for rightly interpreting the Vedic texts, as also of what forms its only claim to being classed among speculative systems, namely, a philosophical examination of the means of, and the proper method for, arriving at accurate knowledge. The foundation of this school, as well as the composition of the Sūtras or aphorisms, the *Mīmāṃsā-darśana*, which constitute its chief doctrinal authority, is ascribed to Jaimini. The Sūtras were commented on by Sabara Śāmin in his *Bhāṣya*; and further annotations (*Tantra-vārtika* and *Śloka-vārtika*) thereon were supplied by the great theologian Kumāra Bhaṭṭa (about A.D. 700). The most approved general introduction to the study of the Mīmāṃsā is the metrical *Jaiminīya-Nyāya mālavastara*, with a prose commentary, both by Mādhyama Āchārya.

Vedānta.—2. The *Vedānta* philosophy or *Uttara-mīmāṃsā* (Second Inquiry) in the comparatively primitive form in which it presents itself in most of the older Upanishads, constitutes the earliest phase of sustained metaphysical speculation. In its essential features it remains to this day the prevalent belief of Indian thinkers, and enters largely into the religious life and convictions of the people. It is an idealistic monism, which derives the universe from an ultimate conscious spiritual principle, the one and only existent from eternity—the *Ātman*, the Self, or the *Purusha*, the Person, the *Brahman*. It is this primordial essence or Self that pervades all things, and gives life and light to them, "without being sullied by the visible outward impurities or the miseries of the world, being itself apart"—and into which all things will, through knowledge, ultimately resolve themselves. "The wise who perceive him as being within their own Self, to them belongs eternal peace, not to others." But, while the commentators never hesitate to interpret the Upanishads as being in perfect agreement with the Vedāntic system, as elaborated in later times, there is often considerable difficulty in accepting their explanations. In these treatises only the leading features of the pantheistic theory find utterance, generally in vague and mystic, though often in singularly powerful and poetical language, from which it is not always possible to extract the author's real idea on fundamental points, such as the relation between the Supreme Spirit and the phenomenal world—whether the latter was actually evolved from the former by a power inherent in him, or whether the process is altogether a fiction, an illusion of the individual self.

The foundation of the Vedānta system, as "the completion of the Veda," is naturally ascribed to Vyāsa, the mythic arranger of the Vedas, who is said to be identical with Bādarāyana the reputed author of the *Brahma-* (or *Sāraka-*) *sūtra*, the authoritative, though highly obscure, summary of the system. The most distinguished interpreter of these aphorisms is the famous Malabar theologian Sankara Āchārya, who also commented on the principal Upanishads and the Bhagavadgītā, and is said to have spent the greater part of his life in wandering all over India, as far as Kashmir, and engaging in disputations with teachers—whether of the Śaiva, or Vaiṣṇava, or less orthodox persuasions—with the view of rooting out heresy and re-establishing the doctrine of the Upanishads. In Sankara's philosophy the theory that the material world has no real existence, but is a mere illusion of the individual soul wrapt in ignorance—that, therefore, it has only a practical or conventional (*vyavahārika*) but not a transcendental or true (*pāramārthika*) reality—is strictly enforced. In accordance with this distinction, a higher (*parā*) and a lower (*aparā*) form of knowledge is recognised; the former being concerned with the Brahman (n.), whilst the latter deals with the personal Brahman, the Īśvara, or lord and creator, who, however, is a mere illusory form of the divine spirit, resulting from ignorance of the human soul. To the question why the Supreme Self (or rather his fictitious development, the Highest Lord) should have sent forth this phantasmagory this great thinker (with the author of the Sūtras) can return no better answer than that it must have been done for sport (*līla*), without any special motive—since to ascribe such a motive to the

Supreme Lord would be limiting his self-sufficiency—and that the process of creation has been going on from all eternity. Sankara's *Sāraka-mīmāṃsā-bhāṣya* has given rise to a large number of exegetic treatises, of which Vāchaspati-miśra's exposition, entitled *Bhāmati*, is the most esteemed. Of numerous other commentaries on the Brahma-sūtras, the *Sri-bhāṣya*, by Rāmānuja, the founder of the Sri-Vaiṣṇava sect, is the most noteworthy. This religious teacher, who flourished in the first half of the 12th century, caused a schism in the Vedānta school. Instead of adhering to Sankara's orthodox *advaita*, or non-duality, doctrine, he interpreted the obscure Sūtras in accordance with his theory of *vaiśiṣṭhādvaita*, i.e., non-duality of the (two) distinct (principles), or, as it is more commonly explained, non-duality of that which is qualified (by attributes). According to this theory the Brahman is neither devoid of form and quality, nor is it all things; but it is endowed with all good qualities, and matter is distinct from it; whilst bodies consist of souls (*chit*) and matter (*achit*); and God is the soul. On the religious side, Rāmānuja adopts the tenets of the ancient Vishnuite Pāñcharātra sect, and, identifying the Brahman with Viṣṇu, combines with his theory the ordinary Vaiṣṇava doctrine of periodical descents (*avatāra*) of the deity, in various forms, for the benefit of creatures; and allowing considerable play to the doctrine that faith (*bhakti*), not knowledge (*vidyā*), is the means of final emancipation. This phase of Indian religious belief, which has attached itself to the Vedānta theory more closely than to any other, makes its appearance very prominently in the *Bhagavadgītā*, the episode of the *Mahābhārata*, already referred to—where, however, it attaches itself to Sāṅkhya-yoga rather than to Vedānta tenets—and is even more fully developed in some of the Purāṇas, especially the Bhāgavata. Its highest phase of development this doctrine probably reached in the Vaiṣṇava sect founded, towards the end of the 15th century, by Chaitanya, whose followers subsequently grafted the Vedānta speculations on their doctrine. In opposition both to Sankara's theory of absolute unity, and to Rāmānuja's doctrine of qualified unity—though leaning more towards the latter—Mādhyama Āchārya, or Pūrṇaprajña (A.D. 1197-1276), started his *dvaita*, or duality doctrine, according to which there is a difference between God and the human soul (*jīva*), as well as between God and nature; whilst the individual souls, which are innumerable, eternal, and indestructible, are likewise different from one another; but, though distinct, are yet united with God, like tree and sap, in an indissoluble union. This doctrine also identifies the Brahman with Viṣṇu, by the side of whom, likewise infinite, is the goddess Lakṣmī, as Prakṛiti (nature), from whom inert matter (*jaḍa*) derives its energy. Here also *bhakti*, devotion to God, is the saving element. A popular summary of the Vedānta doctrine is the *Vedānta-sāra* by Sadānanda, which has been frequently printed and translated.

Sāṅkhya.—The *Sāṅkhya* system seems to derive its name from its systematic enumeration (*sankhyā*) of the twenty-five principles (*tattva*) it recognizes—consisting of twenty-four material and an independent immaterial principle. In opposition to the Vedānta school, which maintains the eternal coexistence of a spiritual principle of reality and an unspiritual principle of unreality, the Sāṅkhya assumes the eternal coexistence of a material first cause, which it calls either *mūla-Prakṛiti* (em.), "prime Originant" (matter), or *Pradhāna*, "the principal" cause, and a plurality of individual souls, *Purusha*, which continually interact on one another. The system recognizes no intelligent creator (such as the Īśvara, or demiurgus, of the Vedānta)—whence it is called *nirīśvara*, godless; but it conceives the Material First Cause, itself unintelligent, to have become developed, by a gradual process of evolution, into all the actual forms of the phenomenal universe, excepting the souls. Its first emanation is *buddhī*, intelligence; whence springs *ahaṁkāra*, consciousness; thence the subtle elements of material forms, namely, five elementary particles (*tanmātra*) and eleven organs of sense; and finally, from the elementary particles, five elements. The souls have from all eternity been connected with matter,—having in the first place become invested with a subtle frame (*līnga*), or

sūksma-, *śarīra*), consisting of seventeen principles, namely, intelligence, consciousness, elementary particles, and organs of sense and action, including mind. To account for the spontaneous development of matter, the system assumes the latter to consist of three constituents (*guṇa*) which are possessed of different qualities, viz. *satva*, of pleasing qualities, such as "goodness," lightness, luminosity; *rajas*, of pain-giving qualities, such as "force," passion, activity; and *tamas*, of deadening qualities, such as "darkness," rigidity, dullness, and which, if not in a state of equipoise, cause unrest and development. Through all this course of development, the soul itself remains perfectly detached, its sole properties being those of purity and intelligence, and the functions usually regarded as "psychic" being due to the mechanical processes of the internal organs themselves evolved out of inanimate matter. Invested with its subtle frame, which accompanies it through the cycle of transmigration, the soul, for the sake of fruition, connects itself ever anew with matter, thus, as it were, creating for itself ever new forms of material existence; and it is only on attaining perfect knowledge, which reveals the absolute distinction between soul and matter, that the Puruṣa is liberated from the miseries of Samsāra, and continues to exist in a state of absolute consciousness and detachment from matter. The existence of God, on the other hand, is denied by this theory, or rather considered as incapable of proof; the existence of evil and misery, for one thing, being thought incompatible with the notion of a divine creator and ruler of the world.

The reputed originator of this school is the sage Kapila, to whom tradition ascribes the composition of the fundamental text-book, the *Sāṅkhya-sūtra*, or *Sāṅkhya-pravachana*, as well as the *Tattva-saṁśā*, a mere catalogue of the principles but these are comparatively modern. Probably the oldest existing work is Iśvarakṛishṇa's excellent *Sāṅkhya-kārikā*, which gives, in the narrow compass of sixty-nine śloka, a lucid and complete sketch of the system.

Yoga.—The *Yoga* system is a branch of the preceding school, holding the same opinions on most points treated in common in their Sūtras, with the exception of one important point, the existence of God. To the twenty-five principles (*tattva*) of the Nīrśvara Sāṅkhya, the last of which was the *Puruṣa*, the *Yoga* adds, as the twenty-sixth, the *Nirguṇa Puruṣa*, or Self devoid of qualities, the Supreme God of the system. Hence the *Yoga* is called the *Sētvā* (theistic) *Sāṅkhya*. But over and above the purely speculative part of its doctrine, which it has adopted from the sister school, the theistic Sāṅkhya has developed a complete system of mortification of the senses—by means of prolonged apathy and abstraction, protracted rigidity of posture, and similar practices—many of which are already alluded to in the Upanishads—with the view of attaining complete concentration (*yoga*) on, and an ecstatic vision of, the Deity, and the acquisition of miraculous powers. It is from this portion of the system that the school derives the name by which it is more generally known.

Nyāya and Vaiśeṣika.—The *Nyāya* and *Vaiśeṣika* (the latter the older) are separate branches of one and the same school, which supplement each other and the doctrines of which have virtually become amalgamated into a single system of philosophy. The term *Nyāya* (*nī-āya*, "in-going," entering), though properly meaning "analytical investigation," as applied to philosophical inquiry generally, has come to be taken more commonly in the narrower sense of "logic," because this school has entered more thoroughly than any other into the laws and processes of thought, and has worked out a formal system of reasoning which forms the Hindu standard of logic.

The followers of these schools generally recognize six categories (*padārtha*): substance (*dravya*), quality (*guṇa*), action (*karma*), generality (*sāmānya*), particularity (*vīśeṣa*), intimate relation (*samavāya*) to which was added a seventh, non-existence (*abhāva*). Substances forming the substrata of qualities and actions are of two kinds: eternal (without a cause), namely, space, time, ether, soul and the atoms of mind, earth, water, fire and air; and non-eternal, comprising all compounds, or the things we perceive, and which must have a cause of their existence.

Causality is of three kinds, that of intimate relation (material cause); that of non-intimate relation (between parts of a compound); and instrumental causality (effecting the union of component parts). Material things are thus composed of atoms (*anu*), i.e., ultimate simple substances, or units of space, eternal, unchangeable and without dimension, characterised only by "particularity (*vīśeṣa*). It is from this predication of ultimate "particulars" that the Vaiśeṣikas, the originators of the atomistic doctrine, derive their name. The *Nyāya* draws a clear line between matter and spirit, and has worked out a careful and ingenious system of psychology. It distinguishes between individual or living souls (*jīvalman*), which are numerous, finite and eternal, and the Supreme Soul (*Paramātmān*), which is one only, the seat of eternal knowledge, and the maker and ruler (*īśvara*) of all things. It is by his will and agency that the unconscious living souls (soul-atoms, in fact) enter into union with the (material) atoms of mind, etc., and thus partake of the pleasures and sufferings of mundane existence.

The original collection of *Nyāya-sūtras* is ascribed to Gautama, and that of the *Vaiśeṣika-sūtras* to Kaṇāda. The etymological meaning of the latter name seems to be "atom eater," whence in works of hostile critics the synonymous terms *Kaṇa-bhñj* or *Kaṇa-bhākṣa* are sometimes derisively applied to him, doubtless in allusion to his theory of atoms.

Heresetical Systems.—As regards the different heretical systems of Hindu philosophy, there is no occasion, in a sketch of Sanskrit literature, to enter into the tenets of the two great anti-Brahmanical sects, the Jains and Buddhists. Among the minor systems may be mentioned the following:

The *Cārvākas* are an ancient sect of undisguised materialists, who deny the existence of the soul, and consider the human person (*puruṣa*) to be an organic body endowed with sensibility and with thought, resulting from a modification of the component material elements, but their authoritative text-book, the *Bārhaspatya-sūtra*, is only known so far from a few quotations in polemics against the school. The sect was anti-Brahmanical and such moral teaching as it taught was pure hedonism.

The *Pūncōhrītas*, or *Bhāgavatas*, are an early Vaiṣṇava sect, in which the doctrine of faith, already alluded to, is strongly developed. Hence their tenets are defended by Rāmānuja, though they are partly condemned as heretical in the *Brahma-sūtras*.

The *Pāśupatas*, one of several *Saiva* (Māheśvara) sects, hold the Supreme Being (*īśvara*), whom they identify with *Siva* (as *paśu-pati*, or "lord of beasts"), to be the creator and ruler of the world, but not its material cause. With the Sāṅkhyas they admit the notion of a plastic material cause, the *Pradhāna*; while they follow Patañjali in maintaining the existence of a Supreme God.

Grammar (Vyākaraṇa).—*Pāṇini*. Linguistic inquiry, phonetic as well as grammatical, was early resorted to both for the purpose of elucidating the meaning of the Veda and with the view of settling its textual form. The particular work which came ultimately to be looked upon as the "vedāṅga" representative of grammatical science, and has ever since remained the standard authority on Sanskrit grammar in India, is Pāṇini's *Aṣṭādhyāyī*, so called from its "consisting of eight lectures (*adhyaīya*)," of four *pādas* each. For a comprehensive grasp of linguistic facts, and a penetrating insight into the structure of the vernacular language, this work stands probably unrivalled in the literature of any nation—though few other languages, it is true, afford such facilities as the Sanskrit for a scientific analysis. Pāṇini's system of arrangement differs entirely from that usually adopted in our grammars, namely, according to the parts of speech. As the work is composed in aphorisms intended to be learnt by heart, economy of memory-matter was the author's paramount consideration. His object was chiefly attained by the grouping together of all cases exhibiting the same phonetic or formative feature, no matter whether or not they belonged to the same part of speech. For this purpose he also makes use of a highly artificial and ingenious system of algebraic symbols, consisting of technical letters (*ambandha*), used chiefly with suffixes and indicative of the changes which the roots or stems have to undergo in word-formation. The date of

Pāṇini has been the subject of much discussion but may be safely put at about 400 B.C.

Pāṇini mentions some sixty-four predecessors which shows that this study had undergone a long process of development. Perhaps the most important of his predecessors was Śākāṭyāna, also mentioned by Yāska—the author of the *Nirukta*, who is likewise supposed to have preceded Pāṇini—as the only grammarian (*vyākaraṇa*) who held with the etymologists (*nairuktā*) that all nouns are derived from verbal roots.

Pāṇini's Sūtras continued for ages after to form the centre of grammatical activity. But, as his own work had superseded those of his predecessors, so many of the scholars who devoted themselves to the task of perfecting his system have sunk into oblivion.

Kātyāyana—The earliest of his successors whose work has come down to us (though perhaps not in a separate form) is Kātyāyana, the author of a large collection of concise critical notes, called *Vārtika*, intended to supplement and correct the Sūtras, or give them greater precision.

Patañjali—Kātyāyana was followed by Patañjali, the author of the (*Vyākaraṇa*—) *Mahā-bhāṣya*, or Great Commentary, who flourished about 150 B.C. For the great variety of information it incidentally supplies regarding the literature and manners of the period, this is, from an historical and antiquarian point of view, one of the most important works of the classical Sanskrit literature. The *Mahābhāṣya* is not a continuous commentary on Pāṇini's grammar, but a collection of the critical comments or *kārikās* on 1,713 of the 4,000 rules of Pāṇini. Patañjali is also called Gonardiya perhaps meaning "a native of Gonarda," a place, probably identical with Gonḍa, a town some 20 m. north-west of Oudh—and Goṇḍakūṭa, or son of Goṇika.

Lexicography—Sanskrit dictionaries (*koṣa*), invariably composed in verse, are either homonymous or synonymous, or partly the one and partly the other. There are occasional attempts at alphabetical order in the former but not in the latter. There are many intended for the use of poets and are collections of rare words and synonyms, rather than lexicons of the language. The great dictionary is the famous *Amara-kośa* ("immortal treasury") by Amarasimha, who probably lived in the 6th century. This dictionary consists of a synonymous and a short homonymous part; whilst in the former the words are distributed in sections according to subjects, such as heaven and the gods, time and seasons, etc.; in the latter they are arranged according to their final letter, without regard to the number of syllables.

Prosody (Chandas)—The oldest treatises on prosody have already been referred to in the account of the technical branches of the later Vedic literature. Among more modern treatises the most important is the *Mṛta-saṃjvāni*, a commentary on Piṅgala's Sūtra, by Halāyudha (perhaps identical with the author of the glossary above referred to). Sanskrit prosody, which is probably not surpassed by any other either in variety of metre or in harmoniousness of rhythm, recognizes two classes of metres, namely, such as consist of a certain number of syllables of fixed quantity, and such as are regulated by groups of breves or metrical instants, this latter class being again of two kinds, according as it is or is not bound by a fixed order of feet.

Music (Sāṅgita)—The musical art has been practised in India from early times. The theoretic treatises on profane music now extant are, however, quite modern productions. The two most highly esteemed works are the *Sāṅgita-ratnākara* ("jewel-mine of music"), by Śārṅgadeva, and the *Sāṅgita-darpaṇa* ("mirror of music"), by Dāmodara. Each of these works consists of seven chapters, treating respectively of—(1) sound and musical notes (*svara*); (2) melodies (*rāga*); (3) music in connection with the human voice (*prakīrṇaka*); (4) musical compositions (*prabandha*); (5) time and measure (*tāla*); (6) musical instruments and instrumental music (*nāḍya*); (7) dancing and acting (*nṛtita* or *nṛtya*).

Rhetoric (Alaṅkāra-śāstra)—Treatises on the theory of literary composition are very numerous. Indeed, a subject of this description—involving such nice distinctions as regards the various kinds of poetic composition, the particular subjects and

characters adapted for them, and the different sentiments or mental conditions capable of being both depicted and called forth by them—could not but be congenial to the Indian mind. The *Nāṭya Śāstra* of Bharata is possibly as early as the sixth century. Not much later is the *Kāvya-dūṣa*, or "mirror of poetry," by Daṇḍin, the author of the novel *Dātakumāracharita*. The work consists of three chapters, treating—(1) of two different local styles (*ṛiti*) of poetry, the Gauḍī or eastern and the Vaidarbhi or southern (to which later critics add four others, the Pāñchālī, Magadhī, Lātī, and Avantīkī); (2) of the graces and ornaments of style, as tropes, figures, similes; (3) of alliteration, literary puzzles and twelve kinds of faults to be avoided in composing poems. Other important works are the *Kāvya-lankāra*, by the Kashmirian Rudrata (9th century), the *Daśarūpa*, or "ten kinds of drama," by Dhanañjaya (10th century), the *Sarasvatī-kanṭhābharaṇa*, "the neck-ornament of Sarasvatī (the goddess of eloquence)," a treatise, in five chapters, on poetics generally (11th century), the *Kāvya-prakāśa*, "the lustre of poetry," (12th century) by Mammata, a Kashmirian, and the late but important *Sāhitya-darpaṇa* (c. A.D. 1450).

Medicine (Ayur-veda, Vaidya-śāstra)—Though the early cultivation of the healing art is amply attested by frequent allusions in the Vedic writings, it was doubtless not till a much later period that the medical practice advanced beyond a certain degree of empirical skill and pharmaceutical routine. From the simultaneous mention of the three humours (wind, bile, phlegm) in a *vārtika* to Pāṇini (v. 1, 38), some kind of humoral pathology would, however, seem to have been prevalent among Indian physicians several centuries before our era. The oldest existing work is supposed to be the *Charaka-saṃhitā*, a bulky cyclopaedia in śloka, mixed with prose sections, which consists of eight chapters, and was probably composed for the most part in the early centuries of our era. Whether the Chinese tradition which makes Charaka the court physician of King Kanishka (c. A.D. 100) rests on fact is uncertain. Of equal authority, but doubtless somewhat more modern, is the *Suśruta* (*-saṃhitā*), which Suśruta is said to have received from Dhavanṭari, the Indian Aesculapius, whose name, however, appears also among the "nine gems." It consists of six chapters, and is likewise composed in mixed verse and prose—the greater simplicity of arrangement, as well as some slight attention paid in it to surgery, betokening an advance upon Charaka. Both works are, however, characterized by great prolixity, and contain much matter which has little connection with medicine.

Astronomy and Mathematics—Early Indian astronomical knowledge is summed up in the *Jyotiṣa Vedāṅga* (ed. Weber, 1862). A more scientific era is marked by the appearance of the five original Siddhāntas (partly extant in revised redactions and in quotations), the very names of two of which suggest Western influence, namely, the *Pāṭṃmukha*, *Sārya*, *Vaṇṇikha*, *Roma* (*i.e.* Roman), and *Paulīna-siddhāntas*. Based on these are the works of the most distinguished Indian astronomers, namely, Āryabhaṭa, probably born in 476; Varāha-mihira, probably 505–587; Brahmagupta, who completed his *Brahma-sphuṭa-siddhānta* in 628; Bhāṭṭa Uppala (10th century), distinguished especially as commentator of Varāha-mihira; and Bhāscara Āchārya, who, born in 1114, finished his great course of astronomy, the *Siddhānta-bhāṣanī*, in 1150.

In the works of several of these writers, from Āryabhaṭa onwards, special attention is paid to mathematical (especially arithmetical and algebraic) computations. The question whether Āryabhaṭa was acquainted with the researches of the Greek algebraist Diophantus (c. A.D. 300) remains still unsettled, but, even if this was the case, algebraic science seems to have been carried by him beyond the point attained by the Greeks.

SANSON, CHARLES HENRI (b. 1739), public executioner of Paris from 1788 to 1795, was great-grandson of Charles Sanson, who had received in 1688 the office of *exécuteur des hautes œuvres de Paris*, which became hereditary in his family. Sanson's brothers exercised the same trade in other towns. In the last days of 1789 Gorsas in the *Courrier de Paris* accused Sanson of harbouring a Royalist press in his house. Sanson was brought to trial, but acquitted, and Gorsas withdrew the accusation. After the execution of Louis XVI., a statement by Sanson was inserted in the *Thermomètre politique* (13th February 1793) in contradiction of the false statements made in respect of the king's behaviour when confronted with death. He surrendered his office in 1795 to his son Henri, who had been his deputy for some time, and held his father's office till his death in 1840. There is no record of the elder Sanson's death. Henri's son Clément Henri was the last of the family to hold the office.

The romantic tales told of C. H. Sanson have their origin in the apocryphal *Mémoires pour servir à l'histoire de la Révolution Française par Sanson* (2 vols., 1829). Other *Mémoires of Sanson*, edited by A. Grégoire (ps. for V. Lombard) in 1830, and by M. d'Olbreuzé (6 vols., 1862-63) are equally fictitious. The few facts definitely ascertainable are collected by G. Lendtre in *La Guillotine pendant la Révolution* (1893).

SANSOVINO, ANDREA CONTUCCI DEL MONTE (1460-1529), Florentine sculptor and architect, was the son of a shepherd, Niccolò di Domenico Contucci, and was born at Monte Sansovino near Arezzo, whence he took his name. He was a pupil of Antonio Pollaiuolo, and at first worked in the style of 15th-century Florence. Early works are: the terra-cotta altarpiece in Santa Chiara at Monte Sansovino, and the marble reliefs of the "Annunciation," the "Coronation of the Virgin," a "Pietà," the "Last Supper," and various statuettes in the Corbinelli chapel of S. Spirito at Florence. In 1490 he was invited to Portugal by King John II. and some pieces of sculpture by him still exist in the monastic church of Coimbra. These early reliefs show strongly the influence of Donatello. The beginning of a more pagan style is shown in the statues of "St. John baptizing Christ" over the east door of the Florentine baptistery. This group was, however, finished by the weaker hand of Vincenzo Danti. In 1502 he executed the marble font at Volterra, with good reliefs of the "Four Virtues" and the "Baptism of Christ." The statues of the Virgin and John the Baptist in the cathedral of Genoa were completed in 1503. His earliest work in Rome is probably the monument of Pietro da Vicenza (1504), in the church of Ara Coeli. The monuments of Cardinal Ascanio Maria Sforza, and of the bishop Hieronimus Bassus for the church of S. Maria del Popolo are among his most important works. In 1512, Sansovino executed a group of the "Madonna and Child with St. Anne," now over one of the side altars in the church of S. Agostino. From 1513 to 1528 he was at Loreto, where he ceased the outside of the Santa Casa in white marble, covered with reliefs and statuettes in niches between engaged columns; the greater part of his sculpture was executed by his assistants, and though the general effect is rich and magnificent, the individual pieces are both dull and feeble, the greater part of the work being executed by his assistants. The earlier reliefs, executed by Sansovino himself, are interesting. Jacopo Sansovino was his best pupil.

SANSOVINO, JACOPO (1486-1570), Italian sculptor and architect, was born at Caprese near Florence, his family name being Tatti. He became a pupil of Andrea Sansovino, from whom he received his name. In 1503 he accompanied Giuliano di Sangallo to Rome, devoting himself there to the study of the antique. Julius II. employed him to restore damaged statues, and he made a copy of the Laocoon group, which was afterwards cast in bronze. In 1511 he returned to Florence, and began the statue of St. James the Elder, which is now in a niche in one of the great piers of the Duomo. He carved a nude figure of "Bacchus and Pan," now in the Bargello. Soon afterwards Jacopo returned to Rome, and designed for his fellow-citizens the church of S. Giovanni dei Fiorentini, carried out by Antonio Sangallo, the younger. A marble group of the "Madonna and Child," now in S. Agostino, was his next important work. In 1527 Jacopo fled from the sack of Rome to Venice, where he remained the rest of his life. He had charge of the public buildings adjacent to the Piazza di S. Marco, with the exception of the Doge's Palace. His most important works of sculpture at Venice are the colossal statues of "Neptune" and "Mars" on the grand staircase of the ducal palace; the bronze doors of the sacristy of St. Mark, cast in 1556 and the series of six bronze reliefs round the choir of the same church. In 1565 he completed a small bronze gate with a graceful relief of "Christ surrounded by Angels"; this gate shuts off the altar of the Reserved Host in the choir of St. Mark's. He made the monument of the Doge Francesco Venier, who died in 1556.

Jacopo's chief claim to distinction rests upon the numerous fine Venetian buildings which he designed, such as the public library, the mint and the Palazzo Corner della Cà Grande and the Palazzo Manin on the grand canal; also the graceful Loggetta of the Campanile di San Marco with the bronze statues of Peace, Mercury, Apollo and Pallas. Among his ecclesiastical works the chief were the choir of S. Fantino, the church of S. Martino and the façades of S. Maria Mater Domini and of the Scuola di S. Giorgio dei Schiavoni.

In 1545 the roof of the public library, which he was then constructing, fell in; on this account he was imprisoned and fined. However, he was soon set at liberty, and in 1548 he was restored to his post. He died on Nov. 27, 1570. Sansovino's architectural works have much beauty of proportion and grace of ornament, a little marred in some cases by an excess of sculptured decoration, though the carving itself is always beautiful, both in design and execution. He used the classic orders with great freedom and tasteful invention, and was instrumental in introducing the High Renaissance into Venice. He was much assisted by Alessandro Vittoria (1524-1608).

(See Vasari, *Vite* (ed. Milanese); T. Temanza, *Vita di J. Sansovino* (Venice, 1752); L. Pittioni, *J. Sansovino* (Venice, 1909).

SAN STEFANO, TREATY OF, a treaty signed between Russia and Turkey on March 3, 1878, concluding the Russo-Turkish War. It created a very great vassal principality of Bulgaria, enlarged Serbia, and increased Montenegro to three times its size. The independence of all three States was recognized by the Porte. Russia obtained the Dobruja, Ardahan, Kars, Bayazid and Batum, and the demolition of all the Danube fortresses. Improved conditions were promised the Armenian Christians; the autonomy of Bosnia-Herzegovina was to be admitted. But the treaty was viewed with concern by other countries.

In effect this treaty would have disintegrated the Turkish empire. The additional power falling to Russia directly and indirectly would have been tremendous. In the Balkans themselves there were protests from the Armenians and Greeks who, especially, would be sufferers in the rearrangement of territories, and from all the inhabitants of the different ceded provinces. Great Britain was especially opposed to the treaty because of the almost certainty that the Big Bulgaria would prove to be entirely under Russian influence. Austria also saw her Balkan interests threatened, and it was Austria who first demanded that the whole matter should be discussed by a European congress. The consequence was the meeting of the Congress of Berlin (q.v.), June 13-July 13, 1878, which entirely redrafted the Treaty of San

Stefano. (See also EASTERN QUESTION.)

SANTA ANA, the capital of the department of Santa Ana, El Salvador, 50 mi. by rail N.W. of San Salvador. Population (1950), 51,676. It is situated about 1,100 ft. above sea level, in a valley surrounded by high mountains, which are covered by coffee and sugar plantations and woods.

Cigars, pottery, starch, spirits, sugar and various textiles are manufactured, and the export trade in coffee and sugar has developed rapidly since the opening in 1900 of a railway to San Salvador and the Pacific port of Acapulco.

SANTA ANA, a city of southern California, U.S., 35 mi. S.E. of Los Angeles and 10 mi. from the ocean on the west and the Santa Ana mountains on the east; the county seat of Orange county. It is served by the Pacific Electric, the Santa Fe and the Southern Pacific railways, and by motor-coach lines. Pop. (1950) 45,534; (1940) 31,921, by federal census. It is the commercial centre of the rich Santa Ana valley (producing especially oranges, avocados, dairy products and beans) and the neighbouring oil fields; and has numerous factories making a variety of products, including aircraft parts, glass, beet sugar, farm machinery, woolen goods, tiles, pumps, perfumes, preserved fruits, tools and citrus products. There are many fruit-packing plants and canneries in and about the city. Santa Ana was platted in 1869 and incorporated in 1888. In 1900 the population was 4,933, and it increased more than ninefold in the next 50 years.

SANTA ANNA, ANTONIO LOPEZ DE (1795-1876), Mexican revolutionist, dictator, president and soldier, was born in Jalapa, Vera Cruz, on Feb. 21, 1795. Entering the Spanish colonial army as cadet in 1810, he served against the revolutionists in Tamaulipas, Tex., and Vera Cruz until March 29, 1821, when he declared in favour of the *Plan de Iguala*. This revolution resulted in Mexican independence and the empire of A. de Iturbide. Santa Anna advanced rapidly under the empire until Iturbide attempted to remove him from Vera Cruz. He pronounced opportunely for a republic and the subsequent revolution led to the downfall of Iturbide. Santa Anna was sent to San Luis Potosi, where he failed in another attempt at revolution, was recalled, and next sent to Yucatan, where he spent about a year as governor and military commander, returning to Mexico in 1825 and in 1827 to civil and military command in Vera Cruz. He subverted the election of 1828 by a revolution in favour of V. Guerrero, who became president. He defeated an ill-advised attempt of the Spaniards to recapture Mexico in 1829 and, resigning his commands, retired to his hacienda, Manga de Clavo, where, except for a futile effort to sustain Guerrero, he was quiescent until 1833, when he headed a revolution which made M. G. Pedraza president. In 1833 Santa Anna became president, an office that, alternating with various substitutes, he occupied until his defeat and capture by the Texans at San Jacinto, April 21, 1836. He returned to Mexico in 1837, retiring to his hacienda until called to command forces against the French. He lost a leg in action against them at Vera Cruz. Santa Anna was president ad interim for a few weeks in 1839 and in 1841 again seized the office by revolution. He was captured by the counterrevolutionists in 1845 and was exiled. He retired to Havana, Cuba, but returned to Mexico the following year upon the outbreak of war with the U.S. He was offered the presidency but, preferring to lead in the field, commanded the Mexicans in the battles of Angostura and Cerro Gordo and minor engagements. Early in 1847 he also assumed the presidency but, after his final defeats in the siege of Mexico City, retired to exile in Jamaica, from which, in 1850, he moved to New Granada. Recalled by the conservatives, he resumed the presidency for the fifth and last time on April 29, 1853. He became supreme dictator but was again exiled Aug. 17, 1855. He twice attempted to return to Mexico, but was turned back by the French in 1864 and by U.S. naval forces in 1867. As a result of amnesty, he returned to Mexico in 1874 and, poor, broken and blind, died June 20, 1876. Santa Anna was unscrupulous, immoral and of no fixed principles, but he was energetic and of a magnetic personality. He fancied himself a western Napoleon and was the chief contributor to the disturbed condition of Mexico for 30 years. He fostered a tradition of success not entirely justified by facts and in time of national crisis his turbulent countrymen again and again turned to him as the one possible leader.

See *Cambas, Gobernantes de México*; Wharton, *El Presidente*.

SANTA BARBARA, a municipality (with administrative centre and 70 barrios or districts) of the province of Iloilo, island of Panay, Republic of the Philippines, on the Jalaur river, a few miles north of Iloilo (the provincial capital), on the Iloilo-Capiz railway. Pop. (1939) 35,406 (a gain of 6,939, since 1918), of whom 17,415

were males and none was white. The chief agricultural products are sugar, maize (corn), palay (rice), cacao, coconuts and tobacco. Cattle raising and textile weaving are also carried on. The vernacular is Pansy-Bisayan. Of the inhabitants aged 6 to 19 inclusive, 42.2% were reported in 1939 as attending school, while 57.6% of the population ten years old and over was reported as literate.

SANTA BARBARA, a city of southwestern California, U.S., on the Pacific ocean, 90 mi. above Los Angeles; the county seat of Santa Barbara county. It is on federal highway 101 and is served by the Southern Pacific railway, United Air Lines and motorbus lines. Pop. (1950) 47,764; (1940) 34,958, by federal census. The city lies around a crescent beach, on the southern slope of the Santa Ynez mountains. The beauty of the situation, the ideal climate throughout the year, the luxuriant semitropical vegetation, the historic interest and the picturesque modern architecture combine to make it one of the most delightful resorts of the state. A modified Spanish type of architecture generally prevails. Old Mission Santa Barbara, established by Father Junipero Serra in 1786, is the largest and best preserved of the California missions, and is now the Franciscan headquarters for the Pacific coast. The University of California (Santa Barbara) has a fine location overlooking the ocean. A fiesta, "Old Spanish days," is held in August every year. In the Painted cave, 13 mi. distant, are fine rock paintings generally attributed to prehistoric Indians. This region produces a great variety of fruits, nuts and vegetables, including about half the entire commercial crop of lima beans grown in the United States. There are high-gravity oil fields near by. A Spanish presidio was established there in 1782, four years before the mission. Santa Barbara took part in the revolution of 1829, and in the following sectional struggles inclined to the side of Monterey and the north. It was occupied by the Americans in Aug. 1846; then by the Californians in October; again by the U.S. forces on Nov. 27, 1846. In 1850 it was incorporated as a city. The railroad reached it in 1887. On June 29, 1925, a disastrous earthquake visited it, but the city was rapidly rebuilt.

SANTA CATALINA, an island in the Pacific ocean, one of the Santa Barbara group, about 50 mi. S. of the centre of Los Angeles, Calif., and 30 mi. by steamer from Wilmington (Los Angeles harbour). A part of the state of California and Los Angeles county, it comprises 76 sq. mi. and is 22 mi. long and 8 mi. wide at its greatest width. Spurs and canyons which radiate from the main mountain ridges running the length of the island form numerous picturesque bay openings and coves. Highest point is Mt. Orizaba (2,109 ft.). Santa Catalina attracts several hundred thousand tourists each year. Most famous attraction is the undersea gardens off the southern coast, where luxuriant marine vegetation and many varieties of fish are seen from glass-bottomed boats. Also well known is the Catalina Bird park. The Gulf of Santa Catalina and the San Pedro channel, which separate the island from the mainland, are noted as a game-fishing ground, yielding tuna, marlin and broadbill swordfish, white sea bass, rock bass and yellowtail. The climate is dry and sunny; the temperature averages about 10° warmer than the southern California coastal areas in winter, and 10° cooler in summer.

Santa Catalina was discovered in 1542 by Juan Rodriguez Cabrillo, Portuguese navigator in the service of Spain. Sebastian Vizcaino, also sailing under the flag of Spain, rediscovered the island in 1602 on the eve of the feast of St. Catherine and named it Santa Catalina in honour of the saint. It became part of the Republic of Mexico in 1822, and became part of California with the signing of the Guadalupe-Hidalgo treaty, ending the California-Mexican War in 1848. The principal city is Avalon (pop., 1950, 1,498).

SANTA CATARINA, a maritime state of southern Brazil, bounded north by Paraná, east by the Atlantic, south by Rio Grande do Sul and west by the Argentine territory of Misiones (q.v.). It has an area of 36,235 sq. mi., and the population in 1950 was 1,578,159.

The Serra do Mar rises not far from the coast and leaves only a narrow coast zone; the plateau above is much broken with irregular ranges of mountains. The coast region, which is interrupted by swamps and lagoons, is hot, humid and densely forested; the plateau is less densely wooded, temperate, and its fertile plains or open campos are devoted in large part to stock raising.

The drainage of the western and southern parts of the state is westward to the Uruguay, the rivers being tributaries of the Uruguay, which forms the southern boundary. A number of prosperous areas settled by Germans—the largest and best known including Blumenau, Dona Francisca, Joinville, Itajaí, Brusque, Dom Pedro and São Bento—are devoted chiefly to agriculture. There is not so much cultivation on a large scale as in São Paulo and the northern provinces. Coffee is produced to a limited extent, as are also Indian corn, beans, onions, fruit and mandioca. A prominent industry is the gathering and preparation of *mate* or Paraguayan tea (*Ilex paraguayensis*), which is an article of export.

The mineral resources include coal, iron, silver, gold and petroleum; the first alone is mined. A railway, the Dona Teresa Cristina, runs from Laguna, at the mouth of a lagoon of that name on the southern coast, northward to the port of Imbituba, as also westward up the valley of the Rio Tubarão to the coal-fields of that name (69 mi.) and southward to Araranguá. Another, a branch of the São Paulo-Rio Grande, runs from São Francisco do Sul inland to União da Vitória on the main line which crosses the western part of this state. Another short line connects Blumenau with Trombudo.

The capital of the state is Florianópolis (q.v.), also called Santa Catarina; other towns (the population given being that of the municipal district in 1950) are Blumenau (48,581), Lages (78,300), Laguna (38,966), Joinville (44,368), Itajaí (51,976), Brusque (32,614), São José (22,899), opposite Florianópolis, Araranguá (38,808), Tubarão (67,643), and São Francisco (20,159), a good port in the northern part of the state.

SANTA CLARA or **VILLA-CLARA**, the capital of Las Villas province, Cuba, about 185 mi. (by rail) E.S.E. of Havana. Pop. (1943) 53,981. It is situated near the centre of the island, on a plateau, between two small streams, and is served by three railway lines and the Central highway. The streets are straight and wide, and there are many fine buildings. The oldest church is of the latter part of the 18th century. The city is surrounded by fertile plains, which are cultivated in cane or devoted to grazing. Santa Clara was founded in 1689 by a band of families from Remedios.

SANTA CLARA, a town of Santa Clara county, California, U.S., adjoining San Jose on the northwest. It is served by the Southern Pacific railway and by motor coach, air and truck lines. Pop. (1950) 11,702; in 1940, 6,650. It has immense fruit canneries and green-fruit and dried-fruit packing plants and other large and diversified manufacturing industries. It is the seat of the Mission of Santa Clara de Asis, founded by Father Junípero Serra in 1777, and of the University of Santa Clara (Roman Catholic), established in 1851.

SANTA CRUZ, ÁLVARO DE BAZAN, 1st MARQUIS OF (1526-1588), Spanish admiral, born at Granada on Dec. 12, 1526, of an ancient family. In 1564 he aided in the capture of Velez de Gómera, was appointed in 1568 to command the galleys of Naples and was thus brought into close relations with Don John of Austria during the formation of the Holy League (1570). In the operations at Lepanto (Oct. 7, 1571) Bazan was always in favour of the more energetic course; his prompt action averted disaster when the allied line was broken. He accompanied Don John at the taking of Tunis (1572). When Philip II of Spain enforced his claim as heir to the crown of Portugal (1580-81), Santa Cruz held a naval command. In 1583 he was sent against the prior of Crato, an illegitimate representative of the Portuguese royal family, who with his friends held the island possessions of Portugal in the Atlantic. His victory off Terceira decided the struggle in favour of Spain. A zealous advocate of war against England, he made to Philip, on Aug. 9, 1583, the first definite suggestion of the Armada. The King's political and financial embarrassments caused many delays, and Santa Cruz, who was to have commanded, was hindered from acting with effect. He was at Lisbon without the means of fitting out his fleet when Drake burned the Spanish ships at Cadiz (1587). Santa Cruz's independence of judgment finally offended the king and he was held responsible for failures and delays. He died on Feb. 9, 1588, at Lisbon. He was the designer of the great galleons which

were employed to carry the trade between Cadiz and Vera Cruz in Mexico.

See C. Fernández Duro, *La Armada Invencible*, 2 vol. (1884-85); A. Altalaguirre y Duval, *Don Alvaro de Bazán . . . estudio histórico-biográfico* (1888); W. Stirling Maxwell, *Don John of Austria* . . . 2 vol. (1883).

SANTA CRUZ, an eastern department of Bolivia, bounded north by El Beni, east by Brazil, south by Paraguay and Chuquisaca and west by Chuquisaca and Cochabamba. Area 143,918 sq. mi. Pop. (1947 est.) 393,000. It is only partly explored. It consists of a great plain extending east from the base of the Andes to the frontiers of Brazil and Paraguay, broken by occasional isolated hills, and in the northeast by a detached group of low sierras known collectively as the Chiquitos, which belong to the Brazilian highlands rather than to the Andes. On the western side of the department is an upland zone belonging to the eastern slope of the Andes, and there the Bolivian settlements are chiefly concentrated. The great plains, whose general elevation is about 900 ft. above the sea, are so level that the drainage does not carry off the water in the rainy season, and immense areas are flooded for months at a time. Extensive areas are permanently swampy. There are forests in the north and west, but the larger part of the department consists of open grassy plains, suitable for grazing. There are two river systems, one belonging to the Amazon and the other to the Plata basins. The first includes the Guapay or Rio Grande, Piray or Sara, Yapacani and Maracó, upper tributaries of the Mamoré, and the San Miguel, Blanco, Baures and Paragua tributaries of the Guaporé—both draining the western and northern parts of the department. In the extreme east a few streams flow eastward into the Paraguay, the largest of which is the Otusquis; their channels are partly hidden in swamps and lagoons. The climate of the plains is hot; nevertheless, on the Andean slopes the temperature is more agreeable. Products of the western districts are sugar, rum, cacao, rice, cotton, coffee and maize. Rubber and medicinal products are also exported. The Guapay is navigable for small boats in high water, and also the lower courses of the other rivers named.

The principal markets for Santa Cruz products are in the Bolivian cities of the Andes. No railway leads to the capital, Santa Cruz; and the principal means of communication is by air.

The only large town of the department is Santa Cruz (pop. 1946 est. 33,000), on the Piray, a tributary of the Mamoré, 1,450 ft. above sea level. It is situated on a lower terrace of the Andean slope in a highly fertile district, devoted to growing sugar cane and stock raising. It is a dusty, straggling, frontier town with a population consisting chiefly of whites. There are flour mills, sugar mills, distilleries, tanneries and leather manufactories. The original site of Santa Cruz de la Sierra was in the uplands, but it was removed to its present site about 1590, the phrase "de la Sierra" being kept until early in the 20th century.

SANTA CRUZ, a municipality (with administrative centre and 21 *barrios* or districts), capital of the province of Laguna, Luzon, Republic of the Philippines, on the southeast shore of Laguna de Bay, about 35 mi. southeast of Manila, with which it has railway connection. Pop. (1939) 17,649 (a gain of 3,493 since 1918), of whom 8,912 were males and 5 were white. Santa Cruz is a sugar centre and has a number of sugar mills and other manufactures. Other important products are palay (rice) and maize (corn). Tagalog is the vernacular. Of the inhabitants aged 6 to 19 inclusive, 40.4% were reported in 1939 as attending school, while 73% of the population 10 years old and over was reported as literate. The number of parcels of private land declared for taxation in 1938 was 3,936, and the number of owners was 2,974. (C. S. L.)

SANTA CRUZ, a city of California, U.S., on the northern headland of Monterey bay, 80 mi. S. of San Francisco; the county seat of Santa Cruz county. It is served by the Southern Pacific railway.

The population in 1950 was 21,970; (1940) 16,896; (1930) 14,395, by the federal census.

From a curving beach the city slopes up to the foothills

of the Santa Cruz mountains, in surroundings of great natural beauty. The mountains are covered with one of the noblest redwood forests of the state. Among the Santa Cruz bigtrees, 6 mi. from the heart of the city, are some 65 ft. in circumference and 300 ft. high. The State Redwood park is 23 mi. north. Poultry, bulbs (especially narcissus, freesia and gladioli), berries, cherries, grapes, other fruits and vegetables, are the principal products of the region. Loganberries were originated there; strawberries are picked nine months of the year; and the strip of land along the coast from Santa Cruz to San Francisco produces most of the artichokes grown in the United States. The city has a considerable fishing industry. Principal industrial products are clothing, canned goods, leather, cement, crates and boxes, lumber, limestone, sand, rock and gravel, furniture, paint, mattresses and water heaters. The city owns the long wharf, which extends out 2,600 ft. into deep water. A Franciscan mission (no longer in existence) was established there in 1791, and the Pueblo of Branciforte (never very important) was founded near by in 1797. In July 1846 the U.S. flag was raised over the town, and in 1876 it was chartered as a city.

SANTA CRUZ DE TENERIFE, a seaport and the capital of Tenerife and of the Canary Islands; in 28° 28' N. and 16° 15' W., on the east coast. Pop. (1950) 75,000 (mun., 102,437). Santa Cruz occupies a small plain which is bounded by rugged volcanic rocks, and seamed by watercourses which are dry almost throughout the year.

Scarcely any vegetation, except cactuses and euphorbias, is to be seen in the neighbourhood.

Almost the entire town was rebuilt in the 19th century, when its population more than tripled. There are many good public buildings, including a school of navigation, technical institute, library, natural history museum and hospital. An aqueduct 5 mi. long brings pure water from the mountains of the interior. Dromedaries from the adjacent islands of Lanzarote and Fuerteventura are used to convey merchandise and in agriculture. The town was bombarded by the British fleet under Robert Blake in 1657, and by Horatio Nelson, who lost his arm during the attack, in 1797. Some British flags lost on that occasion hang in one of the churches.

— Santa Cruz is an important coal station and commercial centre. (See CANARY ISLANDS.)

SANTA FE, a central province of Argentina, bounded north by the Chaco territory, east by Corrientes and Entre Ríos, south by Buenos Aires, and west by Córdoba and Santiago del Estero. Population (1914 census) 502,452, (1947 est.) 1,695,383; area, 51,354 sq. mi. The two largest cities in the province are Santa Fe, the capital, and Rosario, the second largest city in Argentina.

For the most part the province belongs to the great pampa region of Argentina and has no wooded lands in the south except along the river courses. In the north there are extensive forests of commercially valuable woods, interspersed with grassy *campos*. The surface is a level alluvial plain, and the soils are among the most productive in the country. The climate is healthful and moderate, with mean annual temperatures ranging from 63° F. in the south to 68° F. in the north. Rainfall varies from 28 in. to 35 in. per year, and is more abundant in the littoral region than in the interior.

The leading crops are flax, corn, alfalfa and wheat, together with smaller but significant acreages of oats, rye and barley. In the northern part of the province peanuts, tobacco, sugar cane and cotton are grown. Although agriculture provides the principal source of wealth, the livestock industry is developed extensively and the province is often ranked as the second largest producer of cattle in Argentina. In addition to beef and dairy cattle, large numbers of sheep and hogs are raised. The principal industries of the province are based on dairy and forest products; several large companies are engaged in the exploitation of *quebracho*, in addition to which there are several large sugar refineries, flour mills, breweries and distilleries. Rail, highway, water and air communications are highly developed, and the province is surpassed in its economic position within the country only by the province of Buenos Aires.

(R. W. R.; X.)

SANTA FÉ, a city of Argentina and capital of the province of that name, on the Santa Fé channel of the Paraná near the mouth of the Salado, about 310 mi. N.W. of Buenos Aires. Pop. (1947 est.) 152,000. It is built on a sandy plain a little above the river level. It is regularly laid out and contains a cathedral, bishop's palace, Jesuits' college and church dating from 1660, a university, the cabildo or town hall facing on the principal square and provincial government buildings. It serves as headquarters of the Santa Fé railway. The town is less modern in appearance than Rosario, and has a number of old residences and educational and charitable institutions. It is a port of call for small river steamers and is in ferry communication with Paraná on the opposite bank of the river. Its shipping port for larger steamers was at Colastiné, until 1911, when the modern port of Santa Fé was opened, with large docks capable of accommodating ocean-going vessels. Santa Fé has railway communications with Rosario, Córdoba, Tucumán and the frontier of the Chaco.

Santa Fé was founded by Juan de Garay in 1573.

SANTA FE, capital of New Mexico, U.S., in the northern part of the state, on the Rio Santa Fe; county seat of Santa Fe county and oldest seat of government in the United States. It is on federal highways 64, 84, 85 and 285; is connected by bus with the Santa Fe railway at Lamy (18 mi. S.) and is served by American, United and Trans World air lines. Pop. (1950) 27,998. It lies 7,000 ft. high, at the foot of the Sangre de Cristo range. The climate is dry, sunny and invigorating, with an average annual rainfall of 14.49 in. and an average monthly mean temperature ranging from 28.8° F. in January to 69° in July. The original Spanish plaza is still the heart of the city. Located there is the old governor's palace, built in 1610, occupied continuously until 1909 by the Spanish, Indian, Mexican and U.S. governors of New Mexico and now housing the collections of the Historical Society of New Mexico and the exhibits of the Museum of New Mexico and the School of American Research.

The Art gallery of the Museum of New Mexico is an example of the "Santa Fe" architecture (reproducing in a blend the façades of six early New Mexico missions), where members of the Santa Fe and Taos "art colonies" exhibit their work before sending it east. Near the plaza is the chapel of San Miguel (early 17th century), and "the old house" of Indian construction, possibly antedating the Spanish occupation. St. Francis cathedral dates from 1869 and occupies the site of a church built in 1622. In the northeastern part of the city are the ruins of Fort Marcy, built by General Kearny in 1846. A stone in the plaza marks the end of the old Santa Fe Trail. The modern structures are mainly in the distinctive "Santa Fe" type of architecture, developed (largely since 1910, through the efforts of a small group of persons connected with the School of American Research and the State Museum) by combining features from the terraced dwellings of the Pueblo Indians, the crumbling Franciscan missions, and the *haciendas* of Spaniard and Mexican. The Pecos Division of the Santa Fe National Forest lies 5 mi. east of the city. Farther away, at distances ranging from 9 to 75 mi., are the

ruins of the ancient Anasazi, or "Ancestral Pueblo" culture. The city was founded in 1610, during the administration of Don Pedro de Peralta, and the building of the presidio was begun at the same time. By 1630 there was a population of 250 Spaniards, 700 Indians and 50 half-breeds. In 1680, the Pueblo Indians drove out their conquerors (see New Mexico) and enjoyed independence until Diego de Vargas quietly secured their submission again in 1692. Minor revolts took place in 1694 and 1696. Since 1712 an annual fiesta has been held in commemoration of the reconquest of 1692. During the 18th

century a considerable trade in sheep, wool, pelts and wines developed, chiefly with Chihuahua and the Indians of the plains. Later, Santa Fe became the centre of an extensive commerce with the United States, carried on at first by pack animals, and from 1822 by wagon trains over the old Santa Fe Trail from Independence and Kansas City. In the later years of Spanish rule a number of American citizens were imprisoned in the dungeons of the governor's palace, charged with entering the province for trade and commerce, among whom were Maj. Zebulon M. Pike (1807), Auguste Pierre Chouteau and Joseph de Mun (1817) and David Meriwether (later a governor of New Mexico) in 1819. On Aug. 18, 1846, the city was occupied by an American force under Gen. S. W. Kearny. A few months later the Mexicans assassinated the new governor, Charles Bent, and other Americans, but the revolt was quickly suppressed. In 1847 an English newspaper was established (the first in New Mexico) and in 1848 an English school was opened. At the outbreak of the Civil War the officers at Fort Marcy sympathized with the Southern cause. In 1862 the city was taken by Gen. H. H. Sibley, and for two weeks the flag of the Confederacy floated over the governor's palace. The first railway reached the city in 1880.

SANTAL, an aboriginal tribe of Bihar, which gives its name to the Santal Parganas district (q.v.). In 1941 the Santals numbered 829,025. They are short and dark skinned, with broad noses, thick and everted lips, coarse and occasionally curly (but not woolly) hair, and prominent cheekbones. They are good cultivators and cattle breeders and are also skilled hunters. They have an elaborate tribal structure, with 12 exogamous clans; their villages are well-built and clean, and each has its cadre of village officials and each pargana or group of villages its chiefs, who are assisted or controlled by a council. The Santals' religion is animistic. They practise both fraternal polyandry and sororal polygamy. Santali is a dialect of the Munda language Kherwar. See C. H. Bompas, *Folklore of the Santal Parganas* (London, 1909); A. Campbell and R. M. McNair, *A Santal-English Dictionary*, 2 vol. (Fokhuria, 1933).

SANTALACEAE, the sandalwood family, dicotyledonous, semiparasitic shrubs, trees and herbs of tropical and temperate regions. There are 30 genera and about 400 species. *Santalum album* is the true sandalwood (q.v.). The bastard toadflax (*Thesium humifusum*), an herbaceous root parasite with green leaves, native to Great Britain, belongs to this family. To it belong the North American species of *Comandra*, likewise called bastard toadflax and sometimes parasitic, and also the oil nut or buffalo nut (*Pyralia pubera*), of the Appalachian region.

See R. Pilger, "Santalaceae," Engler and Prantl, *Die natürlichen Pflanzenfamilien* 16b: 52-57, figs. 27-47. (1935).

SANTAL PARGANAS, a district of the Bhagalpur division of Bihar, Republic of India. Area 5,480 sq.mi. Pop. (1951) 2,322,092. In the east a sharply defined belt of hills stretches for about 200 mi.; west of this a rolling tract of long ridges with intervening depressions covers about 2,500 sq.mi., while there is a narrow strip of alluvial country about 120 mi. long, lying for the most part along the loop line of the Eastern railway running roughly parallel to the Ganges in the north and east of the district. The principal range in the east is that of the Rajmahal hills, which cover about 2,000 sq.mi.; they nowhere exceed 2,000 ft. The alluvial tract has the damp heat and moist soil of the lower Ganges basin, while the undulating and hilly portions are swept by the hot westerly winds of Bihar and are very cool in the winter. Coal is worked in the small Jaintia field. Pakaur is the chief centre of the shellac-making industry.

The early history of British administration is a record of the measures taken to pacify and civilize the Paharias of the Rajmahal hills, who under Mohammedan rule had been turbulent robbers and marauders. The Santals, who numbered 829,025 in 1941 began to migrate there from Chota Nagpur and the adjoining districts in the late 18th century. The oppression of landlords, the exactions of Hindu moneylenders and the consequent loss of land caused a rebellion (the Santal War) in 1855-56. This led to the establishment of a form of administration congenial to the immigrants; and a land settlement was afterward carried out on conditions favourable to the cultivators. The Daman-i-Koh, mean-

ing "the skirts of the hills," a government estate of 1,336 sq.mi., was established as a reserve for them and other aboriginals, such as the Paharias. The district is traversed by both the loop line and the chord line (running parallel to the southwest border) of the Eastern railway. It contains the old Mohammedan city of Rajmahal and the modern commercial mart of Sahibganj (pop. 1941, 20,742), both on the Ganges; and the Hindu place of pilgrimage of Deogarh (Deogarh) (pop. 1941, 19,792). The administrative headquarters are at Dumka, or Naya Dumka (pop. 1941, 10,811).

See W. B. Oldham, *Santal Parganas Manual* (Calcutta, 1898); F. B. Bradley-Birt, *The Story of an Indian Upland* (London, 1905), 2.

SANTA MARIA (DA BOCCA DO MONTE), an inland town of Brazil, in Rio Grande do Sul, 162 mi. by rail west of Margem do Taquari, the railway terminus for Porto Alegre, about 80 mi. by water northwest of that city. The population in 1950 was 45,907 for the city and the *município* 84,274. Santa Maria, which lies 382 ft. above the sea, is the commercial centre of a rich district on the slopes of short mountain ranges, one of which, the Serra do Pinhal, forms the water parting between the eastern and western river systems of the state. The town derives its chief importance as the junction of the railway from Porto Alegre and the Brazilian railway from São Paulo to the Uruguayan border.

SANTA MARTA, a city and port of Colombia and the capital of the department of Magdalena, on a small bay 40 mi. E.N.E. of the mouth of the Magdalena river. Pop. (1947) 43,950. It is built partly on the beach and partly on the slopes of the Sierra Nevada de Santa Marta toward the southeast. Though small, the harbour is one of the best and safest on the coast, as no river flows into it to fill its anchorage with silt. The city is an episcopal see and has a cathedral. A 176 mi. railway runs southward to Fundación. Ciénaga (on the large lagoon of Ciénaga) connects with steamers running to Barranquilla (50 mi. farther).

Santa Marta was founded by Rodrigo de Bastidas in 1525, and became an important port and centre of trade during the Spanish colonial era. It was also a base of operations in the exploration and conquest of the interior.

SANTA MAURA (LEUCADIA, LEUCAS, LEVKAS) (Λευκάδα, ancient Λευκάς), one of the Ionian Islands (20 mi. N. to S., 5-8 mi. E. to W.; area 169 sq.mi.; population (1951) 37,752), off the coast of Acarnania (Greece), S. of the entrance to the Gulf of Arta. It is a rugged mass of limestone and bituminous shales (partly Tertiary), rising to 2,000 and 3,000 ft. with limited areas of level ground. The grain crop suffices only for a few months' local consumption; but much olive oil is produced. The vineyards (in the west especially) yield red wine (bought mainly by Rouen, Cete, Trieste and Venice); the currant, introduced about 1859, has come to be the principal source of wealth; and cotton, flax, tobacco and valonia are grown. The salt trade, formerly of importance, has suffered from customs regulations. The chief town, Amaxichi (more usually Santa Maura, after the neighbouring fort), is at the northeast end opposite the lagoon. In the southwest is the village of Vasiliki, whence the currant crop is exported.

Cyclopean and polygonal walls at Kaligoni (south of Amaxichi) probably mark the ancient acropolis of Neritus (or Nericus), and the later Corinthian settlement of Leucas. From this point a Roman bridge seems to have crossed to the mainland. Between the town and Fort Santa Maura extends a Turkish aqueduct partly destroyed by the town by the earthquake of 1825. Forts Alexander and Constantine commanding the bridge are relics of the Russian occupation; the other forts are of Turko-Venetian origin. The magnificent cliff, 2,000 ft. high, at Cape Ducato at the S. end of the island, still bears the ruined temple of Apollo Leucas (hence the modern name). At the annual festival of Apollo a criminal was obliged to plunge from the summit into the sea, where, however, an effort was made to pick him up; and it was by the same leap that Sappho and Artemisia, daughter of Lydamis, are said to have ended their lives.

A theory has been proposed by Professor Dörpfeld, that Leucas is the island described in the *Odyssey* under the name of Ithaca; arguing that the Homeric description of the island and its position, and also the identification of such sites as the palace of

Odysseus; the harbour of Phorcys, the grotto of the Nymphs and the island Asteris, where the suitors lay in wait for Telemachus, suit Leucas better than does the island called Ithaca (q.v.).

The strait separating it from the mainland is liable to silt. In 1903, however, a canal was completed 50 ft. broad and 17 ft. deep. The island was occupied by axis troops in 1941.

See CONRU; also P. Goessler, *Leukas-Ithaka* (Stuttgart, 1904); W. Dörpfeld, *Alt-Ithaka*, 2 vols. (Stuttgart, 1917).

SANTA MONICA, a city of Los Angeles county, California, U.S.A., on the Pacific ocean, 16 mi. W. of Los Angeles. It is on federal highways 66 and 101A and is served by the Union Pacific, the Santa Fe and the Southern Pacific railways and by bus lines. Population in 1950 was 71,595 and in 1940 it was 53,300 by the federal census. It is primarily a year-round seaside resort, beautifully situated on the Palisades, facing broad Santa Monica bay, and protected by mountains on the north. The elaborate and varied recreation facilities include a municipal fishing pier. Santa Monica was incorporated in 1886 and chartered as a city in 1907. It has the great Douglas Aircraft plant, Cloverfield airport and numerous beach and aquatic attractions. In 1947 the city adopted a council-manager form of government.

SANTANDER, a maritime province of northern Spain, bounded north by the Bay of Biscay, east by the province of Biscay, south by Burgos and Palencia, and west by Leon and Oviedo. Pop. (1950) 400,088, area 2,108 sq.m. Santander was part of the Roman province of Cantabria, which, after passing under the empire of the Goths, became the principality of Asturias (q.v.). The portion called Asturia de Santa Juliana, or Santillana, was included in the kingdom of Old Castile, and, on the subdivision of the old provinces of Spain in 1833, became the province of Santander. The province is traversed from east to west by the Cantabrian Mountains (q.v.), which in the Picos de Europa reach a height of over 8,600 ft., and send off numerous branches to the sea. The province is traversed from north to south by the railway and high road from Santander by Palencia to Madrid; the highest point on the railway (Venta de Páozal) is 3,229 ft. above the sea. Other railways connect Santander with Bilbao on the east and with Cabezona de la Sal on the west. The province saw some of the heaviest fighting of the civil war of 1936-39; it was occupied by nationalists in 1937.

SANTANDER, the capital of the Spanish province of Santander, seat of a bishop and one of chief seaports of Spain; 370 mi. by rail N. of Madrid, on the Bay of Santander, an inlet of the Bay of Biscay. Pop. (1950) 85,000 (mun., 102,510). It is on the inside of a rocky peninsula, Cabo Mayor, which shelters a harbour from 2 to 3 mi. wide and 4 mi. long. Santander is divided into an upper and a lower town. The Muelle is officially named Paseo de Pereda, in honour of the great novelist. The harbour was improved after 1850. In the civil war of 1936-39 Santander was attacked by Nationalist columns from Biscay, Soncillo and Navarre, well-supplied with tanks. It fell Aug. 16, 1937.

SANTAREM, a city of Brazil in the state of Pará, on the right bank of the Tapajoz, near its entrance into the Amazon. Population (1950) town 14,564 and *município* 61,611. It is one of the most important towns and distributing centres of the Amazon between Belém and Manaus and is a port of call for all river steamers and a station on the Amazon cable line. Santarém is 435 mi. from Belém (by air) and is served regularly by Panair do Brasil. Seen from the river the town is attractive in appearance and consists of a European (white) and an Indian quarter, the latter of palm-thatched huts. Ruins remain of a fort built in colonial times to protect the population against hostile Indians. Its principal public buildings are a municipal hall and tribunal, a large municipal warehouse, a market, theatre and two churches. The productions of the neighbourhood are cacao, Brazil nuts, rubber, tobacco, sugar cane and cattle; and the rivers furnish an abundance of fish, which are cured here at the season of low water, when turtle eggs are also gathered upstream for the manufacture of oil and "butter." The Tapajoz is navigable for steamers to the rapids, 170 mi. above Santarém, and for small boats nearly to Diamantino, Mato Grosso, and of considerable trade comes from

Mato Grosso and the settlements along its banks. Santarém was founded by a Jesuit missionary in 1661 as an Indian *aldeia*, and became a city in 1848.

SANTAREM, a city on the right bank of the river Tagus, 51 mi. by rail N.E. of Lisbon, Portugal. Pop. (1940) 11,785. The older part contains the ruined castle of Alcaçova, famous in the middle ages as a royal residence. Below is Ribeira de Santarém, a comparatively modern river-port, and on the opposite bank is Almerim, a village which was also a royal residence until 1755, when it was almost entirely destroyed by earthquake. Santarém has some trade in fish and agricultural produce, including wine and olive oil. Its chief buildings are an ecclesiastical seminary; the late Gothic church of the Convento da Graça, which contains the tomb of Pedro Álvares Cabral, the first Portuguese to visit South America (1502); the Igreja do Milagro, an early Renaissance church; and the church of Santa Iria (St. Irene), from which the name of the city is derived. There is a fine bridge,

Santarém is the Roman *Scallabis*, renamed *Proesidium Iulium* by Julius Caesar. From its position in the Tagus valley it became an important fortress during the wars between the Moors, Portuguese and Spaniards. Alphonso VI. of Castile first took it from the Moors in 1093, but it was recaptured and occupied by them until 1147, when Alphonso I. of Portugal recovered it. The Almohades endeavoured to win it back in 1184, but were defeated. The Miguelites were defeated here in 1834 (see PORTUGAL: History).

The administrative district of Santarém coincides with the eastern part of the ancient province of Estremadura (q.v.); population (1950) 458,658; area 2,583 sq.m.

SANTAROSA, ANNIBALE SANTORRE DI ROSSI DE POMAROLO, COUNT OF (1783-1825), Piedmontese insurgent, and leader in the revival (Risorgimento) of Italy, was born at Savigliano, near Coni, on Nov. 18, 1783. He was the son of a general officer in the Sardinian army who was killed at the battle of Mondovì in 1796. Santarosa entered the service of Napoleon during the annexation of Piedmont to France, and was sub-prefect of Spezia from 1812 to 1814. After the restoration of the king of Sardinia in 1814, he continued in the public service. When in 1821 the Austrian army was moved south to coerce the Neapolitans, Santarosa conspired to obtain the intervention of the Piedmontese in favour of the Neapolitans by an attack on the Austrian lines of communication. The conspirators sought the co-operation of the prince of Carignano, afterwards King Charles Albert. On March 6, 1821, Santarosa and three associates had an interview with the prince, and on the 10th they carried out the military "pronunciamento" which proclaimed the Spanish Constitution. The movement had no real popular support, and very soon collapsed. Santarosa was arrested, but escaped, and fled to France, living for a time in Paris under the name of Conti. Here he wrote in French and published in 1822 his *La révolution piémontaise*, which attracted the notice of Victor Cousin, by whom he was finally contacted. He was imprisoned and expelled from Paris. He passed over to England, where he found refuge in London with Ugo Foscolo. He accompanied his countryman Giacinto Collegno to Greece in Nov. 1824. He was killed when the Egyptian troops attacked the island of Spheacteria, near Navarino, on May 8, 1825.

See ALTO VANNUCI, *I Martiri della libertà italiana* (Milan, 1877), and vol. ix. of the series called *I Centomperatori italiani* (Turin), in which there is a life by Angelo de Gubernatis. Santarosa's correspondence was edited by Bianchi, *Lettere di Santarosa Santarosa* (Turin, 1877). A personal description by Victor Cousin will be found in the *Revue des deux mondes* for March 1, 1840.

SANTA ROSA, a city of California, U.S., 52 mi. N. by W. of San Francisco, in a broad valley of the Coast Ranges, at an altitude of 150 ft.; the county seat of Sonoma county. It is served by the Northwestern Pacific railway, Southwest Airways, and by motor-stage and truck lines.

Population (1950) was 17,902; 1940 federal census 12,605. It is the trading centre and shipping point for a wide area, producing large quantities of poultry, eggs, cheese, butter, prunes, grapes, berries, hops, wool and other agricultural products. Because of the favourable conditions of climate and soil which it presented for horticultural experiments, Luther Burbank in 1875 chose Santa

Rosa for his home.

The city has varied manufacturing industries, supplying local needs and utilizing local products. Santa Rosa was settled about 1838 and incorporated in 1853.

In 1854 it replaced Sonoma as the county seat and in 1867 it was chartered as a city. It suffered severely in the earthquake of April 18, 1906. Since 1920 it has had a council-mayor form of government.

SANTA TECLA, Salvador: see NUEVA SAN SALVADOR.

SANTAYANA, GEORGE (1863-1952), U.S. philosopher and poet, was born at Madrid, Dec. 16, 1863. At the age of nine he was taken to the United States.

He received the degree of B.A. from Harvard university in 1886, and served there, first as instructor, and then as professor of philosophy, from 1889 to 1912. For a long time his attachment to literature competed with "the love of wisdom."

In 1894 he published *Sonnets and Other Poems*; at later intervals he issued small volumes of classically compact and severely beautiful poetry, warmed with the restrained emotionalism of a Spaniard and an aristocrat and coloured with the peculiar melancholy of one who envied the consolations of "that splendid error [religion] which conforms better to the impulses of the soul" than life itself can do.

His first essay in philosophy was *The Sense of Beauty* (1896), which even the matter-of-fact Hugo Münsterberg rated as the best American contribution to aesthetics; five years later appeared *Interpretations of Poetry and Religion*; then for seven years he worked on *The Life of Reason*.

These five volumes, *Reason in Common Sense*, *Reason in Society*, *Reason in Religion*, *Reason in Art*, and *Reason in Science*, at once lifted Santayana to fame.

In 1912 he abandoned his position at Harvard and went to live in Europe. For many years he wandered from country to country, adding industriously to his philosophical product and reputation. Early during World War II, he settled in Rome at the convent of the Little Company of Mary. In 1923 he issued *Scepticism and Animal Faith*, as an introduction to "one more system of philosophy"; and in 1927 he published *The Realm of Essence*, first of four volumes on *Realms of Being*. These later works have given form and completeness to a world view which, in the *Life of Reason*, modestly announced itself as merely a contemporary application of Aristotle's thought. Epistemologically, Santayana's position is that idealism is true, but irrelevant and useless. Certainly the only reality is experience; and the "realm of essence" means the colours, forms, tastes, odours, pressures and temperatures which sensation gives, and the ideas, words, images and other interpretative representations which thought weaves around these essential experiences of the flesh. Our belief that these perceptions, by and large, fairly report the "external world" (the "realm of matter") is a form of "animal faith," a rough hypothesis which has the sufficient sanction of pragmatic use, and embodies the concordant element in the experience of all normal men.

Consequently we may accept as real what the senses report, and in every case this is matter. "In natural philosophy I am a decided materialist—apparently the only one living." Matter is far more complex in its structure, and far subtler in its possibilities, than we supposed; and to Santayana there is nothing strained in viewing thought as a function quite as natural and corporeal as digestion, and as transitory. "I believe there is nothing immortal. . . . No doubt the spirit and energy of the world is what is acting in us, as the sea is what rises in every little wave; but it passes through us; and cry out as we may, it will move on. Our privilege is to have perceived it as it moved." Mechanism is universal, and prevails even in the inmost recesses of the soul. Consciousness has no causal efficacy; it may see, and enjoy or deplore, the operations of life, but it cannot further or impede them in any way. Despite this materialism and scepticism, Santayana discussed the problems and ideals of religion with the sympathy of a poet and the tolerance of a sage. "Religion is human experience interpreted by human imagination. . . . Matters of religion should never be matters of controversy. . . . We

speak rather to honour the piety and understand the poetry embodied in these fables."

In ethics Santayana cleaves to Aristotle: "In Aristotle the conception of human nature is perfectly sound: everything ideal has a natural basis, and everything natural an ideal fulfilment. His ethics, when thoroughly digested and weighed, will seem perfectly final." A rational morality, based upon secular education and intelligence, would serve for a society of philosophers; but for the majority of mankind morality will have to retain its emotional basis in natural affection and the social training of the home. So too with government: we must put up with the second best, which so admirably accords with our own quality. Democracy has many faults, but it has the great virtue of providing a more equal opportunity than other forms of government to talent and genius of whatever origin and rank. Perhaps in the distant future men will be sufficiently intelligent to combine aristocracy with democracy, giving the franchise to all, but limiting office to the fit. Till then we must suffer fools gladly.

WRITINGS.—*Sonnets and Other Poems* (1894); *The Sense of Beauty* (1896); *Luchter, a Theological Tragedy* (1899); *Interpretations of Poetry and Religion* (1900); *The Hermit of Carmel, and Other Poems* (1901); *The Life of Reason, or the Phases of Human Progress* (1905-06); *Three Philosophical Poets* (Lucretius, Dante and Goethe) (1910); *Winds of Doctrine* (1913); *Character and Opinion in the United States* (1920); *Egoism in German Philosophy* (1916; rev. ed. 1940); *Poems* (1923); *Scepticism and Animal Faith* (1923); *Soliloquies in England* (1925); *Dialogues in Limbo* (1925); *Platonism and the Spiritual Life* (1927); *Realms of Being*, 4 vol. (1927-40); *The Last Puritan*, a novel (1936); *Obiter Scripta* (1936); *Persons and Places*, 2 vol. (1944-45); *Domination and Powers* (1951). (W. D.; X)

SANTIAGO, a province in the northern part of central Chile, bounded northwest by Valparaíso, north by Aconcagua, east by Argentina, south by O'Higgins, southwest by Colchagua, and west by the Pacific. Area, 6,559 sq. mi.; population (1950), 1,933,445, of whom 1,200,754 lived in the urban area of the national capital. Physiographically the province is divided into three longitudinal zones, the coastal mountains and valleys, the central valley, and the western watershed of the Andes. Climatically the greater part of the province has a Mediterranean type characterized by mild, rainy winters and warm to hot, dry summers. Winter precipitation in the Andes is principally in the form of snow, the meltwaters from which feed the perennial streams (tributaries of the Río Maipo) that are vitally important to the agricultural economy of the central valley during the long period of summer drought. The natural vegetation, similar to Mediterranean *maquis* (California *chaparral*), has been largely cleared from the lands suited to agriculture and grazing; the most conspicuous trees in the valley lands, found principally along irrigation canals and roads, are eucalyptus and Lombardy poplars, both of which are exotic. Under irrigation the fertile alluvial soils of the central valley are highly productive, large areas being planted in wheat, barley, corn, alfalfa, potatoes, legumes, grapes, figs, olives and a great variety of other temperate and subtropical fruits, cereals and vegetables. In addition to its leading agricultural position, Santiago ranks high in the production of cattle and other livestock. Although most of the land is still held in large *haciendas* or *fincas*, the need for increased agricultural production to feed the large urban population of Santiago is gradually resulting in the subdivision of lands, especially in the vicinity of the capital.

SANTIAGO or **SANTIAGO DE CHILE**, a city of Chile, capital of the republic and of a province of the same name, on the Mapocho river, a small tributary of the Maipo or Maipú, 115 mi. southeast of Valparaíso by rail, in 33° 26' 42" S., 70° 40' 36" W. Population (1950 est.) 1,200,754. The city is built on a wide, beautiful plain about 1,800 ft. above sea level, between the main range of the Andes and the less elevated heights of Cuesta del Prado. In the centre of the city rises the rocky hill of Santa Lucía, once forming its citadel, but now converted into a pleasure-ground, with winding walks, picturesque views, theatres, restaurants and monuments. Immediately north-northwest and northeast are other hills, known as Colina, Renca and San Cristóbal, and overshadowing all are the snow-clad Andean peaks of La Chapa and Los Amarillos, visible from all parts of the city. The

Mapocho, once the cause of destructive inundations (especially in 1609 and 1783), was enclosed with solid embankments during the administration of Ambrosio O'Higgins, and is crossed by several handsome bridges; the oldest (1767-79) of these has 11 arches.

Santiago is laid out with great regularity, and its comparatively broad straight streets form parallelograms and enclose several handsome public squares, the Plaza de Armas, Plaza Constitución and others. It has all the characteristics of a modern capital: fine public buildings and private residences, broad avenues, well-paved and well-lighted streets and modern conveniences of every sort. There are many modern skyscrapers and apartment houses, particularly along the Avenida Bernardo O'Higgins, the main thoroughfare. The electric tramway and lighting company, which before World War I had been in German hands, was reorganized as a Chilean enterprise. It constructed hydroelectric projects at Santiago in 1921, and secured the contract for supplying power to the railway from Santiago to Valparaíso after its electrification, as well as for lighting the city and running its trams. In 1924 the government granted a concession to a local firm for the construction of an underground way through the centre of the city (5½ mi. long, 33 ft. below the surface). Water is brought in through two aqueducts, one 5 mi. long (1865), and the other from Laguna Negra 33 mi. away.

There is a railway communicating with Valparaíso, with Los Andes and the international tunnel, and with the provincial capitals of the south and the north.

Manufacturing industries play an important role in Santiago, constituting more than 50% of the country's total. Among the leading industries are breweries, flour-mills, foundries, machine-shops, woodworking plants, tanneries, knitting-mills, soap factories, factories for making shoes, hats, umbrellas and articles of clothing.

The cathedral, facing on the Plaza de Armas, was erected originally in 1619 by Pedro de Valdivia. It was rebuilt by García Hurtado de Mendoza, destroyed by the earthquake of 1647, and was rebuilt on a new plan subsequent to 1748. It is 357 ft. long and 92 ft. wide, has only one tower and is not striking in appearance. Its interior decorations, however, are rich and in good taste.

Among the other ecclesiastical buildings are the church of San Agustín, erected in 1595 by Cristóbal de Vera, and in modern times adorned with a pillared portico; the church of San Francisco (the oldest in Santiago); La Merced and Santo Domingo, dating

Santiago.

Among the secular buildings the more noteworthy are the capitol with its rows of massive columns and its beautiful gardens; the Moneda, or executive residence, which contains the offices of the cabinet ministers also; the civic centre; the courts, or palace of justice; the post office and telegraph department; the exposition palace in the Quinta Normal, which houses the national museum; the University of Chile, dating from 1842; the national library; the national conservatory of music; the astronomical observatory; the national institute; the mint; and a municipal theatre. There are also a military school and a number of charitable institutions.

The old Universidad de San Felipe, founded in 1747, was closed in 1839, and was succeeded three years later by the present national university.

Facing the capitol, which includes the two halls of congress, is a small park and commemorative shaft, marking the spot where stood the Jesuits' church which was burned down on the night of Dec. 8, 1868, and with it "2,000 victims, more or less," chiefly women.

Santiago was founded in 1541 by Pedro de Valdivia, who was engaged in the conquest of Chile, and it received the title of Santiago del Nuevo Estremo. It has suffered from earthquakes and from political disorder. After the defeat of the royalists at Chacabuco (Feb. 12, 1817), it was occupied by the revolutionary forces under Gen. José de San Martín. Though the scene of many revolutionary outbreaks, it has never been subjected to a regular siege.

The fifth international conference of American states was held in Santiago in 1933, and the third Pan American Highway congress convened there in 1939.

The province of Santiago, bounded N. by Aconcagua, E. by Argentina, S. by O'Higgins and Colchagua and W. by the Pacific and Valparaíso, has an area of 6,559 sq.mi. and a population (1940 census) of 1,261,717. It embraces part of the "Valle de Chile," celebrated for its fertility and fine climate.

SANTIAGO DE COMPOSTELA or SANTIAGO, a city of northwest Spain, in the province of Coruña; at the northern terminus of a railway from Tuy, near the confluence of the Sar and Sarela rivers, and 32 mi. S.W. of the city of Coruña. Pop. (1940) 30,127 (mun., 49,191). The Galician region, of which the city is the centre, is composed of hills which have been strongly folded and faulted and where in consequence metal veins occur. In the ages when metal began to be known in the west people from the Mediterranean moved along the coasts of western Europe, and with these movements was associated the cult of the megaliths. In those days navigation was precarious and sailors made for one of a number of small ports which had a common focus inland. Santiago was probably a focus for the numerous ports on the Galician rias. (Cf. Canterbury and St. David's.) At Padrón, one of the ports of Santiago, there are two great stones called *Barca* and *Patron* (the ship and the skipper). The tradition of the sanctity of the old stone monuments lingered for centuries and the legend arose that St. James the Apostle had, after his martyrdom in Palestine, been borne hither for burial and that the body was brought ashore at Padrón.

After the Moorish conquest the northwest corner was the only part of Spain that retained its independence and it was the region from which the reconquest of Spain for Christendom was begun. This produced a great enthusiasm for the Christian religion, an enthusiasm fanned by the reputed discovery of the bones of St. James at Compostela. A church was built over the relics and a bishopric transferred thither. The city thus became a centre for pilgrims and when the royal family of Castile became connected by marriage with that of Burgundy, which was associated with the Cluniac monks, the site gained an international significance. The road (*route de S. Jacques*) of the pilgrims became famous and many of the great romances of the middle ages developed from the tales told by the pilgrims to while away the tedium of the long journey to this remote corner of Spain. (Cf. the *Canterbury Tales*.) There were also many pilgrims from those western fringes of Europe, which had been con-

WEATHER GRAPH OF SANTIAGO. THE THERMOMETER INDICATES THE ANNUAL MEAN TEMPERATURE, THE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE, AND THE COLUMNS, THE NORMAL MONTHLY PRECIPITATION.

from the 18th century; the church of the Reformed Dominicans, rich in monolithic marble columns; the Carmen Alto, or church of the Carmelite nunnery, a small Gothic structure; the Augustine nunnery, founded by Bishop Medellín in 1576; the episcopal palace; and the chapel erected in 1852 to the memory of Pedro de Valdivia, next to the house in which he is reputed to have lived.

There are two cemeteries—one exclusively Roman Catholic and the other secularized. Mural interment is the custom in

nected with Galicia ages before in the early days of metal. The city was formerly the capital of Galicia, and is still the seat of a university and of an archbishopric, which long disputed the claim of Toledo to the primacy of all Spain. Its chief industries, apart from agriculture, are brewing, distillation of spirits, and the manufacture of linen, paper, soap, chocolate and matches. The city has also been long celebrated for its silversmiths' work.

In 1078 the erection of the present cathedral was begun and it was consecrated in 1211. It is a cruciform Romanesque building. The Puerta Santa is kept closed, except in jubilee years, when it is opened by the archbishop. Perhaps the chief beauty of the cathedral is the Portico de la Gloria, behind the western classic portal. It is a work of the 12th century, and probably the utmost development of which round-arched Gothic is capable. The shafts, tympana, and archivolts of the three doorways which open on to the nave and aisles are a mass of strong sculpture.

The Hospicio de los Reyes, on the north of the Plaza Mayor, for the reception of pilgrims, was begun in 1504 by Enrique de Egas under Ferdinand and Isabella.

SANTIAGO DE CUBA, a city and seaport of Cuba, on the southern coast of the eastern end of the island, capital of the province of Oriente, and next to Havana the most important city of the republic. Population of the city (1943) 118,266 and of the *municipio* 120,577. It is connected by the Cuba railway with Havana, 540 mi. to the W.N.W.; short railways extend into the interior through gaps in the mountains northward; and there are steamer connections with other Cuban ports and with New York and Europe.

Santiago is situated about 6 mi. inland on a magnificent landlocked bay (6 mi. long and 3 mi. wide), connected with the Caribbean sea by a long, narrow, winding channel with rocky escarpment walls, in places less than 200 yd. apart. The largest vessels have ready entrance to the harbour but direct access to the wharves is impossible for those of more than moderate draught (about 14 ft.). Smith key, an island used as a watering place, divides it into an outer and an inner basin. To the east of the sea portal stand the Morro, a picturesque fort (built 1633 *seg.*), on a jutting point 200 ft. above the water, and the Estrella; and to the west the Socapa. West of the harbour are low hills, to the east precipitous cliffs, and north and northeast, below the superb background of the Sierra Maestra, is an amphitheatre of hills, over which the city straggles in tortuous streets. The houses are mostly of one story. In the cathedral, Diego Velázquez (*c.* 1460–1524), conqueror of Cuba, was buried. It has suffered much from earthquakes and has been extensively repaired. Probably the oldest building in Cuba is the convent of San Francisco (a church since the secularization of the religious orders in 1841), which dates in part from the first half of the 16th century. Great improvements have been made in the city since the end of colonial rule, especially as regards the streets, the water supply and other public works and sanitation. On a hill overlooking the city is a beautiful schoolhouse of native limestone, erected by the American military government as a model for the rest of the island. Santiago is the hottest city of Cuba (mean temperature in winter about 82° F., in summer about 88°), owing mainly to the mountains that shut off the breezes from the east. There is superb mountain scenery on the roads to El Caney and San Luis in the thickly populated valley of the Cauto. In the barren mountainous country surrounding the city are valuable mines of iron, copper and manganese. On these the prosperity of the province largely depends. There are also foundries, soapworks, tanyards and cigar factories. The city has an important trade with the interior, with other Cuban ports, and to a less extent with New York and European ports. Mineral ores, tobacco and cigars, coffee, cacao, sugar, rum and cabinetwoods are the main articles of export.

History.—Santiago are the least important politically under the republic than it was when Cuba was a Spanish dependency. The place was founded in 1514 by Diego Velázquez, and the capital of the island was removed thither from Baracoa. Its splendid bay, and easy communication with the capital of Santo Domingo, then the seat of government of the Indies, determined its original importance. From Santiago in 1518–19 departed the historic

expeditions of Juan de Grijalva, Hernán Cortés and Pánfilo de Narváez. Cortés was the first mayor of Santiago. So important already was the city that its *ayuntamiento* had the powers of a Spanish city of the second class. In 1522 it received the arms and title of *ciudad*, and its church was made the cathedral of the island. But before 1550 the drain of military expeditions to the continent, the quarrels of civil, military and ecclesiastical powers, and of citizens, and the emigration of colonists to the Main produced a gradual decline. In 1589 Havana became the capital. Santiago was occupied and plundered by French corsairs in 1553, and again by a British military force from Jamaica in 1662. The capture of that island had caused an immigration of Spanish refugees to Santiago that greatly increased its importance; and the illicit trade to the same island—mainly in hides and cattle—that flourished from this time onward was a main prop of prosperity. From 1607 to 1826 the island was divided into two departments, with Santiago as the capital of the eastern department. After 1826 Santiago was simply the capital of a province. In July 1741 a British squadron from Jamaica under Adm. Edward Vernon and Gen. Thomas Wentworth landed at Guantánamo and during four months operated unsuccessfully against Santiago. The climate made great ravages among the British, who lost perhaps 2,000 out of 5,000 men. The bishopric became an archbishopric in 1788, when a suffragan bishopric was established at Havana. After the cession of Santo Domingo to France, and after the French evacuation of that island, thousands of refugees settled in and about Santiago. They founded coffee and sugar plantations and gave a great impulse to trade. There were destructive earthquakes in 1675, 1679, 1766 and 1832. In the 19th century some striking historical events are associated with Santiago, including the Virginian affair of 1873. The most notable military and naval events (in Cuba) of the Spanish-American War (*q.v.*) of 1898 took place at and near Santiago. Monuments commemorate the actions at El Caney and San Juan hill. The city's learned societies flourished independently of those of the capital, and in 1949 its university was granted official recognition equal to that of Havana.

SANTIAGO DE LAS VEGAS, an inland city of Havana province, Cuba, south of Havana. Pop. (1943) 9,385; (*municipio*, 25,201). Tobacco is the principal industry. An agricultural experiment station is maintained there by the Cuban government. The town dates from 1688, when a church was built for a colony of tobacco cultivators of the neighbourhood.

SANTIAGO DEL ESTERO, a province of Argentina, bounded north by Salta and the Chaco territory, east by the Chaco and Santa Fé, south by Córdoba, and west by Catamarca, Tucumán and Salta. Area 52,222 sq. mi.; pop. (1914) 261,678; (1947) 469,377. With the exception of the Sierra de Guasayán in the west and the Sumanapa and Ambargasta hills in the south, the surface is a vast plain, more than two-thirds of which is covered with a great variety of commercially valuable trees. There are extensive swamps along the river courses and large saline areas, especially in the southwest. The most important rivers are the Salado and the Dulce, between which lie the most fertile lands in the province. The climate is extremely hot in the summer, the maximum temperature being as high as 118° F.; frosts occur occasionally in the winter. There is an average annual rainfall of from 20 in. to 25 in., most of which falls in summer.

Although the forests provide the principal source of wealth, agriculture and stock raising are also important. The principal crops are wheat, alfalfa, linseed, corn and cotton, in addition to which a wide variety of fruits is raised.

The province is traversed by several railway lines which afford connection with all parts of Argentina, and with Bolivia and Chile.

The provincial capital, SANTIAGO DEL ESTERO, is on the right bank of the Río Dulce, 630 mi. N.W. of Buenos Aires, to which it is connected by rail. Population (1947 est.) 58,925. The city stands on a level open plain, 520 ft. above sea level, and in the vicinity of large swamps (*esteros*) bordering the Río Dulce, from which its name is derived. There are a number of interesting old buildings in the city—a government house, several churches, a Jesuit college, a Franciscan convent and a girls' orphanage. The city was founded in 1553 by Francisco de

Aguirre and was the first capital of the province of Tucumán, the earliest settled of the La Plata provinces (R. W. R., X.)

SANTI QUARANTA, a seaport of Albania, on the Bay of Butrinto, and opposite the island of Corfu (Corcyra). Pop. before the Italian occupation of 1939, about 5,000, of whom 75% were Orthodox and the remainder Moslems.

In the neighbourhood are the ruins of the ancient Buthrotum, traditionally founded by Helenus, son of Priam (see Virgil, *Aen.* iii, 291 *et seq.*). In the 1st century B.C. Buthrotum became a Roman colony on the main highway between Dyrrachium (Durazzo) and Apollonia. The modern city belonged to the Venetians from the 14th century till 1797 when it was captured by Ali Pasha of Janina. In 1939 the Italians renamed the town Porto Edda, after Mussolini's daughter. It was captured by the Greeks Dec. 6, 1940, and held until Germany's Balkan invasion in April 1941.

SANTO DOMINGO (officially known as the Dominican Republic) occupies the eastern two-thirds of the island of Hispaniola and has an area of about 19,120 sq. mi. Its population by the census of 1950 was 2,121,000. There are several hundred Spanish and a few other European families living in the country but the mass of the population is Afro-American. Spanish is the universal language and the cultural heritage is that of Spain.

The Dominican Republic is very mountainous (see HAITI). Extending northwest to southeast and almost in the centre of the country is the great Cordillera Central whose highest elevation exceeds 10,000 ft. and whose maximum width is 80 mi. This great mountain mass is largely unoccupied and is heavily forested. It receives an abundant rainfall and is the chief drainage divide of the country. The mountains and valleys north of this central core are well watered as a rule and support nearly two-thirds of the population. Sugar, cacao, tobacco and coffee are the chief money crops, but as elsewhere in the republic, most of the land is held by small farmers and utilized for sustenance crops. This section contains the famous Vega Real of early Spanish days. South of the Cordillera Central much of the land is arid, necessitating extensive irrigation. A thriving sugar industry is found east and west of Ciudad Trujillo. Mineral developments of some promise include iron, bauxite and gypsum. There are a number of good harbours in the republic. Docks are in operation at Ciudad Trujillo, Puerto Plata, La Romana, San Pedro de Macoris and Barahona. At the other ports lighters must be used.

History.—The area now occupied by the Dominican Republic along with the portion now included in the Republic of Haiti was held by Spain as the colony of Hispaniola until the Treaty of Ryswick in 1697. After that date the Haitian portion was ceded to France and the Dominican portion remained under Spanish dominion and became known as Santo Domingo, after the patron saint of Columbus' father. At the end of the 18th century the Spanish control was lost and the entire island came under the French. When the French lost control of the colony in the early part of the 19th century, the empires of Toussaint L'Ouverture and Jean Jacques Dessalines for a time united the entire island under one government, independent of all European powers. During the second decade of the 19th century, Spain again asserted its dominion over the eastern end of the island but was forced out by a revolution in 1821. A republic was proclaimed under the guidance of Colombia. The following year, Pres. Jean Pierre Boyer of Haiti invaded the country and again united the island under one flag. In 1844, the year following Boyer's downfall, the Dominican Republic was founded and since that date two political entities have been maintained. The presidency of the new republic alternated, with one exception, between Buenaventura Báez and Pedro Santana until in 1861 when Spain, on the invitation of Santana, again annexed the country. Dissatisfaction with Spanish rule brought revolution and the Spanish withdrew for the last time in 1865. Four years later, when Báez was again president, a treaty was negotiated by Gen. O. E. Babcock, U.S., for the annexation of the Dominican Republic to the United States. This treaty was ratified by the Dominican senate but was rejected by the United States. With the exception of the rule of Ulises Heureaux, 1882-99, presidents followed each

other in rapid succession and an unstable condition prevailed. An unusually violent revolution broke out following the election of Eladio Victoria in Feb. 1912 and the United States sent a mediatory commission which helped to effect a temporary agreement. Victoria resigned and the popular Archbishop Adolfo A. Nouel was elected president. He proved a poor executive and Bordas Valdes became provisional president. Revolution again became active and a second commission was sent from the United States. Bordas resigned and Báez became provisional president on Aug. 27, 1914. Juan Isidro Jiménez took office as president in December of the same year. He was deposed in April 1916 by Desiderio Arias, the secretary of war, who assumed power. On May 5, U.S. forces were landed, Henriquez y Carvajal was then appointed as provisional president. More trouble followed and the United States felt compelled to intervene formally, establishing, on Nov. 29, 1916, the Military Government of the United States in Santo Domingo. As the occupation was not undertaken with the object of destroying the sovereignty of the Dominican Republic, arrangements were made for the withdrawal of U.S. forces as soon as conditions warranted. The military governor sailed on Oct. 24, 1922, when a satisfactory provisional government had been set up.

On June 26, 1924, the Dominican Republic ratified the treaty proposed by the United States and on July 12 the last of the U.S. forces were withdrawn. Horacio Vázquez was at the same time inaugurated as president for four years, a term which was subsequently extended by constitutional amendment to six years. In the last year of his administration (Feb. 1930), Vázquez was suddenly expelled from office by a revolution and after a brief period under Provisional Pres. Ureña, Gen. Leonidas Trujillo became president.

In the following two decades, Gen. Trujillo, either as president or as military chief at the side of the president selected by him, carried out a program of thoroughgoing economic and political consolidation. Relations with the neighbouring republic of Haiti were initially hostile, with much border warfare, but tended to improve in the period after 1940. Relations with the Venezuelan regime of Acción Democrática (1945-48) were equally hostile, as well as with the administrations of Ramón Grau San Martín and Prío Socarrás in Cuba. A program of road building and the improvement of water supplies, irrigation, hospital and school construction was consistently carried out. A central bank was set up (1949-50), the foreign debt paid off, the internal debt reduced (to \$21,761,000 by June 30, 1951) and the budget maintained in balance (revenue in 1950, for example, totalled \$96,500,000 and expenditures \$90,881,000; the 1951 budget was estimated to balance at \$74,606,000). When Trujillo took the presidency, the national income was equivalent to \$30,000,000; in 1951 it exceeded \$300,000,000.

Government, Education, Finance.—A representative government is established under the constitution. All males over 18 years of age are qualified to vote. The administration is in the hands of three co-ordinate powers: the executive, the legislative and the judicial. The chief executive is the president. Prior to the constitution of June 13, 1924, he was elected by indirect vote for six years and was not eligible for re-election to a second successive term. At that time the term was reduced to four years and election was made by direct vote. The office of vice-president was created for the first time. The president cannot be re-elected to the presidency nor elected to the vice-presidency for the constitutional period following. He is assisted by a cabinet consisting of the secretaries of the seven departments: interior and police, foreign affairs, treasury and commerce, war and navy, justice and public instruction, agriculture and immigration, promotion and communications. There are 12 provinces, each of which elects by direct popular vote, for four periods, one senator and two members to the chamber of deputies. Each province has an appointed governor and is divided into communes, with necessary local officials. The supreme court is composed of a chief justice and six justices. Courts of appeal are located in two or three of the larger centres. A court of first instance is located in each province and in each commune there is at least one local court. The Policía Nacional Dominicana (Guardia) has the double function of police and army.

This organization was trained by and largely modelled after the U.S. marine corps.

Primary education is free and, in theory, compulsory. It is supported by local communities with national participation in the cost. Secondary schools and the university are supported by the national government. The state contributes to the support of the Catholic Church; other religious bodies are free to organize and maintain congregations.

The peso is at par with the U.S. dollar. External debt had all been paid off by 1952, except a few thousand dollars' worth of bonds for which the fiscal agents held the funds to pay them when presented.

Production and Trade.—Agriculture provides the principal source of wealth. Sugar, produced on property exploited by foreign capital, in the main, is the foremost product (a record total of 587,343 short tons, plus 25,813,275 gal. of blackstrap molasses was produced in 1950-51). It has gone to Great Britain traditionally, but an increasing proportion enters the world market. Coffee (326,899 bags of 132 lb. each in the 1950-51 season) and cacao (34,000 short tons) encountered steady and dependable demand after 1937; tobacco (24,000 short tons) and bananas are other but relatively minor sources of trade. Some mineral developments began to give promising signs in the late 1940s.

The rapid expansion of export trade brought its total value for 1951 to more than \$108,000,000 while the value of imports exceeded \$48,000,000. Leading customers are the United States (44% of the total in 1950) and the United Kingdom (42%). Principal suppliers are the United States (73% in 1950), the Netherlands Antilles (5%) and the United Kingdom and West Germany (each 2%). The chief ports are Ciudad Trujillo, San Pedro de Macoris and La Romana.

The public railroad mileage of the republic at mid-20th century was about 170, and in addition there were about 650 mi. of industrial narrow-gauge lines operated mostly by the sugar companies. There were about 500 mi. of improved highway connecting Ciudad Trujillo with northern points and with the Republic of Haiti. Foreign shipping facilities and foreign air line connections were tending to increase.

SANTORIN (corruption of St. Irene) or **Thera**, a volcanic island in the Aegean sea, the southernmost of the Sporades. Officially it is a province in the Greek department of the Cyclades (q.v.), divided into 9 communes.

In shape Santorin forms a crescent and encloses a bay on the north, east and south; on the western side lies the smaller island of Therasia. The encircling wall thus formed, elliptical, and 18 mi. round its inner rim, is broken in two places—toward the northwest by a strait a mile in breadth, where the water is not less than 1,100 ft. deep, and southwest by an aperture about 3 mi. wide, shallow, with Aspronisi (White Island) in the middle. From the bay, cliffs rise perpendicularly to as much as 1,000 ft.; but toward the open sea, both in Santorin and Therasia, the ground slopes and has been converted into broad level terraces of tuffaceous agglomerate, which though bare and ashen, produce the famous Santorin wine. The tufa itself is exported as cement especially for house-works.

Toward the southeast, the limestone peak of Mount Elias (1,856 ft.) existed before the volcano was formed. In the middle of the bay lie three small volcanic islands, Palaea-Kaümene and Nea-Kaümene (Old, Little and New Burnt islands). The highest, Nea-Kaümene, was thrown up in 1707 and 1866 to 351 ft. above the sea.

Because of the depth at the foot of the cliff there is no anchorage, and vessels have to be moored to the shore, except at one point in the neighbourhood of the modern town, where there

is a patch of shallow bottom. The cliffs show horizontal bands of black lava, white and yellow tufa, and other volcanic strata, red, purple, brown and green, with but little herbage. The modern town of Thera (or Phera, as it is commonly pronounced) is built at the edge of these cliffs, overlooking the bay at a height of 900 ft.

The foundations of the houses and in some cases their sides, are excavated in the tufa, so that they are hardly traceable except by their chimneys. Because of the absence of timber—for, except the fig, cactus and palm, there are hardly any trees on the island—they are roofed with barrel vaults. Both wood and occasionally water are imported from neighbouring islands; for there are no wells, and the rain water, collected in cisterns, sometimes fails.

The next largest village, Apanomeria ("Upper Part"), near the north entrance, is crowded together in a white-washed mass above the reddest rocks in the island.

Geology.—Most geologists agree that the whole of the bay was once covered by a single volcanic cone, represented by the outward slope of Santorin and Therasia, with its crater at the Kaümene Islands; and that the bay results from explosion and subsidence.

The Kaümene Islands arose subsequently, and Palaea-Kaümene is considered to be prehistoric. Principal eruptions in historic times were those of 196 B.C. (Strabo 57), when flames arose from the water between Thera and Therasia for four days and an island appeared; of A.D. 726, when again an island was thrown up; of 1570, when Mikra-Kaümene arose; of 1650, which destroyed many lives by noxious exhalations, and ended in the upheaval of an island in the sea to the northeast of Santorin, which is now a reef below sea level; that of 1707, when Nea-Kaümene arose; and that of 1866, when Nea-Kaümene was extended toward the south and enlarged threefold.

In the southern parts both of Santorin and Therasia prehistoric dwellings were found at some height above the sea, and there was evidence that these date from a period antecedent to the formation of the bay. This was demonstrated by their position underneath the layer of tufa which covers the islands and by these layers of tufa being broken off precipitously, in the same way as the lava rocks, a fact which could only be explained by the supposition that they all fell in together.

The foundations of the dwellings rested not on the tufa but on the lava below it; and here and there between the stones, branches of wild olive were found, according to a mode of building that still prevailed in the island in modern times in order to resist the shocks of earthquakes.

Few implements of metal were found. Vases of imported Cretan ware date this settlement to the middle Minoan period, and connect the volcanic explosion with the earthquake which wrecked the first palace at Cnossus.

In Greek legend the island of Thera originated from a clod of earth presented to the Argonauts by Triton (Apoll. Rhod., *Argonaut*, iv, 1551 et seq., 1731 et seq.). A colony was left there by Cadmus (Herod., iv, 147.). Subsequently a colony from Sparta, including Minyan refugees from Lemnos, was brought by Theras, who gave the island his own name, in place of Callisto. But the chief event in Thera's history was the planting of its famous colony of Cyrene on the north coast of Africa by Battus in 631 B.C., in accordance with a command of the Delphic oracle. Thera, as a member of the league of the Cyclades, was from 308 to 145 B.C. under the protectorate of the Ptolemies.

The ancient capital occupied a site on the eastern coast now called Mesavourop, between Mount Elias and the sea. It has been excavated since 1895 by Baron Hiller von Göttrich. There are extensive cemeteries; a Heroum of Artemidorus; an Agora; a Royal Portico; a temple of Dionysus and the Ptolemies, later dedicated to the Caesars; the Ptolemaic barracks and a gymnasium. The main street has narrow lanes to right and left; one leads to the sanctuary of the Egyptian gods. Near the street there is a small theatre, beneath the seats of which is a cistern into which rain water drains from the auditorium; water was evidently scarce then as now. Farther southeast are the temples

of Ptolemy Euergetes III, and of Apollo Carneius, finally, where the rocks fall precipitously, a gymnasium of the Ephēbi. Numerous rock-carvings and inscriptions have been discovered, as well as statues and vases. Near the west foot of Mount Elias is the temple of The Basilēia, perfect even to the roof, now dedicated to St. Nicholas Marmarites.

Tournfort mentions that in his time nine or ten chapels were dedicated to St. Irene, the patron saint of the place; the name Santorin was given after the fourth crusade, when the island formed a portion of the duchy of the archipelago.

SANTOS, a city and seaport of Brazil, in the state of São Paulo, about 200 mi. S.W. of Rio de Janeiro, and 49 mi. by rail S.E. of São Paulo city. Population (1950) 206,920. Santos covers an alluvial plain on the inner side of an island (São Vicente) formed by an inland tidal channel sometimes called the Santos river. The commercial part of the city is some miles from the mouth of the channel, but the residential sections extend across the plain and line the beach facing the sea. The city is only a few feet above sea level, the island is swampy and deep, cement-lined channels drain the city. The Santos river is free from obstructions and in front of the city widens into a bay deep enough for the largest vessels. The water front, once beds of mud and slime, the source of many epidemics of fever, was faced by a wall of stone and cement. The quay is about 3 mi. long and can accommodate 50 steamers at one time; belt conveyors operated by steam load several thousand bags of coffee per hour. Many warehouses are splendidly equipped with machinery which replaces manual labour. The British-built but government-owned railway to São Paulo ("heart of coffee-land"), 49 mi. distant, transports the bulk of coffee of that region to Santos, making the line the best paying railway in South America. A paved highway from São Paulo to Santos was completed by the state government in 1910. Another, and wider, road was opened to traffic in 1947.

Santos has passed Rio de Janeiro in the amount of its exports and is now the world's greatest coffee port, shipping annually from 8,000,000 to 13,000,000 bags. The annual imports have increased in 20 years from 1,053,450 to 2,693,194 metric tons. About 3,000 ships visit the port yearly, the busiest season being from August to January. The other exports include cotton, sugar, rice, rum, fish, hides and manufactured goods. Bananas are grown in the vicinity for the River Plate markets.

An annual rainfall of about 77 in. and a mean temperature of 69° F., combined formerly to create unhealthy conditions, but the building of a series of drainage canals, extension of modern sanitation, paving of streets, construction of better houses and port improvements were largely responsible for the change to a healthful city. A suburban seaside resort, Guarujá draws many visitors from inland parts of Brazil.

The first settlement on the São Paulo coast was that of São Vicente in 1532, about 6 mi. S. of Santos on the same island. Other settlements soon followed, among them that of Santos in 1543-46, and later on the small fort at the entrance to its harbour, which was used for protection against Indian raids from the north. São Vicente did not prosper, and was succeeded (1681) by São Paulo as the capital and by Santos as the seaport of the colony. It was captured by the English privateer, Thomas Cavendish, in 1591, when São Vicente was buried.

SANTOS-DUMONT, ALBERTO (1873-1932), Brazilian aeronaut, was born at São Paulo, Brazil, on July 20, 1873. In 1897 he made his first balloon ascent from Paris. In 1898 he began to construct dirigible airships, and after many failures built one which, on Oct. 19, 1901, won the Deutsch prize and a prize from the Brazilian government for the first flight in a given time from Saint Cloud to the Eiffel tower. In 1903 he erected at Neuilly the first airship station. There he kept his fleet of dirigibles and travelled in them about the streets of Paris between

the houses.

In 1905 Santos-Dumont turned his attention to heavier-than-air machines, and after experiment with a vertical-propeller model, he built in 1906 a machine on the principle of the box kite, and with it won the Deutsch-Archdeacon prize in October, while in November he flew 220 m in 21 sec. In 1909 he produced his famous "demoiselle" or "grasshopper" monoplane, the forerunner of the modern light plane. On Dec. 3, 1928, after many years of residence in France, he returned to Brazil. On his arrival the government declared a half-holiday in his honour.

Santos-Dumont wrote *My Airships: A Story of My Life* (1904).

SANUTO or SANUDO, MARINO, the younger (1466-1533), Venetian historian, son of the senator, Leonardo Sanuto, was born on May 22, 1466. Marino Sanuto was elected a member of the Maggior Consiglio when only 20 years old, and became a senator in 1498. He collected a fine library, which was rich in mss. and chronicles both Venetian and foreign, including the famous Almino chronicle, the basis of early Venetian history.

His chief works are: *Itinerario in terra ferma* (ed. Rawdon Brown, 1847); *I commentarii della guerra di Ferrara*, an account of the war between the Venetians and Ercole d'Este (Venice, 1829); *La Spedite di Carlo VIII.* (MS. in the Louvre); *Le Vite dei Dogi*, vol. xxi of Muratori's *Rerum italicarum Scriptores* (1733). *The Diarii*, his most important work, which cover the period from Jan. 1, 1496, to Sept. 1533, were edited by various scholars and published at Venice (58 vol., 1879-1903). Owing to the relations of the Venetian republic with the whole of Europe and the east it is practically a universal chronicle.

BIBLIOGRAPHY—M. Rawdon Brown, *Ragguagli sulla vita e sulle opere di Marino Sanuto*, 3 vol. (Venice, 1837-38); G. Tiraboschi, *Storia della Letteratura Italiana*, vol. vi, R. Fulin, *Marino Sanuto* (Turin, 1880); Ricotti, *I Diarii di Marino Sanuto* (Turin, 1880); G. de Leva, *Marino Sanuto* (Venice, 1888).

SAN VICENTE, the capital of the department of San Vicente, El Salvador; 30 mi. E. of San Salvador, on the river Acahuapa, a left-hand tributary of the Lempa. Pop. (1950) 10,945. San Vicente is situated in a volcanic region abounding in hot springs and geysers. The volcano of San Vicente, the highest in the department, reaches an altitude of more than 7,000 ft. There are indigo and tobacco plantations. Shoes, hats, cloth, silk, spirits and cigars are manufactured. San Vicente was founded in 1634 on the site of Tehuacan, an ancient Indian city. For one year (1839-40) it was the capital of the republic.

SÃO FRANCISCO, a river of eastern Brazil rising in the southwest part of the state of Minas Gerais, about 20° 30' S., 46° 40' W., near the narrow valley of the Rio Grande, a tributary of Paraná, and within 240 mi. of the coast west of Rio de Janeiro. It flows in a general north-northeast direction across the great central plateau of Brazil to about lat. 9° 30' S., long. 42° W., where it turns northeast and then southeast in a great bend, entering the Atlantic in lat. 10° 20' S. It has a total length of 1,800 mi. and a fall of 2,700-2,800 ft. It is navigable from the Atlantic to Piranhas (148 mi.) and is nearly 1 mi. wide at Penedo, 22 mi. from the sea. Above Piranhas, about 193 mi. from its mouth, are the falls of Paulo Afonso, where the river plunges through a narrow gorge—in one place only 51 ft. wide—and over three successive falls, altogether 265 ft. The obstructed part of the river is about 190 mi. long, and consists of a series of rapids above the falls and a deep canyon with whirlpools for some distance below. The Brazilian government has built a railway around these falls from Piranhas (151 ft. elevation) to Jatobá (978 ft.) with an extension of 71 mi.

Above Jatobá there is another series of rapids, called the Sobradinho, nearly 90 mi. above the lower rapids, which are navigable at high water, and above these an unobstructed channel for light-draught river boats up to Pirapora, a little above the mouth of the Rio das Velhas, a distance of 984 mi. There the river runs through a barren, semiarid region, sparsely settled. The rapids of Pirapora are 17 mi. above the mouth of the Rio das Velhas, and this point, the head of navigation on the river, and 1,742 ft. above sea level, is the objective-point of the Central do Brasil railway, the purpose being to create by rail and river a central route from Rio de Janeiro to the northern ports of Salvador and Recife.

The principal tributaries of the São Francisco are: on the

right, the Pará, Paraopeba, Velhas and Verde-Grande; on the left, the Indaia, Abaeté, Paracatu, Urucury, Canhinha, Corrença and Grande. Several of these tributaries are navigable for long distances by small boats—the aggregate being a little more than 1,000 mi. Some authorities give the aggregate navigable channels of the São Francisco as 4,350 mi. The upper valley of the São Francisco is partly forested, has a temperate climate, with a mean annual temperature of 85° F. and a rainfall of 1,637 mm. The rainy season is from December to March, but on the lower river there are sometimes droughts covering several years.

An admirable description of this great river is given by Richard Burton in *The Highlands of Brazil* (1866), and a more technical description by E. Liás in *Hydrographie du Haut San-Francisco et du Rio das Velhas* (Rio de Janeiro, 1865).

SÃO LEOPOLDO, a city of the state of Rio Grande do Sul, Brazil, on the left bank of the Rio dos Sinos, 20½ mi. by rail north of Porto Alegre. It is the chief town of a *município* (commune) of the same name, having an area of 340 sq.mi. and inhabited chiefly by German colonists. Population (1950) of the *município*, 76,251. São Leopoldo has river and railway communication with Porto Alegre and railway connection with Santa Maria. It is a prosperous industrial town, with broad straight streets, substantial buildings and good schools. Among the articles which it manufactures are matches, hats, boots and shoes, soap, liquors and artificial drinks, leather and leatherwork and earthenware. In the surrounding districts cattle and hogs are raised, and jerked beef, hides, pork, lard, potatoes, beans, *farinha de mandioca* (cassava flour), Indian corn, tobacco and a great variety of vegetables and fruits are produced.

The city was originally a German colony founded by the emperor Pedro I in 1824 and established at a place known as the *Feitoria Real de Cânhamo* (Royal flax factory).

SÃO LUIS or, in full, **SÃO LUIS DO MARANHÃO**, a seaport of northern Brazil, capital of the state of Maranhão, on the west side of an island of the same name, in lat. 2° 30' S., long. 44° 17' W. of Greenwich, about 300 mi. E.S.E. of Belém (Para). Population of the *município* (1950) 121,917. An important part of the population is made up of the planters of the state, who live in town and leave their estates to the care of overseers. The island of Maranhão lies off the mouths of the rivers Meirim and Itapicuri, between the Bay of São Marcos on the west and the Bay of São José on the east, and is separated from the mainland by a small channel called the *Canal do Mosquito*. It is irregular in outline, its greatest length from northeast to southwest being 34 mi., and its greatest breadth 19 mi. Its surface is broken by a number of low hills and short valleys. The city is built upon a tongue of land between two small estuaries, Anil and Bacanga, which unite and open upon the Bay of São Marcos. It covers two low hills and the intervening valley, the transverse streets sloping sharply to the estuary on either side. These slopes make it difficult to use vehicles in the streets, but they afford a natural surface drainage which makes São Luis cleaner and more healthful than are usually the coast towns of tropical Brazil. The buildings are of the old Portuguese type, with massive walls of broken stone and mortar, having an outside finish of plaster or glazed tiles and roofs of red tiles. The principal public buildings are the cathedral, a large and severely plain structure, the Episcopal palace, the Carmelite church, the Government palace, town hall, customhouse, hospital and a number of asylums, convents and charitable schools. There are schools of law, pharmacy, agriculture and arts. Exports are mainly babassu nuts and cotton. Communication with the mainland is carried on by means of small steamers, and by a railway which crosses the eastern part of the state to Senador Furtado on the Parnaíba river opposite Teresina.

São Luis was founded in 1612 by La Rivardière, a French officer commissioned by Henry IV to establish a colony in this vicinity. The French colony was expelled in 1615 by the Portuguese, who, in turn, surrendered to the Dutch in 1641. In 1644 the Dutch abandoned the island, when the Portuguese resumed possession and held the city to the end of their colonial rule in Brazil. The city became the seat of a bishopric in 1679.

SAÔNE, a river of east France, 301 mi., long, rising in the

Faucilles mountains (Vosges), 15 mi. S.W. of Épinal at a height of 1,300 ft. and uniting with the Rhône at Lyons. The name is derived from *Sauconna*, a 4th-century name. Rising in the Vosges Hercynian massif, it meanders in the wide depression on Jurassic and Tertiary rocks between the Plateau of Langres, the Côte d'Or and the mountains of Charolais and Beaujolais to the west, and the western slopes of the Vosges and Jura and the plain of Bresse and the plateau of Dombes on the east. Near Allery the Saône unites with the Doubs (left), which rivals it in volume and exceeds it in length at this point. At Chalon-sur-Saône it turns south, and passes Mâcon. Below Trévoux its valley narrows, winds past the Mont d'Or group and joins the Rhone at Lyons. The Saône is canalized from Corre to Lyons, a distance of 233 mi., the normal depth of water being 6½ ft. At Corre (confluence with the Coney) it connects with the Eastern canal, at Heuilly (below Gray) with the Saône-Marne canal, at St. Symphonien (above St. Jean-de-Losne) with the Rhône-Rhine canal, and at St. Jean-de-Losne with the canal de Bourgogne and at Chalon with the Canal du Centre. (See RHÔNE.)

SAÔNE-ET-LOIRE, a department of east-central France formed from the districts of Autunois, Brionnais, Chalonnais, Charollais and Mâconnais, previously belonging to Burgundy. It is bounded north by the department of Côte d'Or, east by that of Jura, southeast by Ain, south by Rhône and Loire, west by Allier and Nièvre. Pop. (1946) 506,749. Area, 3,331 sq.mi. The department extends down into the valley of the Loire on the west and into that of the Saône on the east, both with Pliocene deposits, from a high, but discontinuous, central north-to-south axis, stretching from the Côte d'Or (Jurassic) to the Beaujolais (largely granitic). The chief break in the highlands is used by the railway through the Charollais from Dijon through Beaune to Digoën on the Loire, and by the canal from Chalon-sur-Saône to Dijon. On the east the department extends beyond the Saône to include a large part of the region of Bresse which focuses chiefly on Chalon. The heights of the Morvan (2,955 ft. in the department) rise on the northwestern border.

The average temperature at Mâcon (52° or 53° F.), the most temperate spot in the department, is slightly higher than at Paris, the winter being colder and the summer hotter. At the same town the yearly rainfall is about 33 in., but both the rigour of the climate and the amount of rain increases in the hilly districts.

Agriculture prospers in Saône-et-Loire. Wheat, oats and maize are the chief cereals; potatoes, clover and other fodder, and mangold-wurzels are important, and beets, hemp, colza and rape are also grown. Excellent pasture is found in the valleys of the Saône and other rivers. The vine, one of the principal resources of the department, is cultivated chiefly in the neighbourhood of Chalon and Mâcon. Of the wines of Mâconnais, the vintage of Thorins is in high repute. The white Charollais oxen are one of the finest French breeds; horses, pigs and sheep are reared, and poultry farming is a thriving occupation in the Bresse. The industrial importance of the department is great, chiefly owing to its coal and iron mines; the chief coal mines are those near Creusot, Autun and Chapelle-sous-Dun. A pit at Épinac is more than 2,600 ft. in depth. Iron is mined at Mazenay and Change, and manganese is found at Romanèche and there are quarries of various kinds. There are well-known warm mineral springs containing chloride of sodium and iron at Bourbop-Lancy. The iron and engineering works of Schneider and Company at Le Creusot are the largest in France. The department also has many distilleries, potteries, porcelain works (Digoën and Charolles), tile works, oil works and glass factories, and manufactures leather goods, esparto goods, sugar and fecula. Its commerce between the north and the mid is facilitated by navigable streams—the Loire, Saône, Doubs and Seille—the Canal du Centre, which joins Chalon-sur-Saône with Digoën on the Loire, and the canal from Roanne to Digoën and the lateral Loire canal, both following the main river valley. The chief railway of the department is the P.L.M.

Saône-et-Loire forms the diocese of Autun; it is part of the district of the 8th army corps (Bourges); its educational centre is Lyons and its court of appeal that of Dijon. It is divided into

arrondissement.—Mâcon, L'ouhans, Chalon-sur-Saône, Autun, Chârolais—51 cantons, and 590 communes. Mâcon, Chalon-sur-Saône, Autun, Le Creusot, Cluny, Montceau-Les-Mines, L'ouhans, Charolais (99.4.). Tournus and Paray-le-Monial are the chief towns in the department. St. Marcellin-Châlon has a Romanesque church, once attached to an abbey where Peter Abélard died; Anzy has a Romanesque church and other remains of an important monastery; Sully has a château of the 16th century; and Semur-en-Brionnais and Varennes-l'Arçonne fine Romanesque churches. Prehistoric remains of the Old Stone Age have been found at Solutré near Mâcon, and have given the name Solutrian to a period of prehistoric time.

SÃO PAULO, a state of Brazil extending from 19° 54' to 25° 15' S. lat. and bounded north by Mato Grosso and Minas Gerais, east by Minas Gerais, Rio de Janeiro and the Atlantic, south by the Atlantic and Paraná and west by Paraná and Mato Grosso. Pop. (1950) 9,242,610; area 95,459 sq. mi. The state has a coast 373 mi. long, skirted closely by the Serra do Mar below which is a narrow coastal zone broken by lagoons, tidal channels and mountain spurs. Above is an extensive plateau, 1,500 to 3,000 ft. above sea level. Isolated ranges of low elevation break the surface in places, but in general the state may be described as a tableland with an undulating surface sloping westward to the Paraná. The extreme eastern part, however, has an eastward slope and belongs to the Paraíba basin. The state is traversed by a number of large rivers, tributaries of the Paraná, the largest of which are the Rio Grande, Peixe, Tietê, Aguapeí, Tigre and Paranapanema. The eastern slopes of the Serra do Mar are well wooded but there are wide grassy plains (*campos*) on the plateau. A large part of western São Paulo is still unsettled. The coastal zone has a hot climate, and it also has a heavy rainfall. On the plateau the rainfall is sufficiently abundant, but the air is drier and more bracing, the sun temperature being high and the nights cool. The open country is singularly healthful, but the river lowlands are generally not so.

The great industries are agricultural, and the most conspicuous is coffee production. São Paulo produces more than one-half the total Brazilian crop and its one great port, Santos, is the largest coffee-shipping port in the world. The *terra roxa* (red earth) lands of the central and northern parts of the state are peculiarly favourable. This soil is ferruginous, pasty and free from stone, and it covers the higher surface of the plateau with a thick layer. The best plantations are on the high divides between the river courses, and not in their eroded valleys.

The other agricultural products of the state include sugar, cotton, rice, tobacco, Indian corn, beans, mandioca, bananas and other fruits, and many of the vegetables of the temperate zone. Cereals can be grown, but climatic conditions have been considered unfavourable. Sugar cane was the first exotic to be cultivated in São Paulo, and was its principal product in colonial times. Cotton was largely produced, especially during the American Civil War. The industry nearly disappeared, but now is again improving because of the demand for fibre by the national cotton factories. The cultivation of rice also is increasing, under the stimulus of protective duties. Although São Paulo is not classed as a pastoral region, the state possesses large herds of cattle, which are being improved by the importation of purebred stock from Europe. Butter and cheese are produced to a limited extent, and the supply of fresh milk to the cities is attracting some attention. Attention is also given, to a limited extent, to the breeding of horses and mules. The most general and profitable of the animal industries is the breeding of swine, which thrive remarkably on the plateau. The state has an excellent agricultural school and experiment station at Piracicaba, and there is also a zootechnic station near the capital.

The principal manufactures are cotton and woollen textiles, jute bagging, *aramina* fabrics, furniture, iron and bronze, coffee machinery and agricultural implements, artificial liquors and food products. Steam power is generally used, though both electric and hydraulic power are employed. The iron mines and works at Ipanema, near Sorocaba, a government enterprise, are one of the oldest industries of the state, dating back to the first quar-

ter of the 19th century.

São Paulo is well provided with railways, which include the pioneer line from Santos to Jundiaí (formerly owned by the British but taken over by the state government) which has a double track from Santos to the city of São Paulo, the Paulista lines which are a continuation of the Santos-Jundiaí line into the interior, the Mogiana lines running northward from Campinas through rich coffee districts to Uberaba in Minas Gerais and into Goiás. The São Paulo branch of the Central do Brasil line which passes through the eastern part of the state and provides communication with the national capital, the São Paulo and Rio Grande which crosses the states of Paraná, Santa Catarina and Rio Grande and connects with the railways of Uruguay, and the line from São Paulo to Puerto Esperanza. The ports of the state are Santos, which is visited by large steamers in the foreign trade, and Cananéia, Iguape, São Sebastião and Ubatuba which are engaged in the coasting trade only. Cananéia and Iguape are chiefly known for the rice grown in their vicinity.

The capital of the state is São Paulo (q.v.) and its principal port and second city in importance is Santos (q.v.). The chief cities and towns, with populations in 1950 are as follows, the enumeration being for municipalities or parishes, including large rural towns and *fazendas* including separate villages: Campinas (9.7.); Guaratinguetá (37,404), on the Paraíba, 120 mi. N.E. of São Paulo; Phadecaba (88,855), 85 mi. N.W. of São Paulo; Limeira (46,822), in a fertile thickly-settled district; Rio Claro (47,668), 135 mi. S.W. of Santos, on a branch of the Paulista railway, in a fertile coffee-producing region, 2,000 ft. above the sea; Taubaté (53,759), one of the oldest cities of the state, on the Paraíba 80 mi. E.N.E. of the capital, in a rich agricultural district, with works for refining oil from the petroleum-bearing shales which are in the vicinity; Bragança (59,177), 50 mi. N. of São Paulo in a fertile country partly devoted to sugar production and stock; São José dos Campos (45,228); Tietê (18,073) on the Tietê river northwest of São Paulo; Pindamonhangaba (29,286), on the Paraíba river and Central do Brasil railway 105 mi. N.E. of São Paulo in a long settled district, 1,770 ft. above the sea, producing coffee, sugar, rice, Indian corn, beans, rum and cattle; Sorocaba (64,868); city 69,631), a prosperous manufacturing and commercial town on the Sorocaba and Sorocabana railway, 50 mi. W. of São Paulo; Itu, or Ytá (51,295), about 70 mi. W.N.W. of São Paulo on the Tietê river and Itana railway, with water power derived from the Salto (falls) do Itú, and with important manufactures; São Carlos (48,750); Casa Branca (17,662), in the northern coffee region; Paraíba (16,971); Pirassununga (16,413); Batatais (12,827); Franca (55,558), on the Tietê (17,850); Botucatu (47,868); Jundiaí (66,879), 86 mi. N. of Santos, an important manufacturing town and railway junction, 2,320 ft. above sea level; Ribeirão Preto (91,374); city 66,081), 197 mi. N. of Campinas on the Mogiana railway in a fertile coffee-producing region; Iguape (15,547), a port on the southern coast of the state, on a shallow channel of sufficient depth for coastwise steamers, with exports of rice and timber; Lorena (25,147), 130 mi. N.E. of São Paulo, beautifully situated, 1,760 ft. above the sea, a station on the Central do Brasil railway, and the junction of a branch railway to the Campos do Jordão where the national government has established a military sanatorium because of its dry, bracing climate.

São Paulo was settled in 1532 by the Portuguese under Martin Afonso de Souza, who established a colony near Santos, at São Vicente, now an unimportant village. It was originally called the *capitania* of São Vicente (organized 1534) and covered the whole of southern Brazil from Rio de Janeiro south. After the suppression of the captaincy grants, parts of this enormous territory were cut off from time to time to form other captaincies, from which developed the present states of Rio de Janeiro, Minas Gerais, Mato Grosso, Paraná, Santa Catarina and Rio Grande do Sul. In 1681 São Paulo succeeded São Vicente as the capital of the captaincy.

(R. D'E.)

SÃO PAULO, a city of Brazil, capital of a state of the same name, largest industrial center of the nation and seat of a bishopric, on the Tietê river 49 mi. by rail N.W. of the port of Santos and 308 mi. by rail S.W. of Rio de Janeiro. City population in 1950 was 2,227,512. São Paulo is connected by rail with Santos, its port, with Rio de Janeiro and with other inland cities. In great part the city occupies an elevated open stretch of tableland commanding extensive views of the surrounding country; and a small part of it is in the low alluvial land bordering the Tietê. The upper part has several slight elevations forming healthful residential districts. The city is just within the tropics, but its elevation (2,500 ft. above the sea) gives it a temperate climate, bracing in the cool season and yet with high sun temperatures in summer. The city is singularly healthful.

In the mid-19th century it was still a small colonial village; 100 years later it was the third town in South America. In 1945,

12,838 building licences for new homes and apartment houses were issued. Originally, the city derived its wealth from coffee and cotton-growing in the rich red soil section of the state. The construction in near-by Cubatão of a power plant with a capacity of more than 500,000 h.p. enabled the city to become one of the largest industrial centres in Latin America. In 1950 there were 353,530 industrial workers in the city out of a total of 610,100 of all plants in the state (which, in turn, had 33% of the industrial population of all Brazil). The busy centre of the city, called "Triangle," with its skyscrapers and continuous activity, is the most characteristic part of São Paulo. There are fine avenues, imposing buildings, including the state university, the Pacaembu stadium (capacity, 70,000), the Jockey Club course and pleasant residential districts such as Jardim America and Avenida Paulista. The Butantan institute, a research centre for the study of snakes and the production of antitoxins and antivenins, is unique of its kind. The museum and monument of Ipiranga commemorates the national declaration of independence in 1822. The city, which has a large Italian population, was founded by the Jesuits under Manuel de Nobrega (in 1554) as an Indian settlement and at first bore the name of Piratininga. In 1681 it succeeded São Vicente as the capital of the captaincy. (R. N. E.)

SÃO SALVADOR, Brazil: see SALVADOR.

SAPAJOU, an alternative name for the American capuchin monkeys (*q.v.*), comprising the genus *Cebus*. (See also PRIMATES.)

SAPAN or **SAPPAN WOOD**, a soluble red dyewood (Malay *sapang*), from a tree belonging to the leguminous genus *Caesalpinia* (*C. sappan*), a native of tropical Asia and the Indian archipelago. The wood is somewhat lighter in colour than Brazil wood and its other allies, but the same tinctorial principle, brazilin, appears to be common to all.

SAPARUA, the name of the chief island, and capital, of the Uliassers, a group of islands lying east of the island of Ambolma, in the Moluccas. Japan occupied Saparu in 1942.

SAPINDACEAE, a large family of dicotyledonous plants, with about 150 genera and 2,000 species, chiefly tropical, consisting of trees, shrubs and vines. The leaves are mostly alternate and compound, occasionally simple, while the flowers, mostly small, are irregular or unsymmetrical, mostly polygamo-dioecious, the fruits various. Important fruit trees include the litchi (*q.v.*) (*Litchi chinensis*), of China, longan (*Euphoria longana*) of China and India, the rambutan (*Nephelium lappaceum*) and palusau (*Nephelium mutabile*) of the Indo-Malayan region, the akee (*q.v.*) (*Blighia sapida*) of Africa, and others. The seeds of *Schleichera oleosa* yield macassar oil, while the aril surrounding the seeds is edible. Other species yield important timbers, and the bark of still others is rich in saponin. The varnish tree (*Koeleruteria*) is widely cultivated in Europe and North America as an ornamental.

See L. Radlkofe, "Sapindaceae," *Pflanzenreich* 98 (iv, 165): 1-1539, figs 1-45 (1931-33).

SAPONINS AND SAPOGENINS. Saponins are water-soluble plant substances characterized by special properties, namely, the ability to lower the surface tension of water and hence to cause foaming, the ability to destroy red blood corpuscles (haemolysis) and the ability to kill fish, all at relatively low concentrations. They probably are present in all plants, having been identified in more than 75 families and more than 500 species. They may be distributed throughout the plant or occur in high concentration in one part of the plant; e.g., the root or bulb, leaves, bark, flowers, fruit flesh or seeds. Their function in the plant is not known. Some appear to serve as a storage form of carbohydrate (*q.v.*) in the plant, whereas others seem to be waste products of plant metabolism.

Common names for plants containing high concentrations of saponins are soap root, soap wort, soap bark, soap plant and amole. These names are indicative of their use as cleansing agents by peoples throughout the world since ancient times. They do not form a scum in hard water, and even in comparatively modern times were preferred to soap for laundering fine fabrics, such as silk shawls. They formerly were used as foaming agents in

foam-type fire extinguishers and as wetting agents in agricultural sprays, but were displaced for these purposes by the less expensive synthetic detergents and wetting agents. Saponin solutions are used in photographic emulsions to permit even spreading on the base, and in multilayered coatings to permit spreading and adhesion of successive layers.

Aborigines throughout all parts of the world have used saponins for catching fish. A quantity of a plant having a high saponin content was crushed and stirred into a pool. After a short time the fish rose to the surface and were taken easily.

It is estimated that from 300 to 400 species of plants were used for this purpose. As early as the 13th century, in order to prevent extermination of the fish, laws were passed forbidding the use of fish poisons. Saponins cause death in fish probably by disabling the breathing mechanism of the gills. Although saponins are haemolytic and toxic to warm-blooded animals when injected into the blood stream, they are not absorbed from the intestines. Hence fish killed by saponins can be eaten with safety. The non-toxicity to man on ingestion is evident when one considers that the foaming properties of certain beverages, such as root beer, result from the presence of saponins.

Chemically the saponins belong to a large class of substances known as glycosides (see GLYCOSIDES, NATURAL). When a water solution of a saponin is heated in the presence of a strong acid, the saponin molecule is split into fragments with the addition of the elements of one molecule of water at every point at which scission takes place (hydrolysis). The products are a molecule of sapogenin and several molecules of one or more kinds of sugar (see CARBOHYDRATES). For example, in the hydrolysis of digitonin, one of three different saponins isolated from foxglove leaves, each molecule combines with five molecules of water to yield one molecule of a sapogenin, called digitogenin, one molecule of xylose and four molecules of galactose.

Because several different saponins may occur in the same plant, and because the saponins are amorphous and not readily crystallized, it has been difficult to isolate them in a pure state, and at mid-20th century relatively little work had been done on the chemistry of the saponins themselves. The sapogenins, on the other hand, are crystalline compounds that are purified readily, and a large amount of work had been expended in attempts to determine the way in which the constituent atoms are linked together. It was found that the sapogenins thus far isolated belong to two main types. One type contains 27 carbon atoms with varying numbers of hydrogen and oxygen atoms. They have at least one alcoholic function (hydroxyl group), and contain a carbon framework like that present in the animal and plant alcohols known as sterols. Hence they are called steroid sapogenins. The saponins from foxglove leaves, sarsaparilla root, yucca and agave, belong to this class. Some steroid sapogenins, such as diosgenin prepared commercially from a Mexican yam, have become valuable raw materials for the synthesis of the female hormone, progesterone, and the adrenal cortical hormone, cortisone.

The second type of sapogenin contains 30 carbon atoms, along with varying amounts of hydrogen and oxygen. They are called triterpene sapogenins because there are three times as many carbon atoms in the molecule as in a terpene molecule (see TERPENS). Like the steroid sapogenins, they contain at least one alcoholic function (hydroxyl group), but in addition they contain an acid function (carboxyl group) and sometimes are called acid sapogenins. Saponins yielding triterpene sapogenins appear to be more widely distributed than those yielding steroid sapogenins. Moreover, the same triterpene sapogenin may occur free, as well as combined with sugars as a saponin. Oleo-nolic acid can be obtained by hydrolysis of saponins present in guinea bark, sugar beets or calceola flowers. It also occurs free in clove buds, in the waxy coatings of olive and mulberry leaves and in grape skins.

A further point of interest is that the triterpene alcohols, which occur in plant resins, are related closely in structure to the triterpene sapogenins. By replacing the acid function, COOH, of oleonolic acid by the group CH₃, a compound is obtained which is identical with betanin, a triterpene alcohol isolated from *Mania clematis* and other resins. (C. R. N.)

SAPOTACEAE, a family of tropical dicotyledonous plants, most of which are trees with leathery leaves. There are 35 genera and about 600 species, many of which are of economic importance as sources of gutta percha (*q.v.*), balata, shea butter, ironwood, etc. *Chrysophyllum cainito* is the West Indian star apple. *Mimusops kuberi* is the Brazilian milk tree. *Achras sapota* of tropical America, cultivated in all tropical countries, yields the excellent fruit known as the sapodilla or naseberry, and the im-

portant chicle (*q.v.*), the basis of much chewing gum. *Lucuma nervosa* is the egg-fruit or canistel, of South America, now naturalized in Florida and the West Indies. The important commercial product gutta percha is chiefly derived from various species of *Palauquium* and *Payena* growing in the Malay peninsula and archipelago.

SAPPHIC METRE, certain forms of quantitative verse, named after their supposed originator, the Aeolic poetess Sappho (*cf.* ALCAICS). For two of her famous metres see CHORIAMBIIC VERSE. Characteristic of all these metres is the emergence of a choriambus (— — —), or perhaps a dactyl (— — —), in the midst of what appears to be a series of feet of other lengths, especially trochees (— —) (*q.v.*). The best-known employment of lines of this sort is in the Sapphic stanza, three Sapphic hendecasyllables followed by an Adonic, thus:

iam satis terris nixi atque diu
grandinis misit pater et rubenti
dextra sacras inculcat arces
terram urbem.

This is used occasionally in Latin by Catullus, frequently by Horace, who introduced some small modifications (fourth syllable always long, fifth syllable almost always the end of a word), and by later writers; in the Middle Ages it was much used for hymns, notably by Gregory the Great.

In modern languages, the Sapphic stanza has been imitated, sometimes with fair success, as by Swinburne:

Heard the flying feet of the Loves behind her
Make a sudden thunder upon the waters,
As the thunder rung from the strong undrag
Wings of a great wind.

But it remains an exotic, not well suited to our methods of versification.

SAPPHIRE, a blue transparent variety of corundum (*q.v.*), or native alumina, much valued as a gem-stone. It is essentially the same mineral as ruby, from which it differs chiefly in colour which, normally, varies from palest blue to deep indigo, the most esteemed tint being that of the blue cornflower. Many crystals are parti-coloured, but by skilful cutting, the deep-coloured portion may be caused to colour the entire gem. As the sapphire crystallizes in the rhombohedral system it is dichroic, but in pale stones this character may not be well marked. In a deep-coloured stone the colour may be resolved, by the dichroscope, into an ultramarine blue and a bluish or yellowish green. In blue tourmaline and in folite—stones sometimes mistaken for sapphire—the dichroism is much more distinct. The blue of sapphire has been referred to the presence of oxides of chromium, iron or titanium, whilst an organic origin has also been suggested. On exposure to high temperature, sapphires usually lose colour, but, unlike rubies, do not regain it on cooling. A. Verneuil succeeded in imparting a sapphire-blue colour to artificial alumina by addition of 1.5% of magnetic oxide of iron and 0.5% of titanous acid (*Comptes rendus*, Jan. 17, 1910). According to F. Bordas, sapphire exposed to the action of radium changes to green and then to yellow.

Under artificial illumination many sapphires appear dark and inky, and in some cases the blue changes to a violet. In spite of its hardness, which slightly exceeds that of ruby, it has been sometimes engraved as a gem.

Sapphires occur, with many other gem-stones, as pebbles or rolled crystals in the alluvial deposits of sand and gravel of Ceylon, the gem-gravel being known locally as *Wams*. The principal localities are Ratnapura, Rakwana and Matara. Some of the slightly-cloudy Ceylon sapphires, usually greyish-blue, display when cut with a convex face a chatoyant luminosity, sometimes forming a luminous star of six rays, or "star-sapphires".

The asterism seems due to the presence of microscopic tubular cavities, or to enclosure of crystalline minerals, arranged in a definite system. In 1875 sapphires were discovered in deposits of clay and sand in Battambang (Siam), where they have been worked on a considerable scale; they occur also with rubies in the provinces of Chantabun and Krat. Many of the Siamese

sapphires are very dark, some being so deeply tinted as to appear almost black by reflected light. In Upper Burma sapphires occur in association with rubies, but are much less important (*see* RUBY), and they are also found in the Zaskar range, Kashmir, especially near the village of Soomjam, associated with tourmaline.

Madagascar yields sapphires as rolled crystals generally of very deep colour. They are widely distributed through the gold-bearing drifts of Victoria, New South Wales and Queensland, but the blue of the Australian stones is usually dark, and it is notable that green tints are not infrequent. The Anakie sapphire-fields of Queensland are situated to the west of Emerald and east of the Drummond Range. Coarse sapphire is found in many parts of the United States, and the mineral occurs of gem quality in North Carolina and Montana. The great corundum deposits of Corundum Hill, Macon county, N.C., have yielded good sapphires, and they are found also at Cowee Creek in the same county. In Montana, sapphires were found in washing for gold in 1865, and have been worked on a large scale. The rolled crystals of sapphire occur, with garnet and other minerals, in glacial deposits, and have probably been derived from dikes of igneous rocks, like andesite and lamprophyre. They display much variety of colour, and exhibit peculiar brilliancy when cut, but are often of pale tints. The principal localities are at Missouri Bar, Ruby Bar and other places near Helena, where they were first worked, and also at Yogo Gulch, near Utica. The Helena crystals are of tabular habit, being composed of the basal pinacoid with a very short hexagonal prism, whilst at Yogo Gulch many of the crystals affect a rhombohedral habit. The Montana sapphires and the matrix have been described by Dr. G. F. Kunz, Professor L. V. Pirsson and Dr. J. H. Pratt (*Amer. Jour. Sc.*, ser. 4 vol. iv, 1897). The sapphire occurs also in Europe, being found in the Iserwey of Bohemia and in the basalt of the Rhine valley, Le-Puy-en-Velay in France, and in tholeiite intrusions in the island of Mull, but the European stones have no interest as gems.

SAPPHO (or as she calls herself PSAPPHO), the greatest poetess of Greece, was a native of Lesbos. In spite of her fame almost every detail in her history is doubtful. Only a few of the many and often conflicting statements made about her by ancient authors can be checked by her own writings. It would seem probable that she came of an aristocratic Mytilenean family (another account connects her with Eretria) and was born round about 600 B.C., so that she was contemporary with Pittacus and with the poet Alcaeus, with whom she may have exchanged verses. No less than eight versions of her father's name are recorded by Suidas, of which Scamandronymus, the form given by Herodotus (ii. 135), may be taken as the most acceptable. Her mother is said to have been named Cleis, and if the fragment *inc. lib.*, 17 is rightly ascribed, the statement is supported by the fact that her daughter also was a Cleis. There is more certainty about her brothers, or at any rate about two of the three, Charaxus and Larichus. She speaks of Larichus as being cupbearer, a position filled by youths of good family, and Charaxus (though not mentioned by name in the extant remains) is evidently the "brother" referred to in α 3. We learn from Herodotus and others that he sailed to Egypt and bought out a courtesan, Rhodopis or Doricha, for which Sappho attacked him. α 3 seems to be a prayer for his safe return from overseas and a reconciliation with his sister and α 4b perhaps contained a prayer that Doricha may not entangle him again. The poetess's family is of less interest than the pupils, friends and rivals with whom we meet repeatedly in the fragments of the poems, with their references on the one hand to Atthis, once loved but now estranged, Anactoria, gone far away, Dica, "loverling than soft Gyrimo," on the other to Andromeda, who stole Atthis away, Gorgo and others. In α 1 there seems to be a hint of some enmity towards the house of Penthius, with which Pittacus was connected by marriage, but it happens most frequently that where we have names the thought cannot be followed far, and that in the longer pieces, where affection is most touchingly, or distastefully expressed, no names have survived. Apart from the relations just referred to we know next to nothing of the life of Sappho. She is said to have been banished, like other aristocrats, and to have gone to Sicily, but this flight has left no trace in the

remains unless the reference to Aphrodite of Panormus in *αἷ7 App.* be such. As for the story of her passion for Phaon and her leap from the Leucadian rock, it bears every sign of being pure fiction. There are two references to the advance of old age; we cannot tell whether her own or another's. Of the end of her life we know nothing at all.

Sappho's poems are said by Tullius Laurea to have been arranged in nine books. Suidas says there were nine books of lyrical poems, but epigrams, elegia, etc., besides. The author of P. Oxy. 1800, also counts a separate book of elegia, but his figure for the books of lyrical poems is lost. From the fragments we know of only eight books of lyrical poems. It appears that these books were, as far as possible, arranged according to metre (Bk. 1, for instance, containing only pieces in the so-called Sapphic stanza, and so on), but in the case of one book (the Epithalamia, perhaps Bk. 8) according to subject. The language seems to be no literary dialect, but the ordinary speech used by the contemporaries of the poetess, and so to differ in a greater or less degree from almost all the other Greek poetry that has come down to us. The conjunction of extreme simplicity of language with intensity of emotion, from which the poetry derives its peculiar effect, as well as the perfection of the form, has hitherto completely baffled translators, Swinburne among the rest.

Until comparatively recent times the poetry of Sappho survived only in the quotations made by ancient authors. The number of the fragments thus preserved was not inconsiderable, but their text was often seriously depraved, and, with two exceptions—the complete or nearly complete poems cited by Dionysius of Halicarnassus "Longinus"—their extent was insignificant. Within the last 50 years, however, there have been recovered from the soil of Egypt papyrus rolls and vellum codices, written at dates ranging from the 2nd to the 6th or 7th centuries A.D., which contain authentic texts of Sappho, terribly mutilated indeed, but remarkable for the integrity of their tradition. These remains are now preserved in Oxford, Berlin, London, Florence, Halle and Graz, and photographic facsimiles of parts of them may be seen in the publications of the Egyptian Exploration Society, the Berlin academy, the Società Italiana and the Graeca Halensis. Of the older editors, who were concerned only with the quotations, none but Bergk need be mentioned (*Poetae lyricae graecae*, 4th ed., Leipzig, 1882). Those who have done most for the editing and interpretation of the book texts are Professors W. Schubart and U. von Wilamowitz Moellendorf in Germany and A. S. Hunt in England. The only complete collection of all the known material is in *Σαπφῶς μὲλῃ* (Oxford, 1925), by E. Lobel, but a reference may be made to Diehl's *Anthologia Lyrica*, iv. (Leipzig, 1923), though the text is uncritical and much of the illustrative material irrelevant. In the introductions to *Σαπφῶς μὲλῃ* and its companion volume *Ἀλκαίῳ μὲλῃ* (Oxford, 1927), will be found an attempt to establish the proper method of constituting the text. There is an article on Sappho by W. Aly in Pauly-Wisowa, *Realencyclopädie*, which collects the material for the life work of the poetess, but its conclusions should be treated with caution.

SAPPORO, the official capital of Hokkaido, Japan, situated in 43° 4' N. and 141° 21' E. Pop. (1950) 313,850. It was chosen in 1870, and owed its prosperity at the outset chiefly to public institutions established in connection with the colonization bureau.

Sapporo has a university which pays special attention to agricultural science, a museum, sawmills, flour mills, breweries and hemp and flax factories.

SAPROPEL is an unconsolidated sedimentary deposit rich

in bituminous substances. It is distinguished from peat in being rich in fatty and waxy substances and poor in cellulosic material. The term was first used by H. Potonié in 1904. When consolidated into rock, sapropel becomes oil shale, bituminous shale or boghead coal. The principal components are certain types of algae which are rich in fats and waxes. Minor constituents are mineral grains and decomposed fragments of spores, fungi, bacteria and nonvascular plants. The organic materials accumulate in water under reducing conditions, mostly in fresh water.

See David White, *Treatise on Sedimentation* (1932). (P. D. T.)

SAPROPHYTES, the name given in botany to plants which grow upon decaying organic matter, the products of the decay of which they absorb. Many fungi (*q.v.*) are saprophytic, as are some orchids (*q.v.*) and other flowering plants.

SAPRU, SIR TEJ BAHADUR (1875-1949), Indian jurist and politician, was a Kashmiri Brahmin born on Dec. 8, 1875. He was a successful advocate of the high court of Allahabad from 1896; a member of the United Provinces legislative council (1913-16); and a member of the imperial legislative council (1916-20). In 1919-20 he was president of the United Provinces Liberal league. In Dec. 1920 he was appointed law member of the governor-general's executive council, but resigned to resume his practice in February 1923. Later in the year he was a representative of India at the imperial conference in London. A man of great gifts of expression, he had a leading share in the drafting of the Nehru report of the so-called All-Parties conference formulating a scheme of dominion self-government for India approved at a conference held at Lucknow in August 1928. He was active in the promotion of education. He died Jan. 20, 1949, in Allahabad. (F. H. BR.; X.)

SAPSUCKER, the name given to American woodpeckers of the genus *Sphyrapicus*; there are three North American species—*S. varius*, the yellow-bellied sapsucker of eastern U.S.; *S. ruber*, the red-breasted sapsucker, and *S. thyroideus*, the Williamson sapsucker, the two latter inhabiting the western mountain ranges of Canada and the U.S.

All species have a habit of girdling trees with rows of holes. *S. ruber* has a dull red head and breast; this tint is confined to the head and (in the males) throat in *S. varius*, and to the throat alone in the male *S. thyroideus*, which has a bright yellow belly.

SAPULPA, a city of northeastern Oklahoma, U.S., on federal highways 66 and 75; the county seat of Creek county. It is served by the Frisco and the Tulsa-Sapulpa Union railways.

The population was 13,032 in 1950 and 12,249 in 1940 by federal census. It is in one of the principal oil and gas producing areas of the Mid-Continent field. The city was founded in 1888 and incorporated in 1898. In 1922 it adopted a commission-manager form of government.

SARABAND, a slow dance, generally believed to have originated in Spain in the earlier half of the 16th century. The most probable account of the word is that the dance was named after Zarabanda, a celebrated dancer of Seville. Its music is in triple time, generally with three minims in the bar. Many examples occur in the Suites and Partitas of Handel and J. S. Bach.

SARACENS, the current designation among the Christians in the middle ages for their Muslim enemies, especially for the Muslims in Europe. In earlier times the name *Saraceni* was applied by Greeks and Romans to the nomad Arabs of the Syro-Arabian desert who harassed the frontier of the empire. *Σαρακενῶν*, being a district in the Sinaiic peninsula (Ptolemy v. 16).

SARAGOSSA (*Zaragoza*), an inland province of northern Spain, one of the three into which Aragon was divided in 1833; bounded on the north by Logroño and Navarre, north-east and east by Huesca, south-east by Lérida and Tarragona, south by Teruel and Guadalajara and west by Soria. Pop. (1950) 616,881; area, 6,608 sq.m. Saragossa belongs wholly to the basin of the Ebro (*q.v.*). The main valley is bounded on the south-west by the Sierra de Moncayo (with the highest elevation 7,707 ft.).

Saragossa is traversed by the Ebro Valley Railway, which connects Miranda with Lérida, Barcelona and Tarragona, and has a branch to Huesca; it also communicates via Calatayud with

Nárid and Sagunto; and there are local lines to Cariñena (south-west from Saragossa) and to Tarazona and Borja (near the right bank of the Ebro). The only towns with over 5,000 inhabitants (pop. 1940) are Saragossa (205,833) (q.v.); Calatayud (15,116) (q.v.); Tarazona (10,375), an episcopal see, with a curious 13th-century cathedral; Caspe (7,343); Egea (7,398), Tauste (5,814); Epila (5,096); and Alagón (6,130). (On the inhabitants and history of this region, see ARAGON.)

SARAGOSSA, the capital of the Spanish province of Saragossa and formerly of the kingdom of Aragon, seat of an archbishop, of a court of appeal, and of the captain general of Aragón; on the right bank of the river Ebro, 212 mi. by rail N.E. of Madrid. Pop. (1940) 205,833 (mun. 238,601). Saragossa (Celtiberian, *Salduba*) was made a colony by Augustus at the close of the Celtiberian War (25 B.C.), and renamed *Caesarea Augusta* or *Caesaraugusta*, from which "Saragossa" is derived. Under the Romans it was the chief commercial and military station in the Ebro valley, and the seat of one of the four *conventus iuridici* (assizes) of Hither Spain.

Saragossa was captured in 457 by the Suebi, and in 476 by the Visigoths, whose rule lasted until the Moorish conquest in 712, and under whom Saragossa was the first city to abandon the Arian heresy. In 777 its Moorish ruler, the viceroy of Barcelona, appealed to Charlemagne for aid against the powerful caliph of Cordova, Abd-ar-Rahman I. Charlemagne besieged the Cordovan army in *Sarkosta*, as the city was then called; but a rebellion of his Saxon subjects compelled him to withdraw his army. The Moors were finally expelled by Alphonso I of Aragon in 1118, after a siege lasting nine months. As the capital of Aragon, Saragossa prospered greatly until the second half of the 15th century, when the court was transferred to Castile.

In 1710 the allied British and Austrian armies defeated the forces of Philip V at Saragossa in the war of the Spanish Succession.

It was in the Peninsular War (q.v.) that the city reached the zenith of its fame. An ill-armed body of citizens, led by José de Palafox y Melzi (see PALAFOX), held the hastily-entrenched city against Marshal Lefebvre from June 15 to Aug. 15, 1808. The siege was then raised in consequence of the reverse suffered by the French at Bailén (q.v.), but it was renewed on Dec. 20 and on the 27th of January the invaders entered the city. Even then they encountered a desperate resistance, and it was not until Feb. 20 that the defenders were compelled to capitulate. Thousands of people perished in the city, largely through famine and disease. Among the defenders was the famous "Maid of Saragossa," María Agustín, whose exploits were described by Byron in *Child Harold* (1, 55 sqq.). During the civil war of 1936-39, Saragossa was captured by the Nationalists.

Saragossa is an important railway junction; it is connected by main lines with Valladolid, Madrid and Valencia in the west and south, and by the Ebro Valley railway with Catalonia and the Basque provinces; also with France, via the Somport tunnel and with the northern districts of Aragon and Cariñena on the southwest. The city is built in highly cultivated land, irrigated by a multitude of streams which distribute the waters of the Imperial canal, and surrounded by an arid plain exposed to the sweep of violent gales which blow down, hot in summer and icy in winter.

One of its two stone bridges, the seven-arched Puente de Piedra, dates from 1447; there is also an iron bridge for the railway to Pamplona. The two most important buildings of Saragossa are its cathedrals, to each of which the chapter is attached for six months in the year. La Seo ("The See") is the older of the two, dating chiefly from the 14th century; its prevailing style is Gothic, but the oldest portion, the lower walls of the apse, is Byzantine.

The Iglesia Metropolitana del Pilar is the larger building, dating only from the latter half of the 17th century; it was built after designs by Herrera el Mozo, and owes its name to one of the most venerated objects in Spain, the "pillar" of Iaspar on which the Virgin is said to have alighted when she manifested herself to St. James as he passed through Saragossa. The university was founded in 1474.

SARAGOSSA, COUNCILS OF (*Concilii Caesaraugustana*). In or about 380 a council of Spanish and Aquitanian bishops adopted at Saragossa eight canons bearing more or less directly on the prevalent heresy of Priscillianism (see PRISCILLIAN).

A second council, held in 592, solved practical problems incident to the recent conversion of the West Goths from Arianism to orthodox Christianity.

The third council, in 691, issued five canons on discipline. In 1318 a provincial synod proclaimed the elevation of Saragossa to the rank of an archbishopric; and from Sept. 1565 to Feb. 1566 a similar synod made known the decrees of Trent.

SARAJEVO, capital of the Bosnian People's Republic, Yugoslavia. Pop. (census 1931) 78,173, (1948) 118,806, chiefly Serbs and Croats. It lies in a fine situation in a valley 1,800 ft. above sea level.

Though it is still half oriental and wholly beautiful with its hundred mosques, its ancient Turkish bazaar, picturesque wooden houses and cypress groves, it was largely rebuilt after western fashion in 1878. Sarajevo is the seat of a Roman Catholic bishop, an Orthodox metropolitan and the highest Moslem religious authority in Yugoslavia. Notable in the town are the *Begova Džamija* (Džamija), or mosque of Husref Bey, founded in 1465 and among the three most beautiful mosques in Europe, the Roman Catholic and Orthodox cathedrals, the hospitals, the town hall, the museum and the university, founded in 1946. Near the bazaar is the oldest church in Bosnia, containing a 14th-century picture of the Virgin. The industries include potteries, silk and flour mills, a sugar beet factory, timber and, under state control, a brewery, tobacco, embroidery and carpet factories. Weaving on hand looms is an important industry.

Founded in 1262 by the Hungarian general Cótroman, under the name of Bosnavor or Vrhbosna, Sarajevo was enlarged two centuries later, and takes its name from the palace (Turkish, *serai*) which he founded. During the wars between Turkey and Austria, its ownership was often contested; and it fell before King Matthias I of Hungary in 1480, and before Prince Eugene of Savoy in 1697. Destructive fires laid it waste in 1480, 1644, 1666, 1687 and 1789.

Sarajevo was chosen as the seat of Turkish government in 1850 instead of Travnik. In 1878 it became the seat of the Austro-Hungarian administration of Bosnia-Herzegovina and subsequently of the Bosnian diet. Under Austrian rule it was largely modernized, but the schools established also served as a focus of Serb nationalist feeling.

Students at Sarajevo perpetrated the murder of the archduke Francis Ferdinand (q.v.) which led to World War I. As the archduke motored from manoeuvres to a gala lunch in the city a bomb was thrown unsuccessfully in the suburbs. The fatal shots were fired as the archduke's car reversed out of a narrow street leading off the quays, opposite the chief bridge. (See also DIMITRIJEVIĆ DRAGUTIN; JOVANOVIĆ, LJUBA.) In Nov. 1918 the diet at Sarajevo proclaimed union with Yugoslavia.

In World War II, during part of which it was nominally included in the kingdom of Croatia, Sarajevo suffered considerable damage from Allied bombing. In 1944 it was reincorporated into Yugoslavia.

SARAN, a district in the Tirhut division of Bihar, Republic of India. Area, 2,669 sq. mi. Pop. (1951) 3,155,144. It is a vast alluvial plain with a general inclination toward the southeast, as indicated by the flow of the rivers in that direction. The principal rivers, besides the Ganges, are the Gandak and Gogra, which are navigable throughout the year. The district has long been noted for its high state of cultivation and dense population. It yields large crops of rice, besides other cereals, pulses, oil seeds, poppy and sugar cane.

The indigo industry, formerly of the first importance, declined, and sugar refining in great part took its place. The production of saltpetre is an industry of some importance. Saran is exposed to drought and flood.

It suffered from famines in 1874 and 1897, and from floods in 1921, when 20 in. of rain fell in a single night.

A scheme for irrigation from the Gandak river, started in 1878, proved a failure, and the canals were long closed to irrigation. But a Gandak valley project was made a part of India's five-year plan of 1951. At Manjhi there are the remains of a fort, with ramparts still 30 ft. high, which date back to about the 6th century A.D. The administrative headquarters were established at Chapra pop. (1951) 64,309.

SARANAC LAKE, a village of northeastern New York, U.S., in the Adirondack mountains, near Lower Saranac lake, on the boundary line between Essex and Franklin counties; served by the New York Central railway and air line. Pop. (1950) 6,913; (1940) 7,138 by federal census. It is a summer and a winter resort, for both health and pleasure. Near the village, at an altitude of 1,650 ft., is the Trudeau sanatorium, founded in 1884 as the Adirondack Cottage sanatorium by Edward L. Trudeau (1848-1915), the first semicharitable institution in the U.S. for the open-air treatment of early tuberculosis. Trudeau, attacked by tuberculosis soon after beginning medical practice in New York city in 1872, had gone to the Adirondacks to die in a place he loved, but before the first winter was over was surprised to find his health greatly improved. He stayed on, making Saranac Lake his home for the remaining 40 years of his life, and out of his personal experience developed a method of treatment which had a wide influence. The sanatorium grew to a small village in itself, and Saranac Lake became a resort for private patients. Robert Louis Stevenson spent the winter of 1887-88 at Saranac Lake. In 1894 Trudeau established the Saranac laboratory for research in tuberculosis (the first of its kind in the U.S.) and after his death an endowment was raised for it (under the name of the Trudeau foundation) as a memorial to him. In 1916 the Trudeau School of Tuberculosis was opened (also the first institution of its kind) to give specialized instruction in the diagnosis and treatment of the disease to practising physicians. The village of Saranac Lake was incorporated in 1892. Other institutions in the vicinity are the New York State Ray Brook sanatorium, Stony Wood sanatorium, Sanatorium Gabriels and Will Rogers International Variety clubs. Paul Smith's college (forestry and hotel management) is located there.

SARAPUL, a town of European U.S.S.R., in the Udmurt A.S.S.R. on the river Kama, in 56° 32' N., 53° 45' E. Population, 24,959. It is the centre for an agricultural district, and has oil-pressing, rope-making, brewing and leather industries. Like other towns in the Udmurt A.S.S.R., it depends on Asiatic Russia for a market for its manufactured products.

SARASATE Y NAVASCUES, PABLO MARTIN MELITON DE (1844-1908), Spanish violinist, was born at Pamplona on March 10, 1844. At the age of 12 he began to study under Jean Alard at the Paris conservatoire. His first public appearance as a concert violinist was in 1860. He paid the first of many visits to London, where he enjoyed great popularity, in 1861, and in the course of his career he visited all other parts of Europe and also both North and South America. He was one of the first and most fascinating violinists of modern times, his playing being remarkable equally for purity and sweetness of tone, and for facility of execution. He died at Biarritz, Fr., on Sept. 30, 1908.

SARASIN OF SARRAZIN, JEAN FRANÇOIS (1614-1654), French author, son of Roger Sarasin, treasurer-general at Caen, was born at Hermanville near Caen. He was on terms of intimate friendship with Paul Scarron, with whom he exchanged verses, with Gilles Ménage, and with Paul Pellisson. In 1639 he supported Georges de Scudéry in his attack on Pierre Corneille with a *Discours de la tragédie*. He accompanied Léon Bouthillier, comte de Chavigny, secretary of state for foreign affairs, on various diplomatic errands until 1643-44. He joined in the pamphlet war against Pierre de Montmaur, against whom he directed his satire, *Belium parasiticum* (1644). He was accused of writing satires on Jules Mazarin, and for a short time gave up the practice of verse. In 1648 he entered the household of Armand de Bourbon, prince de Conti, whose marriage with Mazarin's niece he helped to negotiate. He died at Paris, on Dec. 5, 1654. The most considerable of his poems were the epic fragments of *Rollen con-*

quérant and *La guerre espagnole*, with *Dulot vaincu* and the *Pompe funèbre* in honour of Vincent Voiture. As a poet he was overrated, but he wrote excellent pieces of prose narration, the *Histoire du siège de Dunkerque* (1649) and the unfinished *Conspiration de Walstein* (1651).

His *Oeuvres* appeared in 1656, *Nouvelles Oeuvres* (3 vols.) in 1674. His *Poésies* were edited in 1877 by Octave Uzanne with an introductory note. A new edition of his *Oeuvres* was published in 1926 by Paul Festugière. Much of his correspondence is preserved in the library of the Arsenal, Paris. See Albert Menning's *Jean François Sarasin: Leben und Werke* (3 vol., Halle, 1927-34).

SARASOTA, a city on the west coast of Florida, U.S., 53 mi. S. of Tampa; the county seat of Sarasota county and one of the most charming resorts of the state. It is on federal highway 41 and the Tamiami trail; has a municipal airport, a deep-water harbour and municipal docks; and is served by the Atlantic Coast Line and the Seaboard Air Line railways. Pop. 18,896 in 1950 and 11,141 in 1940 by the federal census.

The city lies on the east shore of Sarasota bay, connected by causeways with long palm-studded keys to the west (St. Armands, Longboat, Lido and Siesta). The assessed valuation in 1949-50 was \$50,385,890. Sarasota was founded in the early '80s by a Scotch syndicate of which Sir John Gillespie was president. In 1885 his son, J. Hamilton Gillespie, laid out there the first golf course in the U.S.

SARASWATI, a river in the Punjab frequently mentioned in the *Rig-Veda*. Its meaning, "abounding in pools," suggests that it was at that early period a larger river than now. It is lost in the desert sands toward Rājputāna. Corresponding phonetically to the Iranian *Haraquiti* (the modern Helmand), the name may have been applied to the Indus by the invading Aryans before they reached the eastern Punjab, but it soon ceased to refer to that river. As the Sarṣṭi, its present name, it joins the Ghaggar, the dry bed of the Hakra, the lost river of the Indian desert which can still be traced to its junction with the Indus. With the Drishadwati the Saraswati formed the west boundary of Brahmavarta, and was the holy stream of Vedic India. As "fluent" it became the personified goddess of eloquence, learning and wisdom, wife of Manu, mother of the *Vedas*, and a daughter of Brahma. From her the Sarṣṭi Brahmans (q.v.) claim their name. Another Saraswati, in Guzerāt, also loses itself in the sand.

See A. A. Macdonell and A. B. Keith, *Vedic Index* (1912); A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897); and E. W. Hopkins, *Epic Mythology* (Strassburg, 1915).

SARATOGA, BATTLES OF. The plan of campaign for the British in America in 1777 sought to isolate New England by occupying the Hudson valley. Gen. John Burgoyne, the author of the plan, coming down from Canada via Lakes Champlain and George, was to meet Viscount Howe, marching up from New York, at Albany. A third, but much smaller force, under Barry St. Leger, was to advance from Oswego down the Mohawk valley and join the other two columns. The plan failed because Howe, the British commander-in-chief, marched on Philadelphia, George Germaine, Viscount Sackville, the secretary of state, having failed to give him definite instructions. Burgoyne, with about 8,000 men, including seven regiments of British regulars and 3,000 Germans, reached Ticonderoga (July 1), which was evacuated by its weak garrison (July 6). He reassembled his army after the pursuit at Skenesborough and marched through the woods and swamps to Fort Edward, which was evacuated by the American commander Maj. Gen. Philip Schuyler, who retreated across the Hudson to Stillwater, 30 mi. above Albany (July 31). The march was most laborious, involving the construction of 40 bridges, and necessitated a long halt at Fort Edward. Burgoyne should have taken his army back to Ticonderoga, and transferred it to Fort George, where a direct road led to Fort Edward. Had he taken this route, he might have reached Albany by the 16th.

A German detachment, on the advice of "Colonel" Skene, who was also responsible for the recent march, was sent to Bennington to seize horses and supplies, but was surrounded and almost annihilated by the Green Mountain militia, under John Stark (Aug. 16). Burgoyne now became uneasy; he had left nearly 1,000 men to garrison Ticonderoga; he had heard from Howe of his intention to invade Pennsylvania; and St. Leger was held up

before Fort Stanwix (actually St. Leger retreated Aug. 22). But he considered himself bound by his orders to press on to Albany. Having collected 30 days' rations, he crossed the Hudson (Sept. 13) and encamped near Saratoga. The Englishman, Gates, who had displaced Schuyler in command (Aug. 19), was encamped 4 m. away, on Bemis's Heights, with 12,000 men and was daily receiving reinforcements. Burgoyne advanced to the attack (Sept. 19). But Arnold came out with 3,000 men to meet him at Freeman's Farm. After 4 hours' fierce fighting Arnold retired, and Burgoyne encamped on the battlefield, but he had lost over 500 men, including a large number of officers, victims of Morgan's sharpshooters. Burgoyne heard (Sept. 21) from Clinton, who had been left in command at New York, that he was about to make a diversion up the Hudson. He sent a despatch to Clinton (Sept. 27) asking for orders. The answer was never received. Clinton started with a small force (Oct. 3) and captured two forts on the west bank, but he never had any intention of penetrating to Albany.

Burgoyne had now under 5,000 "effectives" left, and his supplies were running short. He reckoned that they might last till the 20th. He led out 1,500 men on reconnaissance (Oct. 7), but the Americans made a fierce counter-attack, and led by Arnold, inflicted a severe defeat upon the British army. Next day Burgoyne began his retreat, but Gates, with 20,000 men, surrounded him at Saratoga. Burgoyne opened negotiations on the 14th and the Convention of Saratoga was signed (Oct. 17), Burgoyne insisting that it was not a capitulation, and finding a precedent in the Seven Years' War.

See F. J. Huddleston, *Gentleman Johnny Burgoyne* (1928).

SARATOGA SPRINGS, a city of Saratoga county, New York, U.S.A., 30 mi. N. of Albany and 12 mi. W. of the Hudson river; served by the Boston and Maine and the Delaware and Hudson railways. Pop. (1950) 15,434; (1940) 13,705. The city is in a region of great historic interest, and has been famous for its medicinal mineral springs since colonial days. It is a pleasure resort in summer, a health resort at all seasons, and is the seat of Skidmore college for women (1917).

Adjoining the city is "Yaddo," the beautiful estate of Katrina Trask (Mrs. George Foster Peabody), which after her death in 1902 was made a summer retreat for a limited number of painters, writers and other creative artists. Saratoga lake (6 mi. long) is 3 mi. S.E. of the city. The August races of the Saratoga Association for the Improvement of the Breed of Horses (organized 1863) draw a brilliant attendance. Among the long established hotels is the Grand Union (400 rooms). The Convention hall seats 3,000. The 122 springs (heavily charged with carbonic acid gas and containing in varying proportions bicarbonates of lime, sodium, magnesium, chloride of sodium and other minerals) are in a reservation of 1,700 ac., owned and controlled by the State. The State bath houses have a capacity of about 5,000 treatments daily, and the bottling plant can fill 6,000,000 pint bottles in a year. The therapeutic value of the springs was known to the Indians, and the Saratoga country was a favourite summer camping ground of the Iroquois. It became a theatre of hostilities between the French and English colonists and their Indian allies. In 1693 a French expedition was checked in a sharp conflict near Mt. McGregor by an English and colonial force. In 1745 the settlement on the Hudson directly east of the present city of Saratoga Springs (called Saratoga at first, later Old Saratoga and now Schuylerville) was attacked by French and Indians, who massacred many of its inhabitants. The battles of Saratoga (g.v.) in the Revolutionary War were fought at Bemis Heights, 12 m. S.E. of Saratoga Springs. Most of the battlefield has been acquired by the State of New York, and Congress in 1926 authorized making it a national military park. The first white man known to have benefited from the Saratoga waters was Sir William Johnson, whose Indian friends carried him to the springs in 1767. A log house for the lodging of visitors was built in 1771; in 1783 Gen. Philip Schuyler and his family camped at the springs through the summer; in 1791 Gideon Putnam bought a large tract of land and put up the first inn; and in 1793 Dr. Valentine Seaman published a book about the waters which spread the knowledge of their curative properties.

Other hotels (large barn-like wooden structures) were built early in the 19th century, and by 1820 the Springs had become a popular resort. The Civil War brought depression, and cut off the patronage from the South; but soon afterwards, with the establishment of the races and the rebuilding of the United States hotel, it again became popular, and in the 1870's and '80s was one of the most fashionable watering-places of America ("the Queen of Spas"). Commercial exploitation of the springs (bottling the water and liquefying the carbonic acid gas) diminished their flow until they almost disappeared, and the resort was again depressed until the State intervened, first prohibiting the pumping and later acquiring the property (1909) and placing it in charge of the conservation commission (1916). Under State management the flow and mineral strength of the springs have been restored, and the patronage has increased tenfold in a decade. Saratoga Springs was incorporated as a village in 1826 and as a city in 1915.

SARATOV, a region of the Russian S.F.S.R., much smaller than the former Saratov province, lying on the right bank of the Volga river, with Penza on the north, Tambov on the west, Stalingrad on the south, and the German Volga Autonomous republic and Kuibyshev on the east. Its area is 31,815 sq. mi. and its pop. (1939) 1,798,805 (urban 665,763; rural 1,133,042). A small portion of it, the Novo-Uzensk district, lies east of the German Volga republic. The region occupies the eastern part of the great central plateau of Russia, which slopes gently to the south until it merges imperceptibly into the steppe region; its eastern slope, deeply cut into by ravines, falls abruptly to the Volga. The higher parts range from 700 to 900 ft. above the sea, while the Volga flows at an elevation of 20 ft. only at Khvalynsk in the north, and thus the river banks have a hilly appearance.

Every geological formation from the Carboniferous to the Miocene is represented, though the older formations are concealed under Cretaceous deposits of fossiliferous marls, flint-bearing clays and iron-bearing sandstones. The boulder clay of the Finland and Olonets ice sheets penetrates into the east of the region, and loess and other post-glacial deposits are found in the southeast. Iron ore is abundant and chalk, lime and white pottery clay are obtained in some parts.

The region is comparatively well drained; the upper course of the Sura, a tributary of the Volga, lies in the north, and the upper Medveditsa and Khoper flow south and drain into the Don. They are navigable in spite of their shallows, and ready-made boats are brought in pieces from the Volga, and put together on their shores. The forest has almost disappeared; bouses are made of clay and dung is used for fuel.

The climate is severe and continental, with a recorded range of temperature of 119° F. in some parts; at Saratov the average January temperature is 12.4° F., the average July temperature 71.5° F. The Volga at Saratov is frozen for 162 days in the year. Rainfall is scanty and irregular, varying between 8 and 16 in. in normal years and much less in drought years, the rain falling mainly in spring and early summer. The region is arid and rapid desiccation is progressing. In the north and west are sandy black-earth soils, interspersed with dark gray forest lands and gray wooded clays (Volsk, Khvalynsk, the northern part of Petrovsk). In Petrovsk, Serdobsk, Atkarsk and Balashov counties are clayey black earths, while Balashov contains a strip of rich black earth with a high humus content, although even here there are patches of salt land and salt marshes.

The yield of the soil in Saratov region has become stabilized at a low level because, although the soil contains about 6-10% of humus, its friability disappears after a few years of persistent planting with cereals. The great variability of crop yield, sometimes so low as to reduce the district to starvation (e.g., in 1921), and the appearance of salting indicate the need for more intensive methods of agriculture. Attempts are being made to increase the friability of the soil, to put large areas under grass for several years, and to introduce plough culture and better types of crop rotation, with less fallow, and to introduce the sowing of the more drought resisting type of grain. Marmots, mice and insects are great pests to agriculture. Experimental stations have been

established at eight points and the agronomical faculty of the University of Saratov has an experimental institute. In the Novo-Uzensk district east of the German Volga republic the soil and drought problem is even more acute; here are light brown and brown clayey soils, with some chestnut brown soil and sands and salty areas. In good years crops are successful, in drought years famine is severe. For 50 years the peasants there have been practising a form of irrigation and plans have been made for lagoon irrigation of an extensive area above the town of Novo-Uzensk and near the settlement of Alexandrov-Gai, utilizing the waters of the Great Uzen.

Winter rye is the main crop, summer wheat, millet, oats and sunflower seed come next and potatoes are increasingly grown. Barley forms a very small percentage of the harvest. The region was slow in recovering from the terrible years of 1917-21.

There is a fair amount of stock raising in the district; sheep and working cattle occupy the first place, and horses and pigs are also bred, but on the whole this is a diminishing industry. Cucumbers, melons, watermelons, and vegetables are grown around Saratov, Volsk, Atkarsk and Kamyshin, and in the Novo-Uzensk district. Beetroot cultivation is increasing.

Poultry raising of an export character is carried on, but dairy produce is not much developed. Fishing and the preparation of caviare are important at Kamyshin. A more intensive development of cattle breeding for meat and dairy purposes would lead to greater development of local production of bran and cattle foods, with a probable development of the bacon industry in dependence on by-products from the dairying industry. Flour milling is the main industry, oil pressing from oleaginous seeds is an export industry and there is some tobacco manufacture. There are metalworks dependent on the local iron, and a shale-using electric plant at Saratov. The shale is obtained from the Kashpir beds near Syzran and is brought cheaply by water.

The railway net includes the line from Tambov to Kamyshin, with a branch linking with Penza, a line from Tambov to Saratov, one from Volsk on the Volga going through Petrovsk and Atkarsk to Balanda, part of the Penza-Syzran line, and the branch from the Volga through Novo-Uzensk to Alexandrov-Gai. The region is thus better supplied than the Kuibyshev region and has a good deal of transit trade between shipping and railway lines.

The rate of literacy is considerably higher than in the Kuibyshev region, though it is low among women. Saratov university helps to spread a higher standard of culture in the district. The chief towns are Saratov, Kuzeinsk (*qq.v.*), Balachov and Volsk; the remaining centres have fewer than 20,000 inhabitants.

The district of Saratov has been inhabited since at least the Neolithic period. The inhabitants of a later epoch left numerous bronze remains in their *kurgans* (burial mounds) but their ethnological position is still uncertain. In the 8th and 9th centuries the seminomad Burtases peopled the territory and recognized the authority of the Khazar princes.

SARATOV, a city of the Russian S.F.S.R., in the oblast of Saratov, in 51° 35' N., 46° 1' E., on the Volga river, and on the plateau slopes near that river. Landslips from the Sokolov hill (560 ft.) often occur. Two ravines divide the city into three parts. The streets are wide and regular, with broad squares, and there are some fine buildings. Pop. (1939) 375,860.

Industries developed in Saratov include iron smelting, shipbuilding, the making of nails and bolts, sawmilling, flour milling and railway repair shops. A large combine harvester plant was established there.

The shallowness of the Volga river opposite the city and the immense shoals along its right bank proved drawbacks, but Saratov became a river port of some importance. Linked by rail with other shipping points, it built up an extensive collecting and entrepôt trade. The importance of Saratov, a major transfer centre for petroleum, was increased after World War II, a pipe line to Moscow for the transportation of gas being completed in 1948. During the war Saratov had been expanded in order to exploit the sources of the natural gas which had been discovered.

A university was established there in 1919, and there are institutes and other educational institutions, and various museums.

Saratov was the capital of the Saratov government, until 1928 and of the Lower Volga territory from that date until 1934. It came under the control of the Russian S.F.S.R. in 1943.

Saratov was founded at the end of the 16th century, 7 mi. above the modern site, to which it was removed about 1605. Sary-tau or Yellow mountain on which it stands has been inhabited from remote antiquity.

SARAWAK, a British crown colony on the northwest coast of Borneo lying between lat. 0° 50' and 5° N. and long. 109° 36' and 115° 40' E. Area c. 47,000 sq.mi. (about the size of England). Pop. (1947) 546,385. It has a coastline of about 450 mi. on the China sea and is bounded on the northeast by British North Borneo and on the southeast by Indonesian Borneo.

Climate and Physical Features.—The climate is tropical but not unhealthy. The thermometer rarely rises above 90° F. and often falls to 70° F. at night. The heat is usually tempered by a breeze but humidity is generally high. The annual rainfall varies between 100 and 200 in. There are no marked seasonal changes but there is more rain from October to March than in the other six months. The alluvial coastal plain varies from 5 to 50 mi. in width. The rest of the country consists of forest-covered hills and mountains, a long irregular range forming the spine of the island of Borneo with peaks up to 5,000 and 6,000 ft. These are mostly of sandstone but there are extrusions of limestone forming sheer cliffs and pinnacles. There are many fine rivers, chief among them being the Rejang, Baram, Limbang and Batang Lupar. All of these are navigable; the first-named by ocean-going ships for a distance of 170 mi. (For flora and fauna, see BORNEO.)

Ethnology.—The main indigenous groups are the Iban (Sea-Dayak), Malay, Melanau, Land-Dayak, and the miscellaneous group of tribes known as Kayans, Kenyahs, Kelabits, Muruts and others. The Malays are Mohammedans, the others pagans (animist) except where converted to Christianity. Nonindigenous peoples are Europeans, Chinese, Javanese and Indians. The 1947 census disclosed that Europeans formed 0.1% of the total, Malays 17.9% and Chinese 26.6%. Chinese were formerly encouraged to settle but immigration has in recent years been severely restricted.

Administration.—The governor is assisted by an executive council. The legislative body is a council known as the *Council Negri*. Both these councils contain unofficial as well as official members and consist of persons of all races living in the territory. Administration is conducted by a civil service composed of British and of native officers. The higher posts in the service are at present mainly held by British officials but promotion is open to all.

Local government has been established in most parts of the country. This is in the hands of local authorities in the rural areas and municipal boards in the towns. All local government bodies have their own treasuries, their revenue consisting of rates levied by the authority supplemented by grants from the central government.

The judicial system comprises a supreme court, circuit courts and magistrates courts administering the ordinary law of the territory, and native courts which apply the native or customary law in appropriate cases.

The governor of Sarawak is also the high commissioner for the state of Brunei, a Malay state under British protection and ruled by a Malay sultan, the land boundaries of which march with those of Sarawak.

History.—Sarawak was known to the explorers and map makers of the 16th century, but its history as a state begins with the arrival of James Brooke (*qq.v.*) in 1840. Then part of the sultanate of Brunei, the country was in rebellion against the rapacity of the sultan's officials. Brooke restored order, and a year later was publicly installed at Kuching as rajah of the territory then known as Sarawak which extended from Cape Datu to the Samarahan river, an area of about 7,000 sq.mi.

The rajah immediately began to introduce the elements of good government. He abolished slavery, suppressed head-hunting, and, with the help of a young naval officer who afterward became Admiral Sir Henry Keppel, expelled pirates from the Saribas and Batang Lupar rivers. Accretions of territory took place from

time to time throughout the 19th century, generally because the native peoples preferred the reasonably good government of Rajah Brooke to the oppression of the Malay nobles, and the country finally attained its present size in 1905.

James Brooke, who had been created a K.C.B. in 1863, was succeeded in 1868 by his nephew Sir Charles Johnson Brooke (1828-1917). In 1888 a treaty was concluded which placed the state under British protection and in return gave the United Kingdom the right to control its foreign relations while leaving the internal administration of the country entirely in the hands of the rajah. The rajah's title was formally recognized by Edward VII in 1904. The fifth rajah, Sir Charles Vyner Brooke, G.C.M.G. (1874-), succeeded his father in 1917.

In 1941 to mark the centenary of Brooke rule a proposal for a new constitution with a representative legislature was proclaimed, but the Japanese invasion intervened. Such was the disruption, misery and ruin caused by three and a half years of Japanese occupation that the rajah decided, with the consent of his council, to cede the country to the British crown; and on July 1, 1946, the cession was accepted. The first governor of the new colony, Sir Charles Arden Clarke, was appointed in Oct. 1946.

Social Services.—Primary education is gradually being brought within the reach of all, though the difficulty of the terrain and scattered population make the process a slow one. Teachers are trained at a college in Kuching. Post-primary education is provided on a small scale by one government and a few mission schools. In 1952 there were 41 government schools, 94 run by local authorities, 71 mission schools and 226 Chinese schools. Medical and health services are made available by the government by means of hospitals and dispensaries, many of the latter being mobile and consisting of powered boats operating on the rivers and streams.

The Red Cross society has a branch in Sarawak, and institutions for the care of special sections of the community include a boys' home for juvenile delinquents, a leper settlement, a mental hospital and homes for the aged and destitute at Sibul and Kuching. The Boy Scout and Girl Guide associations find supporters among young people of all races.

Trade and Industry.—The chief exports are mineral oil, rubber, sago flour, pepper, cutch (a tanning extract) and timber. Gold is mined in small quantities and coal of good quality has been found but is somewhat inaccessible. There are several minor industries. Some 13,000 sq.mi. of land are in cultivation, including about 11,000 under rice. Fishing and fish curing are the means of livelihood of many Malays and Chinese.

Imports in 1952 were valued at \$382,946,000 and exports at \$438,563,000.

Government revenue (1951) totalled \$47,349,000 and expenditure \$22,517,000. Local currency is the Malayan dollar valued at 32.67 cents U.S. and at 2s. 4d. in sterling in 1952.

Towns.—The chief towns are Kuching (pop. 38,000), the capital, having a large Chinese trading community, the main government offices, Anglican and Roman Catholic cathedrals, museum, wharves, warehouses and dockyard; Sibul (pop. c. 10,000); and Miri (9,000), the centre of the Sarawak oil fields. Other administrative centres with settlements of a few thousand persons are Simanggang, Sarikei, Bintang, Mukah, Bintulu and Limbang.

Communications.—Internal communication is chiefly by water, there being no extensive road system and no railways. There are some 450 mi. of roads in and around the towns and a trunk road from Kuching to Simanggang was under construction in 1953. There is a modern airfield near Kuching and there are landing grounds in a few other places. A regular air service and good steamship services operate between Sarawak, Singapore and North Borneo.

There are exterior wireless links, and an extensive system of wireless telegraph stations throughout the territory.

(C. W. DA.)

SARCOPHAGUS, the name given to a coffin in stone, which

on account of its caustic qualities, according to Pliny (H.N. xxxvii. 27), consumed the body in 40 days (Gr. *σαρκοφάγος*, literally "flesh-eating," from *σάρξ*, flesh, *φάγειν*, to eat); also by the Greeks to a sepulchral chest, in stone or other material, which was more or less enriched with ornament and sculpture. One of the finest examples known is the sarcophagus of Tutankhamun (c.

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

AN ETRUSCAN TERRA COTTA URN OF THE THIRD CENTURY. B.C. IN THE FORM OF A SARCOPHAGUS

1550 B.C.) made of granite and ornamented with angels with outspread wings. Of later date are the green porphyry sarcophagus and the terra-cotta sarcophagus from Clazomenae; both of these date from the early 6th century B.C., and are in the British Museum. The finest Greek examples are those found at Sidon in 1887 by Hamdy Bey, which are now in the Imperial Museum at Constantinople. (See GREEK ART.)

Early Roman sarcophagi there are numerous examples in terra-cotta; occasionally they are miniature representations of temples, and are sometimes in the form of a couch on which rest figures of the deceased; one of these is in the British Museum. The earliest Roman sarcophagus is that of Scipio in the Vatican (3rd century B.C.), carved in peperino stone.

Of later Roman sarcophagi, there is an immense series enriched with figures in high relief, of which the chief are the Nubid example in the Lateran, the Lycomedes sarcophagus in the Capitol, the Penthiesia sarcophagus in the Vatican, and the immense sarcophagus representing a battle between the Romans and the barbarians, in the Museo delle Terme. In later Roman work there was a great decadence in the sculpture, so that in the following centuries recourse was had to the red Egyptian porphyry, of which the sarcophagi of Constantia (A.D. 355) and of the empress Helena (A.D. 589), both in the Vatican, are fine examples. Later, during the Byzantine period, there is a large series, either in museums or in the cloisters of the Italian churches. They are generally decorated with a series of niches with figures in them, divided by small attached shafts with semicircular or sloping covers carved with religious emblems, one of the best examples

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

THE FRONT OF A SMALL ROMAN SARCOPHAGUS, OF THE THIRD CENTURY B.C., DEPICTING THE FOUR SEASONS

being the sarcophagus of Sta. Barbara, dating from the beginning of the 6th century, at Ravenna, where there are many others.

SARDANAPALUS or **SARDANAPALLUS**, according to Greek fable, the last king of Assyria, the thirtieth in succession from Ninyas. The name is derived from that of Assur-dan-pal, the rebel son of Shalmaneser II., whose reign ended with the fall of Nineveh in 823 B.C. (or perhaps from that of Assur-dan III., the last king but one of the older Assyrian dynasty); his character is that ascribed to Assur-bani-pal. He was the most effeminate and corrupt of a line of effeminate princes; hence Arbaces, satrap of Media, rebelled and, with the help of Belesys, the Babylonian priest, besieged Nineveh. Sardanapalus now threw off his sloth and for two years the issue was doubtful. Then, the Tigris having undermined part of the city wall, he collected his wives and treasures and burned them with himself in his palace (880 B.C.).

His fate is an echo of that of Samassum-yukin, the brother of Assur-bani-pal (q.v.).

See J. Gilmore, *Fragments of the Persika of Ktesias* (1888). (A. H. S.)

SARD AND SARDONYX. These semi-precious stones are colour-varieties of chalcedony (q.v.). Sard is a variety of carnelian; its colour is brown by reflected and red by transmitted light. (See CARNELIAN.) Sardonyx is a variety of onyx (q.v.) having white layers alternating with strata of sard. Both sard and sardonyx were esteemed by the ancients and by the craftsmen of the Renaissance for use in gem-cutting.

SARDICA, COUNCIL OF, an ecclesiastical council convened in 343 by the emperors Constantius and Constans, to attempt a settlement of the Arian controversies, which were then at their height. Of the hundred and seventy bishops assembled, about ninety (principally from the West) were Athanasians, while on the other side were eighty Eusebians from the East. The anticipated agreement, however, was not attained; and the result of the council was simply to embitter the relations between the two great religious parties, and those between the Western and Eastern halves of the Empire. For as Athanasius and Marcellus of Ancyra appeared on the scene, and the Western bishops declined to exclude them, the Eusebian bishops of the East absolutely refused to take part, and contented themselves with formulating a written protest addressed to numerous foreign prelates.

Special importance attaches to this council through the fact that Canons 3-5 invest the Roman bishop with a prerogative which became of great historical importance, as the first legal recognition of his jurisdiction over other sees and the basis for the further development of his primacy.

The canons are printed in C. Mirbt, *Quellen zur Geschichte des Papsttums* (1902), p. 46 f.; Hefele, *Conciliengeschichte*, ed. 2, I. 533 sqq.

SARDINE, the young of the pilchard (q.v.), and also used for other related small herrings when similarly preserved in oil.

SARDINIA, an island of the Mediterranean sea, belonging to Italy. It lies 7½ mi. S. of Corsica, from which it is separated by the Strait of Bonifacio, some 50 fathoms deep. The harbour of Terranova, in the north-eastern portion of the island, is 125 mi. south-west of Civitavecchia, the nearest point on the mainland of Italy. Sardinia lies between 8° 7' and 9° 49' E., and extends from 38° 52' to 41° 15' N. The length from south-west to north is about 160 mi., the breadth about 68 mi. Area, 9,187 sq.mi., or including the small islands adjacent, 9,298 sq.mi.; pop. (1936) 1,034,206. It is divided into three provinces, Cagliari, Nuoro and Sassari. The density of population is lower than that of any other part of Italy, coming below that of Venezia Tridentina in 1936.

The island is mountainous, almost continuously so along the coast, and largely granitic with lofty upland plains in the east, and volcanic in the west. The highest point in the north-east group of the island (called Gallura) is Monte Limbara (4,468 ft.) south-east of Tempio. The valleys on the south-east and south-west are followed by the railway from Golfo degli Aranci to Chilivani and Sassari. The north-western portion of the island, called the Nurra, is entirely volcanic; so are the mountains to the south of it, near the west coast; the highest point is the Monte Ferru (3,448 feet). East of the railway from Chilivani to Oristano, on the other hand, the granitic mountains continue. The highest points are Monte Rasu (4,127 ft.), south of Ozieri, in the district called Logudoro, and, farther south, in the region called Barbagia, the Punta Bianca Spina, the highest summit of the chain of Gennargentu (6,016 feet). These two groups are divided by the deep valley of the Tirso, the only real river in Sardinia, which has a course of 94 miles. South of Gennargentu, in the district of the Sarcidano, is the Monte S. Vittoria (3,980 feet). Still farther west is the volcanic upland plain of the Giara (1,988 ft.) and south of the Sarcidano are the districts known as the Trexenta, with lower, fertile hills, and the Sarrabus, which culminates in the Punta Serpeddi (3,507 ft.), and the Monte dei Sette Fratelli (3,333 ft.), from the latter of which a ridge descends to the Capo Carbonara, at the south-east extremity of the island. South of Oristano, traversed by the railway to Cagliari, is the Campidano (divided into the Campidano of Oristano

and the Campidano of Cagliari), a low plain the watershed of which is only about 100 ft. above sea-level. It is 60 mi. long by 7-14 mi. broad, and is the most fertile part of the island. South-west of it are the fine mountain groups around Iglesias (4,055 feet). In this south-western portion of the island the mining industry of Sardinia is carried on.

Coast.—The coast of Sardinia contains few seaports, but a good proportion of these are excellent natural harbours. At the north-eastern extremity is a group of islands, upon one of which is the naval station of La Maddalena; farther south-east is the well-protected Gulf of Terranova, the port of arrival for the mail steamers from Civitavecchia. To the south of Terranova there is no harbour on the east coast until Tortoli is reached, nor on the south coast before Cagliari, the most important harbour on the island. In the south-western portion of Sardinia the island of S. Antioco, joined by a narrow isthmus and a group of bridges to the mainland, forms a good natural harbour to the south of the isthmus, the Golfo di Palmas; while the north section of the peninsula, with the island of S. Pietro, forms a more or less protected basin, upon the shores of which are several small harbours (the most important being Carloforte), which are centres of the export of minerals and of the tunny fishery. Not far from the middle of the west coast is the Gulf of Oristano, into which, besides the Tirso, several streams fall, forming considerable lagoons. Bosa has only an open roadstead; and at the southern extremity of the Nurra come the Gulf of Alghero and the Porto Conte to the west. Porto Torres is the chief port on the north-west coast of Sardinia.

Geology.—Geologically Sardinia consists of two hilly regions of pre-Tertiary rock, separated by a broad depression filled with Tertiary deposits. This depression runs nearly from north to south, from the Gulf of Asinara to the Gulf of Cagliari. Physically its continuity is broken by Monte Urticu and smaller hills, remains of Tertiary volcanoes. In the south the depression is known as the Campidano. In the north it forms the plain of Sassari. Both east and west of this depression the Archaean and Palaeozoic rocks are strongly folded, except the Permian beds. In the eastern region this was the last folding which has affected the country, and the Mesozoic and Tertiary beds are almost undisturbed. In the western region, on the other hand, all the Mesozoic beds are involved in a later system of folds; but here also the Tertiary beds lie nearly horizontal. In the western region all the Mesozoic systems, including the Trias, are well developed. The Trias does not belong, as might have been expected, to the Alpine or Mediterranean type; but resembles that of Germany and northern Europe. In the eastern region the Trias is absent, the Mesozoic series begins with the Upper Jurassic.

Granite and Archaean schists form nearly the whole of the eastern hills from the Strait of Bonifacio southwards to the Flumendosa river, culminating in the Monti dei Gennargentu. The Palaeozoic rocks form two extensive masses, one in the south-east, the other in the south-west. They occur also on the extreme north-western coast, in the Nurra. Cambrian, Ordovician and Silurian beds have been recognized, the Upper Cambrian consisting of a limestone which is very rich in metalliferous ores (especially galena and calamine). The Permian, which contains workable coal seams, lies unconformably upon the older beds and seems to have been deposited in isolated basins (e.g., at Fondu Corrongiu and San Sebastiano), like those of the Central Plateau of France. The Mesozoic beds are limited in extent, the most extensive areas lying around the Gulf of Orsei on the east and west of Sassari in the north. The Tertiary deposits cover the central depression.

Climate.—The climate of Sardinia is more extreme than that of Italy, but varies considerably in different districts. The mean annual temperature is 62° F. at Cagliari and 61° F. at Sassari, the respective maxima and minima (for a period of 30 years) being 98.5° F. and 97° F. and 36.5° F. and 38.5° F. The island is subject to strong winds, which are especially felt at Cagliari owing to its position at the south-east end of the Campidano, and the autumn rains are sometimes of almost tropical violence. There are comparatively few streams and no inland lakes. Snow hardly ever

fals near the coast but is abundant in the higher parts of the island, though none remains throughout the summer. The rainfall in the southwest portion of the island is considerably greater than in other districts, in which it is extremely low, about 19 in. at Cagliari and 24 in. at Sassari.

The scourge of malaria has considerably diminished, but the undrained coast swamps still provide breeding-places for the malaria-carrying mosquito.

Customs and Dress.—The population of Sardinia appears to have belonged since ancient times to the so-called Mediterranean race. (See G. Sergi, *La Sardegna*, Turin, 1907.) The race has probably suffered less here than in most parts of the Mediterranean basin from foreign intermixture, except for a few Catalan and Genoese settlements on the coast (Alghero and Carloforte are respectively the most important of these); and the population in general seems to have deteriorated slightly since prehistoric times, the average cranial capacity of the prehistoric skulls from Anghehu Ruju being 1,490 c.c. for males and 1,308 c.c. for females, while among the modern population 60% of males and females together fall below 1,250 c.c. and the stature is generally lower than in other parts of Italy. In the province of Cagliari 29.99% of the recruits born in 1862 were under 5 ft. 1 in. and in that of Sassari 21.99%, the percentage for ten provinces of south Italy being 24.35.

These small individuals present apparently no other differences, and Sergi maintains that the difference is racial, these being descendants of a race of pygmies who had emigrated from central Africa.

But the lowness of stature extends to the lower animals—cattle, horses, donkeys, etc.—and this may indicate that climatic causes have some part in the matter also.

The dialects differ very much in different parts of the island, so that those who speak one often cannot understand those who speak another and use Italian as the medium of communication. They contain a considerable number of Latin words, which have remained unchanged. The two main dialects are that of the Logudoro in the north and that of Cagliari in the south.

The native costumes also vary considerably. In the southeast they have largely gone out of use, but elsewhere, especially in the mountainous districts, they are still habitually worn.

In the Barbagia the men have a white shirt, a black or red waistcoat and black or red coat, often with open sleeves; the cut and decorations of these vary considerably in the different districts. They have a kind of short kilt, stiff, made of black wool, with a band from back to front between the legs; under this they wear short linen trousers, which come a little below the knee, and black woollen leggings with boots. They wear a black cap, about 14 ft. long, the end of which falls down over one side of the head.

In other districts the costume varies considerably, but the long cap is almost universal. Thus at Ozieri the men wear ordinary jackets and trousers with a velvet waistcoat; the shepherds of the Sulcis wear short black trousers without kilt and heavy black sheepskin coats, and the two rows of waistcoat buttons are generally silver or copper coins.

The costume of the women is different (often entirely so) in each village or district. Bright colours (especially red) are frequent, and the white chemise is an integral part of the dress. The skirts are usually of the native wool (called *orbacia*) and two are often worn, one over the other.

For widows or deep mourning the peculiar cut of the local costume is preserved but carried out entirely in black. The native costume is passing out of use in many places (especially among the women, whose costume is more elaborate than that of the men), partly owing to the spread of modern ideas, partly owing to its cost; and in the Campidano and in the mining districts, it is now rarely seen.

The curious customs, too, of which older writers tell us, are gradually dying out. But the festivals, especially those of mountain villages or of pilgrimage churches, attract in the summer a great concourse of people, all in their local costumes. There may be seen the native dances and bareback horse-races through the main street of the village.

Agriculture.—The greater part of the island is devoted to agriculture; according to the statistics of 1930, 126,744 individuals were occupied in it. Of these, 76,303 cultivated their own land.

Much of the island is stony and unproductive; but cultivation has not been extended nearly so much as would be possible. Where rational cultivation has been introduced, it has been often by non-Sardinian capitalists.

Two-fifths of the land belong to the state and two-fifths more to the various communes; the remaining fifth is minutely subdivided among a large number of small proprietors. Comparatively little grain is now produced, whereas under the republic, Sardinia was one of the chief granaries of Rome; and most of the soil, except the rugged mountain regions, is adapted to corn growing.

The Campidano and other fertile spots, such as the so-called Ogiastra on the east side of the island, inland of Tortolì, the neighbourhood of Oliena, Bosa, etc., produce a considerable quantity of wine, the sweet, strong, white variety called Vernaccia, produced near Oristano, being especially noteworthy.

The cultivation of olives is widespread in the districts of Sassari, Bosa, Iglesias, Alghero and the Gallura. Tobacco, vegetables and other garden produce are much cultivated.

The following list gives the acreage under cultivation and the various products (in tons) for 1938:

Products	Acre	Tons
Wheat	597,493	326,832
Barley	68,429	34,297
Oats	39,767	21,826
Maize	17,784	12,566
Beans	121,524	43,431
Garden produce	232,180	79,977
Potatoes	93,860	35,163
Forage	318,630	1,157,084
Grapes	83,680	...
Wine	17,831,689 (gallons)
Olives	112,879	...
Olive oil	1,875,661 (gallons)
Citrus fruits	14,573	69,000

Livestock.—A considerable portion of Sardinia, especially in the higher regions, is devoted to pasture. The native Sardinian cattle are small but make good draught oxen. A considerable amount of cheese is manufactured but largely by Italian capitalists. Sheep's milk cheese (*pecorina*) is largely made but sold as the Roman product. Horses are bred to some extent, while the native race of donkeys is remarkably small in size. Pigs, sheep and goats are also kept in considerable numbers. In 1930 there were 101,400 horses and donkeys, 240,000 cattle, 102,000 pigs, 2,054,000 sheep and 436,000 goats.

Of wild animals may be noted the moufflon (*Ovis Ammon*), the stag and the wild boar, and among birds various species of the vulture and eagle in the mountains and the pelican and flamingo (the latter coming in August in large flocks from Africa) in the lagoons.

Fisheries.—The tunny fishery is considerable, and it is centred principally in the southwest. A special fishing harbour and market are to be built here. The sardine fishery at present serves mainly for local consumption. Lobsters are exported, especially to Paris.

The coral fishery—mainly on the west coast—has lost its former importance. Neither the tunny nor the coral fishery is carried on by the Sardinians themselves, who are not sailors by nature; the former is in the hands of Genoese and the latter of Neapolitans.

The unhealthful lagoons contain abundance of fish. The mountain streams often contain small but good trout.

Hydro-electric Power.—This is at present derived from two artificial lakes—that which collects the waters of the Tiro, in the centre of the island (capacity 588,577,500 cu.yd., generating up to 25,000 h.p.), and that of Coghinis, in the north (capacity 447,318,900 cu.yd., generating 24,000 horse power).

Minerals.—The mining industry in Sardinia is confined in the main to the south-western portion of the island. The mines were known to the Carthaginians, as discoveries of lamps, coins, etc. (now in the museum at Cagliari), testify. The Roman workings too, to judge from similar finds, seem to have been considerable. The centre of the mining district (*Metalla* of the itineraries) was probably about 5 m. south of Fluminimaggiore, in a locality known as Antas, where are the remains of a Roman temple dedicated to an emperor, probably Commodus. After the fall of the Roman empire the workings remained abandoned until the days of the Pisan supremacy, and were again given up under the Spanish government, especially after the discovery of America. When the island passed to Savoy in 1720 the mines passed to the state; but in the period up to 1840 only 14,620 tons of galena were extracted and 2,772 of lead. In 1840 the freedom of mining was introduced, the state giving perpetual concessions in return for 3% of the gross production.

The following tonnage of minerals was extracted in 1926:

Minerals	Tons
Iron	8,124
Manganiferous iron	500
Manganese	540
Copper	620
Lead	49,802
Zinc	
Calamine	100,943
Blende	28,312
Antimony	2,613
Arsenic	200
Iron pyrites	257
Anthraxite	10,598
Lignite	56,940

The most important minerals are lead and zinc, obtained in lodes in the forms of galena and calamine respectively. In most cases, owing to the mountainous character of the country, horizontal galleries are possible. The Montepioni company smelts its own zinc, but the lead is almost all smelted at the furnaces of Pertusola near Spessa. Lignite is mined at Bacu Abis, near Gonessa, and anthracite near Seui.

The salt-pans at Cagliari and of Carloforte are of considerable importance; they are let by the Government to contractors, who have the sole right of manufacture, but are bound to sell the salt necessary for Sardinian consumption at a low rate; the Government does not exercise the salt monopoly in Sardinia any more than in Sicily, but in the latter island the right of manufacture is unrestricted. The salt-pans of Cagliari produce 300,000 tons of salt annually, potash (for manure), magnesium sulphate and other kindred salts.

Communications.—The railway system of Sardinia is in the hands partly of the State and partly of two private companies. The State lines of the ordinary gauge run from Cagliari, past Macomer, to Chilivani (with a branch at Decimomannu for Iglesias). From Chilivani the line to Sassari and Porto Torres diverges to the north-west and that to Golfo degli Aranci to the north-east. The Terranova and narrow-gauge lines run from Cagliari to Mandas (whence lines diverge north to Sorgono and east to Tortolì, the former having a branch south-west to Villamar, and thence to Ales or Sanluri, on the main line from Cagliari to Macomer and the latter a short branch from Gairo to Ierzu), from Macomer east to Nuoro and west to Bosa, from Sassari south-west to Alghero, from Chilivani south to Tiroso (on the line between Macomer and Nuoro), and from Monti (on the line from Chilivani to Golfo degli Aranci) north-west to Tempio. From Iglesias there is a line to Palmas-Suergiu with branches to Siliqua and Calasetta. There is a steam tramway from Cagliari to Quartu S. Elena. The trains are few and the speed on all these lines is moderate, but the gradients are often very heavy. The main road system, which dates from 1828, previous to which there were only tracks, is good, and the roads well engineered; many of them are traversed by road motor services. There is a daily steam communication with Civitavecchia from Terranova (the mail route), and weekly steamers run from Cagliari to

Naples, Genoa (via the east coast of the island), Palermo and Tunis, and from Porto Torres to Genoa (calling at Bastia in Corsica and Leghorn) and Leghorn direct. A line also runs along the west coast of the island from Cagliari to Porto Torres. There is also a service between Porto Torres and Ajaccio in Corsica. There is an air service between Rome and Cagliari via Terranova and twice direct.

The archiepiscopal sees of the island are: Cagliari (under which are the suffragan sees of Galluri-Nuoro, Iglesias and Oliastura), Oristano (with the suffragan see of Ales and Terralba) and Sassari (under which are the suffragan sees of Alghero, Ampurias and Tempio, Bisarcio and Bosa).

Education.—In 1931, 31% of the males and 41% of the females (or 36% of the total population over 6 years) were able to read.

The University of Cagliari had 945 students in 1938-39 and that of Sassari 366. There is a mining school at Iglesias.

(T. A.; X.)

HISTORY

Archaeology.—No trace of palaeolithic man is recorded in Sardinia, and the earliest evidence of human occupation dates from the time when metal was first coming into use in the Western Mediterranean. There are, it is true, a few coastal stations in the south of the island that have yielded purely lithic industries, but in the greater number of the simple cave-dwellings wherein the earliest civilization is to be recognized, there are abundant copper implements together with the usual stone and obsidian tools. Indeed, it was probably the natural richness of the island in copper and lead that was responsible for the first settlements therein. This first civilization is, in a sense, the only prehistoric civilization of the island, for it continued without any remarkable alteration not only until the advent of the Greeks and the Carthaginians, but even until the coming of the Romans. In character it betrays a somewhat different aspect from the contemporary culture of its nearest neighbour, for whereas the affinities in Corsica pointed to a Ligurian source, here the ties are closer with central Italy and Sicily, and also, it has been argued, with North Africa.

The first habitations were perhaps cave-dwellings, but it was not long before stone-built huts were erected. Many villages of such huts are known, one of the best examples being that at Gonessa in the south-west of the island. The little houses themselves were mostly round, and about 20 ft. in diameter; inside they were furnished with benches, stalls for animals, and an altar near the entrance. In a strategic position near the huts were dwellings of grander character, perhaps the residences of chieftains, but fortified so that they might serve as watch-tower, refuge and defence for the whole village in times of danger. These are the *nuraghi*, double-storeyed towers in the shape of a truncated cone and built of large stones laid in regular horizontal courses, sometimes with the aid of a clay mortar. They are generally about 25 to 35 ft. in diameter and about 40 ft. in height, and in their usual form they contain an upper and lower chamber with tall and pointed corbelled roofs connected by a winding staircase; but sometimes they have several communicating chambers built bastion-wise against the tower on the ground level; or, again, the *nuraghi* proper may form part of a completely fortified enclosure that is protected by an additional tower. The *nuraghi* are sometimes furnished with embrasures or loop-holes, as at Losa, Giara and Santa Vittoria, and there is no doubt that they were primarily forts, all the constructional details being arranged with a view to tactical advantage in defence. The *nuraghi*, however, were not exclusively used in times of war, for many show abundant evidence of ordinary domestic occupation, and of use as bronze foundries; e.g., Ortu Comidu near Sarda. The intimate connection between village-life and the *nuraghi* is best illustrated on the plateau Giara di Gesturi, for this has no less than seventeen *nuraghi* set round its edge to defend the big cluster of huts on the top of the plateau. Here there is evidence of occupation extending from the copper age until the Roman period.

Though the earliest settlers lived in caves, and it is in caves that their burials are found, the tombs of the nuraghi-civilization are artificially constructed, and of three different kinds. The best-known are the *Domus de Ganas* (witches' houses), complicated artificial grottoes of which there are famous examples at Angeliu Ruffu and S. Andrea Priu. In plan they show a nest of burial-cells communicating by means of narrow passages with an antechamber. This last was seemingly used for devotional and religious purposes, for it is sometimes painted red and decorated with paintings; while inside are pillars, also carved with cult-symbols, and stone troughs and hearths. The dead were buried in the cells in a crouched position

FROM TIRRELLA, "THE ISLAND OF SARDINIA" (BACCHILLI).
"GIANTS' GRAVE" SHOWING FA-
CADE WITH GABLED SLAB; SARDINIA

and accompanied by rich grave-goods including stone axes, mace-heads, arrowheads, copper daggers, axes and awls, personal ornaments and amulets of many varieties, and pottery that included (at Angeliu Ruffu) bell-beakers, a supposed link with the Spanish beaker-culture. The third and contemporary type of grave is a polygonal or rectangular megalithic structure, at first little better than a stone-lined pit, but passing into regular cist-forms. These rectangular chambers, however, are not numerous, and much more common is the third type, an obvious derivative of the cist, known as *Tombe dei Giganti* (giants' graves). In these a rectangular chamber with a corbelled roof is encased in a stone-edged mound with crescentic horns, and in the centre of this curved façade, and at the head of the chamber, is a gabled and paneled portal slab with a small hole at its foot, or, alternatively, a door of two up-rights and a lintel. The chambers vary from 24ft. in length to as much as 50ft., and doubtless served as graves for whole families, or even whole villages. In addition to these villages and graves, it remains to note the existence of a number of menhirs.

There was no Greek colonization in the formal sense although Greek historians have recorded that such colonization was projected (Herodotus, I, 170) and was achieved (Pausanias, X, 17, 5). Nevertheless, Olbia and Neapolis, as their names imply, were doubtless founded by Greeks, and there must have been more than one short-lived Greek settlement in the island. But the first serious intervention of the nuraghi-civilization was an occupation by Carthage about 500 to 480 B.C. that resulted in the exploitation of Sardinia as an important grain-growing land, and in the foundation of such towns as Cornus, Tharro and Sulci. The island remained a Carthaginian colony until 238 B.C. when it was ceded to Rome, and a struggle began between the natives and their new masters. Roman conquest was, however, inevitable, and in a short while the island was organized as a province that ultimately became one of the main corn-supplies for Rome.

Roman Period.—In 238 B.C. the Carthaginian mercenaries revolted, and the Romans took advantage of the fact to demand the surrender of the island. The native tribes opposed the Romans, but were conquered after several campaigns; the island became a province under the government of a *praetor* or *propraetor*, to whose jurisdiction Corsica was added soon afterwards. A rebellion in 215 B.C., fostered by the Carthaginians, was quelled by T. Manlius Torquatus (Livy xlii. 40). After this the island began to furnish considerable supplies of corn; it was treated as a conquered country, not containing a single free city, and the inhabitants were obliged to pay a tithe in corn and a further money contribution. It was classed with Sicily and Africa as one of the main sources of the corn-supply of Rome. There were salt-works as early as about 150 B.C., as is attested by an inscription assigned

to this date in Latin, Greek and Punic. There were two insurrections of the mountain tribes, in 181 and in 114 B.C., but even in the time of Strabo there was considerable brigandage.

In the division of provinces made by Augustus, Sardinia and Corsica fell to the share of the senate, but in A.D. 6, Augustus, owing to the frequent disturbances, took them over and placed them under a *praefectus*. In A.D. 67 Nero restored Sardinia to the senate (but not Corsica) in exchange for Achaia, and the former was then governed by a *legatus pro praetore*; but Vespasian took it over again before A.D. 78, and placed it under an imperial *praetor* as *praefectus*. It returned to the senate, not before A.D. 83 but certainly before the reign of M. Aurelius, when we find it governed by a *proconsul*, as it was under Commodus; the latter, or perhaps Septimius Severus, took it over again and placed it under a *procurator* as *praefectus* once more (D. Vaglieri in *Notizie degli scavi*, 1897, 280). A bronze tablet discovered in 1866 near the village of Esterzili is inscribed with a decree of the time of Otho with regard to the boundaries of three tribes, the Gallienes, Patulienes and Campani, who inhabited the eastern portion of the island. Carales was the only city with Roman civic rights in Sardinia in Pliny's time (when it received the privilege is unknown). A Roman colony had been founded at Turris Libisonis (Porto Torres) and others, later on, at Usellis and Cornus. We hear little of the island under the empire, except as a granary and as remarkable for its unhealthiness and the audacity of its brigands. It was not infrequently used as a place of exile.

Byzantine Period.—After the time of Constantine, the administration of Sardinia was separated from that of Corsica, each island being governed by a *praeses* dependent on the *vicarius urbis Romae*. In 456 it was seized by Genseric. It was retaken for a short time by Marcellianus, but was not finally recovered until the fall of the Vandal kingdom in Africa in 534, by Cyril. In 551 it was taken by Totila, but reconquered after his death by Narses for the Byzantine Empire. Under Byzantium it remained nominally until the 10th century, when we find the chief magistrate still bearing the title of *dux*.

Saracens.—In the 8th century (720) the period of Saracen invasion began; but the Saracens never secured a firm footing in the island. In 735 Liutprand purchased and removed to Pavia the body of St Augustine of Hippo from Cagliari, whither it had been brought in the 6th century by the exiled bishop of Hippo. In 815 Sardinia submitted to Louis the Pious, begging for his protection; but the Saracens were not entirely driven out, and about A.D. 1000 the Saracen chief Musat established himself in Cagliari. Pope John XVIII. preached a crusade in 1004, promising to bestow the island (when or whether it had ever definitely passed into the power of the papacy is not absolutely clear) upon who ever should drive out the Saracens. The Pisans took up the challenge, and Musat was driven out of Cagliari with the help of the Genoese in 1022 for the third time. The Pisans and Genoese now disputed about the ownership of Sardinia, but the pope and the emperor decided in favour of Pisa. Musat returned to the island once more and made himself master of it, but was defeated and taken prisoner under the walls of Cagliari in 1050, when the domination of Pisa was established.

Pisan Period.—The island had (probably since the end of the 9th century) been divided into four districts—Cagliari, Arborea, Torres (or Logudoro) and Gallura—each under a *giudice* or judge, in whom the dignity became hereditary. *Judices* are already mentioned as existing in the account of the mission sent by Nicholas I. in 864, as though the single authority of the Byzantine *dux* was already weakened. The three *duxes* who appear in 10th-century inscriptions bear alternately the names Torcororius and Salusius; and, inasmuch as this is the case with the *judices* of Cagliari from the 11th to the 13th century, there seems no doubt that they were the successors of these Byzantine *duxes*, who were perhaps the actual founders of the dynasty. These names, indeed, continue even after the Pisan family of Lacon-Massa had by marriage succeeded to the judicature. The Greek language occurs in their official seals down to the 13th century. Inter-marriage (sometimes illitit) was apparently frequently used by the dominant

families for the concentration of their power. Thus we find that after the failure of Must members of the family of Lacon-Unali fled all the four judicatures of the island. In the continual struggles between Pisa and Genoa some of these princes took the side of the latter. In 1164 Barisone, *giudice* of Arborea, was given the title of king of the whole island by Frederick Barbarossa, but his supremacy was never effective. In 1241 Adalasia, heiress of Gallura and Logudoro, was married as her third husband to Enzo, the natural son of Frederick II., who received the title of king of Sardinia from his father, but fell into the hands of the Bolognese in 1249, and remained a prisoner at Bologna until his death. After this the Pisan supremacy of the island seems to have become more of a reality, but Arborea remained independent, and after the defeat of the Pisans by the Genoese at the naval battle of Meloria in 1284 they were obliged to surrender Sassari and Logudoro to Genoa. In 1297 Boniface VIII. invested James II., the king of Aragon, with Sardinia; but it was not until 1323 that he attempted its conquest, nor until 1326 that the Pisans were finally driven out of Cagliari, which they had fortified in 1305-1307 by the construction of the Torre di S. Pancrazio and the Torre dell' Elefante, and which became the seat of the Aragonese government. To the Pisan period belong a number of fine Romanesque churches, among which may be specially mentioned those of Ardara, S. Giusta near Oristano, La Trinità di Saccargia and Tratalias.

Aragonese Period.—The Aragonese enjoyed at first the assistance of the *giudici* of Arborea, who had remained in power; but in 1352 war broke out between Mariano IV. and the Aragonese, and was carried on by his daughter Eleonora, wife of Brancione Doria of Genoa, until her death in 1403. Peter IV. had meanwhile in 1355 called together the *cortes* (parliament) of the three estates (the nobles, the clergy and the representatives of the towns) for the first time after the model of Aragon. After 1403 the Aragonese became masters of Arborea also. The title of *giudice* was abolished and a feudal marquise substituted. The code of laws issued by Eleonora was in 1421 extended to the whole island by the *cortes* under the presidency of Alphonso V., who visited Sardinia in that year. In 1478 the marquise of Oristano was suppressed, and henceforth the island was governed by Spanish viceroys with the feudal régime of the great nobles under them, the *cortes* being convoked once every ten years. Many of the churches show characteristic Spanish Late Gothic architecture which survived until a comparatively recent period. The Renaissance had little or no influence on Sardinian architecture and culture.

Modern History.—The island remained a Spanish province until the War of the Spanish Succession, when in 1708 Cagliari capitulated to an English fleet, and the island became Austrian; the *status quo* was confirmed by the peace of Utrecht in 1713. In 1717, however, Cardinal Alberoni retook Cagliari for Spain; but this state of things was short-lived, for in 1720, by the Treaty of London, Sardinia passed in exchange for Sicily to the dukes of Savoy, to whom it brought the royal title. The population was at that time a little over 300,000; public security and education were alike lacking, and there were considerable animosities between different parts of the island. Matters improved considerably under Charles Emmanuel III., in whose reign of 43 years (1730-73) the prosperity of the island was much increased. The French attacks of 1792-93 were repelled by the inhabitants, Cagliari being unsuccessfully bombarded by the French fleet. But the refusal by Victor Amadeus III. to grant the Sardinians privileges promised in consideration of their bravery led to the revolution of 1794-96. In 1799 Charles Emmanuel IV. of Savoy took refuge in Cagliari after his expulsion by the French, but soon returned to Italy. In 1802 he abdicated in favour of his brother Victor Emmanuel I., who in 1806 returned to Cagliari and remained there until 1814, when he retired, leaving his brother, Carlo Felice, as viceroy. Carlo was successful in repressing brigands, but had to deal with much distress from famine. In 1821 he became king of Savoy by the abdication of his brother, and the construction of the highroad from Cagliari to Porto Torres was begun (not without opposition on the part of the

inhabitants) in 1822. Feudalism was abolished in 1836, and in 1848 complete political union with Piedmont was granted. The later history of Sardinia is bound up with that of Piedmont and Italy. Victor Emmanuel II. (*q.v.*), king of Sardinia, became the king of a united Italy in 1861. During World War II, after the Allied victory in Tunisia (May 1943) Sardinia was bombed almost continuously. Few of the larger towns were spared; in the late summer of 1943 Sardinia was occupied by British and U.S. forces and the fascist regime ended without struggle.

SARDIS, more correctly **SARDIS** (*αἰζάρδεις*), the capital of the ancient kingdom of Lydia, the seat of a *conventus* under the Roman Empire, and the metropolis of the province Lydia in later Roman and Byzantine times, was situated in the middle Hermus valley, at the foot of Mt. Tmolus, a steep and lofty spur of which formed the citadel. It was about 2½ m. S. of the Hermus. The earliest reference to Sardis is in Alcan (Bergk, *Fr.* 24, c. 650 B.C.); in the *Iliad* the name *Hydē* seems to be given to the city of the Maeonian (*i.e.*, Lydian) chiefs, and in later times, *Hydē* was said to be the older name of Sardis, or the name of its citadel. It is, however, more probable that Sardis was not the original capital of the Maeonians, but that it became so amid the changes which produced the powerful Lydian empire of the 8th century B.C. The city was captured by the Cimmerians in the 7th century, by the Persians and by the Athenians in the 6th, and by Antiochus the Great at the end of the 3rd century. "Once at least, under the emperor Tiberius, in A.D. 17, it was destroyed by an earthquake; but it was always rebuilt, and was one of the great cities of Asia Minor till the later Byzantine period. As one of the Seven Churches of Asia, it was addressed by the author of the Apocalypse in terms which seem to imply that its population was notoriously soft and faint-hearted. Its importance was due, first to its military strength, secondly to its situation on an important highway leading from the interior to the Aegean coast, and thirdly to its commanding the wide and fertile plain of the Hermus."

The early Lydian kingdom was far advanced in the industrial arts (*see* **LYDIA**), and Sardis was the chief seat of its manufactures. The most important of these trades was the manufacture and dyeing of delicate woollen stuffs and carpets.

In the Hellenistic and Roman periods Sardis was eclipsed by Pergamum (the Attalid capital), by Ephesus (the capital of the province of Asia) and probably also by Smyrna. After Constantinople became the capital of the East a new road system grew up connecting the provinces with the capital. Sardis then lay rather apart from the great lines of communication and lost some of its importance. It still, however, retained its titular supremacy and continued to be the seat of the metropolitan bishop of the province of Lydia, formed in A.D. 295. It is enumerated as third, after Ephesus and Smyrna, in the list of cities of the Thracian *thema* given by Constantine Porphyrogenitus in the 10th century; but in the actual history of the next four centuries it plays a part very inferior to Magnesia ad Sipylum and Philadelphia (*see* **ASA-SHREK**), which have retained their pre-eminence in the district. The Hermus valley began to suffer from the incursions of the Seljuk Turks about the end of the 11th century; but the successes of the Greek general Philocalas in 1118 relieved the district for the time, and the ability of the Comneni, together with the gradual decay of the Seljuk power, retained it in the Byzantine dominions. The country round Sardis was frequently ravaged both by Christians and by Turks during the 13th century. Soon after 1301 the Seljuk amirs overran the whole of the Hermus and Cayster valleys, and a fort on the citadel of Sardis

was handed over to them by treaty in 1306. Finally in 1390 Philadelphia, which had for some time been an independent Christian city, surrendered to Sultan Bayezid's mixed army of Ottoman-Turks and Byzantine Christians, and the Seljuk power in the Henthus valley was merged in the Ottoman empire. The *large* reference to the city of Sardis relates its capture (and probable destruction) by Timur in 1402. Its site is now practically deserted.

The ruins of Sardis, so far as they are now visible, are chiefly of the Roman time; but though few ancient sites offered better hope of results, the necessity for heavy initial expenditure was a deterrent (*e.g.*, to H. Schliemann). On the banks of the Pactolus two columns of a great Ionic temple, now known to be that of Cybele-Artemis, were still standing. More than one attempt to excavate this temple, the last by G. Dennis in 1882, was made and prematurely brought to an end by lack of funds. In 1910-1914 and also in 1922, the temple site and part of the necropolis were studied by H. C. Butler and others, of the American Society for the Excavation of Sardis.

See reports in *Am. Journal of Archaeology*, 1911-27, and the volumes of *Sardis*, especially I. and II. (H. C. Butler) on the history of the excavations down to 1914, and VI. pts. 1-2 (E. Littmann-W. H. Buckler) on the Lydian inscriptions; results and bibliography in Pauly-Wissowa *R. Enc.* XIII, 223 f. (Büchrens-Deeters-J. Kell); for the city's history in early Christian times, W. M. Ramsay, *Letters to the Seven Churches* (1904); V. Schultz, *Altchristliche Städte II*, 2, 245 f. (1926).

SARDOU, VICTORIAN (1831-1908), French dramatist, was born in Paris on Sept. 5, 1831. The Sardous were settled at Le Cannet, a village near Cannes, where they owned an estate, planted with olive trees. A night's frost killed all the trees and the family was ruined. Victorien's father, Antoine Léandre Sardou, came to Paris, and earned his living in a succession of employments. Victorien had to make his way as best he could. A play of his, *La Taverne des étudiants*, produced at the Odéon on April 1, 1854, was withdrawn after five nights. Many disappointments followed; some plays were rejected, others were accepted and not performed.

Sardou was now in actual want, and his misfortunes culminated in an attack of typhoid fever. He was dying in his garret, surrounded with his rejected manuscripts. A lady named Mlle. de Brécourt nursed him back to health, and introduced him to Mlle. Déjazet. Then fortune began to smile on the author. It is true that *Candide*, the first play he wrote for Mlle. Déjazet, was stopped by the censor, but *Les Premières Armes de Figaro*, *Monsieur Garat*, and *Les Prés Saint Gervais*, produced almost in succession, had a splendid run, and *Les Pattes de mouche* (1860: afterwards anglicized as *A Scrap of Paper*) obtained a similar success at the Gymnase. *Fédora* (1882) was written expressly for Sarah Bernhardt, as were many of his later plays. He soon ranked with Augier and Dumas. He ridiculed the vulgar and selfish middle-class person in *Nos Intimes* (1861: anglicized as *Peril*), the gay old bachelors in *Les Vieux Garçons* (1865), the modern Tartuffes in *Saphire* (1868), the rural element in *Nos Bons Villagers* (1866), old-fashioned customs and antiquated political beliefs in *Les Ganaches* (1862), the revolutionary spirit and those who thrive on it in *Rabagas* (1872) and *Le Roi Carotte* (1872), and the then threatened divorce laws in *Divorçons* (1880).

He struck a new vein by introducing a strong historic element in some of his dramatic romances. Thus he borrowed *Théodora* (1884) from Byzantine annals, *La Haine* (1874) from Italian chronicles, *La Duchesse d'Athènes* from the forgotten records of mediaeval Greece. *Pathe* (1869) is founded on the rising of the Dutch *guinea* at the end of the 16th century. The scene of *La Sorcière* (1904) was laid in Spain in the 16th century. The French Revolution furnished him with three plays, *Les Merveilleuses*, *Thermidor* (1891) and *Robespierre* (1902). The last named was written expressly for Sir Henry Irving, and produced at the Lyceum theatre, as was *Dayle* (1903). The imperial epoch was revived in *La Tosca* (1887) and *Madame Sans Gêne* (1893). Later plays were *La Piste* (1905) and *Le Drame des poisons* (1907).

Sardou married his benefactress, Mlle. de Brécourt, but eight

years later he became a widower, and soon after the revolution of 1870 was married again, to Mlle. Soulié. He was elected to the French Academy in 1878. He died at Paris on Nov. 8, 1908.

SARGASSO SEA, a tract of the North Atlantic ocean covered with floating seaweed (*Sargassum*, originally named *sargao* by the Portuguese). This tract is bounded approximately by 25° and 31° N. and by 40° and 70° W., but its extent and density are influenced by winds and ocean currents. The weed, known as Gulf Weed (*Sargassum Bacciferum*), belongs to the brown algae (*g.v.*), and is easily recognized by small berry-like bladders. The floating masses are believed to be replenished by additional supplies torn from the coasts to the south-west and carried by currents to the great whirl of the Sargasso sea. The weed supports a considerable amount of somewhat low forms of animal life of a type always more characteristic of the littoral zone than of the open ocean. The Sargasso sea was first reported by Columbus, who on his initial "West Indies" voyage was involved in it for several days. The widely credited story of ships becoming embedded in the weed beyond possibility of escape was disproved by the "Michael Sars" expedition (1910).

SARGENT, JOHN SINGER (1856-1925), Anglo-American painter. For 40 years before his death John Singer Sargent was too towering a personality for his contemporaries to judge either him or his work in true perspective. A tall commanding presence, with a small head well set on broad shoulders, with large, somewhat prominent grey eyes, kindly in expression though nothing escaped them, with a close-cut beard at a time when nine men out of 10 were clean-shaven, he made an instant impression upon those who came into contact with him. During the last years of his life, with his great size, his dark hair and beard turned silver-white, his florid complexion, and an air about him of singular freshness and calm, he had a look as of some serene and beneficent Jove.

That he was a great artist is universally acknowledged, but that he was a great man his life attested—in its austerity, its generous high-mindedness, its breadth of vision, and above all in its independence of praise, fame or wealth.

Essentially a cosmopolitan, he was of American descent. His father, Dr. Fitzwilliam Sargent, was born in Gloucester, Massachusetts, where his ancestors, emigrating from Gloucester, England, settled before 1650. For his medical training Fitzwilliam Sargent went to Philadelphia, and married Miss Mary Newbold Singer, a member of an old Philadelphia family. In 1854 the young couple went for change of air and scene to Europe, with no premonition that this journey would result in their permanent establishment abroad. Two years later, on Jan. 12, 1856, in Florence, at the Casa Arretini, on the Lungarno Guicciardini, their son, John Singer Sargent, was born. He showed his special aptitudes from his earliest childhood, which was spent at Nice, in Rome, in Dresden, with periodical returns to Florence. Whenever possible he took drawing lessons of a desultory kind, interrupted by the exigencies of schooling and a life of constant travel. His mother, who all her life loved to sketch in water-colours, recognised and encouraged his unusual gifts.

His own awakening to the enchantment of being able to express his delight in the visual world came to him, he once mentioned, at Müren, in the summers of 1868 to 1870. His early drawings were carefully painstaking efforts to show every variation in rock forms, or in the verdure that sprang from their crevices. In 1873 he won a prize for drawing at the Accademia in Florence.

In 1876 he paid the first of many visits to America, but before the short interruption of this trip he had begun his artistic education in earnest, having entered the studio of Carlus-Duran, in Paris, in 1874, at the age of eighteen.

A fellow student described him as a tall, slenderly built, rather silent youth, with a friendly, somewhat shy manner, who could, on occasions, in spite of his diffidence, express himself with startling decision. His industry was no less remarkable than his youthful strength which was not unduly taxed by the strain of

attending the classes not only at Duran's studio, but the Beaux Arts and evening life classes as well.

Contrary to many published recollections, Sargent himself declared, perhaps with characteristic modesty, that he was by no means a brilliant pupil, and that he only acquired his amazing technical skill by continued concentrated effort. What he did recognise, with instant appreciation and lifelong acknowledgment, was the scientific precision of the method taught by Carolus Duran, who had based his theories on a close study of Franz Hals and Velasquez. John Sargent, not without struggle, made this technique his own, and it gave him, at the start, the assured mastery of his materials.

His first picture, exhibited in the Salon of 1878, won an honourable mention. It was called "En route pour la Pêche," and is now in the Corcoran Gallery at Washington. In the next year's Salon he showed the portrait of his master, which he had painted in 1877, at the age of 21, and which was instantly acclaimed as of extraordinary promise. Shortly after, emancipated from schools, he made a pilgrimage to Spain, which he had already visited as a boy, and the studies done in the Prado Gallery, which, after his death, were sold at Christie's at such phenomenal prices, were painted on this occasion.

Immediately after his return to Paris he painted the beautiful canvases "El Jaleo" (Salon 1882), now at Fenway Court, Boston, and "The Children of E. D. Bolt" (Salon 1883), now in the Boston Fine Arts Museum. Of "The Lady of the Rose" (Miss Burkhart), which was shown in 1881 and gained a second class medal, Henry James wrote that it was the work of "a talent which on the very threshold of its career has nothing more to learn." This was a phrase, for to the end of his days Sargent remained the student, making even briefer the span between brain and hand, between conception and achievement; yet these early canvases are remarkably mature, with a beauty of surface texture he rarely excelled, and with the atmospheric "quality" he had learned from Velasquez. He had the special readiness of genius to absorb great traditions, to take valuable hints from every source, and incorporate them into his own work with the freshness and vigour of a deeply original mind.

From the outset commissions came to him unsought. He had to knock at no doors; but it was not till the Salon of 1884, when he showed the portrait of Madame Gautreau (Metropolitan Museum of New York), that the painter awoke to find himself famous—or infamous. Madame Gautreau was the friend of Gambetta, acclaimed by the Republican party, and Sargent was accused of having purposely done a caricature. The journalists outdid each other in senseless abuse.

This experience, with its astounding unreason, probably laid the foundation for his almost incredible independence of critical comment. Irritated by adulation, detesting every form of publicity, he could never be induced, unless it was forced upon him, to read any criticism of his own work, appreciative or the reverse.

So furious and so prolonged was the outcry in the French Press that finally, in a fit of disgust, Sargent left Paris and moved to London. His first studio was in Kensington, but in 1885 he had already settled at 33 Tite Street, Chelsea. In 1901 he bought the adjacent house (No. 31), and a door was cut through between the two studios. Here he lived and worked till his death on April 15, 1925.

Into these 40 years of his London domicile was crowded the experience of a dozen ordinary lifetimes. His first exhibited study of childhood: "Carnation, Lily, Lily, Rose," was bought in 1887, by the Chantrey bequest, for the Tate Gallery. A few years later the Luxembourg acquired the picture of the Spanish dancer "Carmenita," painted 1890, shown at the Royal Academy 1891. In spite of adverse criticism, it was not long before he was in great demand as a portrait painter, and the unflagging zeal of his industry kept pace with every triumph of public recognition. He numbered among his sitters princes and princesses, musicians, actors, teachers, writers, statesmen and diplomats. Many of his distinguished models he painted in their habit as they lived. The great groups of "The Duke of Marlborough and his Family" (1905), the "Ladies Athletes" (1902), the "Daughters of the

Hon. Percy Wyndham" (1900), the "Misses Hunter" (1902), etc., and a noble series of single portraits, notably those of the Duke and Duchess of Connaught (1908), the Duke (1901) and Duchess of Portland (1902), Lord Russell of Killowen (1900); of Francis Penrose, Esq. (1898), and of innumerable beautiful women: The Duchess of Sutherland (1904), the Countess of Warwick (1904), Lady Agnew (1893), Lady (Jan) Hamilton (1896), Mrs. Hammersley (1893), increased his every-growing prestige.

In 1894 he was elected an associate, in 1897 to full membership of the Royal Academy, and at the exhibitions at Burlington House his portraits were the centre of interest and of controversy. It became a high distinction to be painted by him, and hundreds clamoured for the honour in vain. Universities offered him degrees, he had as many medals as a war veteran. Quite unmoved by all this acclamation, he retained the serene simplicity of manner that made him so exceptional and so distinguished a figure.

In the sense of being generally understood John Sargent was never a popular painter. Painting is the most outspoken of the arts, but its language is not easy to read. Its apparent simplicity and the directness of its appeal to the eyes are misleading, and in the case of pictures so incisive and brilliant, so uncompromising in their truth, so unerring and authoritative in their presentation of character, it was no wonder that they awakened as much resentment as admiration. There are mysteries of light, as well as of darkness, and the secrets of this accomplishment were no less inscrutable, became actually more tantalising, because the method of expression was so frank, and looked so amazingly easy to imitate. And he was imitated, inevitably, but in no single instance with any distinction. Referred to as a psychologist or a stylist, he was frequently accused of deliberately accentuating the less pleasing qualities in his sitters—a foolish legend he dismissed with a shrug of his shoulders. "I chronicle," he once said, "I do not judge." Though his outlook on life was essentially indulgent, his sense of humour was irrepressible, and the unerring rectitude of his realism struck at a deep-rooted human weakness—a preference to be seen not as we are but as we should like to be.

In that its conclusions are so little deliberate, painting differs from literature. John Sargent did not sum up his characters, he painted what he saw; but he caught, subconsciously perhaps, each fugitive betrayal of a passing thought, a restless movement, a smile or a glance. This subtle power of definition has been, in all ages, the peculiar gift of great portrait painters.

In recalling the astonishing variety and scope of his work, it may be assumed that he was almost indifferent to the form in which he was called upon to portray the modern spirit. His only prayer must have been that that spirit should not be utterly commonplace. For dullness he had no talent, even his magic touch failed to enliven it. Before the strange, the unexpected, the bizarre, his resource and his freshness were unflagging. No happy invention was permitted to degenerate into a formula. He never repeated himself. For the extremes of youth and of age he had undeniable tenderness; with incredible delicacy he portrayed the flower-like freshness of one, and if he did not disguise in the other the hint of decrepitude it was generally illumined by more than a suggestion of wisdom and dignity.

At the very height of his fame, in 1910, he decided to give up the painting of portraits. He had grown tired of the tyranny of sitters, and had begun to lose interest in his work. This decision, so typical of his artistic integrity, he lived up to. Only in exceptional instances was he afterwards induced to break his rule, and then never for considerations of money. Though he lived on a generous scale, he was never a wealthy man. Always ready to give a helping hand to a student, or to a brother artist, he was at once too busy and too impatient of all forms of implied superiority ever to want to teach. Deliberately then, perhaps, he set his face against the scattering of his energies over too wide a field. An omnivorous reader and a passionate musician, an excellent host and a most entertaining guest, his rare leisure was all too adequately filled.

In a holiday spirit he began to play with water-colour (in which medium he had made his earliest efforts at painting) and the result of his first summer of freedom may be seen in the sparkling

brilliance, the irresistible gaiety of the 80 sketches bought *en bloc* by the Brooklyn Fine Arts Museum. His disciplined hand had acquired an almost miraculous lightness and certainty of touch.

But a heavier task had already for years been engaging his energies, and the last 20 years of his life were given more and more to the magnificent series of decorations which illustrate the range of his great gifts. It was said of his "History of Religion," begun in 1890 and not completed till 1916 (the subject for the great Hall in the Boston Public Library known as Sargent Hall), that his work here was not only a monument to the picturesque possibilities of his colossal subject, but to the sheer erudition of the painter. This task took him on several journeys to Egypt, Palestine, etc., as well as for a few months almost every year to America, where he had a studio in Boston, in the Columbus Avenue Building; and he had also another studio in London, for these huge decorations, at The Avenue Studios, 75 Fulham Road.

In 1914, at the outset of the War, he was on holiday in Austria, and he witnessed with horror the disintegration of the Europe he had known. He gave without stint; and when the opportunity offered went to the front to record his impressions at first hand. In his famous war picture "Gassed" (London War Museum) he testified to his deep admiration for the invincible pluck of the British soldier. In the background, through the waning light of the late afternoon, we see the ground carpeted by writhing figures; while a tragic procession of wounded men, blinded by gas, staggers towards the dressing station.

The quieter life in London suited Sargent's temperament better than the more lavish social exactions of Boston. In London finally he was to know an honour no living painter had hitherto experienced. The magnificent series of portraits, bequeathed to the nation by Asher Wertheimer, were hung in the National Gallery. A wing in the Tate Gallery, the gift of Sir Joseph Duveen, now houses these, and such other works by Sargent as are already in national possession—the portraits of Lord Ribblesdale (1902), of Coventry Patmore (1895), of Henry James (1914), Octavia Hill (1899), of Ellen Terry as Lady Macbeth (1899), and many others. Sargent is represented in the principal galleries of the world, but the Metropolitan in New York, and the Boston Fine Arts Museum, are particularly rich in fine examples. The decorations for the Boston Library, for the Boston Fine Arts Museum, for the Harvard Memorial Chapel, absorbed him till, fortunate to the end, death overtook him in his sleep, in his 70th year, with no evident diminution of his forces, no weakening of his physical or mental energy.

In looking back over his immense achievement, his extraordinary vitality strikes one first. His slightest sketch pulsates with life. The beautiful suavity of his style, acquired through the iron discipline of years, never sacrificed its spontaneity. He shirked no labour, and knew no greater joy in life than this concentration on work provided him. He would paint a head twenty times over in order to establish an appearance of fluency and ease. His insight into character went far beyond ordinary perception either of artists or of laymen; at its best it became a miracle of intuition as of skill in its rendition.

What he lacked entirely may be called, for lack of a better term, the feminine touch. Beauty or charm that were not in direct relation with his subject he could not entertain. This severity was his strength in contradistinction to the weakness of most of the art of the period which perpetuated the worship of purely irrelevant sweetness.

Taken as a whole his portraits, drawn from every class of society, in their great number and variety, in the boldness, the wit, the keen incisiveness and the distinction of their presentation, must come to be considered an epitome of the age he lived in—of its stateliness and splendour, of its elegance and grace, of its pretentiousness and its vulgarity. The human panorama, in its every manifestation, he found endlessly diverting and fascinating it as he did with uncompromising directness, his work, in its unflinching yet happy realism, bears the very stamp of truth.

Mr. Sargent had never married. He had been a devoted son

and brother, and was survived by his two sisters, Miss Emily Sargent and Mrs. Francis Ormond. His body was interred at Brookwood Cemetery. Memorial services were held at Westminster Abbey, at the request of the Royal Academy, and a replica in bronze of the Crucifixion in the Boston Library, with a memorial tablet, has been placed in the Crypt of St. Paul's Cathedral. (J. H.N.)

SARGON, more correctly **SARRU-KINU** ("the legitimate king"), an Assyrian general who, on the death of Shalmaneser IV., during the siege of Samaria, seized the crown on the 12th of Tebet 722 B.C. He claimed to be the descendant of the early kings, and accordingly assumed the name of a famous king of Babylonia who had reigned about 2,000 years before him. His first achievement was the capture of Samaria, 27,200 of its inhabitants being carried into captivity. Meanwhile Babylon had revolted under a Chaldean prince, Merodach-baladan, who maintained his power there for twelve years. In 720 B.C. Yahu-bihdi of Hamath led Arpad, Damascus and Palestine into revolt: this was suppressed, and the Philistines and Egyptians were defeated at Raphia (mod. er-Rafa). In 719 B.C. Sargon defeated the Minni to the east of Armenia, and in 717 overthrew the combined forces of the Hittites and Moschi (Old Testament Meshech). The Hittite city of Carchemish was placed under an Assyrian governor, and its trade passed into Assyrian hands.

The following year Sargon was attacked by a great confederacy of the northern nations—Ararat, the Moschi, Tibareni, etc.—and in the course of the campaign he marched into the land of the Medes in the direction of the Caspian. In 715 B.C. the Minni were defeated, and one of their chiefs, Däyuku or Daiukku (Delioes), transported to Hamath. In 714 B.C. the army of Rusas of Ararat was annihilated, and a year later five Median chiefs, including Arbaku (Arbaces) became tributary. Cilicia and the Tibareni also submitted as well as the city of Malatia, eastern Cappadocia being annexed to the Assyrian Empire. A league was now formed between Merodach-baladan and the princes of the west, but before the confederates could move, an Assyrian army was sent against Ashdod, and Edom, Moab and Judah submitted to Sargon, who was thus free to turn his attention to Babylonia, and Merodach-baladan was accordingly driven from Babylon, where Sargon was crowned king. Shortly after this Sargon sent a statue of himself to Cyprus and annexed the kingdom of Commagene. He was murdered in 705 B.C., probably in the palace he had built at Dur-Sargina, now Khorsabad, which was excavated by P. E. Botta.

(1925), 43-60. For Sargon the Ancient, founder of the Accadian Empire, see S. Langdon, *Cambridge Ancient History*, vol. i. (1923), 402-408.

SARI BAIR, BATTLE OF, 1915: see **DARDANELLES CAMPAIGN.**

SARIPUL or **SRIPEUL**, a town and khanate of Afghan Turkistan. The town lies 100 m. S.W. of Balkh; estimated pop. 18,000. Two-thirds of the people are Uzbeks and the rest Hazaras. The khanate, which lies between Balkh and Maimana, was allotted to the Afghans by the Anglo-Russian boundary agreement of 1873.

SARI QAMISH, BATTLE OF, 1914. This battle in Dec. 1914, between the Russians and the Turks in the Caucasus, is described under **CAUCASUS, CAMPAIGN IN THE**. It arose out of Enver Pasha's (g.v.) rash project for a wide enveloping manoeuvre in midwinter, and although almost carried to success by the astonishing fortitude of the Turkish troops, ended in a disaster which almost annihilated the Turkish 3rd army.

SARK, one of the smaller Channel Islands, lying 7 mi. E. of Guernsey. It is 3 mi. long and 1½ mi. in extreme breadth. Area 2 sq.mi.; pop. (1931) 541, excluding visitors. It is divided into Great Sark (the more northern) and Little Sark, connected by the Coupée, an isthmus, more than 100 yd. long and six ft. wide, with precipices on each side going down 300 ft. to the sea. The coastal scenery, commemorated in art by the painter Toplis, is of surpassing beauty, with fretted crystalline rocks, rocky islets, natural arches, caverns, etc. Creux, the harbour of Sark, on the east side, has its only communication with the interior by two tunnels, one

dating from 1588, the other 1868. The fauna of the surrounding seas is rich. The island is highest (375 ft.) about the centre of Great Sark, where stand the church, a few dwellings and a mill. Groups of houses at La Ville, Valette, Collinette, Discart and in Little Sark, suggest much earlier settlements. About the 6th century the Celtic saint, St. Magloire, founded a monastery here. There is little record of permanent settlement until the 16th century, when Elizabeth granted the lordship to Helier de Cartaret who repopulated the island, dividing the land among 40 farmers in strips from east to west. De Cartaret set up a scheme of government—partly manorial, partly parochial, which still holds. The island is included in the bailiwick of Guernsey, but has a court of justice of its own, the officers being appointed by the court of Guernsey under recommendation of the seigneur. There is also a court of chief pleas, whose members are the holders of the 40 original properties. Farming and fishing are the chief occupations.

SARMATAE or SAUROMATAE (the second form is mostly used by the earlier Greek writers, the other by the later Greeks and the Romans), a people whom Herodotus (iv. 21, 117) puts on the eastern boundary of Scythia (q.v.) beyond the Tanais (Don). He says expressly that they were not pure Scythians, but, being descended from young Scythian men and Amazons (iv. 110-117), spoke an impure dialect and allowed their women to take part in war and to enjoy much freedom. Hippocrates classes them as Scythian. From this we may infer that they spoke a language cognate with the Scythic. The greater part of the barbarian names occurring in the inscriptions of Olbia, Tanais, and Panticapaeum are supposed to be Sarmatian, and as they have been well explained from the Iranian language now spoken by the Ossetes of the Caucasus, these are supposed to be the representatives of the Sarmatae and can be shown to have a direct connection with the Alani (q.v.), one of their tribes. By the 3rd century B.C. the Sarmatae appear to have supplanted the Scyths proper in the plains of south Russia, where they remained dominant until the Gothic and Hunnish invasions. Their chief divisions were the Roxolani (q.v.), the Iazyges (q.v.), with whom the Romans had to deal on the Danube and Theiss, and the Alani. M. I. Rostovtzev has put serious difficulties in the way of the assumption that Sauromatae and Sarmatae were actually the same people; see his *Iranians and Greeks in S. Russia* (1922), and *Skhitya i Bospor* (1925).

SARMIENTO, DOMINGO FAUSTINO (1811-1888), Argentine educator, author, journalist and president of the republic, was born in San Juan de la Frontera on Feb. 14, 1811. He had little formal education and at an early age, because of his political opinions, took refuge in Chile, where he earned a precarious livelihood. In 1836 he returned to San Juan and was imprisoned for propaganda, but escaped to Chile in 1839 and engaged in journalism, editing *El Mercurio* of Valparaíso and founding *El Nacional* in Santiago. In 1841 he went back to Argentina to join the resistance to the dictator Rosas, but perceiving it to be useless, returned to Chile, where he added politics to journalism, founded the first Chilean normal school, was a member of the faculty of the university and waged violent polemics in behalf of liberal government and public instruction. His interest in public education was intense and in 1846 led him to make a several years' visit to Europe, Africa and the United States to study educational methods. In 1852 Gen. Urquiza's rebellion against Rosas drew him once more to Argentina and on Feb. 3, 1852, he assisted in overthrowing the dictator at the battle of Monte Caseros. Unwilling, however, to acknowledge Urquiza's political domination, he withdrew to Chile, but in 1856 reappeared in Buenos Aires, thrust himself into the journalistic arena and commenced a far-sighted campaign for public education. Elected governor of San Juan in 1862, while representing Buenos Aires in the national senate, he surrendered this position in 1864 to become minister to Chile and Peru and, in 1865, to the United States. While there he was elected president of Argentina for the term Oct. 12, 1868, to Oct. 12, 1874. As president he maintained political, economic and social stability, successfully terminated the War of the Triple Alliance against Paraguay (1865-70) and completely reorganized and amplified the national system of public instruction. Soon after

he retired from the presidency he was re-elected to the senate and then appointed director of education in the province of Buenos Aires. He continued to maintain an aggressive journalistic stand on all debatable questions. In 1878 he became editor of *El Nacional*, was appointed minister of the interior in President Avellaneda's government in 1879 and in 1881 was made national superintendent of schools, in which capacity he was able to carry to its logical conclusion much of his long campaign for universal education. He died in Asunción, Paraguay, on Sept. 11, 1888. In the first instance an educator, Sarmiento achieved fame also as an author. His complete works fill 52 volumes, and *Pacífico o la civilización y la barbarie* (1845), a portrait of Argentina in the epoch of Rosas, is the best known work in Argentina's literature and has been frequently translated. Notable also are: *Recuerdos de provincias* (Santiago de Chile, 1850), *Viajes* (Santiago, 1849), *Vida de Lincoln* (New York, 1866), *Las escuelas base de la prosperidad y de la república en los Estados Unidos* (New York, 1866).

See J. G. Guerra, *Sarmiento su vida y sus obras* (Santiago de Chile, 1901); J. P. Paz Soldán, *Domingo Faustino Sarmiento* (Buenos Aires, 1911); A. Coester, *The Literary History of Spanish America* (New York, 1906); R. Blanco-Fombona, *Grandes escritores de América* (Madrid, 1917); *Enciclopedia Universal Ilustrada* (Madrid, 1927).

SARNATH, 4 mi. from Benares city, in India, is the scene of the richest of the recent archaeological discoveries in the United Provinces. It was known to occupy the place of the Deer Park, where Gautama Buddha first launched his reforming faith and preached the "eight-fold path"; but except for a vast dismantled stupa, there was, at the beginning of this century, little indication of its buried treasures. The Chinese pilgrim, Hsien Tsang, in the 7th century, had visited the Deer Park, and described a monastery for 1,500 monks, a stupa, and in front of it a memorial pillar which Asoka had built, 70 feet high and polished like a mirror. In 1904, with Lord Curzon's encouragement, the ruins of Sarnath were opened, and the work of excavation went on for years. Asoka's monumental column is broken and fallen, though its surface retains its polish. A museum houses the finds of diggers.

SARNEN, the capital of the western half (or Obwalden) of the Swiss canton of Unterwalden. It stands 1,558 ft. above sea-level, at the north end of the lake of Sarnen (3 sq.mi. in extent), and is 43 mi. by rail from Alpnachstad, its port on the lake of Lucerne. Pop. (1950), 6,199. In the archives is preserved the famous ms. the *White Book of Sarnen*, which contains one of the earliest known versions of the Tell legend. (See TELL, WILLIAM.)

SARNIA, a city and port of entry, Ontario, Can., capital of Lambton county, 55 mi. N.E. of Detroit, Mich., on the left bank of the river St. Clair at the foot of Lake Huron. Pop. (1951) 34,420. It is on the Canadian National and the Chesapeake and Ohio railways, and is an important transshipping point for Great Lakes steamers carrying lumber, grain, coal and package freight. It contains a large oil refinery which handles the greater part of the product of the Ontario oil region, and is headquarters of the massive government-owned Polymer corporation engaged in the production of synthetic rubber. The Canadian National railway crosses the river at this point by the St. Clair tunnel, 6,025 ft. long or, including the approaches, 24 mi., which connects with the U.S. city of Port Huron, Mich.; motor traffic uses the Blue Water bridge.

SARNO (anc. *Sarnus*), a town of Campania, Italy, in the province of Salerno, 15 mi. N.E. from that city and 30 mi. E. of Naples by the main railway. Pop. (1936) 14,811 (town), 21,998 (commune). It lies at the foot of the Apennines, 92 ft. above sea-level, near the sources of the Sarno (anc. *Sarnus*), a stream connected by canal with Pompeii and the sea. Teias was defeated here by Narses in A.D. 552. Sarno has the ruins of a mediæval castle, which belonged to Count Francesco Coppola, who took an important part in the conspiracy of the barons against Ferdinand of Aragon in 1485. Walter of Brienne is buried in the ancient church of S. Maria della Foce rebuilt in 1701. The travertine which forms round the springs of the Sarno was used even at Pompeii as building material.

SARONNO, a town of Lombardy, Italy, in the province of Milan, from which city it is distant 13 mi. N.N.W. by rail. Pop.

(1536), 15,782 (town); 29,017 (commune). The pilgrimage church of the Madonna dei Miracoli, begun in 1498 by Vincenzo dell'Orto, has a dome of rich architecture; the campanile dates from 1516. Internally it is decorated with fine frescoes by Gaudenzio Ferrari, representing a concert of angels, while those in the chancel are by Bernardino Luini and are among his finest works. The place is well known for its gingerbread (*amarètti*) and is also a manufacturing town.

SARPEDON, in Greek legend, son of Zeus and Laodameia, Lycian prince and hero of the Trojan war. He fought on the side of the Trojans and was slain by Patroclus. Apollo rescued his body from the command of Zeus, handed it over to Sleep and Death, by whom it was conveyed for burial to Lycia, where a sanctuary (Sarpodæum) was erected in his honour. In later tradition, Sarpedon was the son of Zeus and Europa and the brother of Minos. Having been expelled from Crete by the latter, he and his comrades sailed for Asia, where he finally became king of Lycia.

See Homer, *Iliad*, v. 479, xii. 292, 419–683; Apollodorus iii. 3 ff.

SARPI, PAOLO (1552–1623), Venetian patriot, scholar and church reformer, was born at Venice, on Aug. 14, 1552. Against the wish of his relatives, he entered the order of the Servi di Maria, a minor Augustinian congregation of Florentine origin, at the age of thirteen. He assumed the name of Paolo, by which, with the epithet *Servita*, he was always known to his contemporaries. In 1570 he sustained no fewer than three hundred and eighteen theses at a disputation in Mantua, with such applause that the duke made him court theologian. Sarpi spent four years at Mantua, applying himself to mathematics and the Oriental languages. After leaving Mantua, he repaired to Milan, where he enjoyed the protection of Cardinal Borromeo, but was soon transferred by his superiors to Venice, as professor of philosophy at the Servite convent. In 1579 he was sent to Rome on business connected with the reform of his order, which occupied him several years, and brought him into intimate relations with three successive popes, as well as the grand inquisitor and other persons of influence. He returned to Venice in 1588, and passed the next seventeen years in study, occasionally interrupted by the part he was compelled to take in the internal disputes of his community. He was twice recommended for preferment to a bishopric, but the pope refused his sanction in each case. Sarpi, therefore, continued to occupy himself with mathematics, metaphysics and anatomy. The only certain physiological discovery which can be safely attributed to him is that of the contractility of the iris. It must be remembered, however, that his treatises on scientific subjects are lost, and only known from imperfect abstracts.

In the dispute which arose between Paul V. (q.v.) and Venice on the extent of the papal jurisdiction in the Venetian State, Sarpi prepared on behalf of the republic a memoir, pointing out that the threatened censures might be met in two ways—*de facto*, by prohibiting their publication, and *de jure*, by an appeal to a general council. The document was received with universal applause, and Sarpi was immediately made canonist and theological counsellor to the republic. In the following April Paul excommunicated the Venetians and sought to lay their dominions under an interdict. Sarpi now republished the anti-papal opinions of the famous canonist Gerson. In an anonymous tract published shortly afterwards (*Risposta di un Dottore in Teologia*) he laid down principles which struck at the very root of the pope's authority in secular things. This book was promptly put upon the *Index*, and the republication of Gerson was attacked by Bellarmine with a severity which obliged Sarpi to reply in an *Apologia*. The *Considerazioni sulle censure* and the *Trattato dell' interdicto*, the latter partly prepared under his direction by other theologians, speedily followed. Numerous other pamphlets appeared, inspired or controlled by Sarpi, who had received the further appointment of censor over all that should be written at Venice in defence of the republic. The Venetian clergy, a few religious orders excepted, disregarded the interdict, and discharged their functions as usual. The Catholic powers refused to be drawn into the quarrel. At length (April 1607) a compromise was arranged through the mediation of the king of France, which, while saving over the

pope's dignity, conceded the points at issue.

The republic rewarded Sarpi by making him state counsellor in jurisprudence, and giving him access to the state archives. On Oct. 5 he was attacked by a band of assassins and left for dead, but the wounds were not mortal. The bravos found a refuge in the papal territories. "Agnosco stylium Curiae Romanae," Sarpi himself pleasantly said, when his surgeon commented upon the ragged and inartistic character of the wounds.

The remainder of Sarpi's life was spent peacefully in his cloister, though plots against him continued to be formed, and he occasionally spoke of taking refuge in England. In 1615 a dispute between the Venetian government and the Inquisition respecting the prohibition of a book led him to write on the history and procedure of the Venetian Inquisition; and in 1619 his chief literary work, the *History of the Council of Trent*, was printed at London under the name of Pietro Soave Polano, an anagram of Paolo Sarpi Veneto. Sarpi never acknowledged his authorship. He survived the publication four years, dying on Jan. 15, 1623. His posthumous *History of the Interdict* was printed at Venice the year after his death, with the disguised imprint of Lyons.

Great light has been thrown upon Sarpi's real belief and the motives of his conduct by the letters of Christoph von Dohna, envoy of Christian, prince of Anhalt, to Venice, published by Moritz Ritter in the *Briefe und Acten zur Geschichte des dreissigjährigen Krieges*, vol. ii. (Munich, 1874). These letters seem to show that Sarpi was a patriot first and a religious reformer afterwards. His scientific attainments must have been great; and, though Sarpi did not, as has been asserted, invent the telescope, he immediately turned it to practical account by constructing a map of the moon.

Sarpi's life was written by his enthusiastic disciple, Father Fulgenzio Micciano, whose work is meagre and uncritical. Bianchi-Giovini's biography (1836) is greatly marred by digressions, and is inferior in some respects to that by Arabella Georgina Campbell (1889), which is enriched by numerous references to MSS. unknown to Bianchi-Giovini. T. A. Trollope's *Paul the Pope and Paul the Friar* (1861) is in the main a mere abstract of Bianchi-Giovini, but adds a spirited account of the concave of Paul V. The incidents of the Venetian dispute from day to day are related in the contemporary diaries published by Enrico Cornet (Vienna, 1859). Giusto Fontanini's *Storia arcana della vita di Pietro Sarpi* (1863), a bitter libel, is nevertheless important for the letters of Sarpi it contains, as Grissini's *Memorie e aneddoti* (1866) is from the author's access to Sarpi's unpublished writings, afterwards unfortunately destroyed by fire. Foscarini's *History of Venetian Literature* is important on the same account. Sarpi's memoirs on state affairs remain in the Venetian archives. Portions of his correspondence have been printed at various times, and inedited letters from him are of frequent occurrence in public libraries. The King's library in the British Museum has a valuable collection of tracts in the interdict controversy, formed by Consul Smith.

(In addition to the above works see Balan, *Fra Paolo Sarpi* (Venice, 1887) and Pascolato, *Fra Paolo Sarpi* (Milan, 1893). Some hitherto unpublished letters of Sarpi were edited by Karl Benath and published under the title *Paolo Sarpi. Neue Briefe, 1608–10* (at Leipzig in 1909).)

SARPSBORG, a seaport and manufacturing town of Norway, in Smaalenene amt (county), 68 m. S.E. of Oslo on the Gothenburg railway. Pop. (1930) 12,401. It became important through the utilization of the falls in the river Glommen for driving saw-mills and generating electric power. The Sarpsfos is a majestic fall, descending 74 ft. with a width of 120 ft., and providing 50,000 h.p. for factories for calcium carbide (used for manufacturing acetylene gas), paper, cellulose, zinc, wood pulp and aluminium; and spinning and weaving mills. The port is at Sannesund; its quays can be reached by vessels drawing 20 feet. The town was founded in the 11th century, and destroyed by the Swedes in 1567. The existing town dates from 1859.

SARRACENIA or **SIDE-SADDLE FLOWER**: see PITCHER PLANTS.

SARRAIL, MAURICE PAUL EMMANUEL (1856–1929), French soldier, was born at Carcassonne (Aude) on April 6, 1856. He graduated from the St. Cyr Military academy in 1877, and after a series of promotions was appointed in 1907 director of infantry at the war office. In 1912 he was promoted general of division and on Nov. 1, 1913, was given command of the 8th army corps, being later (April 24, 1914) transferred to the 6th corps which he commanded on the outbreak of World

War I. On Sept. 2, 1914, after leading the 6th corps with credit at the battle of the Frontiers, he succeeded Ruffey as commander of the 3rd army which played a brilliant part during the retreat to the Marne. During the trench warfare operations of 1914-15 he was less successful, however, and he was transferred to the chief command of the French army of the east. He became commander in chief of the Allied forces on that front (see SALONIKA CAMPAIGNS 1915-18). After the war of 1914-18 he devoted himself to politics and stood, unsuccessfully, as radical deputy for Paris. He was, in Jan. 1925, appointed high commissioner in Syria. His administration was severely criticized; during the rebellion which broke out among the Jebel Druses he bombarded the native quarter of Damascus. In Oct. 1925, as a result of the report by General Dupont, he was relieved of his post. He died on March 23, 1929.

See P. Coblenz, *The Silence of Sarraut* (London, 1930).

SARRAUT, ALBERT PIERRE (1872-), French politician, was born at Bordeaux, graduated in law, and became *conseiller-général* of the canton of Lezignan. He attached himself to the radical-socialist group, and worked on the *Dépêche de Toulouse*, of which his brother, Maurice Sarraut, was one of the editors. He was poet and author as well as journalist. In 1909 he was made under secretary at the war ministry in the first Briand cabinet. In 1911 he was appointed to succeed Klobukowski as governor general of Indo-China. On the outbreak of war in 1914 he returned to France, and became minister of public instruction; later he served in the 30th infantry regiment, and then became again governor general of Indo-China. He was wounded at Hanoi (Tonkin) by a shot fired by a discharged official. In 1922 he became minister for the colonies in the Poincaré government, and in that capacity drew up an important scheme for the develop-

ment of each of the units of the French colonial empire. He was sent in 1925 to Angora as French ambassador for a short time. In 1926 he was elected senator. He held office under Poincaré, 1927-28, and Herriot, 1932; and was premier from Oct. to Nov. 1933. In 1934 he was minister of the interior in the Doumergue government. He was premier from January to June 1936 when he had to face the crisis caused by the German re-occupation of the Rhineland. From June 1937 he held various ministerial posts in successive governments until June 1940. Deported to Germany during World War II, Sarraut was liberated in 1945.

SARRAZIN, JACQUES (1588-1660), French painter, born at Noyon in 1588. He went to Rome where he obtained employment from Cardinal Aldobrandini at Frascati, where he won the friendship of Domenichino, with whom he afterward worked on the high altar of St. Andrea della Valle. He decorated the great portal and the dome of the western façade of the interior court of the Louvre. Sarrazin died on Dec. 3, 1660.

SARREBOURG, a town of France, in the department of Moselle, 44 mi. northwest from Strasbourg. Pop. (1946) 8,667. It has been identified with the Pons Saravi of the Romans; it belonged to the bishops of Metz and the dukes of Lorraine.

SARREGUEMINES (SAARGEMÜND), a town of France, in the department of Moselle at the confluence of the Blies and the Saar, 40 mi. E. of Metz, 60 mi. N.W. of Strasbourg by rail. Pop. (1946) 13,375. Sarreguemines, originally a Roman settlement, obtained civic rights early in the 13th century. In 1297 it was ceded by the count of Saarbrücken to the duke of Lorraine, and passed with Lorraine in 1766 to France, being transferred to Germany in 1871 and to France in 1919. It makes faience, plush, velvet, porcelain and earthenware.
